A life of favage hoftility in the foreft offers the ima- Places gination ore of the moft tremendous pietures in nature. which they In thofe burning countries, where the fun dries up eve frequent. ry brook for hundreds of miles round; when what had the appearance of a great river in the rainy feafon, be. comes, in fummer, one dreary bed of fand; in thofe countrics, a lake that is never dry, or a brook that is pereunial - is confidered by every animal as the greateft convenience of nature. When they have difonvered this, no dangers can deter them from attempting to nake their thirlt. Thus the neighbourhood of a rivulet, in the heart of the tropical continents, is generally the place where all the hoftile tribes of nature draw up. for the engagement. On the banks of this little envied fpot, thoufauds of animals of various kinds are feen venturing to quench their thift, or preparing to feize their prey. The elephants are perceived in a long line, marching from the darker parts of the foreft ; the buffaloes are there, depending upon numbers for fecurity; the gazelles relying folely upon their fwiftnefs; the lion and tiger waiting a proper opportunity to feize; but chiefly the larger ferpents are upon guard there, and defend the acceffes of the lake. Not an hour paffes without fome dreadful combat ; but the ferpent, defended by its fcales, and naturally capable of fuftaining a multitude of wounds, is, of all others, the moft formidable. It is the moft wakeful alfo; for the whole tribe neep with their eyes open, and are confequently for ever upon the watch : fo that, till their rapacity is fatisfied,

\section*{The fround} which they uttur.
few other animals will venture to approach their fta-
In comparing ferpents as to their voices, fome are found filent, fome lave a peculiar cry; but hiffing is the found which they moft commonly fend forth, either as a call to their kind, or as a threat to their enemies. In the countries where they abound, they are gencrally filent in the middle of the day, when they are obliged to retire from the heat of the climate ; but as the cool of the evening approaches, they are then heard iffuing from their cells with continued hiffings; and fuch is the variety of their notes, that fome have affured us they very much refemble the mufic of an Englifh grove. This fome will hardly credit; at any rate, fuch notes, however melodious, can give but very little delight, when we call to mind the malignity of the minftrel. If confidered, indeed, as they anfwer the animal's own occafions, they will be found well adapt. ed to its nature, and fully anfwering the purpofes of terrifying fuch as would venture to offend it.

With refpect to motion, fome ferpents, particularly thofe of the viper kind, move flowly; while others
dart with amazing fwiftnefs. The motion in all is fimilar ; but the ftrength of body in fome gives a very different appearance. The viper, that is but a flow feeble-bodied animal, makes way in a heavy undulating manner ; advancing its head, then drawing up its tail behind, and bending the body into a bow; then from the fpot where the head and tail were united, advancing the head forward as before. This, which is the motion of all ferpents, is very different from that of the eartl-worm or the naked fnail. The ferpent, as was faid above, has a back-bone, with numerous joints; and this bone the animal has a power of bending in every direction, but without being able to fhorten or lengthen it at pleafure. The earth-worm, on the other hand, has no back-bone ; but its body is compofed of rings, which, like a barber's puff, it can lengthen or forten as it finds neceffary. The earth-worm, therefore, in order to move forward, lengtliens the body ; then by the fore part clings to the ground where it has reached, and then contracts and brings up its rear: then, when the body is thus fhortened, the fore-part is lengthened again for another progreffion, and fo on. The ferpent, inftead of Thortening the body, bends it into an arch; and this is the principal difference between ferpentine and vermicular progreffion.

We have inftanced this inotion in the viper, as moft eafily difcerned; but there are many ferpents that dart with fuch amazing fwiftnefs, that they appear rather
- to leap than crawl. It is noft probable, however, that no ferpent can dart upon even ground farther than its own length at one effort. Our fears indeed may increafe the force of their fpeed, which is fometimes found fo fatal. We are told by fome, that they will dart to a very great diftance; but this we have never been able to afcertain. The manner of progreffion in the fwifteft ferpent we know, which is the jaculus, is by inftantly eniling itfelf upon its tail, and darting from thence to its full extent: then carrying the tail, as quick as lightning, to the head ; coiling and darting again; and by this means proceeding with extreme rapidity, without ever quitting the ground. Indeed, if we confider the length and the weaknefs of the back-bone is all thefe apimals; if we regard the make
all the vertebre, in which we hall find the juneture all formed to give play, and none to give power; we cannot be of opinion that they have a faculty of fpringing from the ground, as they entirely want a fulcrum, if we may fo exprefs it, from whence to take their fpring; the whole body being compofed of unfupported mufcles and joints that are yielding.

Though all ferpents are amphibious, fome are much. Thoug fonder of the water than others; and though deftitute yet anh of fins or gills, remain at the bottom, or fwim along yet the the furface, with great eafe. From their internal ftruc-immer ture, we fee how well adapted they are for either ele-in wat ment : and how capable their blood is of circulating at the bottom as freely as in the frog or the tortoife. They can, however, endure to live in frefh water only; for falt is an effectual bane to the whole tribe. The greateft ferpents are moft ufually found in freih water, either choofing it as their favourite element, or finding their prey in fuch places in the greateft abundance. But that all will live and fwim in liquids, appears from an experiment of Redi; who put a ferpent into a large glafs veffel of wine, where it lived fwimming about fix hours; though, when it was by force inmerfed and put under that liquid, it lived only one hour and an half. He put another in common water, where it lived three days; but when it was kept under water, it lived only about 12 hours. Their motion there, however, is perfectly the reverfe of what it is upon land; for, in order to fupport themfelves upon an element lighter than their bodies, they are oblized to increafe their furface in a very artificial manner. On earth their windings are perpendicular to the furface; in water they are parallel to it : in other words, if a perfon fhould wave his hand up-and down, it will give an idea of the animal's progrefs on land; if to the right and left, it will give fome idea of its progrefs on the water.

Some ferpents have a moft horrible foetor attending them, which is alone capable of intimidating the brave. This proceeds from two glands near the vent, like thofe in the weafel or polecat ; and, like thofe animals, in proportion as they are excited by rage or by fear the fcent grows ftronger. It would feem, however, that fuch ferpents as are moft venomous are leaft offenfive in this particular; fince the rattlefnake and the viper have no finell whatever; nay, we are told, that at Calecut and Cranganon, in the Eaft Indies, there are fome very noxious ferpents, who are fo far from being difagrecable, that their exclements are fought after, and kept as the moft pleafing perfune. The Efculapian ferpent is alfo of this number.
Some ferpents bring forth their young alive, as the Some viper; fome bring forth eggs, which are hatched by vipare the heat of their fituation, as the common black fnake, parou and the majority of the ferpent tribe. When a reader, ignorant of anatomy, is told, that fome of thofe animals produce their young alive, and that fome produce egge only, he is apt to fuppofe a very great difference in the internal conformation, which makes fuch a variety in the manner of bringing forth. But this is not the cafe : thefe animals are internally alike, in whatever manner they produce their young; and the variety in their bringing fortli is rather a flight than a real difcrimination. The only difference is, that the viper hatches her eggs, and brings them to maturity, within her body \(;\). the fnake is more premature in her produc-

\section*{S E R [ 305 T S E R}
tions, and fends her eggs into the light fome time before the young ones are capable of leaving the fhell. Thus, if either arc opened, the eggs will be found in the womb, covered with their membranous fhell, and adhering to each other like large beads on a ftring. In the eggs of both, the young ones will be found, though at different ftages of maturity : thofe of the viper will crawl and bite in the moment the fhell that inclofes them is broke open : thofe of the fnake are not yet arrived at their perfect form.

Father Labat took a ferpent of the viper kind that twas nine feet long, and ordered it to be opened in his prefence. He then faw the manner in which the eggs of thefe animals lie in the womb. In this creature there were fix eggs, each of the fize of a goofe egg, but longer, more pointed, and covered with a membranous fkin, by which alfo they were united to each other. Each of thefe eggs contained from 13 to 15 young ones, about fix inches long, and as thick as a goofequill. Though the female from whence they were taken was fpotted, the young feemed to have a varicty of colours very different from the parent ; and this led the traveller to fuppofe that the colour was no characteriftic mark among ferpents. Thefe little mifchievous animals were no fooner let loofe from the fhell, than they crept about, and put themfelves into a threatening pofture, coiling themfelves up and biting the ftick witl which he was deftroying them. In this manner he killed 74 young ones; thofe that were contained in one of the eggs efcaped at the place where the female was killed, by the burfting of the egg and their getting among the bufhes.

The fafcinating power afcribed to ferpents, efpecially \(g_{\text {to }}\) rattlefnakes, by which they are faid to draw animals to them, is very curious. It has been defcribed by fo many different perfons, who affirmed that they had feen inftances of it, and has been believed by fo mary men of penetration and difcernment, that it deferves at leaft to be mentioned. The rattlefnake fixes its eyes upon any animal, fucli as a bird or fquirrel. When the animal fpies the fnake, it 1 kips from fpray to fpray, hovering and approaching nearer, the enemy ; defcending, with diftracted geftures and cries, from the top of the loftieft trees to the mouth of the fnake, who opens his jaws, and in an inftant fwallows the unforturate animal.

The following inftances of fafcination have fo much the appearance of fiction, that it would require a very uncommon degree of evidence to render them credible. They are extracted from a paper in the Gentleman's Magazine for the year 1765, p. 511 . which was communicated by Mr Peter Collinfon from a correfpondent in Philadelphia.
" A perfon of good credit was travelling by the fide of a creek or fmall river, where he faw a ground fquirrel running to and fro between the creek and a great tree a few yards diftant ; the fquirrel's hair looking very rough, which fhowed he was feared, and his returns being fhorter and fhorter, the man ftood to obferve the caufe, and foon fpied the head and neck of a rattlefnake pointing at the fquirrel through a hole of the great tree, it being hollow; the fquirrel at length gave over running, and laid himfelf quietly down with his head clofe to the fuake's; the fnake then opened his mouth wide, and took in the fquirrel's head; upon which the man gave

Vos. XVII. Part.I.
the fnake a whip acrofs the neck, and fo the fquirrel being releafed, he ran into the creek.
" When I was about 13 years old, I lived with William Atkinfon, an honeft man in Bucks county, wl..), returning from a ride in warm weather, told us, that while his horfc was drinking at a run, he heard the cry of a blackbird, which he fpied on the top of a fapling, fluttering and ftraining the way he feemed unwilling to fly, and holding fo falt the fprigs he was perched upon that the fappling top bent. After he had viewed the bird a few minutes, it quitted the place, and made a circle or two higher in the air, and then refumed its former flanding, fluttering and crying: Thereupon William rode the way the bird ftrained, and foon fpied a large black fnake in coil, fteadily eyeing the bird. He gave the fnake a lafh with his whip, and this taking off the fnake's eye from his prey, the charm was broken, and away fled the bird, changing its note to a fong of joy.
" Mr Nicholas Scull, a furveyer, told me, that when he was a young man, as he happened once to be leaning upon a fence, and looking over it, he faw a large rattlefnake in coil, looking ftedfaftly at him. He found himfelf furprifed and liftlefs immediately, and had no power for about a minute (as he thinks) but to look at the fnake, and then he had the refolution to pufh him. felf from the ferice, and turn away, feeling fuch horror and confufion as he would not undergo again for any confideration.
" Doctor Chew tells me, a man in Maryland was found fault with by his companion that he did not come aleng; the companion ftepping towards him, obferved that his eyes were fixed upon a rattlefnake which was gliding flowly towards him, with his head raifed as if he was reaching up at him ; the man was leaning towards the fnake, and faying to himfelf, be will bite me! be will bite me! Upon which his companion caught him by the fhoulder, and pulled him about, and cried out, What the dervil ails you? He will bite you fure enough! 'This man found himfelf very fick after his inchantment."

The fafcinating power of ferpents was believed by Dr Mead and other eminent men, who certainly thought they had fufficient evidence for admitting it. Incredible therefore as it appears, it ought not to be rejected without examination ; though being of a very extraordinary nature, it cannot be received without unqueftion. able evidence. Scepticifm is no lefs abfurd than incredulity; and the true philofopher will carefully avoid both. Human knowledge is founded on obfervation and expcrience ; not, however, on every man's perfonal obfervation and experience, but on the united obfervation and experience of all mankind. But this prefuppofes the credibility of human teftimony in every cafe that does not involve an impoffibility. All the laws of nature are not yet known, nor all the wonderful powers of which the is poffeffed. It is not more incredible a priori, that the eye of a ferpent fhould attract an animal than that a magnet flould attract a piece of iron, or a piece of iron attract electrical matter. The evidence of thefe facts refts entirely on perfonal obfervation or authentic teftimony. The only thing requifite with refpect to objects of teftimony is, when the fact is fo extraordinary as has not fallen within the oblervation of the generality of men, the ftrength
\(\underbrace{\text { Serpnto }}\)

}

\section*{\(S \mathrm{E} R\)}
of the evidence mult be in proportion to the extraordinary nature of the fact. 'To apply this to the prefent care: We have the teftimony of many perfons that fonte ferpents have a power of fafcination ; but the generality of men have never obferved this; it is therefore an extraordinary fact, and requires extraordinary evidence. But the evidence is not fatisfactory ; therefore we do not receive it as a fact : on the other hanc, it is unphilofophical to reject it à priori.

No fubiect has excited more philofophical controverfy than the poifon of ferpents, with regard to its nature and mode of operating, Antiquity has not been fparing in conjeeure and fiction upon this fubject, and its errors have beea retained with the moft reverential obftinacy by the vulgar: among thefe we are to reckon the fictitious fling fixed in the tail of the ferpent, as the painters fometimes have grounclefly enough reprefented it ; fome have invented a fimilar fiction of a black forked tongue, which the ferpent vibrates on both \(\mathfrak{G}\) des, and have afcribed its power of producing fuch noxious effect to this ; while others, affecting an air of fuperior difcernment, have, upon equally good reafons, aferibed it to the teeth in general : thefe are all errors of a maynitude that the moit defultory attention to the fubject would have been fufficient to have removed. There is a very fmall bone clofely fixed to the upper jaw, in the infide of the lip of a poifonous ferpent, which has a power of moving backward or forward; to this two or three fangs are annexed larger than the teeth, which the ferpent, by its affiftance, when enraged, darts forward, or withdraws and conceals at his pleafure, in a fimilar manner to the claws of a cat : thefe fangs, which the common people name the large teeth of the ferpent, are excellently delcribed by Tyfon in the anatomy of the rattlefnake, which he has given in the Philofophical Tranfactions. "In thefe (the fangs) we obferved a confiderable cavity near the bafe; and near the point a very difcernible fiffure of fome length like the Ilit of a pen : the part of the tooth from the fiffure to the root was manifefly channelled, which we firt dif. covered by lightly prefling the gums; we then faw the poifon afcend through the cavity of the fang and flow out of the fiffure; and as thefe fangs are fo very acute, fo firm and folid toward the point (the fiffure being on the external and convex, not the internal fide), nothing could be conceived more convenient either for inflicting, a wound, or to infure the infurion of the poifon." Each of the fangs is furrounded with a veficle furnifhed with glands fecreting a certain fluid; which, upon the veficle beiny. preffed, feems to flow out of the point of the fang. The ferpent when incenfed, raifing his head, extends the fmall bone armed with the fangs mentioned above; and attacking his enemy with a force combined of the weight of his body and the action of the mufcles, he wounds him with the expanded fangs, and the veficle being comprefled the poifon immediately flows into the wound : this is clear from the experience of thofe who, having broken off their fangs with a pair of forceps, handled the ferpent thus difarmed without any hurt. 'The North Americans, after carefully extracting thefe venomous fangs, fuffer the rattlefnake to bite and gnaw them with his teeth till the blood flows freely, with total impunity.

Antiquity amuled itfelf with a fable deftitute of all appearanct of truth, that anger was excited by black
bile : they applice this fiction without hefitation to the prefent fubject, and founded an hypothefis. upon it, to account for the effects of the bite of an incenfed ferpent; pretending to have difcovered an ideal cand which conducted the bile from its veficle to the moutls of the ferpent, whence it flowed into the part bitten, and produced the moft fatal fymptoms. But toward the end of the latt century, this fubject was greatly illuftrated under the aufpices of Ferdinand II. Great Duke of Tufcany: This prince, defirous of inquiring into that myfterions quettion, the nature of ferpents, invited Steno, Rhedi, and fome other philofophers of the firt eninence, to his court; and a multitule of the moft poifonous ferpents being collected, Rhecii made feveral experiments upor them, which difcovered to him. a number of particulars before unknown; of which the following feem to have the beft claim to our attention. When he either caufed a living viper to bite a dog, or wounded him with the teeth of one newly dead (the poifonous veficle remaining unbroken), the event was the fame. If the bite was repeated, its effeet becaine weaker, and at left was loft, the prifon contained in the velicle being totally exhaufted. That the teeth of ferpents, when extended to bite, were moiftened over with3 a certain liquor; and when the veficle at the bafe was preffed, a drop of poifon flowed to the point of the fang. When the poifon thus flowing from the veficle was reccived in foft bread or a fponge, an animal bitten by the ferpent received no more harm from the wound than from being pricked by a needle, till alter a few days, when the venom was refored afrefh : but when an animal was wounded with the point of a needle dipperd: in the poifon, it was tormented with the fame pains as if it: had been bitten by the viper itfelf. Preferving fome of this poifon in a glafs, and totally evaporating the moifo ture in the fun, when the refiduum was diluted again' with water, and the point of a needle dipped in the folution, Rhedi found to his great furprife that it had the fame effect as when recent. But the boldnefs of Tozzi, one who clarmed vipers, flun \(r\) all thefe men who were deeply verfed in natural philofophy into the utmoft aftoniflment. "'hey happening to fall into difcourfe (while the prince was prefent) upon the certain death which would attend any perfon's fwallowing this poifon of the viper by miftake, inftead of fpirit of wine or water ; Tozzi, confiding in his art, drank a confiderable portion of it without hefitation : they were all attonifhed at his apparent rathnefs, and predicted inftant death to the man ; howevcr, he efcaped as fafely as if he had drunk only fo much water. This event, whicl ftruck the prince and his illuftrious affociates in thefe philofophical inquiries by its novelty, was well known to the ancients. Lucan, in the gth book of the Phar* falia, fpeaking of the ferpent, fays,

\section*{Noxia ferpentum eff admijto Sanguine pefis. \\ Morfu virus habent et fatum dente mincntur,}

Pocula miorte carent.
Phar. 1. g. v. 614.
Mix'd with the blood that venom flays alone,
His bite is poifon ; death is in his fang;
Yet is the draught innoxious.
Nor muft we omit obferving, tliat barbarous nations. are perfectly aequainted with the property of the poifon of ferpents by which it retains its deadly power af.

\section*{S E R}

Serpent.
Now tearing up the fands, fome latent vein Fruftrate he fecks; now to the Syrtes fhore Return'd, he fwallows down the briny flood Mix'd with its rolling fands; nor knows his fate And the fad poifon's death, but calls it thirt; Then with his fword opens his fpouting veins, And drinks the burfting blood.
The phytas, or amodytes of Linnæus, or, according to others, the coluber afpis, feems to have been the ferpent made ufe of by Cleopatra to deftroy herfelf. This woman, to terminate a diffipated life with an eafy death, ordered her phyficians to prepare a poifon for her which might beft effect this purpofe. Having tried a number of different experiments upon condemned criminals, they at laft difcovered this fpecies of afp, which brings on death without any previous appearance of diftemper or hiccough : the face feems in a flight perfpiration, an eafy infenfibility and lethargy creeps upon the whole frame, and the perfon bitten feems almoft totally ignorant of his approaching diffolution. Having acquainted the queen with their difcovery, fhe applied the afp either to her bofom or her arms; or, according to fome authors, dipping the point of a needle in the poifon, and pricking herfelf with it, the expired in an eafy fleep.

The bite of the naja is fo fatal, that a man dies by it in the fpace of an hour, his flefh entirely falling off his bones in a femidiffolved putrid ftate: this makes it probable that it is the fame ferpent which the ancients named the Jepe.

The experiments of Rhedi have not, in the opinion of fome celebrated philofophers, fo far cleared the theory of the operation of the poifon of the viper, as to leave nothing further to be defired upon that fubject. Fontana and Carminati have endeavoured to inveftigate its operations more clearly. Carminati, from in experiments, deduces the following conclufions: I. That if poifon be inftilled into a nerve, the animal wounded dies almoft inftantly ; and the whole nervous fyftem, to which it is rapidly conveyed, is deprived of its quality called fenfibility. 2. If a mufcle be wounded, it is deprived of its irritability. This is confirmed by the experiments of Fontana. 3. The poifon injected into a wounded mufcle or tendon is confiderably longer in killing an animal than that introduced into a nerve. 4 . The fymptoms which precede the death of the animal bitten are, a ftupor, lethargy, tremors, convulfions, paralyfis of the legs (part wounded), entire diffolution of the limbs. The blood is not always coagulated, nor its crafis diffolved. Marks of inflammation are fometimes difcovered in certain parts of the animal after death, fometimes not : thefe are the effects of fpafms and convulfions, not of the poifon. 5. Not the leaft fign of the jaundice was difcoverable in the eyes of any of the animals upon which Carminati made his experiments. 6. The ftomach in every one of them was very much inflated; a fymptom remarked only by Fallopius and Albertini. 7. A ligature applied inftantly above the part bitten, if it be fo placed as to admit one, was found by fome experiments a good preventative againft the diffufion of the poifon: its compreffion fhould be confiderable, but not exceffive.

As few ferpents, comparatively fpeaking, are poifonous, it may be interefting to our readers to know what
are the characteritics which diftinguin poifonous from harmlefs ferpents. 'IThe external characteritics of the poifonous tribe are thefe:
" I. A broad head, covered with fmall fcales, though Hto it be not a certain criterion of venomous ferpents, is, poin with fome few exceptions, a general character of them. fer
" 2. A tail under one-fifth of the whole length \(P b\) is alfo a general character of venomous ferpents; but, fince many of thofe which are not venomous have tails as fhort, little dependence can be placed upon that circumftance alone. On the other hand, a tail exceeding that proportion, is a pretty. certain mark that the fpecies to which it belongs is not venomous.
" 3 . A thin and acute tail is by no means to be confidered as peculiar to venomous ferpents; though a thick and obtufe one is only to be found among thofe which are not venomous.
" 4 . Carinated fcales are, in fome meafure, characteriftic of venomous ferpents, fince in them they are more common than fmooth ones, in the proportion of nearly four to one; whereas fmooth fcales are, in thofe ferpents which are not venomous, more common, in the proportion of nearly three to one.
" Upon the whole, therefore, it appears, that though a pretty certain conjecture may, in many inftances, be made from the external characters, yet, in order to determine with certainty whether a ferpent be venomous or not, it becomes neceffary to have recourfe to fome certain diagnoftic. This can only be fought for in the mouth : we mult therefore next confider how the fangs, with which the mouths of venomous ferpents are furnifhed, are to be diftinguifhed from common teeth.
"To thofe who form their ideas of the fangs of a venomous ferpent, from thofe of the rattlefnake, or even from thofe of the Englifh viper, it will appear frange that there fhould be any difficulty in diftinguifhing thofe weapons from common teeth; and indeed the diftinction would really be very eafy, were all venomous ferpents furnifhed with fangs as large as thofe of the fore-mentioned fpecies. But the fact is, that in many fpecies the fangs are full as fmall as common teeth, and confequently cannot, by their fize, be known from them; this is the cafe with the coluber laticaudatus, laceens; and feveral others."

Linnæus thought that the fangs might be diftin. guifhed by their mobility and fituation; but other naturalifts have not found it a general fact that fangs are loofe in their fockets, nor have they obferved any difference in fituation between the fangs of venomous ferpents and the teeth of others. The following diftinction is eftablifhed by Dr Gray in a paper inferted in the Philofophical Tranfactions, Vol. lxxix. All venomous fer. pents bave nnly two rows of teeth in the upper jaw, and all others have four.

In the preface to the Mufeum Regis, and in the introduction to the clafs amphibia in the Sy/tema Nature, Linnæus fays, that the proportion of venomous ferpents to others is one in ten ; yet, in the Sy/lema Natura, of which the fum total in fpecies is 131 , he has marked 23 as venomous, which is fomewhat more than one in fix. How he came to be fo much at variance with himfelf, it is not eafy to fay; but the laft mentioned proportion feems to be not far from the truth, as Dr Gray, after examining 154 fpecies of ferpents, found only 26 that feemed to be venomous.

\section*{S E R}

The coluber folatus and mycierizans, though mark. ed by Linnæus, we are affured by Dr Gray are not poifonous: he thinks the fame may be faid of the leberis and dypfas. On the other hand, he obferves, that the boa contortrix, coluber cerafles, laticaudatus, and coluber fulvus, none of which are marked in the Sylema Natura, are all poifonous.

In addition to the method of cure mentioned in the articles referred to above, we fhall fubjoin the prefcription of a new author, Dr Mofeley*, who fpent 12 years in the Weft Indies, and whofe abilities and extenfive practice very juftly intitle his opinion to a place in this work, to the attention of the public, and to all medical gentlemen going to the Weft Indies.
"'The bites and fings of all venomous animals are cured by the fame local means; which are very fimple, if they were always at hand. The injured part muft be inftantly deftroyed or be cut out. Deftroying it is the mott fafe, and equally certain : and the beft application for that purpofe is the lapis infernalis or the butter of antimony.-Thefe are preferable to an hot iron, which the ancients ufed, becaufe an hot iron forms a cruft, which acts as a defence to the under parts, in ftead of deftroying them. The lapis infernalis is much better than any other cauttic, as it melts and penetrates during its application. The bitten part muft be deftroyed to the bottom, and where there is any doubt that the bottom of the wound is not fufficiently expofed, butter of antimony fhould be introduced into it on the following day, as deep as poffible; and incifions Nhould be made to lay every part open to the action of thefe applications. Befides deftroying, burning, or cutting out the part, incifions fhould be made round the wound, to prevent the communication of the virus. The wound is to be dreffed for fome time with poultices, to affuage the inflammation caufed by the cauftics ; and afterwards with acrid dreffings and hot digeftives to drain the injured parts.
" Where the above-mentioned cauftics cannot be procured, corrofive fublimate, oil of vitriol, aquafortis, fpirit of falt, common cauftic, or a plafter made of Guicklime and foap, may be applied to the wound. Gunpowder laid on the part, and fired, has been ufed with fuccefs. When a perfon is bitten remote from any affiftance, he fhould make a tight ligature above the part, uritil proper application can be made. The Spanifh writers fay, that the babilla de Carthagena, or Carthagena bean, is a fpecific for poifonous bites, taken inwardly.
"Ulloa fays, it is ' one of the moft effectual antidotes known in that country (Carthagena) againft the bites of vipers and ferpents: for a little of it being eaten immediately after the bite, it prefently ftops the effects of the poifon; and accordingly all who frequent the woods, either for felling trees or hunting, never fail to eat a little of this habilla fafting, and repair to their work without any apprehenfion.
- The natives tell you, that this habilla being hot in the higheft degree, much of it cannot be eaten; that
the common dofe of it is lefs than the fourth part of a
Serpent. kernel ; and that no hot liquor, as wine, brandy, \&c. mult be drunk immediately after taking it.'
"The Carthagena bean, or habilla, is found in great abundance in the Weft Indian iflands, where it is generally known by the name of Antidote or Cocoon, or Antidute Cocoon. In fmall dofes it is ftomachic and diaphoretic ; and in large dofes emetic and purgative. In feveral diforders it is a powerful remedy ; but its virtues are not fufficiently known, except among the Indians and negroes, who chiefly ufe an infufion or tincture of it made in rum. This is externally as well as internally ufed for many complaints (A).
"I have been informed by fome intelligent Indians, that any of the red peppers, fuch as bird pepper, or bell pepper, or what is called Cayenne pepper, powdered and taken in a glais of rum as much as the ftomach can poffibly bear, fo as to caufe, and keep up for fome time, great heat and inflammation in the body and a vigorous cicculation, will top the progrefs of the poifon of ferpents, even after its effects are vifible; and that the bitten part only afterwards mortifies and feparates, and that the patient, with bark, wine, and cordials, foon recovers.
" This fiery practice is certainly agreeable to that of the ancients, and probably the only internal treatment that can have any good effect; as in thefe cafes the powers of life, and the action of the heart, are fuddenly enfeebled, and the pulfe in ftrength and frequency obferves almoft a regular declenfion from the time of the bite until it entirely ceafes in death."

Polygala Senega, or rattlefnake-root, was formerly why fome: confidered as a fovereign remedy for the bite of the ferpents are: rattlefnake ; but this opinion is now exploded.
poifonous.
- If it be alked for what purpofe were ferpents created with fuch deftructive weapons? we anfwer, that they were given for felf-defence. Without thefe, ferpents, of all other animals, would be the moft expofed and defencelefs; without feet for efcaping a purfuit, without. teeth capable of inflicting a dangerous wound, or without ftrength for refiftance; incapable, from their fize, of finding fecurity in very fmall retreats like the earthworm, and difgufting all from their deformity, nothing was left for them but a fpeedy extirpation. But furnifhed as they are with powerful poifon, every rank of animals approach them with dread, and never feize them but at an advantage. Nor is this all the benefit they. derive from it. The malignity of a few ferves for the protection of all. Though not above a tenth of their number are actually venomous, yet the fimilitude they, all bear to each other excites a general terror of the whole tribe ; and the uncertainty of their enemies about what ferpents are poifonous, makes even the moft harmlefs formidable. Thus Providence feems to have acted with double precaution: it has given fome of them poifon for the general defence of a tribe naturally feeble; but it has thinned the numbers of thofe which are venomous, left they fhould become too powerful for the reft of animated nature.

Some pe
fous fa-
mous for
charming shem.

30

From thefe noxious qualities in the ferpent kind, it is no wonder that not only man, but beafts and birds, earry on anceafing war againtt them. The ichnenmon of the Indians, and the peccary * of America, deAtroy them in great numbers. 'I hele animals have the art of feizing them near the head; and it is faid that they can fkin them with great dexterity. The vulture and the eagle alfo prey uponthem in erreat abundance ; and often, foufins down from the clouds, drop upon a long ferpent, which they fnatch up ftruggling and writhing in the air. Dogs alfo are bred up to oppofe them. Father Feuillce tells 11s, that being in the woods of Martinico, he was attacked by a large ferpent, which he could not eafily avoid, wher his dog immediately came to his relief, and fei:- d the affailant with great courage. The ferpent entwined him, and preffed him fo violently, that the blood came out of his mouth, and yet the dog never cealed till he had torn it to pieces. The dog was not fenfible of his wounds during the fight ; but foon after his head fwelled prodigioufly, and he lay on the ground as dead. But his matter having found a banana tree hard by, he applied its juice mixed with treacle to the wounds, which recovered the dog, and quickly healed his fores.

The Pfylli of old were famous for charming and deftroying ferpents I. Some moderns pretend to the fame art. Cafaubon fays that he knew a man who could at any time fummon 100 ferpents together, and draw them into the fire. Upon a certain occafion, when one of them, bigger than the reft, would not be brought in, he only repeated his charm, and it came forward, like the reft, to fubmit to the flames. Philoftratus defcribes particularly how the Indians charm ferpents, "They take a fcarlet robe, embroidered with golden letters, and fyread it before a ferpent's hole. The golden letters have a fafcinating power; and by looking ftedfaftly, the ferpent's eyes are overcome and laid afleep." Thefe and many other feats have been often practiled upon thefe animals by artful men, who had firlt prepared the ferpents for their exercife, and then exhibited them as adventitioufly aficmbled at their call. In India there is nothing fo common as dancing ferpents, which are carried about in a broad flat veffel, fomewhat refembling a fieve. Thefe ereet and put themfelves in motion at the word of command. When their keeper fings a flow tune, they feem by their heads to keep time ; when he fings a quicker meafure, they appear to move more brifk and lively. All animals have a certain degree of docility; and we find that ferpents themfelves can be brought to move and approach at the voice of their mafter. From this trick, fuccefsfully practifed before the ignorant, it is mof probable has arifen moft of the boafted pretenfions which fome have made to charming of ferpents; an art to which the na. tive Americans pretend at this very day, but the exitence of which we are affured of by Mr Haffelquilt amongf the native Egyprians.

Though the generality of mankind regard this formidable race with horror, yet there have been fome nations, and there are fome at this day, that confider them with veneration and regard. The adoration paid by the ancient Egyptians to a ferpent is well known : many of the nations at prefent along the weftern coaft of A frica retain the fame unaccountable veneration. Up-
on the gold and have coaftg, a francerer, upon enteriag the cottages of the natives, is often furprifed to fee the roof fwarming with ferpents, that cling there without molefting and unmolefted by the natives. But his furprife will increaic upon going farther fouthward to the king dom of Widah, when he finds that a ferpent is the grod of the country. This animal, which travellers defcribe as a huge overgrown creature, has its habitation, its temple, and its priefts. Thefe imprefs the vulgar with an opinion of its virtues; and numbers are daily feen to offer not only their goods, their provifions, and their prayers, at the fhrine of their hideous deity, but alio their wives and daughters. Thefe the prielts readily accept of, and after fome days of pesance return them to their fuppliants, much benefited by the ferpent's fuppofed embraces.

Serpent, a mufical inftrument, ferving as a bals to the cornet, or fmall Jowwn, to fuftain a chorus of fingers in a large edifice. It has its name ferpent from its figure, as confifting of feveral fulds or wreaths, which ferve to reduce its length, which would otherwife be fix or feven feet.

It is ufually covered with leather, and confifts of three parts, a mouth-piece, a neck, and a tail. It has fix holes, by means whereof it takes in the compafs of two octaves.

Merfennus, who has particularly defcribed this in: frument, mentions fome peculiar properties of it, c. gr. that the found of it is ftrong enough to drown 20 robuft voices, being animated merely by the breath of a boy, and yet the found of it may be attempered to the foftnefs of the fweeteft voice. Another peculiarity to this inftrument is, that great as the diftance between the third and fourth hole appears, yet whether the third hole be open or thut, the difference is but a tone.

SERPENT, in mythology, was a very comnon fymbol of the fun, and he is reprefented biting his tail, and with his body formed into a circle, in order to indicate the ordinary courfe of this luminary, and under this form it was an emblem of time and eternity. The fer* pent was alfo the fymbol of medicine, and of the gods which prefided over it, as of Apollo and Effculapius: and this animal was the object of very ancient and general worthip, under various appellations and characters. In moft of the ancient rites we find fome alluion to the ferpent, under the feveral titles of \(\mathrm{Ob}, \mathrm{Ops}, \mathrm{P}_{\mathrm{y}}-\) thon, \&c. This idolatry is alluded to by Mofes, (Lev. xx. 27.) The woman at Endor who had a familiar fpirit is called Oub, or Ob, and it is interpreted Pythoniffa. The place where fhe refided, fays the learned Mr Bryant, feems to have been named from the worfhip then inttituted; for Endor is compounded of Eroador, and fignifies fons Py/binis, "the fountain of light, the oracle of the god Ador, which oracle was probably founded by the Canaanites, and had never been totally fuppreffed. His pillar was alfo called \(A b b a d i r\), or \(A b\) adir, compounded of \(a b\) and \(a d i r\), and meaning the ferpent deity Addir, the fame as Adorus.

In the orgies of Bacchus, the perfons who partook of the ceremony ufed to carry ferpents in their hands, and with horrid fcreams call upon Eva! Eva! Eva being, according to the writer jult mertioned, the fame as epha, or opha, which the Greeks rendered opbis, and by it denoted a ferpent. Thefe ceremonies and
this fymbolic worfhip began among the Magi, who were the fons of Chus; and by them they were propagated in various parts. Wherever the Amonians founded any places of worhip, and introduced their sites, there was gererally fome flory of a ferpent. There was a legend about a ferpent at Colchis, at Thebes, and at Delphi; and likewife in other places. The Greeks called Apollo himielf Python, which is the fame as Opis, Oupis, and Oub.

In Egypt there was a ferpent named Thermuthis, which was looked upon as very facred; and the natives are faid to have made ufe of it as a royal tiara, with which they ornamented the ftatues of Ifis. The kings of Egypt wore high bonnets, terminating in a round ball, and furrounded with figures of afps; and the priefts likewife had the reprefentation of lerpents upon their bonnets.

Abadon, or Abaddon, mentioned in the Revelations xx. \(2_{0}\) is fuppofed by Mr Bryant to have been the name of the Ophite god, with whofe worfhip the world had been fo long infected. This worfhip began among the people of Chaldea, who built the city of Ophis upon the Tigris, and were greatly addicted to divinations, and to the worfhip of the ferpent. From Chaldea the worfhip paffed into Egypt, where the ferpent deity was called Canoph, Can-eph, and C'reph. It had alfo the name of Ot or Oub, and was the fame as the Bafilifcus or royal ferpent, the fame as the Thermuthis, and made ufe of by way of ornament to the ftatues of their pods. The chief deity of Egypt is faid to have been Vulcan, who was ftyled Opas. He was the fame as Ofiris, the Sun, and hence was often called Ob el, or Pytho-fol ; and there were pillars facred to him, with curious hieroglyphical infcriptions bearing the fame rame; whence among the Greeks, who copied from the Egyptians, every thing gradually tapering to a point was ftyled obelos, or obelifcus.

As the worthip of the ferpent began among the fons of Chus, Mr.Bryant conjectures, that from thence they were denominated Ethiopians and Aithiopians, from Ath.ope or Ath.opes, the god whom they worfhipped, and not from their complexion : the Ethiopes brought thefe rites into Creece, and called the inland where they firt eftablifhed them Ellopia, Solis Serpentis injula, the fame with Eubar, or Oubaia, i. e. "the ferpent ifland." The fame learned wrizer difcovers traces of the ferpent worfhip among the Hyperboreans, at Rhodes, named Ophiufa, in Phrygia, and upon the Helleepont, in the inand Cyprus, in Crete, among the Athenians, in the name of Cecrops, amomer the natives of Theies in Bœotia, among the Lacedemonians, in Italy, in Syria, \&ce. and in the names of many places, as well as of the people where the Ophites fettled. One of the mot early herefies introduced into the Chriftian church was that of the Ophitæ. Bryant's Analyfis of Ancient Mythology, vol. i. p. 43, \&c. p. 473, \&cc.

Serpent Stomes. See Giornu Ammonis.
Sea-Serpent. See Sea-Serpent.
SERPENTARIA; SNAKE-ROOT ; a fpecies of Aristolochia.

SERPENTARIUS, in afronomy, a conftellation of the northern hemifphere, called alfo Ophiuchus, and anciently Refculapius. The ftars in the conftllation Serpentarius, iu Ptolemy's catalogue, are 29 ; in 'l'ycho's
\({ }^{15}\); in Herelius's 40 ; in the Britannic catalogue they serpentine are 74.

SERPENTINE, in general, lenotes any thing that refembles a ferpent; hence the worni or pipe of a flill, twifted in a firal nanner, is termed a cerpentine worm.

Sorpentink Slon, a genus of magnefian earths, of which there are different fpecies: 1. 'The ábrofus, compofed of fibrous and coherent particles. This refem. bles the afbeftos fo much that it might be confounded. with it, were not the fibres of the lerpentine fo clofely coherent, that they cannot be diftinguifhed when the ftone is cut or polifned. The fibres themfelves are large, and feem to be twifted. There are two varictics, a dark green and a light one; the former from Ger many, the latter from Sweden. 2. The zoeblitz ferpentine, found near that place, of many different colours, as black, deep green, light green, red, tluifh-grey. and white ; but the green colour is molt predominant. 3. Porcelain earth mixed with iron. It is met with either diffuible in water or indurated. The former is found of a red colour from China and Montmartre. The water-clinkers, impurted from fome places in Germany, feem to be made of this kind of earth. There are two varicties of the indurated kind, viz. the martial foap.earth, of a red colour, from Jafoerg and oither places in Norway, or black from fome parts of Sweden. 4. The telgitou of the Swerles, the fame with the lapis ollaris. It is found in various places of Norway, as light grey, dark grey, whitifl-yellow, and dark green. It is employed with great advantage for building fire-places, furuaces, \&ce the extremities of the frata being turned towards the fire when it is flaty.
M. Magellan obferves, that there is a great variety of colour as well as compofition in this kind of ftones ;it being found either white, green, brown, yellow, lightblue, black, frotted, or ftreaked with veins of different colours. Its texture is either inditinet, obfcurely laminar, or brous. The fpecific gravity is from 2400 to 2650 ; and it is harder than foap-rock or fteatites : though not hard enough to Atrike fire with fteel; being lefs fmooth to the touch than fteatites, but fufa ceptible of a good polifh, looking like marble; ard is olten met with in thin femitranfparent plates. It melts in a ftrong heat without addition, and corrodes the crucibles, but hardens in a lower degree of heat. It is. nowly and partially folible in acids, but does not effer. vefce with them. According to Bayon's analyfis, 100 parts of it contain about 41 or filex, or rather mica; 33 of magnclia; 10 ot argillaceous earth; 12 of water, and about 3 of iron. That brought from Corlica contains a greater proportion of argil, and a fmaller one of filex. The ferpentine commonly fo called, according to Fabroni, is a true lapis ollaris; but has its name from being variegated with green, yellowifh, and brown fpots, like the fkin of fome ferpents; great quantities of it are found in Italy and Switzerland, where it is frequently worked into difhes and other veffels.

Serpentine verjes, are fuch as begin and end with the fame word. As,

Serpicula keeping in the void fpace, called the liberty of the Scrratula. \(\xrightarrow{-\infty}\) tongue.

SERPICUI, A, in botany ; a genus of plants belonging to the clais of monœcia, and to the order of tetrandia. The male calyx is quadridentate, and the corolla confifts of four petals: The female calyx is divided into four parts, and the pericarpium is a tomentofe nút. There are two fpecies, the verticillata and repens.

SERPIGO, in furgery, a kind of herpes, popularly called a tetter or ringworm. See Surgery.

SERPULA, in natural hiftory; a genus belong. ing to the clafs of vermes, and to the order of teflacea. 'The fhell is fingle, tubular, and adhering to other bodies. The animal which inhabits it is the terebella.
SERRANUS (Joannes), or John de Serres, a learned French Proteftant, was born about the middle of the fixteenth century. He acquired the Greek and Latin languages at Laufanne, and grew very fond of the philofophy of Arifotle and Plato. On his return to France he ftudied divinity. He began to diftinguifh himfelf in 1572 by his writings, but was obliged to forfake his country after the dreadful maffacre of St Bartholomew. He became minitter of Nifmes in 1582, but was never regarded as a very zealous Calvinift: he has even been fufpected, though without reafon, of having actually abjured the Proteftant religion. He was one of the four clergymen whom Henry IV. confulted about the Romifh religion, and who returned for anfwer, that Catbolics might be faved. He wrote afterwards a treatife in order to reconcile the two communions, entitled De fide Catholica, five de principiis religionis Cbrijliance, communi omnium Cbrifianorum confenfu, femper et ubique ratis. This work was diniked by the Catholics, and received with fuch indignation by the Calvinifts of Geneva, that many writers have affirmed that they poifoned the author. It is certain at leaft that he died at Geneva in \(159^{8}\), at the age of 50 . His principal works are, r . A Latin tranflation of Plato, publifhed by Henry Stephens, which owes much of its reptatation to the elegance of the Greek copy which accompanies it. 2. A Treatife on the Immortality of the Soul. 3. De flatu religionis et reipublica in Francia. 4. Me. moire de la \(3^{\text {me }}\) guerre civile et derniers troubles de France fous Charles \(I X . E^{\circ}\) c. 5. Inventaire general de l' \(H_{i}^{3}\) Joire de France, illuftre par la conference de l'Eglife et de l'Empire, छ'c. 6. Recueil de chofe memorable avenue en France fous HenriII. François II. Cbarles IX. HenriIII. Thefe three hiftorical treatifes have been juftly accufed of partiality and paffion; faults which it is next to impoffible for a contemporary writer to avoid, efpecially if he bore any part in the tranfactions which he defcribes. His ftyle is exceedingly incorrect and inelegant ; his miftakes too and mistatements of facts are very numerous.

SERRATED, in general, fomething indented or notched in the manner of a faw ; a term much ufed in the defcription of the leaves of plants. See Botany.

SERRATULA, sAw-wort, in botany : A genus of plants belonging to the clafs of fyngenefia, and to the order of polygamia æqualis. In the natural fyitem it is ranged under the 49 th order, Compofita. The calyx is fubcylindrical, imbricated; the fcales of it pointed, but not fpinous. There are 15 fepecies: The tinctoria, alpina, arverfis, coronata, japonica, falicifolia, multiflora, noveboracenfis, præalta, glauca, fquarrofa, fcariofa, fpicata, amara, and centauroides. The three firlt fpecies
arc Britifh. 1. The tincoria is diftinguifted by a Serrat ftem erect and flender, branched at the top, and three feet high. The leaves are fmooth, pinnatifid, and ferrated: The flowers are purple, in umbels, and terminal. The down of the feed is gloffy, with a brown or gold tinge. It grows in woods and wet paftures. It dyes cloth of an exceeding tine yellow colour, which fands well when fixed with alum. Goats eat this plant; horfes are not fond of it; cattle, fwine, and fheep, leave it untouched. 2. The alpina, or mountain faw-wort. The root and ftem are woody; the latter being from one to two feet high. The leaves are numerous, triangular, long, pointed, fubftantial, dark green above, white beneath, and ferrated, with round intervals between the teeth, on footfalks. The flowers are purple. The feales of the calyx are very fhort and downy. It grows on high mountains, and fowers commonly in July or Auguft. 3. The arvenfis, corn faw-wort, or way-thiftle. The ftem is generally ereet, branched, and two or three feet high. The leaves are finuated, ferrated, and fpinous; thofe above being almoft entire. The flowers are of a pale purple ; the down is very long. This plant grows in cultivated grounds and by wayfides, and flowers in July or Augutt. When burned it yields good afhes for making glafs or fixed alkali.

SERRATUS, in anatomy, a name given to feve. ral mufcles, from their refemblance to a faw. See A natomy, Table of the Mufcles.

SERTORIUS (Quintus), an eminent Roman general ; (fee Spain), under the hiftory of which his exploits are related.

SERTULARIA, in natural hiftory, a genus belonging to the clafs of vermes, and to the order of zoophyta. The ftem is radicated, fibrous, naked, and jointed; the florets are hydræ, and there is one at each joint. This genus comprehends 42 fpecies of corallines.

SERVAL, mountain cat. See Felis, xvi.
SERVANDONI (John Nicolas), was born at Florence in 1695 . He rendered himfelf famous by his exquifite tafte in architecture, and by his genius for decorations, fetes, and buildings. He was employed and rewarded by moft of the princes in Europe. He was honoured in Portugal with the order of Chrift: In France he was architect and painter to the king, and member of the different academies eftablifhed for the advancement of thefe arts. He received the fame title from the kings of Britain, Spain, Poland, and from the duke of Wirtemberg. Notwithftanding thefe advantages, his want of economy was fo great, that he left nothing behind him. He died at Paris in \(\mathbf{1} 766\). Paris is indebted to him for many of its ornaments. He made decorations for the theatres of London and Drefden. 'The French king's theatre, called la falle des Macbines, was under his management for fome time. He was permitted to exhibity fhows confifting of fimple decorations : Some of thefe were aftonifhingly fublime; his "Defcent of Æneas into Hell" in particular, and his "Encbanted Foreft," are well known. He built and embellifhed a theatre at Chambor for Marefchal Saxe; and furnifhed the plan and the model of the theatre royal at Drefden. His genius for fetes was remarkable; he had the management of a great number in Paris, and even in London. He conducted one at Libon given on account of a victory gained by the duke of Cumberland. He was employed frequently by the king of

\section*{S E R}

Portugal, to whom he prefented feveral elegant plans and models. The prince of Wales, too, father to the prefent king, engaged him in lis fervice; but the deatlr of that prince prevented the execution of the defigns which had been projected. He prefided at the magnifcent fete given at Vienna on account of the marriage of the archduke Jofeph and the Infanta of Parma. But it would be endlefs to attempt an enumeration of all his performances and exhibitions.

SERVANT, a term of relation, fignifying a perfon who owes and pays obedience for a certain time to another in quality of a mafter:

As to the feveral forts of fervants: It was obferved, under the article Liberty, that puse and proper flavery does not, nay cannot, fubfift in Britain : fuch we mean whereby an abfolute and unlimited power is given to the mafter over the life and fortune of the flave. And indeed it is repugnant to reafon, and the principles of natural law, that fuch a ftate fhould fubfift anywhere. See Slavery.

The law of England therefore abhors, and will not endure, the exiftence of flavery within this nation: fo that when an attempt was made to introduce it, by ftatute I Edw. VI. c. 3. which ordained, that all idle vagabonds fhould be made flaves, and fed upon bread, water, or fmall drink, and refufe-meat ; fhould wear a ring of iron round their necks, arms, or legs; and hould be compelled, by beating, chaining, or otherwife, to perform the work affigned them, were it ever fo vile; the firit of the nation could not brook this condition, even in the moft abandoned rogues; and therefore this flatate was repealed in two years afterwards. And now it is laid down, that a llave or negro, the inftant he lands in Britain, becomes a freeman ; that is, the law will protect him in the enjoyment of his perfon and his property. Yet, with regard to any right which the mafter may have lawfully acquired to the perpetual fervice of John or Thomas, this will remain exactly in the fame flate as before : for this is no more than the fame fate of fubjection for life which every apprentice fubmits to for the fpace of feven years, or fometimes for a longer term. Hence, too, it follows, that the infamous and unchriltian practice of withholding baptifm from negro.fervants, left they fhould thereby , sain their liberty, is totally without foundation, as well as without excufe. The law of England acts upon general and extenfive principles: it gives liberty, rightly underftood, that is, protection, to a Jew, a 'rurk, or a Heathen, as well as to thofe who profefs the true religion of Chrift; and it will not diffolve a civil obligation between mafter and fervant, on account of the alteration of faith in either of the parties; but the flave is eutitled to the fame protection in England before as after baptifm ; and, whatever fervice the Heathen niegro owed of right to his A merican mafter, by gencral, not by local law, the fame (whatever it be) ins he bound to render when brought to England and made a Chriftian.
1. The firt fort of fervants, therefore, acknowledged by the laws of England, are menial fervants; lo called from being intra mania, or domeftics. 'The contract between them and their mafters arifes upon the hiring. If the hiring be general, without any particular time linited, the law conftrues it to be a hiring for a year; upon a principle of natural equity, that the fervant thall ferve and the mafter maintain him, throughout all the

Vol. XVII. Part I.
\(313]\) S E R
revolutions of the refpective feafons; as well when there is work to be done, as when there is not: but the contract may be made for any larger or fmaller terith. All fingle men between \(1: 2\) years old and 60 , and married ones under 30 years of age, and all fingle women between 12 and 40 , not having any vifible livelihood, are compellable by two juftices to go out to fervice in huf. bandry or certain fpecific trades, for the promotion of honeft indultry; and no mafter can put away his fervant, or fervant leave his mafter, after being fo retained, either before or at the end of his term, without a quarter's warning ; unlefs upon reafonable caufe, to be allow* ed by a juftice of the peace : but they may part by confent, or make a fpecial bargain.
2. A nother fpecies of fervants are called apprentices, (from apprendre, to learn); and are ufually bound for a term of years, by deed indented or indentures, to ferve their mafters, and be maintained and inftructed by them. This is ufually done to perfons of trade, in order to learn their art and myftery; and fometimes very large fums are given with them as a premium for fuch their inftruction: but it may be done to hubandmen, nay, to gentlemen and others. And children of poor perfons may be apprenticed out by the overfeers, with confent of two juftices, till 24 years of age, to fuch perfons as are thought fitting; who are alfo compellable to take them : and it is held, that gentlemen of fortune, and clergymen, are equally liable with others to fuch compulfion: for which purpofes our Itatutes have made the indentures obligatory, even though fuch parifh-apprentice be a minor. A pprentices to trades may be difcharged on reafonable caufe, either at the requeft of themfelves or mafters, at the quarterfeffions, or by one juftice, with appeal to the feffions; who may, by the equity of the fatute, if they think it reafonable, direct reftitution of a rateable fhare of the money given with the apprentice: and parifh-apprentices may be difcharged in the fame manner by two juftices. But if an apprentice, with whom lefs than 10 pounds hath been given, runs away from his mafter, he is compellable to ferve out his time of abfence, or make fatisfaction for the fame, at any time within feven years after the expiration of his original contract. See Apo prentice and Apprenticeship.
3. A third fpecies of fervants are labourers, who are only hired by the day or the week, and do not live intra mania, as part of the family; concerning whom the ftatutes before-cited have made many very good regulations; 1. Directing that all perfons who have no vifible effects may be compelled to work: 2. Defining how long they muft continue at work in fummer and in winter: 3. Punifhing fuch as leave or defert their work: 4. Empowering the juftices at feffions, or the theriff of the county, to fettle their wages: and, 5 . In \({ }^{-}\) flicting penalties on fuch as either give or exact more wages than are fo fettled.

4 There is yet a fourth feecies of fervants, if they may be fo called, being rather in a fuperior, a minitite. rial, capacity ; fuch as flewards, factors, and bailifis; whom, lowever, the law cunfiders as fervants pro etempore, with regard to fuch of their acts as affect thejo mafter's or employer's property.

As to the manner in which this relation affects the mafter, the fervant himfeif, or third parties, fee the article Master and Servant.

Servetife, \(\underbrace{\text { Servetus. }}\) fee Law.

SERVETISTS, a name given to the modern Antitrinitarians, from their being fuppofed to be the followers of Michael Servetus; who, in the year 1553, was burnt at Geneva, together with his books.

SERVETUS (Michael), a learned Spanifh phyfician, was born at Villaneuva, in A rragon, in 1509. He was fent to the univerfity of 'Touloufe to ftudy the civil law. The Reformation, which had awakened the moft polifhed nations of Europe, directed the attention of thinking men to the errors of the Romifh church and to the fludy of the Scriptures. Among the reft Servetus applied to this ftudy. From the love of novelty, or the love of truth, he carried his inquiries far beyond the other reformers, and not only renounced the falle opinions of the Roman Catholics, but went fo far as to queftion the doctrine of the Trinity. Accoringly, after fpending two or three years at Touloufe, he determined to go into Germany to propagate his new opinions, where he could do it with molt fafety. At Bafil he had fome conferences with Oecolampadius. He went next to Straburg to vifit Bucer and Capito, two eminent reformers of that town. From Straßurg he went to Hugenan, where he printed a book, intitled De Trinitatis Erroribus, 2 in 1531. The enfuing year he publifhed two other treatiles on the fame fubject: in an advertifement to which, he informs the reader that it was not his intention to retract any of his former fentiments, but only to ftate them in a more diftinct and accurate manner. To thefe two publications he had the courage to put his name, not fufpecting that in an age when liberty of opinion was granted, the exercife of that liberty would be attended with danger. After publifhing thefe books, he left Germany, probably finding his doctrines not fo cordially received as he expected. He went firt to Bafil, and thence to Lyons, where he lived two or three years. He then removed to Paris, where he ftudied medicine under Sylvius, Fernelius, and other profeffors, and obtained the degree of mafter of arts and doctor of medicine. His love of controverfy involved him in a ferious difpute with the phyficians of Paris; and he wrote an A pology, which was fuppreffed by an edict of the Parliament. The mifunderftanding which this difpute produced with his colleagues, and the chagrin which fo unfavourable a termination occafioned, made him leave Paris in difguft. He fettled two or three years in Lyons, and engaged with the Frellons, eminent printers of that age, as a corrector to their prefs. At Lyons he met with Pierre Palmier, the archbifhop of Vienne, with whom he had been acquainted at Paris. That Prelate, who was a great encourager of learned men, preffed him to accompany him to Vienne, offering him at the fame time an apartınent in his palace. Servetus accepted the offer, and might have lived a tranquil and happy life at Vienne, if he could have confined his attention to medicine and literature. But the love of controverfy, and an eagernefs to eftabl:/h his opinions, always poffeffed him. At this time Calvin was at the head of the reformed church at Geneva. With Servetus he had been acquainted at Paris, and had there oppofed his opinions. For 16 years Calvin kept up a correfpondence with him, endeavour, ing to reclaim him from his errors. Servetus had read the works of Calvin, but did not think they merited the
high eulogies of the reformers, nor were they fufficient Serv to convince him of his errors. He continued, however, to confult him ; and for this purpofe fent from Lyons to Geneva three queftions which refpected the divinity of Jefus Chrift, regeneration, and the neceffity of baptifm. To thefe Calvin returned a civil'anfwer. Servetus treated the anfwer with contempt, and Calvin replied with warmith. From reąfoning he had recourfe to abufive language; and this produced a polemical hatred, the moft implacable difpofition in the world. Calvin having obtained fome of Servetus's papers, by means, it is faid, not very honourable, fent them to Vienne along with the private letters which he had received in the courfe of their correfpondence. The confequence was, that Servetus was arrefted; but having efcaped from prifon, he refolved to retire to Naples, where he hoped to practife medicine with the fame reputation which he had fo long enjoyed at Vienne. He imprudently took his route through Geneva, though he could not but know that Calvin was his mortal enemy. Calvin informed the magiftrates of his arrival ; Servetus was apprehended, and appointed to ftand trial for herefy and blafphemy. It was a law at Geneva, that every accufer fhould furrender himfelf a prifoner, that if the charge thould be found falfe, the accufer floould fuffer the punifhment in which he meant to involve the accufed Calvin not choofing to go to prifon himfelf, fent one of his domeltics to prefent the inpeachment againft Servetus. 'I'he articles brought againft him were collected from his writings with great care; an employment which took up three days. One of thefe articles was, "that Servetus had denied that Judæa was a heautiful, rich, and fertile country; and affirmed, on the authority of travellers, that it was poor, barren, and difagreeable." He was alfo charged with " corrupting the Latin Bible, which he was employed to correct at Lyons, by introducing impertinent, trifling, whimfical, and impious notes of his own through every page." But the main article, which was certainly fatal to him, was, "that in the perfon of Mr Calvin, minitter of the word of God in the church of Geneva, he had defamed the doctrine that is preached, uttering all imaginable injurious, blafphemous words arainft it."
Calvin vifited Servetus in prifon, and had frequent couferences with him; but finding that, in oppofition to all the arguments he conld employ, the prifoner remained inflexible in his opinions, he left him to his fate. Before fentence was paffed, the magiftrates of Geneva confulted the minifters of Bale, of Bern, and Zurich ; and, as another account informs us, the magiftrates of the Proteltant Cantous of Switzerland. And to enable them to form a judgment of the criminality of Servetus, they tranfmitted the writings of Calvin, with his anfwers. The generral opinion was, that Servetus ought to be condemned to death for blafphemy. He was accordingly fentenced to be burnt alive on the 27 th of October 1553. As he continued alive in the midft of the flames more than two hours, it is faid, finding his torment thus protracted, he exclaimed, "Unhappy wretch that I am! Will the flames be infufficient to terminate my mifery! What then! Will the hundred pieces of gold, and the rich collar which they took from me, not purchafe wood enough to confume me more quickly! "Though the fentence of death was paffed againft Servetus by the magiftrates of Genera, with the
appro

\section*{S E R [ 315 ] S E R}
approbation of a great number of the magiftrates and minifters of Switzerland, yet it is the opinion of mott hiftorians that this dreadful fentence was impofed at the inftigation of Calvin. This act of feverity for holding a fpeculative opinion, however erroneeus and abfurd, has left a ftain on the character of this illuftrions reformer, which will attend the name of Calvin as long as hiftory Thall preferve it from oblivion. The addrefs and art which he ufed in apprehending Servetus, his inhumanity to him during his trial, his diffimulation and malevolence after his condemnation, prove that he was as much influenced by perfonal hatred as by a defire to fupport the intereft of religion, though probably, during the trial, Calvin believed he was performing a very pious action. This intolerant fpirit of Calvin and the magiftrates of Gerieva gave the Roman Catholics a fawourable opportunity to accufe the Proteftants of inconfiftency in their principles, which they did not fail to embrace. "How could the magifrates (fays the author of the Dictionnaire des Herefies), who acknowledged so infallible interpretation of the Scriptures, condemp Servetus to death becaufe he explained them differently from Calvin; fince every man has the privilege to expound the Scripture, according to his own judgment, without having recourfe to the church ? It is a great injuftice to condemu a man becaufe he will not fubmit to the judgment of an enthufiaft, who may be wrong as well as himfelf."

Servetus was a man of great acutenefs and learning, and well verfed in the arts and fciences. In his own profeffion his genius exerted itfelf with fuccefs. In his tract intitled Cbrifianifmi Reflitutio, publifhed in 1553, he remarks, that the whole mafs of blood paffes through the lungs by the pulmonary artery and vein, in oppofition to the opinion which was then univerfally entertained, that the blood paffes through the partition which divides the two ventricles. This was an important ftep towards the difcovery of the circulation of the blood.

His works confift of Controverfial Writings concerning the Trinity ; an edition of Pagninus's Verfion of the Bible, with a preface and notes, publifhed under the name of Michael Villanevanus; an Apology to the Phylicians of Paris; and a book intitled Ratio Syruporum. Mofheim has written in Latin a Hiftory of the Herefy and Misfortunes of Servetus, which was publifhed at Helmftadt, in 4 to, in 1728. From the curious details which it gives it is extremely interefting.

SERV1A, a province of Turkey in Europe, bounded on the north by the rivers Danube and Save, which feparate it from Hungary ; on the eaft, by Bulgaria; on the weft, by Bofnia; and on the fouth, by Albania and Macedonia. It is about 190 miles in length from eaft to weft; 95 in breadth from north to fouth; and is divided into four fangiacates. Two of thefe were ceded to the Chriftians in 1718, who united them into one. This continued till 1739 , when the Turks were victori ous; and then they were abaradoned to the T'urks by the treaty of Belgrade. Belgrade is the capital town.

SERVICE, in law, is a duty which a tenant, on account of his fee, owes to his lord.

There are many divifions of fervices; as, 1. Into perfonal, where fomething is to be done by the tenant in perfon, as homage and fealty. 2. Real, fuch as wards, marriages, \&c. 3. Accidental, including heriots, reliefs, and the like. A. Entire, where, on the
alienation of any part of the lands by a tenant, the fervices become multiplied. 5. Frank-fervice, which was performed by freemen, who were not obliged to perform any bafe fervice, but only to find a man and horfe to attend the lord into the army or to court. 6. Knight's fervice, by which lands were anciently held of the king, on paying homage, fervice in war, \&c.

As in every free and well regulated fociety there mult be a diverfity of ranks, there muft be a great number of perfons employed in fervice, both in agriculture and domeftic affairs. In this country, fervice is a contract into which the fervant voluntarily enters; and the mafter's authority extends no farther than to the performance of that fpecies of labour for which the agreement was made.
"The treatment of fervants (fays that refpectable mo- Paley's ralift Mr Paley), as to diet, difcipline, and accommoda-Moral and tion, the kind and quantity of work to be required of Political them, the intermiffion, liberty, and indulgence to be al - Pbiloopoby, lowed them, muft be determined in a great meafure by \({ }^{\text {p. } 139 .}\) cuftom ; for where the contract involves fo many particulars, the contracting parties exprefs a few perhaps of the principal, and by mutual underftanding refer the reft to the known cultom of the country in like cafes.
"A fervant is rot bound to obey the unlawful commands of his mafter ; to minifter, for inftance, to his unlawful pleafures ; or to affift him in unlawful practices in his profeffion; as in fmuggling or adulterating the articles which he deals in. For the fervant is bound by nothing but his own promife; and the obligation of a promife extends not to things unlawful.
"For the fame reafon, the mafter's authority does not juftify the fervant in doing wrong; for the fervant's own promife, upon which that authority is founded, would be none.
"Clerks and apprentices ought to be employed entirely in the profeffion or trade which they are intended to learn. Inftruction is their wages; and to deprive them of the opportunities of inftruction, by taking up their time with occupations foreign to their bufinefs, is to defraud them of their wages.
"The mafter is refponfible for what a fervant does in the ordinary courfe of his employment ; for it is done under a general authority committed to him, which is in juitice equivalent to a fpecific direction. Thus, if 1 pay money to a banker's clerk, the banker is accountable: but not if I had paid it to his butler or his footman, whofe bufinefs it is not to receive money. Upon the fame principle, if I once fend a fervant to take up goods upon credit, whatever goods he afterwards takes up at the fame fhop, fo long as he continues in my fervice, are juftly chargeable to my ac count.
"The law of this country goes great lengths in intending a kind of concurrence in the mafter, fo as to charge him with the confequences of his fervant's conduct. If an innkeeper's fervant rob his guefts, the innkeeper mult make reititution ; if a farrier's fervant lame your horfe, the farrier inuft anfwer for the damage; and ftill farther, if your coachman or carter drive over a paflenger in the road, the paffenger may recover from you a fatisfaction for the hurt he fuffers. But thefe determinations ftand, I think, rather upon the authority of the law, than any principle of natural juftice."

There is a grievance which has long and jufly R r 2
been

\section*{S E R [ 316\(] \quad\) S E R}

Service. been complained of, the giving of good characters to bad fervants. This is perhaps owing to carelefficefs, to a defire of getting rid of a bad fervant, or to miftaIsen compaffion. But fuch careleffnefs is inexcufable. When a man gives his fanction to the character of a bad fervant, he ought to reflect on the nature and confequences of what he is doing. He is giving his name to a falfehood; he is deceiving the honett man who conf.des in his veracity ; and he is deliberately giving a knave an opportunity of cheating an honeft man. To endeavour to get quit of a bad fervant in this way, is furely not lefs criminal than concealing the faults and difadvantages of an eftate which is advertifed for fale, and afcribing to it advantages which it does not poffefs. In this cafe, we know the fale would be reduced, and the advertifer difgraced. Many mafters give claracters to fervants out of compaffion ; but it is to this mittaken compafion that the diforderly behaviour of fervants is perhaps principally owing: for if the punifhment of dihonefty be only a change of place (which may be a reward inftead of a punifhment), it ceafes to be a fervant's intereft to be true to his truft.

We have faid above that a mafter's authority over his fervant extends no farther than the terms of contract; by which we meant, that a mafter could give no unreafonable orders to his fervant, or fuch as was inconfiftent with the terms of contract. But the relation between a mafter and fervant is certainly cloier than the mere terms of a contract : it is a moral as well as a legal relation. A mafter of a family ought to fuperintend the morals of his fervants, and to reftrain them from vices. This he may do by his example, by his influence, and authority. Indeed every man poffeffed of authority is guilty of criminal negligence if he does not exert his authority for promoting virtue in his inferiors; and no authority is fo well adapted for this purpofe as that of mafters of families, becaufe none operates with an influence fo immediate and conftant. It is wonderful how much good a nobleman or gentleman of fortune can do to his domeflics by attending to their morals; and every mafter may be a blefling to individuals and to fociety, by exerting prudently that influence which his fituation gives him over the conduct of his fervant.

Choral SERDICR, in church-hiftory, denotes that part of religious worfhip which confifts in chanting and fing. ing. The advocates for the high antiquity of finging, as a part of church-mufic, urge the authority of St Paul in its favour (Ephef. chap. v. ver. 19. and Co. lof. chap. iii. ver. 16). On the authority of which paffages it is afferted, that fongs and hymns were, from the eflablifhment of the church, fung in the affemblies of the faithful ; and it appears from undoubted tefimony, that finging, which was practifed as a facred rite among the Egyptians and Hebrews, at a very early period, and which likewife conflituted a confiderable part of the religious ceremonies of the Greeks and Romans, made a part of the religious worfhip of Chriftians, not only before churches were built, and their religion eftablifhed by law, but from the firft profeffion of Chriftianity. However, the era from whence others have dated the intro. duction of mufic into the fervice of the church, is that period during which Leontius governee the church of Antioch, i. e. between the year of Chrift 347 and 356 . See Antiphony.

From Antioch the practice foon fpread through the other churches of the Eaft; and in a few ages after its firf introduction into the divine fervice, it not only received the fanction of public authority, but thofe were forbid to join in it who were ignorant of mufic. A canon to this purpofe was made by the council of Laodicea, which was held about the year 372 ; and Zona. nas informs us, that thefe canonical fingers were reckoned a part of the clergy. Singing was introduced into the weftern churches by St Ambrofe about the year 374 , who was the inflitutor of the Ambrofian chant eftablifhed at Milan about the year 386 ; and Eufebius (lib. ii. cap. 17.) tells us, that a regular choir, and method of finging the fervice, were firt eftablihed, and hymns ufed, in the church at Antioch during the reign of Conftantine, and that St Ambrofe, who had long refided there, had his melodies thence. This was about 230 years afterwards amended by pope Gregory the Great, who eftabliffed the Gregorian chant; a plain, unifonous kind of melody, which he thought confiftent with the gravity and dignity of the fervice to which it was to be applied. This prevails in the Roman church even at this day: it is known in Italy by the name of canto fermo; in France by that of tlain chant ; and in Germany and moft other countries by that of the cantus Gregorianus. Although no fatisfactory account has been given of the fpecific difference between the A mbrofian and Gregorian chants, yet all writers on this fubject agree in faying, that St Ambrofe only ufed the four authentic modes, and that the four plagal were afterwards added by St Gregory. Each of thefe had the fame final, or key-note, as its relative authentic; from which there is no other difference, than that the melodies in the four authentic or principal modes are generally confined witbin the compafs of the eight notes above the key-note, and thofe in the four plagal or relative modes, within the compafs of the eight notes below the fifth of the key. See Mode.

Ecclefiattical writers feem unanimous in allowing that Pope Gregory, who began his pontificate in 590, collected the mufical fragments of fuch ancient pfalms and hymns as the firlt fathers of the church had approved and recommended to the firft Chrittians; and that he felected, methodized, and arranged them in the order which was long continued at Rome, and foon adopted by the chief part of the weftern church. Gregory is alfo faid to have banifhed from the church the canto fofurato, as too light and diffolute ; and it is added, that his own clant was called canto fermo, from its gravity and fimplicity.

It has been long a received opinion, that the ecclefrattical tones were taken from the reformed modes of Ptolemy; but Dr Burney obferves, that it is difficult to difcover any connection between them, except in their names; for their number, upon examination, is not the fame; thofe of Ptolemy being feven, the ecclefiaftical eight; and indeed the Greek names given to the ecclefiaftical modes do not agrce with thofe of Ptolemy in the fingle inftance of key, but with thofe of higher antiquity. From the time of Gregory to that of Guido, there was no other diftinction of keys than that of authentic and plagal; nor were any femitones ufed but thofe from E to F, B to C, and occalionally A to Bb.
Wath refpect to the mufic of the primitive church, is

\section*{S E R [ 317\(] \quad\) S E R}
may be obferved, that though it confifted in the finging of pfalms and hymns, yet it was performed in many different ways; fometimes the pfalms were fung by one perfon alone, whilit the reft attended in filence; fometimes they were fung by the whole affembly ; fometimes alternately, the congregation being divided into feparate choirs ; and fometimes by one perfon, who repeated the firlt part of the verfe, the reft joining in the clofe of it: Of the fo: 1 different methods of finging now reci, ted, the fecond and third were properly diftinguifhed by the names of fymphony and ant plony; and the latter was fometimes called refponfaria, in which women were allowed to join. St Ignatius, who \(_{2}\) according: to Socrates (lib. vi. cap. 8.), converfed with the apoflles, is generally fuppofed to have been the firft who fuggefted to the primitive Chriftians in the Eaft the method of finging hymns and pfalms alternately, or in dialogue; and the cuftom foon prevailed in every place where Chriftianity was eftablifhed ; though Theodoret in his hiftory (lib. ii. cap. 24.) tells us, that this manner of finging was firft practifed at Antioch. It likewife ap. peais, that almoft from the time when mulic was firlt introduced into the fervice of the church, it was of two kinds, and confifted in a gentle inflection of the voice, which they termed plain fong, and a more elaborate and artificial kind of mufic, adapted to the hymns and folemn offices contained in its ritual ; and this diftinction has been maintained even to the prefent day.

Aithough we find a very early diftinction made between the manner of finging the hymns and chanting the pfalins, it is, however, the opinion of the learned Martini, that the mufic of the firt five or fix ages of the church confifted chiefly in a plain and fimple chant of unifons and octaves, of which many fragments are ftill remaining in the canto fermo of the Romifh miffals. For with refpect to mufic in parts, as it does not appear, in thefe early ages, that either the Greeks or Romans were in poffeffion of harmony or counterpoint, which has been generally afcribed. to Guido, a monk of A rezzo in Tufcany, about the year 1022, though others lave traced the origin of it to the eighth century, it is in vain to feek it in the church. The choral mufic, which had its rife in the church of Antioch, and from thence fpread through Greece, Italy, France, Spain, and Germany, was brought into Britain by the fingers who accompanied Auftin the monk, when he came over, in the year 596 , charged with a commiffion to convert the inhabitants of this country to Chriftianity. Bede tells us, that when Auftin and the companions of his miffion had their firft audience of king Ethelbert, in the ifle of Thanet, they approached him in' proceffion, finging litanies; and that afterwards, when they entered the city of Canterbury, they fung a litany, and at the end of it Allelujah. But though this was the firf time the Anglo-Saxons had heard the Gregorian chant, yet Bede likewife tells us, that our Eritifh anceftors had been inftrueted in the rites and ceremonies of the Gallican church by St Germanus, aud heard him fing Allelujah many years before the arrival of St Auflin. In 680, John, præcentor of St Peter's in Rome, was fent over by pope Agatho to inftruct the monks of Weremouth in the art of finging; and he was prevailed upon to open fchools for teaching mufic in other places in Northumberland. Benedict Bifcop, the preceptor of Bede, Adiian the monk, and many others, contributed to diffeminate
the knowledge of the Roman chant. At length the fucceffors of Ss. Gregory, and of Auftin his miffionary, having effablifhed a fchool for ecclefiaftical mufic at Canterbury, the reft of the ifland was furnifhed with mafters from that feminary. The choral fervice was firft introduced in the cathedral church of Canterbury; and till the arrival of 'l'heodore, and his fettlement in that : fee, the practice of it feems to have been confined to the churchés of Kent; but after that, it fpread over the whole kingdom; and we meet with records of very ample endowments for the fupport of this part of public workip. 'This mode of religious worthip prevailed in all the European churches till the time of the Reformation: the firf deviation from it is that which folluwed the Reformation by Luther, who, being himfelf a lover of mufic, formed a liturgy, which was a inufical fervice, contained in a work entitled Pfalmodia, h. e. Cantica facra Veteris Eicrlitie fe'ectu, printed at Norimberg in 1.53, and at Wittemberg in 156\%. But Calvin, in his eftablifhment of a church at Geueva, reduced the whole of divine fervice to prayer, preaching, and finging ; the latter of which he reftrained. He excluded the offices of the antiphon, hymn, and motet, of the Romifh lervice, with that artificial and elaborate mufic to which they were fung; and adopted only that plain metrical pfalmody, which is now in general ufe among the reformed churches, and in the parochial churches of our own country. For this purpofe he made ufe of Marot's verfion of the Pfalms, and employed a mulician to fet them to cafy tunes only of one part. In 1553, he divided the Pfalms into paufes or fmall portions, and ap. pointed them to be fung in churches. . Soon after they were bound up with the Geneva catechifm ; from which time the Catholics, who had been accuftomed to fing them, were forbid the ufe of them, under a fevere pe. nalty. Soon after the Reformation commenced in Erig. land, complaints were made by many of the dignified clergy and others of the intricacy and difficulty of the church-mufic of thofe times: in confequence of which it was once propofed, that organs and curious finging fhould be removed from our churches. Latimer, in his diocefe of Worcefter, went ftill farther, and iffued in. junctions to the prior and convent of St Mary, forbidCing in their fervice all manner of finging. In the reign of Edward VI. a commiffion was granted to eight bifhops, eight divines, eight civilians, and eight common lawyers, to compile a body of fuch ecclefiaftical laws as fhould in future be obferved throughout the realm. The refult of this compilation was a work firt publifhed by Fox the martyrologin, in 1571, and afterwards in 1640 , under the title of Reformatio Legum Ecclefiaficarum. 'i'hefe 32 commiffioners, inftead of reprobating churchmufic, merely condemned figurative and operofe mufic, or that kind of finging which abounded with fugues, refponfive paffages, and a commixture of varions. and intricate proportions ; which, whether extemporary or written, is by muficians termed defcant. However, notwithftanding the objections againft choral mufic; and the practice of fome o! the reformed churches, the compilers of the Englifh liturgy in 1548 , and the king himdelf, determined to retain mufical fervice. Accordingly the fatute 2 \& 3 . Edw. VI. cap. 1. though it contains no formal obligation on the clergy, or others, to ufe or join in either vocal or inftrumental mufic in the common prayer, does clearly recognife the practice of fingung;

\section*{S E R}
and in lefs than two years after the compiling of King Edward's liturgy, a formula was compofed, which continues, with fcarce any variation, to be the rule for choral fervice even at this day. The author of this work was John Marbecke, or Marbeike ; and it was printed by Richard Grafton, in 1550, under the title of the Book of Common Prayer, noted. Queen Mary laboured to re-eftablifh the Romifh choral fervice; but the acceffion of Elizabeth was followed by the act of uniformity ; in confequence of which, and of the queen's injunctions, the Book of Common Prayer, noted by Marbecke, was confidered as the general formula of choral fervice. In 1560, another mufical fervice, with fome additions and improvements, was printed by John Day; and in 1565 , another collection of offices, with mufical notes. Many objections were urged by Cartwright and other Puritans againft the form and manner of catheciral fervice, to which Hooker replied in his Ecclefiaftical Polity. In 1664 , the fatutes of Edward VI. and Elizabeth, for uniformity in the Common Prayer, were repealed; and the Directory for Public Worfhip, which allows only of the finging of pfalms, eftablifhed. But upon the reftoration of Charles II. choral fervice was again revived, and has fince uniformly continued. See on this fubject Hawkins's Hiftory of Mufic, vol. i. p. 404. vol. ii. p. 264. vol. iii. p. \(58-468\), \(\& \mathrm{cc}\). vol. iv. p. 44-347.

Service-Tree. See Sorbus.
SERVITES, a religious order in the church of Rome, founded about the year 1233, by feven Florentine merchants, who, with the approbation of the bifhop of Florence, renounced the world, and lived together in a religious comnunity on mount Senar, two leagues from that city.

SERVITOR, in the univerfity of Oxford, a ftudent who attends on another for his maintenance and learring. See Sizar.

SERVITUDE, the condition of a fervant, or rather flave.

Under the declenfion of the Roman empire, a new kind of fervitude was introduced, different from that of the ancient Romans: it confifted in leaving the lands of fubjugated nations to the firft owners, upon condition of certain rents, and fervile offices, to be paid in acknowledgment. Hence the names of fervi cenfiti, afcriptitii, and addiai glebe; fome whereof were taxable zt the reafonable difcretion of the lord ; others at a certain rate agreed on; and others were mainmortable, who, having no legitimate children, could not make a will to above the value of five pence, the lord being heir of all the reft; and others were prohibited marrying, or going to live out of the lordfhip. Mort of thefe fervices exifted lately in France; but they were long ago abolifhed in England. Such, however, was the original of our tenures, \&c. See Slave.

Servitude, in Scots law. See Law, Part III. Sect. ix.

SERVIUS (Maurus Honoratus), a celebrated grammarian and critic of antiquity, who flourifhed about the sime of Arcadius and Honorius; now chiefly known by his Commentaries on Virgil. There is alfo extant a piece of Servius upon the feet of verfes and the quantity of fyllables, called Centimetrum.

SERUM, a thin, tranfparent, faltifh liquor, which
makes a confiderable part of the mafs of blood, See Anatomy, \(1{ }^{\circ}\) 126. and Blood.

SESAMOIDEA nssa, certain fmall bones fomewhat refembling the feeds of fefamum, whence their name. They are placed at the under part of the bones of the laft joints of the fingers and toes.

SESAMUM, olly grain, in botany: A genus of plants belonging to the clafs of didynamia, and to the order of angiofpermia; and in the natural fyftem ranging under the 2 oth order, Lurida. The calyx is divided into five parts. The corolla is campanulated, the tube of which is nearly the length of the calyx ; the throat is inflated, and very lange; the border is divided into five parts, four of which are fprcading and nearly equal ; the fifth is the loweft and largeft. There are four filaments, and the rudiments of a fifth. The Atigma is lanceolated, and the capfule has four cells. There are only two fpecies, the orientale and indicum. I. The orientale has ovate, oblong, entire leaves. It is an annual, and grows naturally on the coaft of Malabar and in the ifland of Ceylon; rifing with an herbaceous four-cornered ftalk, two feet high, fending out a few fhort fide-branches ; the leaves are oblong, oval, a little hairy, and fand oppofite. The flowers terminate the ftalks in loofe fikes; they are fmall, of a dirty white colour, fhaped fomewhat like thofe of the fox-glove. After the flowers are paft, the germen turns to an oval acute-pointed capfule with four cells, filled with oval compreffed feeds, which ripen in autumn. 2. The indicum, with trifid lower leaves, grows naturally in India: this is alfo an annual plant ; the ftalk rifes taller than that of the former ; the lower leaves are cut into three parts, which is the only difference between them.

The firft fort is frequently cultivated in all the eaft. ern countries, and alfo in Africa, as a pulfe; and of late years the feeds have been introduced into Carolina by the African negroes, where they fucceed extremely well. The inhabitants of that country make an oil from the feed, which will keep good many years, without laving any rancid fincll or tatte, but in two years become quite mild; fo that when the warm tafte of the feed, which is in the oil when firft drawn, is worn off, they ufe it as a falad-oil, and for all the purpofes of fweet oil. The feeds of this plant are alfo ufed by the negroes for food; which feeds they parch over the fire, and then mix them with water, and ftew other ingrcdients with them, which makes an hearty food. Sometimes a fort of pudding is made of thefe feeds, in the fame manner as with millet or rice, and is by fome perfons efteemed, but is rarely ufed for thefe purpofes in Europe. This is called benny or bonny in Carolina. In England thefe plants are preferved in botanic gardens as curiofities. Their feeds muft be fown in the fpring upon a hot-bed; and when the plants are come up, they muft be tranfplanted into a frefh hot-bed to bring them forward. After they have acquired a tolerable degree of ftrength, they thould be planted into pots, and plunged into another hot-bed, managing them as hath been directed for amaranths; for if thele plants are not thus brought forward in the former part of the fummer, they will not produce good feeds in this country.

From nine pounds of this feed which came from Ca-

\section*{S E S [ 319 ] S E S}
roline, there were upwards of two quarts of oil drawn,
which is as great a quantity as hath been obtained from any vegetable whatever. This might occafion its being called the oily grain.

SESELT, meadow saxifrage, in botany: A genus of plants belonging to the clafs of pentandria, and to the order of digynia; and in the natural fyttem ranging under the 45 th order, Umbellata. 'The umbels are gloDular ; the involucrum confifts of one or two leafers; the fruit is egg-fhaped and ftreaked. There are II fpecies, the pimpinelloides montanum, glaucum, annuum, ammoides; tortuofum, turbith, byppomarathrum, pyrencum, foxifragum, and elatum. The montanum grows naturally in France and Italy; the glaucum is a native of France ; the ammoides and tortuofum grow in the fouth of Europe ; and the hyppomarathrum is a native of Autria:
SESOSTRIS, king of Egypt. See Egypt, p. 368.

SESQUI, a Latin particle, fignifying a whole and a half; which, joined with altera, terza, quarta, \&c. is much ufed in the Italian mufic to exprefs a kind of ratios, particularly feveral fpecies of triples.

SESqui-Alterate, in geometry and arithmetic, is a ratio between two lines, two numbers, or the like, where one of them contains the other once, with the addition of a half.
Thus 6 and 9 are in a fefqui-alterate ratio; fince 9 contains 6 once, and 3 , which is half of 6 , over; and 20 and 30 are in the fame; as 30 contains 20 , and half 20 or 10.

SESQur-Duplicate ratio, is when of two terms the greater contains the lefs twice, and half the lefs remains; as 15 and \(6 ; 50\) and 20.
Sesqui-Tertional proportion, is when any number or quantity contains another once and one third.

SESSILE, among botanits. See Botany.
SESSION, in general, denotes each fitting or affembly of a council, \&c.

Siession of Parliament, is the feafon or fpace from its meeting to its prorogation. See Parliamfnt.

Kirk-SESSION, the name of a petty ecclefiaftical court in Scotland. See Kirk-Seffon.

Sessions for weights and meafures. In London, four juftices from among the mayor, recorder, and aldermen (of whom the mayor or recorder is to be one), inay hold a feffion to inquire into the offences of felling by falfe weights and meafures, contrary to the ftatutes; and to receive indictments, punifh offenders, \&c. Char. king Charles I.

Couri of Session. See Law, Part III. Sect. ii.
Court of Quarter-SEssions, an Englifh court that muit be held in every county once in every quarter of a year; which, by Hatute 2 Hen. V. c. 4 . is appointed to be in the firft week after Michaelmas-ciay, the firft week after the epiphany, the firlt week after the clofe of Eafter, and in the week after the tranflation of St Thomas the martyr, or the 7th of July. It is leld before two or more juftices of the peace, one of which mult be of the quorum. The juridiction of this court, by 34 Edw . III. c. I. extends to the trying and determining all felonies and trefpaffes whatfoever : though they feldom, if ever, try any greater offence than fmall felonies within the benefit of clergy ; their commiffion providing, that if any cafe of difficulty arifes, they fhall not pro-
ceed to judgment, but in the prefence of one of the juftices of the courts of king's-bench or common-pleas, or one of the judges of affize : and therefore murders, and other capital felonies, are ufually remitted for a more folemn trial to the affizes. They cannot alfo try any new-created offence, without exprefs power given them by the ftatute which creates it. But there are many offences and particular matters which, by particular ftatutes, belong properly to this jurifdiction, and ought to be profecuted in this court ; as, the fmaller mifdemeanors againf the public or commonwealth, not amounting to felony ; and efpecially offences relating to the game, highways, alehoufes, baftard children, the fettlement and provifion for the poor, vagrants, fervants wages, and Popifh recufants. Some of thefe are proceeded upon by indictment : others in a fummary way, by motion, and order thereupon; which order may for the moft part, unlefs guarded againft by particular ftatutes, be removed into the court of king's-bench by writ of certiorari facias, and be there either quafhed or confirmed. The records or rolls of the feffions are committed to the cuftody of a fpecial officer, denominated cuftos rotulorum, who is always a juftice of the quorum; and among them of the querum (faith Lambard) a man for the moft part efpecially picked out, either for wifdom, countenance, or credit. The nomination of the cuflos rotulorum (who is the principal officer in the county, as the lord-lieutenant is chief in military command) is by the king's fign-manual : and to him the nomination of the clerk of the peace belongs; which office he is exprefsly forbidden to fell for money.

In moft corporation-towns there are quarter-feffiors kept before juftices of their own, within their refpective limits; which have exactly the fame authority as the general quarter-feffions of the county, except in a very few inftances; one of the moft confiderable of which is the matter of appeals from orders of removal of the poor, which, though they be from the orders of corporation-juftices, muft be to the feffions of the county, by ftatute 8 and 9 W. III. c. 30 . In both corporations and counties at large, there is fometimes kept a fpecial or petty feffion, by a few juftices, for difpatching fmaller bufinefs in the neighbourhood between the times of the general feffions; as for licenfing alehoufes, paffing the account of parifh-officers, and the like.

SESTERCE, Sestertius, a filver coin, in ufe among the ancient Romans, called alfo fimply nummus, and fometines nu:iamus fefertius. The feftertius was the fourth part of the denarius, and originally contained two aftes and a half. It was at firft denoted by LIL ; the two L's fignifying two libre, and the S half. But the librarii, afterwards converting the two L's into an H , expreffed the feftertius by HS. The word /ejtertius was firt introdueed by way of abbreviation for femiffertius, which fignifies two, and a half of a third, or, li:-rally, only haif a third; for in expreffing half a third, it was underftood that there were two before.

Some authors make two kinds of fefterces; the lefs called Sefertius, in the mafculine gender; and the great one, called Jeflertium, in the neuter: the firt, that we have already defcribed; the latter containing a thoufand of the other. Others will have any fuch diftinction of great and little fefterces unknown to the Romans: \(\int f\) tertius, fay they, was an adjective, and fignified as Jefler -

\section*{S E S [ 320 ]}

Sefterce. tius, or two affes and a half; and when ufed in the plural, as in quinquaginta Ceflertium, or Ceflertia, it was only by way of abbreviation, and there was always underfood centena, millia, \&c.

This matter has been accurately fated by Mr Raper, in the following manner. The fubftantive to which feftertius referred is either as, or pondus; and feffertius as is two affes and a half; feftertium pondus, two pondera and a half, or two hundred and fifty denarii. When the denarius paffed for ten affes, the feftertius of two affes and a half was a quarter of it; and the Romans continued to keep theireccounts in thefe fefterces long after the denarius paffed for fixteen affes; till, growing rich, they found it more convenient to reckon by quarters of the denarius, which they called nummi, and ufed the words nummus and feflertius indifferently, as fynonymous terms, and fometimes both together, as feftertius nummus; in which cafe the word fefertius, having lof its original fignification, was ufed as a fubitantive; for \(\int e f\) bertius nummus was not two nummi and a half, but a fingle nummus of four affes. They called any fum under two thoufand fefterces fo many fefferiii in the mafculine gender; two thoufand fefterces they called duo or bina feftertia, in the neuter; fo many quarters making five hundred denarii, which was twice the feftertium; and they faid dena, vicena, \&c. Sefertia, till the fum amounted to a thoufand feftertia, which was a million of fefterces. But, to avoid ambiguity, they did not ufe the reuter feflertium in the fingular number, when the whole fum amounted to no more than a thoufand fefterces, or tone feftertium. They called a million of fefterces decies nummat \(m\), or decies feflertiaim, for decies centena millia numsorum, or felertiorum (in the mafculine gender), omitting centena millia for the fake of brevity. They like-- wife called the fame fum decies fefletium (in the neuter gender) for decies centies (effertium, omitting centies for The fame reafon; or fimply decies, omitting centena millia Sefertiam, or conties feflertium; and with the numeral adverbs decies, vicies, centies, millies, and the like, either centena millia or centies was always underftood. Thefe - were their moft ufual forms of expreffion; though for - bina, dena, vicena feflertia, they frequently faid bina, dena, vicena millia nummûm. If the confular denarius contain. * ed 60 troy grains of fine filver, it was worth fomewhat \(\therefore\) more than eight-pence farthing and a half fterling ; and the as, of 16 to the denarius, a little more than a halfpenny. - To reduce the ancient fefterces of two affes and a half, when the denarius paffed for 16 , to pounds fterling, multiply the given number by 5454 , and cut off fix figures on the right hand for decimals. 'T'o reduce numini feftertii, or quarters of the denarius, to pounds fterling; if the given fum be confular money, multiply it by. 8727 , and cut of fix figures on the right hand for decimals; but for imperial money diminifh the faid product by one-eighth of itfelf. Phil. 'Tranf. , vol. lxi. part ii. art. \(4^{8 .}\)

To be qualified for a Roman knight, an eftate of 400,000 fefterces was required; and for a fenator, of 800,000 .

Authors alfo mention a copper Seferce, worth about one-third of a penny Englifh.

SESTEKCE, or Seflertius, was alfo ufed by the ancients for a thing containing two wholes and an half of another, as as was taken for any whole or integer.

SESTOS, a noted fortrefs of European Turkey, fio tuated at the entrance of the Hellefpont or Dardanelles, 24 miles fouth-welt of Gallipoli. 'ithis place is famous for the loves of Hero and Leander, fung by the poet Mufaus.

SESUVIUM, in" botany ; a genus of plants belonging to the clafs of icofandria, and to the order of trigynia. The calyx is coloured and divided into five parts; there are no petals; the capfule is egg-fhaped, threecelled, opening horizontally about the middle, and containing many feeds. There is only one fpecies, the portulacaflrum, purflane-leaved fefuvium, which is a native of the Weft Indies.

SET, or Sets, a term ufed by the farmers and gardeners to exprefs the young plants of the white thorn and other Mrubs, with which they ufe to raife their quick or quick-fet hedges. The white thorn is the beft of all trees for this purpe ; and, under proper regulations, its fets feldom fail of anfwering the farmer's utmot expectations.
\(S_{E \tau-\text { off, in law, is an act whereby the defendant ac- }}\) knowledges the juftice of the plaintiff's demand on the one hand; but, on the other, fets up a demand of his own, to counterbalance that of the plaintiff, either in the whole, or in part: as, if the plaintiff fues for 101. due on a note of hand, the defendant may fet off 91. due to himfelf for merchandife fold to the plaintiff; and, in cafe he pleads fuch fet-off, muft pay the remaining balance into court. This anfwers very nearly to the compenfatio or ftoppage of the civil law, and depends upor the fatutes 2 Geo . II. cap. 2.2 and 8 Geo. II. cap. 24.

SETACEOUS worm, in natural hiftory, a name given by Dr Lifter to that llong and 月lender waterworm, which fo much refembles a horfe-hair, that it has been fuppofed by the vulgar to be an animated hair of that creature. Thefe creatures, fuppofed to be living hairs, are a peculiar'fort of infects, which are bred and noulo rifhed within the hodies of other infects, as the worms of the ichneumon flies are in the bodies of the caterpillars.

Aldrovand defcribes the creature, and tells us it was unknown to the ancients; but called Seta aquatica, and vermis fetarius, by the moderns, either from its figure refermbing that of a hair, or from the fuppofition of its once having been the hair of fome animal. We generally fuppofe it, in the imaginary ftate of the hair, to have belonged to a horfe; but the Germans fay it was once the hair of a calf, and call it by a name fignifying vitulus aquaticus, or the " water calf."

Albertus, an author much reverenced by the common people, has declared that this animal is generated of a hair; and adds, that any hair thrown into ftanding water, will, in a very little time, obtain life and motion. Other authors have diffented from this opi, ron, and fuppofed then generated of the fibrous roots of waterplants; and others, of the parts of grafshoppers fallen into the water. This latt opinion is rejected by Aldrovand as the molt improbable of all. Standing and foul waters are molt plentifully ftored with them; but they are fometimes found in the eleareit and pureft fprings, and fometimes out of the water, on the leaves of trees and plants, as on the fruit-trees in our gardens, and the elms in hedges. They are from three to five inches long, of the thicknefs of a large hair; and are browng

\section*{S E V}
brown upon the back, and white under the belly, and the tail is white on every part.

SE'TH, the third fon of Adam, the father of Enos, was born 3874 B . C. and lived 912 years.

SETHIA NS, in church-hiftory, Chriftian heretics; fo called becaule they paid divine worfhip to Seth, whom they looked upon to be Jefus Chrift the fon of God, but who was made by a third divinity, and fubftituted in the room of the two families of Abel and Cain, which had been deftroyed by the deluge. Thefe heretics appeared in Egypt in the fecond century; and as they were addicted to all forts of debauchery, they did not want followers; and continued in Egypt above 200 years

SEI'IMO, a town of Italy, in the province of Piedmont, fituated on the river Po, eight miles north of Turin.
SETON, in furgery, a few horfe hairs, fmall threads, or large packthread, drawn through the fkiii, chiefly the neck, by means of a large needle or probe, with a view to reftore or preferve health.

We find by experience, that fetons are very ufeful in catarrhs, inflammations, and other diforders, particularly thofe of the eyes, as a gutta ferena, cataract, and incipient fuffufion; to thefe we may add intenfe headachs, with ftupidity, drowfinefs, epilepfies, and even the apoplexy it elf.

SETTEE, in fea-lariguage, a veffel very common in the Mediterranean with one deck and a very long and fharp prow. They carry fome two mafts, fome three, without top-mafts. They have generally two mafts, equipped with triangular fails, commonly called lateen fails. The leatt of them are of 60 tons burden. They \{erve to tranfport cannon and provifions for fhips of war and the like. Thefe veffels are peculiar to the Mediterranean fea, and are ufually navigated by Italians, Greeks, or Mahometans.

SETTING, in aftronomy, the withdrawing of a ttar or planet, or its finking below the horizon. Aftronomers and poets make three different kinds of fetting of the ftars, viz. the Cosmical, Acronycal, and HeliAcal. See thefe articles.

Setting, in the fea-language. To fet the land or the fun by the compafs, is to obferve how the land bears on any point of the compafs, or on what point of the compafs the fun is. Alfo when two fhips fail in fight of one another, to mark on what poiut the chafed bears, is termed fetting the chace by the compafs.

Setting, among fportfmen, a term ufed to exprefs the manner of taking partridges by means of a dog peculiarly trained to that purpofe. See Shooting.

Act of SETTLEMENT, in Britifh hiftory, a name given to the ftatute 12 and 13 W. III. cap. 2. whereby the crown was limited to his prefent majefty's illuftrious houfe; and fome new provifions were added, at the fame fortunate era, for better fecuring our relipion, laws, and liberties; which the ftatute declares to be the birthright of the people of England, according to the ancient doctrine of the common law.

SEVENTH, in mufic, an interval called by the Greeks baplachordon. See Interval.
SEVERANCE, in law, the fingling or fevering two or more that join or are joined in the fame writ or action. As if two join in a writ, de libertate probanda, and the one be afterwards nonfuited; here feverance is
Vol. XVII. Part I.
permitted, fo as notwithftanding the nonfuit the one, Severía the other may feverally proceed.

There is alfo feverance of the tenants in affize; when one, two, or more diffeifees appear upou the writ, and not the other. And feverance in debt, where two executors are named plaintiffs, and the one refufes to profecute. We alfo meet with feverance of fummons, feverance in attaints, \&c. An eftate in joint tenancy may be fevered and deftroyed by deftroying any of its unities. I. That of time, which refpects only the original commencement of the joint eftate, cannot indeed (bein; 5 now part) be affected by any fubfequent tranfaction. But, 2. The joint-tenants eftate may be deftroyed without any alienation, by merely difuniting their poffeffion. 3. The jointure may be deftroyed, by deftroying the unity of title. And, 4. By deftroying the unity of intereft.

SEVERIA, a province of the Ruffian empire, with the title of a duchy, bounded on the north by Smolenfko and Mufcovy, on the eaft by Vorotinfbi and the country of the Coffacks, on the fouth by the fame, and on the weft by Zernegovia. It is a country overrun with woods, and on the fouth part is a foreft of great length. Novogrodec, or Novogorod, is the capital town.

ST SEVERINA, a town of Italy, in the kingdom of Naples, and in Lower Calabria, with an archbifhop's fee. It is very well fortified, and feated on a craggy rock, on the river Neeto; in E. Long. 17. 14. N. Lat. 39.15 .

SEVERINO, a town of Italy, in the territory of the church, and in the Marche of Ancona, with a bithop's fee. It has fine vineyards, and is feated between two hills on the river Petenza, in E. Long. 13. 6. N. Lat. 43. 16.

SEVERN, a river which rifes near PlimlimmonHill in Montgomeryfhire, and before it enters Shropfhire receives about 30 ftreams, and paffes down to Laudring, where it receives the Morda, that flows from Ofweftry. When it arrives at Monford, it receives the river Mon, paffing on to Shrewfbury, which it almoft furronuds, then to Bridgeworth; afterwards it runs through the fkirts of Staffordfhire, enters Wor- Lucombe's cefterfhire, and paffes by Worcefter; then it runs to Englijb Giso Tewkeßury, where it joins the Avon, and from thence to Gloucelter, keeping a north-wefterly courfe, till it falls into the Britol Cliannel. It begins to be navigable for boats at Welchpool, in Montgomeryhire, aud takes in feveral other rivers in its courfe, befides thofe already mentioned, and is the fecond in England. By the late inland navigation, it has communication with the rivers Merfey, Dee, Ribble, Oufe, Trent, Derwent, Humber, Thames, Avon, \&c. which navigation, including its windiugs, extends above 500 miles in the counties of Lincoln, Nottingham, York, Lancafter, Weftmoreland, Chetter, Stafford, Warwick, Leicefter, Oxford, Worcefter, \&c. A canal froni Stroud-Water, a branch of the Severn, to join the 'Thames, has lately been undertaken, by which great undertaking of conveying a tunnel 16 feet high aud 16 feet wide, under Sapperton Hill and Hayley-Wood (very high ground), for two miles and a quarter in length, through a very hard rock, lined and arched with brick, is entirely completed, and boats paffed through it the 2 uft of May 1789 . By this opening, a communication is made between the river Severn at

\section*{S E V}

Severus. Framiload and the Thames near Lechlade, and will be continued over the Thames near Inglefham, into deep water in the Thames below St Joln-Bridge, and fo to Oxford, \&c. and London, for conveyance of coals, goods, \&c. It is now navigable from the Severn 10 Themsford, by way of Stroud, Cirencefter, Cricklade, \(\& c\). being filled with water for that purpofe near 40 miles.

SEVERUS (Cornelius), an ancient Latin poet of the Augufan age ; whofe REtna, together with a fragment \(D_{e}\) morte Ciceronis, were publifhed, with notes and a profe interpretation, by Le Clerc, 12 mo , Amtterdam, 1703. 'Ihey were before inferted among the Gatalecan Virgilii publifhed by Scaliger ; whofe notes, with others, Le Clere has reccived among his own.
Severus (Septimus), a Roman emperor, who has been fo much admired for his military talents, that fome lave called him the moft warlike of the Roman emperors. As a monarch he was cruel, and it has been obferved that he never did an act of humanity or forgave a fault. In his diet he was temperate, and he always fhowed himfelf an open enemy to pomp and fplendor. He loved the appellation of a man of letters, and he even compofed an hiftory of his own rcign, which fome have praifed for its correctnefs and veracity. However cruel Severus may appear in his punifhments and in his revenge, many have endeavoured to exculpate him, and obferved that there was need of feverity in an empire where the morals were fu corrupted, and where no lefs than 3000 perfons were accufed of adultery during the fpace of 17 years. Of him, as of Augultus, fome were fond to fay, that it would have been better for the world if he had never been born, or had never died. See Rome, \({ }^{\circ} 372\).

SEVERUS's Wall, in Britih topography, the fourth and laft barrier erected by the Rotnans againft the incurfions of the North Britons. See the articles Adrian, and Antoninus's Wall.

We learn from feveral hints in the Roman hiftorians, that the country between the walls of Hadrian and Antoninus continued to be a fcene of perpetual war and fubject of contention between the Romans and Britons, from the beginning of the reign of Commodus to the arrival of the emperor Septimius Severus in Britain, A.D. 206. This laft emperor having fubdued the Mæatæ, and repulfed the Caledonians, determined to erect a ftronger and more impenetrable barrier than any of the former, againft their future incurfions.
'Though neither Dio nor Herodian make any mention of a wall built by Severus in Britain for the protection of the Roman province, yet we have abundant evidence from other writers of equal authority, that he really built fuch a wall. "He fortified Britain (fays Spartian) with a wall drawn crofs the ifland from fea to fea ; which is the greateft glory of his reign. After the wall was finifhed, he retired to the next fation (York), not only a conqueror, but the founder of an eternal peace." To the fame purpofe, Aurelius Victor and Orofius, to fay nothing of Eutropius and Caffiodo. rus: "Having repelled the enemy in Britain, he fortified the country, which was fuited to that purpofe, with a wall drawn crofs the inland from fea to fea." "Severus drew a great ditch, and built a ftrong wall, fortified with feveral turrets, from fea to fea, to protect that part of the ifiand which he had recovered from
the yet unconquered nations." As the refidence of the emperor Severus in Britain was not quite four years, it is probable that the two laft of them were employed in building this wall ; according to which account, it was begun A. D. 209, and finithed A. D. 210,

I his wall of Severus was built nearly on the fame tract with Hadrian's rampart, at the diftance only of a few paces north. 'The length of this wall, from Coufins' houfe near the mouth of the river Tyne on the eaft, to Boulnefs on the Solway frith on the weft, hath been found, from two actual menfurations, to be a little more than 68 Englifh miles, and a little lefs than 74 Roman miles. To the north of the wall was a broad and deep ditch, the original dimenfions of which cannot now be afcertained, only it feems to have been larger than that of Hadrian. The wall itfelf, which food on the Iouth brink of the ditch, was built of free-ftone, and where the foundation was not good, it is built on piles of oak; the interftices between the two faces of this wall is filled with broad thin fones, placed not perpendicularly, but obliquely on their edges ; the running mortar or cement was then poured upon them, which, by its great ftrength and tenacity, bound the whole together, and made it firm as a rock. But though thefe materials are fufficiently known, it is not eafy to guefs where they were procured, for many parts of the wall are at a great diftance from any quarry of free ftone; and, though ftone of another kind was within reach, yet it does not appear to have been anywhere ufed. The height of this wall was \(I 2\) feet befides the parapet, and its breadth 8 feet, according to Bede, who lived only at a fmall diftance from the cait end of \(i t\), and in whofe time it was almolt quite entire in many places. Such was the wall erected by the command and under the direction of the emperor Severus in the north of England; and, confidering the length, breadth, height, and folidity, it was certainly a work of great magnificence and prodigious labour. But the wall itfelf was but a part, and not the moft extraordinary part, of this work. The great number and different kinds of fortreffes which were built along the line of it for its defence, and the military ways with which it was attended, are ftill more worthy of our admiration, and come now to be defcribed.

The fortreffes which were erected along the line of Severus's wall for its defence, wcre of three different kinds, and three different degrees of ftrength; and were called by three different Latin words, which may be tranflated fations, cafles, and turrets. Of each of thefe in their order.

The flationes, ftations, were fo called from their ftability and the ftated refidence of garrifons. They were alfo called caflra, which hath been converted inte chefires, a name which many of them ftill bear. Thefe were by far the largeft, ftrongett, and moft magnificent of the fortreffes which were built upon the wall, and were defigned for the head-quarters of the cohorts of troops which were placed there in garrifon, and from whence detachments were fent into the adjoining cafles and turrets. Thefe ftations, as appears from the veftiges of them which are ftill vifible, were not all exactly of the fane figure nor of the fame dimenfions ; fome of them being exactly fquares, and others oblong, and fome of them a little larger than others. Thefe variations were no doubt occalioned by the difference of fig. 8

\section*{S E V [ 323 ] S E V}
us. tuation and other circumftances. The ftations were fortified with deep ditches and frong walls, the wall itfelf coinciding with and forming the north wall of each fation. Within the ftations were lodgings for the officers and foldiers in garrifon; the fmalleft of them being fufficient to contain a cohort, or 600 men. Without the walls of each flation was a town, inhabited by labourers, artificers, and others, both Romans and Britons, who chofe to dwell under the protection of thefe fortreffes. The number of the fations upon the wall was exactly 18 ; and if they lad been placed at equal diftances, the interval between every two of them would have been four miles and a few paces: but the intervention of rivers, marfhes, and mountains; the conveniency of fituations for ftrength, profpect, and water ; and many other circumftances to us unknown, determined them to place thefe ftations at unequal diftances. The fituation which was always chofen by the Romans, both here and everywhere elfe in Britain where they could obtain it, was the gentle declivity of a hill, near a river, and facing the meridian fun. Such was the fituation of the far greateft part of the fations on this wall. In general, we may obferve, that the ftations ftood thickeft near the two ends and in the middle, probably becaufe the danger of invalion was greatelt in thefe places. But the reader will form a clearer idea of the number of thefe fations, their Latin and Englifh names, their fituation and diftance from one another, by infpecting the following table, than we can give him with equal brevity in any other way. The firft column contains the number of the fation, reckoning from eaft to weft ; the fecond contains its Latin, and the third its Englin name; and the three laft its diftance from the next ftation to the weft of it, in miles, furlongs, and chains.

The caftella, or caftles, were the fecond kind of fortifications which were built along the line of this wall for its defence. Thefe caftles were neither fo large nor ftrong as the flations, but much more numerous, being no fewer than 81 . The fhape and dimenfions of the caftles, as appears from the foundations of many
of them which are fill wifible, were exact fquares of 66 feet every way. They were fortified on every fide with thick and lofty walls, but without any ditch, except on the north fide; on which the wall itfelf, raifed much above its ufual heiglit, with the ditch attending it, formed the fortification. The cafles were fituated in the intervals between the ftations, at the diftance of about feven furlongs from each other ; thongh particular circunftances fometimes occafioned a little variation. In thefe caftles, guards were conftantly kept by a competent number of men detached from the neareft ftations.

The turres, or turrets, were the third and laft kind of fortifications on the wall. Thefe were ftill much fmaller than the caftles, and formed only a fquare of about 12 feet, ftauding out of the wall on its fouth fide. Being fo fmall, they are more entirely ruined than the ftations and caftles, which makes it difficult to difcover their exact number. They food in the intervals between the caftles; and from the faint ve?tige3 of a few of them, it is conjectured that there were four of them between every two caftles, at the diftance of about 300 yards from one another. According to this conjecture, the number of the turrets amounted to 324 . They were defigned for watch-towers and places for fentinels, who, being within hearing of one another, could convey an alarm or piece of intelligence to all parts of the wall in a very little time.

Such were the ftations, caftles, and turrets, on the wall of Severus; and a very confiderable body of troops was conftantly quartered in them for its defence. The ufnal complement allowed for this fervice was as follows :
1. T'welve cohorts of foot, confilting of 600 men each,

7,200
2. One cohort of mariners in the fation at Boulnefs,
3. One detachment of Moors," probably equal to a cohort,
4. Four alæ or wings of horfe, confiting, at the loweft computation, of 400 each,

For the conveniency of marching thefe troops from one part of the wall to another, with the greater eafe and expedition, on any fervice, it was attended with two military ways, paved with fquare fones, in the moft folid and beautiful manner. One of thefe ways was fmaller, and the other larger. The fmaller military way tun clofe along the fouth fide of the wall, from turret to turret, and caftle to caftle, for the ufe of the foldiers in relieving their guards and centinels, and fuch fervices. The larger way did not kecp fo near the wall, nor touch at the turrets or caftles, but purfued the moft direct couzfe from one fation to another, and was defigned for the conveniency of marching larger bodies of troops.

It is to be regretted, that we cannot gratify the reader's culiolity, by informing him by what particular bodies of Roman troops the feveral parts of this great work were executed; as we were enabled to do with regard to the wall of Antoninus Pius from infrriptions. For though it is probable that there were Ss 2
ftones

\section*{S E V [ 324 ] S E V}

Severus. fones with infcriptions of the fame kind, mentioning the feveral bodies of troops, and the quantity of work performed by each of them, originally inferted in the face of this wall, yet none of them are now to be found. There have indeed been difcovered, in or near the ruins of this wall, a great number of fmall fquare ftones, with very fhort, and generally imperfect, infcriptions upon them; mentioning particular legions, cohorts, and centuries ; but without directly afferting that they had built any part of the wall, or naming any number of paces. Of thefe inferiptions, the reader may fee no fewer than twenty nine among the Northumberland and Cumberland inferiptions in Mr Horfley's Britannia Rømana. As the ftones on which thefe infcriptions are cut are of the fame fhape and fize with the other facing-ftones of this wall, it is almoft certain that they have been originally placed in the face of it. It is equally certain, from the uniformity of thefe in. fcriptions, that they were all intended to intimate fome one thin:, and nothing fo probable as that the adjacent wall was built by the troops mentioned in them. '1his was, perhaps, fo well underftood, that it was not thought neceffary to be expreffed; and the diftance of thefe infcriptions from one another fhowed the quantity of work performed. If this was really the cafe, we know in general, that this great work was executed by the fecond and fixth legions, thefe being the only legions mentioned in thefe inferiptions: Now, if this prodigious wall, with all its appendages of ditches, ftations, caftles, turrets, and military ways, was executed in the face of two years by two legions only, which, when moft complete, made no more than 12,000 men, how greatly muft we admire the fkill, the induftry, and excellent difcipline of the Ruman foldiers, who were not only the valiant guardians of the empire in times of war, but its moft active and ufeful members in times of peace ?

This wall of Severus, and its fortreffes, proved an impenetrable barrier to the Roman territories for near 200 years. But about the beginning of the 5 th century, the Roman empire being affaulted on all fides, and the bulk of their forees withdrawn from Britain, the Mæatæ and Caledonians, now called Scots and Pitts, became more daring; and fome of them hreaking through the wall, and others failing round the ends of it, they carried their ravages into the very heart of Provincial Britain. 'Ihefe invaders were indeed feveral times repulfed after this by the Roman legions fent to the relief of the Britons. The laft of thefe legions, under the command of Gallio of Ravenna, having, with the affiftance of the Britons, thoroughly repaired the breaches of Severus's wall and its fortreffes, and exhorted the Britons to make a brave defence, took their final farewell of Britain. It foon appeared, that the frongeft walls and ramparts are no fecurity to an undifciplined and daftardly rabble, as the unhappy Britons then were. The Scots and Picts met with little refittance in breaking through the wall, while the towns and caftles were tamely abandoned to their deftructive rage. In many places they levelled it with the ground, that it might prove no obftruction to their future inroads. From this time no attempts were ever made to repair this noble work. Its beauty and grandeur procured it no refpect in the dark and taftelels ages which fucceeded. It became the common quarry for more than a thoufand years, out of which all the towns and vil.
lages around were built; and is now fo entirely ruined, that the penetrating eyes of the moft poring and pa. tient antiquarian, can hardly trace its vanifhing foundations.

SEVIGNE (Marie de Rabutin, Marquiffe de), a French lady, was born in 1626. When only a year old the loft her father, who was killed in the defcent of the Englifh on the iffe of Rhé, where he commanded a company of volunteers. In 1644 the married the Mar. quis of Sevigné, who was flain in a duel by the Chevalier d'Albret, in 165 I . She had by him a fon and at daughter, to the education of whom fhe afterwards religiounty devoted herfelf. Her daughter was married in 1669 to the Count of Grignan, who conducted her to Provence. Madame de Sevigné confoled herfelf by writing frequent letters to her daughter. She fell at laft the victim to her maternal tendernefs. In one of her vifits to Grignan, fhe fatigued herfelf fo much during the ficknefs of her daughter, that fhe was fcized with a fever, which carried lier off on the 14 th of January 1696. We have two portraits of Madame de Sevigné; the one by the Compte de Buffi, the other by Madame de la Fayette. The firft exlibits her defects; the fecond her excellencies. Buffi defcribes her as a lively gay coquette, a laver of flattery, fond of titles, honour, and diftinction: M. de la Fayette as a woman of wit ar good fenfe, as poffeffed of a noble foul, ormed for difpenfing benefits, incapable of debafing herfelf by avarice, and bleffed with a generous, obliging, and faithful heart. Both thefe portraits are in fome meafure juft. That fhe was vain-glorious, appears evident from her own letters, which, on the other hand, exhibit undoubted proofs of her virtue and goodnefs of heart.
This illuftrious lady was acquainted with all the wits of her age. . It is faid that fhe decided the famous difpute between Perrault and 13oileau concerning the preference of the ancients to the moderns, thus, "The ancients are the fineft, and we are the prettieft." She left behind her a mott valuable collection of letters, the bett edition of which is that of 1775 , in 8 vols 12 mo . " Thefe letters (fays Voltaire) are filled with anecdotes, written with freedom, and in a natural and animated ftyle; are an excellent criticifm upon fludied letters of wit, and ftill more upon thofe fictitious letters which aim at the epiftolary ftyle, by a recital of falfe fentiments and feigned adventures to an imaginary correfpondent." It were to be wifhed that a proper felection had been made of thefe letters. It is elifficult to read eight volumes of letters, which, though inimitably written, prefent frequent repetitions, aad are often filled with trifles. What makes them in general perhaps \(f_{0}\) interefting is, that they are in part hiftorical. They may be looked upon as a relation of the manners, the ton, the gerius, the fafhions, the etiquette, which reigned in the court of Louis XIV. They contain many curious anecdotes nowhere elfe to be found: But thefe excellencies would be fill more ftriking, were they fometimes ftripped of that multitude of domeftic affairs and minute incidents which ought naturally to have died with the mother and the daughter. A volume entitled Sevigniana was publifhed at Paris in 1756 , which is nothing more than a collection of the fine fentiments, literary and hiftorical anecdotes, and moral apothegms, fcattered thronghout thefe letters.

SEVILLE,

\section*{S E V [ \(32 j] \quad\) S E V}

SEVILLE, a large and populous city of Spain, and St Leander, which are as large as the life; and Sevile. ftands on the banks of the Guadalquiver, in the midft of a rich, and to the eye a boundlefs, plain; in W. Long. \(5^{\circ} 5^{\prime}\) N. Lat. \(37^{\circ} 20^{\prime}\). This city is fupprfed to have been founded by the Phœnicians, who gave it the name of Hi/palis. When it fell under the power of the Romans, it was called \(\mathcal{F u}\) lia; and at laft, after a variety of corruptions, was called Sebilla or Sevilla; both of which names are retained by the Spaniards. The Romans embellifhed it with many magnificent edifices; of which fcarce any veftige now remains. The Gothic kings for fome time made it their refidence : but in procefs of time they removed their court to T'oledo; and Seville was taken by ftorm foon after the victory obtained at Xeres over the Gothic king Rodrigo. In 1027, Seville became an independent monarchy; but was conquered 70 years afterwards by Yufef Almoravides, an African prince. At laft it was taken by Ferdinand III. after a year's fiege ; and 300,000 Moors were then obliged to leave the place. Notwithftanding this prodigious emigration, Seville continued to be a great and populous city, and foon after it was enlarged and adorned with many magnificent buildings, the chief of which is the cathedral. Seville arrived at its utmoft pitch of grandeur a little after the difcovery of America, the reafon of which was, that all the valuable productions of the Weft Indies were carried thither. Its court was then the moft fplendid in Europe; but in the courfe of a few years all this grandeur difappeared, owing to the impediments in navigating the Guadalquiver. The fuperior excellence of the port of Ca diz induced governinent to order the galeons to be ftationed there in time to come.

Seville is of a circular form, and is furrounded by a wall about five miles and a half in circumference, containing \(17^{6}\) towers. 'The ditch in many places is filled up. The ftreets of Seville are crooked and dirty, and moft of them fo narrow that two carriages can fcarcely pafs one another abreaft.

Seville is faid to contain 80,268 fouls, and is divided into 30 parifhes. It has 84 convents, with 24 hor. pitals.

Of the public edifices of this city the cathedral is the moft magnificent. Its dimenfions are 420 feet in length, 263 in breadth within the walls, and 126 feet in height. It has nine dours, 80 altars, at which 500 maffes are daily celebrated, and 80 windows of painted glafs, each of which coft 1000 ducats. At one angle ftands a tower of Moorifh workmanfhip 350 feet high. On the top of it is the giralda, or large brazen image, which, with its palm branch, weighs near one ton and a half, yet turns as a weather-cock with the glighteft variation of the wind. The whole work is brick and mortar. The paffage to the top is an inclined plane, which winds about in the infide in the manner of a fpiral ftaircafe, fo eafy of afcent that a lorfe might trot from the bottom to the top; at the fame time it is fo wide that two horfemen may ride abreaft. What appears very unaccountable, the folid mafonry in the upper half is juft as thick again as that in the lower, tho' on the outfide the tower is all the way of the fame dimenfions. In the opinion of Mr Swinburne, this cathedral is inferior to Yorkminfter. Its treafures are ineftimable; one altar with all its ornaments is folid filver: of the fame metal are the images of St Ifidore
a tabernacle for the holt more than four yards high, adorned with eight and forty columns. Before the choir of the cathedral is the tomb of the celebrated Chritopher Columbus, the difcoverer of America. His monument confifts of one fone only, on which thefe words are infcribed, A Cafella y Arragon otro mundo Bourgoanne's dio Colon; that is, "To Caftile and Arragon Colum. Travels, bus gave another world :" an infcription fimple and ex vol. ii. prefive, the juftnefs of which will be acknowledged by thofe who have read the adventures of this illuitrious but unfortunate man. The cathedral was begun by Don Sancho the Brave, about the clofe of the \(13^{\text {th }}\) century, and finifhed by John II. about an hundred years after. 'To the cathedral belongs a library of 20,000 volumes, collected by Hernando the fon of Columbus; but, to the difgrace of the Spaniards, it has fcarcely received any addition fince the death of the founder. The organ in this cathedral is a very ingenious piece of mechanifm \(\dagger\). "I was much pleafed (fays Mr Townend in his interefting travels) with the conftruction of a new organ, containing 5300 pipes, with 110 ftops, which latter, as the builder told me, is 50 more than are in the famous one of Harlem; yet, fo ample are the bellows, that when ftretched they fupply the full organ 15 minutes. The mode of filling them with air is fingular; for inftead of working with his hands, a man walks backwards and forwards along an inclined plane of about 15 feet in length, which is balanced in the middle on its axis; under each end is a pair of bellows, of about fix feet by three and an half. Thefe communicate with five other pair united by a bar; and the latter are fo contrived, that when they are in danger of being overftrained, a valve is lifted up, and gives them relief. Paffing io times along the inclined plane fills all thefe veffels."

The Canos de Carmone, or great aqueduct of Se- Suenburne's. ville, is reckoned by the hiftorians of this city one Travelis. of the moft wonderful works of antiquity. Mr Swin. \({ }^{\text {1. }} 28\). burne, however, remarks, that it is ugly, crooked, the arches unequal, and the architecture neglected. The conduit is fo leaky, that a rivulet is formed by the wafte water. Neverthelefs, it fill conveys to the city an ample fupply of water fufficient to turn feveral mills, and to give almoft every houfe in town the benefit of it.

Many of the convents are remarkable for the beauty of their architecture ; but in Seville the eye covets only pictures, of which there is a wonderful profufion. A. mong thefe are the works of the famous painter Mu rillo, with many others univerfally admired.

The convent of the Francifcans contains 15 cloifters, with apartments for 200 monks, though, when Mr . Townfend vilited them, they amounted only to 140. The annual expenditure of thefe, who are all fed on.Tozunfend' charity, is about L. 4000 Sterling. "In the principal Travels, cloifter (fays the fame intelligent traveller), which ivol. ii. entirely inclofed by a multitade of little chapels, are reprefented, in 14 pictures, each called a falion, all the fufferings of the Redeemer. Thefe are fo arranged as to mark given diftances by walking round the cloifter from the firft to the fecond, and fo in order to the reft. Over them is mentioned the number of fteps taken by our Lord between the feveral incidents of his paffion in his way to Calvary, and thefe precifely are the paces:

\section*{S E V}

Sevile.
meafured for the penitents in their progrefs from one ftation to another. Over one is the following infeription: 'This ftation confifts of 1087 fteps. Here the bleffed Redeemer fell a fecond time under the weight of his crofs, and here is to be gained the indulgence of feven years and forty quarantines. Mental prayer, the Paternofter, and the Ave Maria.' 'This inay ferve as an example for the reft."
'The principal manufacture of Seville is fnuff. Mr Townfend, who paid particular attention to it, informs us, that the building in which it is carried on is elegant and fimple in its form, and is about 600 feet by 480 , and not lefs than 60 feet in height, with four regular fronts, inclofing 28 quadrangles. It coft \(37,000,000\) of reals, or about L. 370,000. At prefent (1787), no more than 1700 workmen are employed, and 100 horfes or mules; but formerly 3000 men were engaged, and near 400 horfes. 'This falling off is attributed by Mr Swinburne to a practice which the directars followed, of adulterating the tobacco with the red earth of Almazarron. When Mr Townfend vilited this manufacture, they had changed their fyiten. From the year 1780 , he informs us, the annual fale of tobacco from Brazil has been \(1,500,000\) pounds, purchafed from the Portuguefe at three reals a pound; and of fnuff from the produce of their own colonies \(1,600,000\) pounds, befide cigars (a) to a very confiderable amount. They have lying by them more than \(5,000,000\) of pounds of fnuff unfold; but as it will not fuffer by age, they are not uneafy at this accumulation. Befides the peculiar kind of fnuff with which spain was accu. ftomed to fupply the market, they have lately introduced the manufacture of rappee. In this branch alone are employed 220 perfons, old and young, with 16 mules.
"All the workmen (continues Mr Townfend) depofit their cloaks at the door; and when they go out are fo ftrictly examined, that they have little clance of being able to conceal tobacco; yet they fometimes venture to hide it about their perfons. An officer and a guard is always attending to take delinquents into cuitody; and that they may prevent refiltance, no workman is permitted to enter with a knife. Were it not for this precaution, the confequence of a detection might be fatal. The whole bulinels is conducted by a director, with a falary of 40,000 reals a-year, and 54 fuperior officers, affitted by as many fubordinate to them. For grinding their fnuff, they have 40 mills, each confifting of a ftone roller, moved by a large horfe or mule, with the traces faftened to a beam of eight feet in length, in the angle of 45 degrees, confequently lofing precifely half his force."

Before Mr Townfend left Seville, according to his ufual practice, which was truly laudable, he enquired into the prices of labour and provifions. As a piece of curious and ufeful information, and a3 an example to other travellers, we prefent them to our readers. They are as follow :

Day-labourers - \(4^{\frac{x}{2}}\) reals, about L. 0 ○ \(10 \frac{3}{4}\)
Carpenters from 7 to 11 ——
Joiners, if good work-
men, - 24 —— or 049

Weavers, if good workmen, 15 reals, about
L. 0

Bread, for 3 lb . of 16 o\%. or 16 quartos, or 0
-- fometimes 28 quartos, or
Beef, 30 quartos for 32 oz . per lb . about \(\circ\) Mutton, 38 do. do.
Kid, 2.4 do.
Pork from 36 to 42 quartos, do. \(03^{\frac{3}{8}}\) to 0 ○ \(5^{\frac{3}{3} \frac{0}{7}}\)
'I'he price of wheat has at different periods been very remarkable. In 1652 , it fold at the rate of 15 s. \(3^{\frac{1}{2}} \mathrm{~d}\). the bufhel ; and in 1657 , it fell fo low as i s. \(4{ }_{5}^{1} \mathrm{~d}\). per bufhel, reckoning the fanega at \(109 \frac{1}{2} \mathrm{lb}\). and the bufhel at 70.

SEVUM Minerale, mineral tallow; a fubftance fomewhat refembling tallow, found on the fea-coafts of Finland in the year \({ }^{1736}\). It burns with a blue flame, and fmell of greafe, leaving a black vifcid matter which cannot eafily be confumed. It is extremely light ; be. ing only of the fpecific gravity of 0.770 ; whereas tallow is not lefs than 0.969 . It is partly foluble in highly rectified fpirit of wine ; but entirely fo in expreffed oils when boiling. It is met with in fome of the rocky parts of Perfia, but there it appears to be mixed with petrolæum. Dr Herman of Straßurg mentions a fpring in the neighbourhood of that city which contains a fubflance of this fort diffufed through it, feparating, and capable of being collected on ebullition. A fat mineral matter refembling butter or tallow has lately been extracted from peat in Lancafhire. See Peat.

SEWAURY, a Hindoo word ufed in Bengal, and fignifying the train of attendants that accompany a nabob or gieat man.

SEWER, in the Houfehold, an officer who arranges on the table the difhes of a king or nobleman.

Sewer is alfo a paffage or gutter made to carry water into the fea or a river, whereby to preferve the land, \&e. From inundations and other annoyances.

Court of Commiffioners of SEwERS in England, a temporary tribunal, erected by virtue of a commiffion under the great feal ; which formerly ufed to be granted pro re nata at the pleafure of the crown, but now at the difcretion and nomination of the lord chancellor, lord treafurer, and chief juftices, purfuant to the ftatute \({ }_{23}\) Hen. VIII. c. 5. Their jurifdiction is to overlook the repairs of fea-banks and fea-walls, and the cleanfing of rivers, public ftreams, ditches, and other conduits, whereby any waters are carried off; and is confined to fuch county or particular diftrict as the commiffion fhall exprefsly name. The commiffioners are a court of record, and may fine and imprifon for contempts; and in the execution of their duty may proceed by jury, or upon their own view, and may take order for the removal of any annoyances, or the fafeguard and confervation of the fewers within their commiffion, either according to the laws and cuftoms of Romney-marfh, or otherwife at their own difcretion. They may alfo affels fuch rates or fcots upon the owners of lands within their diftrict as they fhall judge neceffary : and if any perfon refufes to pay them, the commiffioners may levy

\section*{S E W [327] S E X}
the fame by diftrefs of his coods and chattels; or they may, by ftatute 23 Hen. VIII. c. 5. fell his freeholdlands (and by the 7 Ann. c. ro. his copyhold allo), in order to pay fuch fcots or alfeffments. But their conduet is under the controul of the court of King's-bench, which will prevent or punifh any illegal or tyrannical proceedings. And yet in the reign of King James I. (Sth Nov. 1616.), the privy-council took upon them to order, that no action or complaint fhould be profecuted againlt the commiffioners unlefs before that board; and committed feveral to prifon who had brought fuch actions at common law, till they fhould rcleafc the fame: and one of the reafons for difcharging Sir Edward Coke from his office of lord chief-juftice, was for countenancing thofe legal proceedings. The pretence for thefe arbitrary meafures was no other than the tyrant's plea of the neceffity of unlimited powers in works of evident utility to the public, "the fupreme reafon above all reafons, which is the falvation of the king's lands and people." But now it is clcarly held, that this (as well as all other inferior jurifdictions) is fubjcet to the difcretionary coercion of his majelty's court of King'sbench.

Common Seiters, in Rome, were exccuted at a great expence. It was propofed that they fhould be of fufficient dimenfions to admit a waggon loaded with hay. When thefe common fewers came to be obftructed, or out of repair, under the republic, the cenfors contracted to pay a thoufand talents, or about 193,000 l. for clearing and repairing then. They were again in difrepair at the acceffion of Augutus Cæfar, and the re. inflating them is mentioned among the great works of Agrippa. He is faid to lave turned the courfe of feven rivers into thefe fubterraneous paffages, to have made them navirgable, and to have actually paffed in barges under the fleets and buildings of Rome. Thefe works are ftill fuppofed to remain; but as they exceed the power and refources of the prefent city to keep them in repair, they are quite concealed, cxcept at one or two places. They were in the midlt of the Roman greatnefs, ard fill are, reckoned among the wonders of the world ; and yet thcy are faid to have been works of the elder Tarquin, a prince whofe territory did not extend, in any direction, above 16 miles; and, on this fuppofition, they muft have been made to accommodate a city that was calculated chiefly for the reception of cattle, herdfmen, and banditti. Rude nations fometimes execute works of great magnificence, as fortreffes and temples, for the purpofes of war and fuperflition; but feldom palaces, and fill more feldom works of mere convenience and cleanlinefs, in which for the moft part they are long defective. It is not unreafonable, therefore, to queftion the authority of tradition in respect to this fingular monument of antiquity, which fo greatly cxceeds what the beft accommocated city of modern Europe could undertake for its own conveniency. And as thofe works are ftill entire, and may continue fo for thoufands of years, it may be fufpered that they were even prior to the fettlement of Romulus, and may have been the remains of a more ancient city, on the ruins of which the followers of Romulus fettled, as the Arabs now hut or encamp on the ruins of Palmyra and Balbeck. Livy owns, that the common fewers were not accommodated to the plan of Rome, as
it was laid out in his time ; they were carried in directions acrofs the flreets, and paffed under buildings of
\(\qquad\)
Sex. the greateft antiquity. 'This derangement indeed he imputes to the hafty rebuilding of the city after its defruction by the Gauls ; but hafte, it is probable, would have determined the peoplc to build on their old foundations, or at leaft not to change them fo much as to crofs thic direction of former ftreets.
SEX, the property by which any animal is male or femate.
Lavater has drawn the following claracteriftic diftinctions between the male and female of the liuman fpecies.
" The primary matter of which women are conflituted appears to Le more flexible, irritable, and elaftic, than that of man. They are formed to maternal nildnefs and affection; all their organs are tender, yielding, eafily wounded, fenfible, and receptible. Among a thoufand females there is fcarcely one without the generic feminine figns ; the flexible, the circular, and the irritable.
" They are the counterpart of man, taken out of man, to be fubject to man ; to comfort him like angels, and to lighten his cares. 'She fhall be faved in childbearing, if they continue in faith, and charity, and holinefs, with fobriety" ( 1 Tim. ii. 15.) This tendernefs, this fenfibility, this light texture of their fibres and organs, this volatility of feeling, render them fo eafy to conduct and to tempt ; fo ready of fubmiffion to the enterprife and power of the man ; but more powerful through the aid of their charms than man, with all his ftrength. The man was not firlt tempted, but the woman, afterward the man by the woman. And, not only eafy to be tempted, fhe is capable of being formed to the purref, nobleft, moft feraphic virtue; to every thing which can deferve praife or affection. Highly fenfible of purity, beauty, and fymmetry, the does not always takc time to reflect on internal life, internal death, internal corruption. 'The woman faw that the tree was good for food, and that it was pleafant to the cyes, and a tree to be defired to make one wife, and fhe took of the fruit thereof.' (Cen, iii. 6.)
-" The female thinks not profoundly; profound thought is the power of the man. Women feel more. Senfibility is the power of woman. They often rule more effectually, more fovereignly, than man. They rule with tender looks, lears, ane fighs ; but not with paffion and threats; for if, or when, they fo rulc, they are no longer women but abortions. They are capableof the fweeteff fenfibility, the moft profound emotion, the utmoft humility, and the excefs of enthufiafm. In: their countenance are the figns of fanctity and inviolability, which every feeling man honours, and the effectsof which are often miraculous. Thercfore, by the irritability of their nerves, their incapacity for deep inquiry and firm decifion, they may eafily from their extreme fcnfibility become the moft irreclaimable, the molt rapturous entluffiafls. 'Their love, ftrong and rooted as it is,. is very changeable; their hatred almoft incurable, and only to be effaced by continued and artful flattery. Men are moft profound; women are more fublime.
" Men moft embrace the whole ; women remark in. dividually, and take more delight in felecting the minutix which form the whole, Man hears the burfing:
thunder \({ }_{2}\).

\section*{S. E X}
thunder, views the deftructive bolt with ferene afpect, and ftands erect amidft the fearful majefty of the Hream. ing clouds. Woman trembles at the lightning, and the voice of diftant thunder; and fhrinks into herfelf or finks into the arms of man. Man receives a ray of light fingle, woman delights to view it through a prifm in all its dazzling colours. She contemplates the rain* bow as the promife of peace; he extends his inquiring cye over the whole horizon. Woman laughs, man fmiles ; woman weeps, man remains filent. Woman is in anguif when man weeps, and in defpair when man is in anguifh; yet has fhe often more faith than man. Man without religion, is a difeafed creature, who would perfuade himfelf he is well, and needs not a phyfician ; but woman without religion, is raging and monftrous. A woman with a beard is not fo difgufting as a woman who acts the freethinker; her-fex is formed to piety and religion ; to them Chritt firft appeared ; but he was obliged to prevent them from too ardently, and too hattily, embracing him: 'Touch me not.' They are prompt to receive and feize novelty, and become its enthufiafts. The whole world is forgotten in the emotion caufed by the prefence and proxinity of lim they love. They fink into the moft incurable melancloly, as they alfo rife to the moft enraptured heights.
" Male fenfation is more imagination, female more heart. When commmicative, they are more communicative than man ; when fecret, more fecret. In general they are more patient, long-fuffering, credulous, benevolent, and modeft. Woman is not a foundation on which to build. She is the gold, filver, precious fones, wood, hay, ftubble (I Cor. iii. I 2.) ; the materials for building on the male foundation. She is the leaven, or more expreffively the oil to the vinegar of man : the fecond part of the book of man.
" Man finsly is but half man; at leaft but half human; a king without a kingdom. Woman, who feels properly what fhe is, whether ftill or in motion, refts upon the man; nor is man what he may and ought to be, but in conjunction with woman : therefore, ' it is siot good that man fhould be alone, but that he fhould leave father and mother, and-cleave to his wife, and they two fhall be one flefh."

They differ alfo in their exterior form and appearance.
ct Man is the moft firm ; woman the moft flexible. Man is the ftraighteft; woman the moft bending. Man ftands ftedfaft; woman gently retreats. Man furveys and obferves : woman glances and feels. Man is ferious; woman is gay. Man is the talleft and broadeft; woman the fmalleft and weakeft. Man is rough and hard; woman fmooth and fott. Man is brown; woman is fair. Man is wrinkly; woman is not. The hair of man is more ftrong and fhort; of woman more long and pliant. The eyebrows of man are comprefled; of woman less frowning. Man has moft convex lines; woman molt concave. Man has moft ftraight lines; woman moft curved. The countenance of man taken in profile is more feldom perpendicular than that of the woman. Man is moft angular; woman molt round."
Titzof/brne's \(Z\) etters.

In determining the comparative merit of the two fexes, it is no derogation from female excellency that it differs in kind from that which diftinguithes the male part of our fpecies: and if, in general, it fhould be found (what upon an impartial inquiry will molt cer-
tainly be found) that women fill up their appointed circle of action with greater regularity than mea, the claim of preference cannot juftly be decided in our faveur. In the prudential and economical parts of life, it is undeniable that they rife far above us : and if true fortitude of mind is beft difcovered by a cheerful refig. nation to the meafures of Providence, we fhall not find reafon, perhaps, to claim that molt fingular of the hu man virtues as our peculiar privilere. There are numbers of the other fex who, from the natural delicacy of their conftitution, pafs through one continued fcene of fuffering from their cradles to their graves, with a firmnefs of refolution that would deferve fo many fatues to be erected to their memories, if heroifm were not ef. teemed more by the fplendor than the merit of actions.

But whatever real difference there may be between the moral or intellectual powers of the male and female mind, Nature does not feem to have marked the diftinction fo ftrongly as our vanity is willing to imagine; and after all, perhaps, education will be found tos conftitute the principal fuperiority. It mult be acknow. ledged, at leaft, that in this article we have every ad. vantage over the fotter fex that art and induftry can poffibly fecure to us. The moft animating examples of Greece and Rome are fet before us, as early as we are capable of any obfervation; and the nobleft compofitions of the ancients are given into our hands almoft as foon as we have frength to hold them; while the employments of the other fex, at the fame period of life, are generally the reverfe of every thing that can open and enlarge their minds, or fill them with juft and rational notions. The truth of it is, female education is fo much worfe than none, as it is better to leave the mind to its natural and uninftrueted fuggeftions, than to lead it into falle purfuits, and contract its views, by turning them upon the loweft and moft trifing objects. We feem, indeed, by the manner in which we fuffer the youth of that fex to be trained, to confider women agreeably to the opinion of certain Mahometan doctors, and treat them as if we believed they had no fouls: why elfe are they

> Bred only, and completed to the tafte
> Of luffful appetence, to fing, to dance,
> To drefs, and troul the tongue, and roll the eye.

Milton.
This ftrange neglect of cultivating the female mind can hardly be allowed as good policy, when it is conlidered how much the interelt of fociety is concerned in the rectitude of their underftandings. I'hat feafon of every man's life which is moft fufceptible of the ftrongeft impreffions, is neceffarily under temale direction; ay there are few inftances, perhaps, in which that fex is not one of the fecret fprings which regulates the moit important movements of private or public tranfactions. What Cato obferves of his countrymen is in one refpect true of every nation under the fun: "The Romans (faid he) govern the world, but it is the women that govern the Romans."

If it be true then (as true beyond all peradventure it is) that female influence is thus extenfive, nothing certainly can be of more importance than to give it a proper tendency, by the affiftance of a well directed edu. cation. Far are we from recommending sisy attempts

\section*{S E X}
to render women learned; yet furely it is neceffary they fhould be raifed above ignorance. Such a general tincture of the moit ufeful fciences as may ferve to free the mind from vulgar prejudices, and give it a relifh for the rational exercife of its powers, might very juftly enter into a plan of female erudition. That fex might be taught to turn the courfe of their reflections into a proper and advantageons channel, without any danger of rendering them too elevated for the feminine duties of life. In a word, they ought to be confidered as defigned by Providence for ufe as well as how, and train. ed up, not only as women, but as rational creatures.

Sex of Bees. See Bee.
Sex of Plants. See Botany, p. 448.
SEXAGENARY, fomething relating to the number fixty: thus fexagenary or fexagefimal arithmetic is a method of computation proceeding by fixties; fuch is that ufed in the divifion of a degree into fixty minutes, of the minute into fixty feconds, of the fecond into fixty thirds, \&c. Alfo fexagenary tables are tables of proportional parts, fhowing the product of two fexagenaries that are to be multiplied, or the quotient of the two that are to be divided.
SEXAGESIMA, the fecond Sunday before Lent, or the next to Shrove-Sunday, fo called as being about the 6oth day before Eafter.

SEXAGESIMALS, or \(S_{\text {exagesimal Fracions, frac- }}\) tions whofe denominators proceed in a fexagecuple ratio ; that is, a prime, or the firft minute, \(=\frac{{ }_{\sigma}}{}{ }^{1}\); a fe -
 were no other than fexagefimals ufed in aftronomy ; and they are ftill retained in many cafes, though decimal arithmetic begins to grow in ufe now in aftronomical calculations. In thefe fractions, which fome call aftronomical fracions, the denominator being always 60 , or a multiple thereof, is ufually omitted, and the numerator only written down : thus, \(4^{\circ}, 59^{\prime}, 32^{\prime \prime}, 50^{\prime \prime \prime}, 16^{\prime \prime \prime}\), is to be read, 4 degrees, 59 minutes, 32 feconds, 50 thirds, 16 fourths, \&c.

SEXTANS, Sextant, a fixth part of certain things. The Romans having divided their as into 12 ounces or uncia, the fixth part of that, or two ounces, was the fextans.-Sextans was alfo a meafure which contained two ounces of liquor, or two cyathi.

Sextans, in aftronomy, a conftllation of the fouthern hemifphere, made by Hevelius out of unformed ftars. In Hevelius's catalogue it contains 1 I , but in the Britannic catalogue 41 ftars .

SEXTAN1', in mathematics, denotes the fixth part of a circle, or an arch comprehending 60 degrees.
'I'he word fextant is more particularly ufed for an aftronomical inftrument made like a quadrant, excepting that its limb only comprehends 60 degrees. The ufe and application of the fextant is the fame with that of the quadrant. See Quadrant; and Navigation, p. 737, \&c.

SEXIIILE, fextilis, the pofition or afpect of two planets when at 60 degrees diftance, or at the diftance of two figns from one another. It is marked thus (*). See Aspect.

SEXTIUS (Quintus), a Pythagorean philofopher, fourifhed in the time of Auguftus. He feemed formed to rife in the republic; but he fhrunk from civil honours, and declined accepting the rank of fenator when it was offered him by Julius Cæfar, that he might have Vol. XVII, Part I.

\section*{329 ]}

\section*{S E X}
time to apply to philofophy. It appears that he win. ed to eftablifh a fchool at Rome, and that his tenets, though chiefly drawn from the doctrines of Pythagoras, in fome particulars refembled thofe of the Stoics.

He foon found himfelf involved in many difficulties. His laws were tinctured with great feverity; and in an early period of his eftabliffment, he found his mind fo haraffed, and the harfhnefs of the doctrines which he wifhed to cttablifh fo repulfive to his feelings, that he had nearly worked himfelf up to fuch an height ot defperation as to refolve on putting a period to his exiftence.

Of the fchool of Sextius were Fabianus, Sotion, Flavianus, Craffitius, and Celfus. Of his works only a few fragments remain; and whether any of them formed a part of the work which Seneca admired fo much, cannot now be determined. Some of his maxims are valuable. He recommended an examination of the actions of the day to his fcholars when they retired to reft ; he taught, that the road to Heaven (ad aftra) was by frugality, temperance, and fortitude. He ufed to recommend holding a looking-glafs before perfons difordered with paffion. He enjoined his feholars to abftain from animal food.
SEXTON, a church-officer, thus called by corruption of the Latin facrifla, or Saxon fegerfone, which denotes the fame. His office is to take care of the veffels, veftments, \&c. belonging to the church; and to attend the minilter, church-warden, \&c. at church. He is ufually chofen by the parfon only. Sextons, as well as parilh-clerks, are regarded by the common law as perfons who have freehold in their offices; and, theretore, though they may be punifhed, yet they cannot be deprived, by ecclefiaftical cenfures.

The office of fexton in the pope's chapel is appropriated to the order of the hermits of St Auguftine. He is generally a bifhop, though fometimes the pope only gives a bifhopric, in partibus, to him on whom he confers the poft. He takes the title of Prefect of the Pope's Sacrifly, and has the keeping the veffels of gold and filver, the relics, \&c. When the pope fays mafs, the fexton always taftes the bread and wine firft. If it be in private he fays mafs, his holinefs, of two wafers, gives him one to eat; and, if in public, the cardinal, who affifts the pope in quality of deacon, of three wafers, gives him two to eat. When the pope is defperately fick, he adminifters to him the facrament of extreme unction, \&c. and enters the conclave in quality of firt conclavift.

The office of a fexton in Sweden is fomewhat fingular. During M. Outhicr's ftay at Stockholm in 1736 he vifited the church of St Clara, and during divine fervice he obferved a fexton going about with a long rod, waking thofe perfons who had fallen afleep.

SEXTUPLE, in mufic, denotes a mixed fort of triple, which is beaten in double time.

SEX'l'US Empiricus, a famous Pyrrhonian philofopher, lived in the fecond century, under the reign of Antoninus the Debonair. He was a phyfician of the fect of the Empirics, and is faid to have heen one of the preceptors of Antoninus the philofopher. There are ftill extant his Pyrrhonian Iuftitutions, and a large work againft the mathematicians, \&c. The beft edition of Sextus Empiricus is that of Fabricius in Greek and Latin, printed at Leipfic in 1718 , folio.

sexulife SEXUALISTR, among botanical writers, thofe II who have eftablifhed the claffes of plants upon the dif. ferences of the fexes and parts of fructification in plants, according to the modern inethod; as Linnreus, \&c.

SEZAWUL, a Hindoo word, ufed in Bengal to exprefs an officer employed at a monthly falary to colleet the revenues.
SFORZA (James), was the founder of the illuftrious honve of Sforza, which acted fo confpicuousa part in Italy during the 15 th and 16 th centuries, which gave fix dukes to Milan, and contracted alliances with almoft every fovereign in Europe. James Sforza was born on the 28th of May 3 3 6 , at Catignola, a fmall town in Italy, lying between Inola and Faënza. His father was a day-labourer, or, according to Commines, a fhoemaker. A company of foldiers happening one day to pafs through Catignola, he was feized with the defire of accompanying them to the wars. "I will go (faid he to himfelf), and dart my hatchet againft that tree, and if it flick fart in the wood, I will immediately become a foldier." The hatchet accordingly ftuck fait, and our adventurer erlifted; and becaufe, fays the Abbéde Choifi, he lad thrown the axe with all his force, he affumed the name of Sforza ; for his true name was Giacomuzzo, or James Attendulo. He rofe rapidly in the army, and foon became commander of 7000 men. He defended the caufe of Jane II. queen of Naples for many years, and was made conftable of her kingdom. He was created Count of Catignola by pope John XXII. by way of paying a debt of 14000 ducats which the chiurch of Rome owed him. His exploits became every day more illuffrious: he obliged Alphonfo king of Arragon to raife the fiege of Naples; and reduced feveral places that had revolted in Abruzzo and Le Labour; but while in purfuit of his enemies he was unfortunately drowned in the river Aterno on the 3d January 1424 , at the age of 54 years. His heroic qualities and the continual wars in which he was eugared, did not hinder lim from forming an attachment to the fair fex. In his youth he fell in love with a woman called Lucia Trezana, whom he married after fhe had born him feveral children. He married afterwards Antoinette Salembini, who brought him feveral excellent eftates; fhe bore him Bofio Sforza, compte of Santa-Flor, a warrior and governor of Orvietra for Pope Martin V. His third wife was Catharine Alopa, fifter of Rodolpho, grand chamberlain to the fovercign of Naples. His laft wife, for he was four times married, was Mary Marzana, daughter to the duke of Seffa. She bore him Charles Sforza, who was general of the order of Auguftines, and archbifhop of Milan.

Sforza (Francis), the fon of James Sforza by Lucia Trezana, was born in 1401, and trained up by his father to the profeflion of arms. At the age of 23 he defeated the troops of Braccio, who difputed with him the paffage of the Aterno. In this action his father was drowned, and Francis, though illegitimate, fucceeded him. He fought fuccersfully à gainft the Spaniards, and contributed a great deal both towards raifing the fiege of Naples, and to the vietory which was gained over the troops of Braccio near Aquila in 1425 , where that general was killed. After the death of queen Jane, in 1435, he efpoufed the interefts of the duke of Anjou, to whom fhe had left her crown, and by his courage and abilities ably fupported
that unfortunate prince. He made hinfelf mater of feveral places in Ancona, from which he was driven by pope Eugenius IV. who defeated and excommunicated him.; but he foon reefzblifhed his affairs by a victory. His reputation was now fo great, that the pope, the Venetians, and the Florentines, chofe him for their general againft the duke of Milan. Sforza had already conducted Venetian armies againt that prince, though be had efpoufed his daughter. 'The duke dying in . 1447 the inhabitants of Milan invited Sforza, his fon-in-law, to lead them againit that duke. But, after fome exertions in their favour, he turned his arms againft themfelves, laid fiege to Milan, and obliged them to receive lim as duke, notwithftanding the rights of Cliarles duke of Orleans, the fon of Valentine of Milan. In 1464, Louis XI. who hated Orleans, gave up to Sforza the rights which the crown of France had over Gcnoa, and even put into his hands Savona, a town belonging to that republic. The duke of Milan foon after made himfelf matter of Genoa. He died in 1466 , with the reputation of a man who was willing to fell his blood to the belt purchafer, and who was not too fcrupulous an obferver of his word. His fecond wife was Blanche Marie, natural daughter of Philip Marie duke of Milan. She bore him Galeas Marie, and Lisdovie Marie, dukes of Milan, Philip Marie count of Pavia, Sforza Marie duke of Bari, Afcagne Marie bifhop of Pavia and Cremona, and a cardinal. He was taken prifoner by the troops of Louis XII. and confined for fome time in the tower of Bourges. He was a cunning man, and deceived Cardinal d' Amboife when that prelate afpired at the papacy. His daughters were Hyppolita, married to Alphonfo of Arragon, afterwards king of Naples; and Elizabeth, married to Willian marquis of Montferrat. He had befides feveral natural children.

SHACK, in ancient cuftoms, a liberty of winterpafturage. In the counties of Norfolk and Suffolk, the lord of the manor has fhack, i, e. a liberty of feeding his fheep at pleafure in his tenants lands during the fix winter months. In Norfolk, fhack alfo extends to the common for hogs, in all men's grounds, from the end of harveft till feed-time. Whence to go \(a\)./back, is to feed at large.

SHACKLES, aboard a fhip, are thofe oblong iron rings, bigger at one end than at the other, with whicls the ports are fhut fatt, by thrinting the wooden bar of the port through them. There is alfo a fort of fhackles to lift the hatches up with, of a like figure, but fmaller. They are faftened at the corners of the hatches.

SHAD, in ichthyology, a fpecies of Clupea.
SHADDOCK, a fecies of Cifrus.
SHADOW, in optics, a privation or diminution of light by the interpofition of an opaque body : or it is a plane where the light is either altogether obfructed, or greatly weakened, by the interpofition of fome opaque body between it and the luminary.

Shadow, in painting, an imitation of a real fhadow, effected by gradually heightening and darkening the colours of fuch figures as by their difpofitions cannot receive any direct rays from the luminary that is fuppofed to enlighten the piece.

Shadow, in perfpective, the appearance of an opaque body, and a luminous one, whofe rays diverge (e. gr. a candle, lamp, \&c.), being given; to find the juft ap.
pearance

\section*{S:H A}

Pr 4 prapance of the fhadow, according to the laws of per ipective, The method is this. From the luminous body, which is here confidered as a point, let fall a perpendicular to the perfpective plane or table; i.e. find the appearance of a point upon which a perpendicular, drawn from the middle of the luminary, falls on the perfpective plane; and from the feveral angles, or raifed points of the body, let fall perpendiculars to the plane. Thefe points, whereon the perpendiculars fall, connect by right linee, with the point upon which the perpen dicular let fall from the luminary falls; and continue the lines to the fide oppofite to the luminary. Laftly, through the raifed points draw lines through the centre of the luminary, interfecting the former ; the points of interfection are the terms or bounds of the fhadow.

SHADWELL (Thomas), defcended of an ancient family in Staffordfhire, was born in 1640, and educated at Caius college, Cambridge. He then was placed in the Middle Temple to ftudy the laws; where having fpent fome time, he travelled abroad, Upon his return home, he became acquainted with the moft celebrated perfons of wit in that age. He applied himfelf chiefly to dramatic writing, in which he had great fuccefs; and upon the Revolution was made poet-laureat and hiftoriographer to king William and queen Mary, in the room of MrDryden. Thefe employments he enjoyed till his death, which happened in 1692 . Befide his dramatic writings, he compofed feveral other pieces of poetry; the chicf of which are his congratulatory poem on the prince of Orange's coming to England ; another on queen Mary; his tranflation of Juvenal's roth fatire, pre. Mr Dryden treats him with great contempt, in his fatire called Mac-Fleckno, The beft judges of that age, however, gave their teftimony in favour of his co. medies; which have in them fine ftrokes of humour ; the characters are often original, Itrongly marked, and well fuftained. An edition of his works, with fome eccount of his life and writings prefixed, was publifhed in 1720, in 4 vols 8 yo,

SHAFT of a COLYMN, in building, is the body thereof between the bafe and capital; fo called from its fraightnefs, Sce Architecture.

Shaft, in mining, is the pit or hollow entrance into the mine. In the tin-mines, after this is funk about a fathom, they leave a little, long, fquare place, which is called a Jomble.

Shafts are funk fome ten, fome twenty fathoms deep into the earth, more or lefs. Of thefe thafts, there is the landing or working fhaft, where they bring up the work or ore to the furface; but if it be worked by a Horfe engine or whim, it is called a whim-/paft ; and where the water is drawn out of the mine, it is indif. ferently named an engine-jbaft, or the rod.jbaft. See Mine.

Shaft, in ornithology, See Trochilus.
SHAFTESBURY, a town of Dorfethire in Eng. land, in W. Long. 2. 20. N. Lat. 51. O. It ftands on ? bigh hill, and is buils in the form of a bow. It en. joys a ferene wholefome air, and has a fine profpect. It is a good thoroughfare, is governed by a mayor, and fends two members to parliament. This town is fup. pofed to have been built in the 8 th century, and to have been enlarged by king Alfred, and had 12 churches, befider a Benedictine monaftery, in the time of the Saxons, but has now only three. St Edward the martyr was
buried here. It had three mints before the conqueft, Shaitefbury and, in the reign of Henry VIII. was the fee of a fufo fragan bihop. It was incorporated by queen Elizabeth and Charles II. and is governed by a mayor, recorder, twelve aldermen, bailifs, and a common-council. It contains about 320 houfes, many of thich are of free-ftone. Water is fo fearce, that it ufed to be fupplied from Motcomb; but it was obtained more commodioully in 1718, by means of engines, whicla raifed the water above 300 feet perpendicnlar, and conveyed it to a large ciftern in the middle of the town, from the difance of two miles. Yet even this is laid afide, and they have dug feveral pits, in which they preferve the rain-water; and the poor get their living to this day by fetching it in pails or on horfes. It gives the title of earl to the noble family of Cooper.

Shaftesbury (earl of). See Cooper.
SHAG, in ornithology. See Pelicanus.
SHAGREEN, or Chagreen, in commerce, a kind of grained leather prepared of the fkin of a fpecies of SQualus, much ufed in covering cafes, books, \&c.

Manner of preparing Shagrein. The fkin, being flayed off, is ftretched out, covered over with muftardfeed, and the feed bruifed on it ; and thus it is expofed to the weather for fome days, and then tanned.

The beft is that brought from Conftantinople, of a brownifh colour; the white is the wort. It is extremely hard; yet, when fteeped in water, it becomes very foft and pliable; whence it is of great ufe among cafe-makers. It takes any colour that is given it, red, green, yellow, or black. It is frequently counterfeited by morocco, formed like fhagreen ; but this laft is diftinguithed by its peeling off, which the firt does not.

SHAIK properly fignifies an old man. In the eaft it is ufed to denote a lord or chief, a man of eminence and property. See Schiechs.

Sifake, in finging. S'ee Trilz.
SHAKESPEARE or Shakspeare (William), the prince of dramatic writers, was born at Stratford upon Avon in Warwickfhire, on the 23 d of April 1564. From the regifter of that town, it appears that a plague brake out there on the 30 th of June following, which raged with great violence ; but fortunately it did not reach the houfe in which this infant prodigy Lay. His father, John Shakefpeare, enjoyed a fmall patrimonial eftate, and was a confiderable dealer in wool ; bis mother was the daughter and heir of Robert: Arden of Wellingcote. Our illuttrious poet being defigned for the bulinefs of his father, received no better education than the inftructions which the free-fchool of Stratford could afford. After applying fome time to the ftudy of Latin, he was called home to affift his father, who feems by fome accident to have been reduced in his circumftances. Before arriving at the age of 19, he married the daughter of Mr Hathaway, a fubftantial yeoman in the neighbourhood of Stratford. This lady was eight years older than her hufband. Having the misfortune to fall into bad company, he was feduced into fome profligate actions, which drew on him a criminal profecution, and at length forced him to take refnge in the capital, In concert with his affociates, he broke into a park belonging to Sir Thomas Lucy of Charlecote, and carried off fome of his deer. Every admirer of Shakefpcare will regrat that fuch a blemin should have ftained his character:

T12
hut \({ }_{3}\)

\section*{S H A [ 332 ] S H A}

Stakefpeare.
but, perhaps, if any thing can extenuate his guilt, we might alcribe it to the opinions of the age, which, perhaps, as was formerly the cafe in Scotland, might not diftinguifh the killing of deer by any mark of difgrace, or any charge of ciminality. One thing at leaft is certain, that whakefpeare himfelf thonght that the profecution which Sir 'lhomas raifed againt him was carritd on with too great feverity; an opinion which he could not have entertained had this action been at that time viewed in the fame criminal light as it is at pre fent. Shakefpeare teftified his refentment againft Sir Thomas, by writing a fatirical ballad, which exafperased him fo much, that the procefo was carried on with redoubled violence; and the young poct, in order to avoid the punifhment of the law, was obliged to make his efcape. This ballad would be confidered as a curicus relict, on account of its being the firlt production of Shakefpeare; it would alfo be interelting to perufe a poem which could irritate the baronet to fo high a degree. 'Tradition has prefersed the firlt flanza:

> A parliamente member, a juftice of peace,
> At lome a poor fcarc-crow, at London an affe
> If lowfie is Lucy, as fome volke mifcalle it,
> Then Lucy is lowfie whatever befall it :
> He thinks himfelf greate,
> Yet an affe in his flate,
> We allowe by his ears, but with affes to mate. If Lucy is lowfie, as fome volke mifcalle it, Sing lowfie Lucy whatever befall it.

If the reft of the ballad was of a piece with this flanza, it might affift uss to form fome opinion of the irritability of the baronet, but will enable us to form no idca of the opening genius of Shakefpeare.

Thus expelled from his native village, he repaired to London, where he was glad to accept a fubordinate office in the theatre. It has been faid that he was firft engaged, while the play was acting, in holding the horfes of thofe who rode to the theatre; but this ftory refts on a flender foundation. As his name is found printed among thofe of the other playcrs before fome old plays, it is probable that he was fome time employed as an actor; but we are not informed what characters he played; we are only told, that the pait which he acied beft was that of the Ghoft in Hamlet ; and that he appeared in the character of Adam in As you like it. If the names of the actors prefixed to Ben Jonfon's play of Every Man in his Humour were arranged in the fame order as the perfons reprefented, which is very probable, Shakefpeare played the part of Old Knowell. We have reafon therefore to fuppofe, as far as we can argue from thefe few facts, that he generally reprefented old men. See Malone's Chronology, in his edition of Shakefpeare.

Bet though he was not qualified to fhine as an actor, he was now in the fituation which could moft effectually roufe thofe latent fparks of genius which afterwards burft forth with fo refplendent a flame. Being well acquainted with the mechanical bufiness of the theatre and the tafte of the times ; poffeffed of a knowledge of the characters of men refembling intuition, an imagination that ranged at large through nature, felecting the grand, the fublime, and the beautiful ; a judicious caution, that difpofed him to prefer thofe plots which had already been found to pleale; an uncommon
fluency and force of expreffion; he was qualified at once to eclipfe all who had gone before him.

Notwithftanding the unrivalled genius of Shakefpeare, moft of his plots were the invention of others; which, however, he certainly much improved, if he did not entirely new-model. We are affured, that prior to the theatrical compofitions of Shakefpeare, dramatic pieces werc written on the following fubjects, viz. King John, King Richard II. and III. King IIenry IV. and V. King Henry VIII. King Lear, Antony and Cleopatra, Meafure for Meafure, the Merchant of Venice, the Taining of a Shrew, and the Comedy of Errors.

Among his patrons, the earl of Southampton is particularly lonoured by him, in the dedication of two poems, Venus and Adonis, and Lucrece; in the latter efpecially, he expreffed himfelf in fuch terms as gives countenance to what is related of that patron's dittinguifhed generofity to him. In the beginning of king James I.'s reign (if not fooner) he was one of the principal managers of the playhoufe, and continued in it feveral years afterwards; till, laving ac. quired fuch a fortune as fatisfied his moderate wifhes and vicws in life, he quitted the ftage, and all other bufinefs, and paffed the remainder of his time in an honourable eafe, at his native town of Stratford, where he lived in a handfome houfe of his own purchafing, to which he gave the name of New Place; and he had the good fortune to fave it from the flames in the dreadful fire that confumed the greateft part of the town in \(16{ }^{1} 4\).

In the beginning of the year 1616, he made his will, wherein he teftified his refpect to his quondam partners in the theatre : he appointed his youngen daughter, jointly with her hufband, his executors, and bequeathed to them the beft part of his eftatc, which they came into the puffeffion of not long after. He died on the 23 d of April following, being the 53 d year of his age; and was interred among his anceftors on the north fide of the chancel, in the great church of Stratford, where there is a handfome monument erected for him, infcribed with the fullowing elcgiac diftich ins Latin:

> Judicio Pylium, genio Socratem, arte. Maronem,
> Terra tegit, Populus maret, Olympus babet.

In the year 1740, another very noble one was raifed to his memory, at the public expence, in Weftminfter-abbey; an ample contribution for this purpofe being made upon exhibiting his trayedy of Julius CæFar, at the theatre-royal in Drury-Lane, April 28th 1738.

Nor mult we omit mentioning another teftimony of the veneration paid to his manes by the public in general, which is, that a mulberry-tree planted upon his eftate by the hands of this reverend bard, was cut down not many years afoo; and the word being converted to feveral domeltic ufes, was all eagerly bouzht at a high price, and each fingle piece treafured up by its purchafer as a precious memorial of the planter.

The character of Shakefpeare as a dramatic write: has been often drawn, but perhaps never with more accuracy than by the pen of Dr Johnfon: "Shakefpeare (fays he) is above all writers, at leat above all moderis writers, the poet of nature; the poet that holds up to his readers a faithful mirror of manmers and of life.

\section*{S H A [ 333 ] S H A}

His characters are not modified by the cuftoms of particular places, unpractifed by the reft of the world; by the peculiarities of ftudies or profeffions, which cant operate but upon fmall numbers; or by the accidents of tranfient fafhions or temporary opirions: they are the genuine prozeny of common humanity, fuch as the wolld will always fupply, and obfervation will always find. His perfons act and fpeak by the influence of thofe general paffions and principles by which all minds are agitated, and the whole fyftem of life is continned in motion. In the writings of other poets, a character is too often an individual; in thofe of Shakefpeare, it is commotily a fpecies.
"It is from this wide extenfion of defign that fo: much inftruction is derived. It is this which fills the plays of Shakefpeare with practical axioms and domeftic wifdom. It was faid of Enripides, that every verfe was a precept ; and it may be faid of Shakefpeare, that from fhis works may be collected a fyttem of civil and economical prudence. Yet his real power is not fhown in the fplendor of paiticular paffages, but by the progrefs of his fable, and the tenor of his dialogue; and he that tries to recommend him by felect quotations, will fucceed like the pedant in Hierocles, who, when he offered his houfe to fale, carried a brick in his pocket as a fecimen.
" Upon every other ftage the univerfal agent is love, by whofe power all good and evil is diftributed, and every action quickened or retarded. But love is only one of many paffions; and as it has no great influence upon the fum of life, it has little operation in the dramas of a poet who caught his ideas from the living world, and exhibited only what he faw before him. He knew that any other paffion, as it was regular or exorbitant, was a caufe of happinefs or calamity.
"Characters thus ample and general were not eafily difcriminated and peferved; yet perhaps no poet ever kept his perfonages more dittinct from each other.
"Other dramatifts can only gaiu attention by hyperbolical or aggravated characters, by fabulous and unexampled excellence or depravity, as the writers of barbarous romances invigorated the reader by a giant and à dwarf; and he that flould form his expectations of human affairs from the play, or from the tale, would be equally deceived. Shakefpeare has no heroes, his fienes are occupied only by men, who act and fpeak as the reader thinks that he fhould himfelf have fpoken or acted on the fame occafion: Even where the agency is frpernatural, the dialogue is level with life. Other writers difguife the moft natural paffions and moft frequent incidents; fo that he who contemplates them in the book will not know them in the world: Shakefpeare approximates the remote, and familiarizes the wonderful; the cvent which he reprefents will not happen, but if it were poffible, its effects would probably be fuch as lie las affigned; and it may be faid, that he has net only fhown humau nature as it acts in real exigencies, but as it would.be found in trials to which it caniot be expofed.
" This therefore is the praife of Shakefpeare, that his drama is the mirror of life; that he who has mazed his imagination, in fullowing the phantoms which other writess raife up before him, may here be cured of his delirious ectafies, by reading human fentiments in human language ; by fencs from which a hermit may efti.
mate the tranfactions of the world, and a confeffor predict the progrefs of the paffions."

The learning of Shakefpeare has frequently been a fubject of inquiry. That he poffeffed much claffical knowledge does not appear, yet he was certainly acquainted with the Latin poets, particularly with Te rence, as Colman has jufly remarked, which appears from his ufing the word thrafonical. Nor was he unacquainted with French and Italian. We are indeed told, that the paffages in which thefe languages occur might be impertinent additions of the players; but is it probable, that any of the players fo far furpaffed Shakefpeare ?

That much knowlec'ge is feattered over his works is very juftly obferved by Pope; but it is often fuch knowledge as books did not fupply. "There is, how. ever, proof enough (fays Dr Johnfon) that he was a very diligent reader; nor was our language then fo indigent of books, but that he might.very liberally indulge his curiofity without excurfion into foreign literature. Many of the Roman authors were tranflated, and fome of the Greek; the Reformation had filled the kingdom with theological learning; moft of the topics of human difquifition had found Englifh writers; and poetry had been cultivated, not only with diligence, but fuccefs. This was a ftock of knowledge fufficient for a mind fo capable of appropriating and improving it."

The works of Shakefpeare confift of 35 dramatic pieces. The following is the chronological order which Mr Malone has endeavoured to eftablifh, after a minute inveftigation, in which he has in general been fuccefs. ful :
\begin{tabular}{|c|c|c|}

Shake frears
33. Ofhello
34. The 'Tempeft
35. Twelfth Night

The three firt of thefe, Mr Malone thinks, there is very ftrong reafon to believe are not the original productiens of Shakefpeare ; but that he probably altered them, and added fome new fcenes,
In the firt folio edition in 1623 , thefe plays were entitled " Mr William Shakefpeare's Comedies, Hiftories, and Tragedies." They have been publifhed by various editors. The firlt folio edition by Ifaac Jaggard and F.dward Blount; the fccond, folio, 1632 , by Thomas Cotes for Robert Allot ; the third, 1664 , for P. C.; the fourth, 1685 , for H. Herringman, E. Brewfter, and R. Bentley. Rowe publifhed an 8 vo edition in 1709, in 7 vols , and a 12 mo edition in 1714 , in Pvols; for which he received L. 36 , 10 s . Pope publifhed a 4 to edition in 1725, in 6 vols, and a 12 mo in 1728 , in 10 vols; for which he was paid L. \(21 \%\), 128 . Theobald gave a new edition in 8 vo in 1733 , in 7 vols, another in 12 mo in 1740 , in 8 vols ; and received for his labour L. 652, 108. Sir Thomas Hanmer publifhed an edition in 1744, in 6 vols 4 to, Dr Warburton's 8 vo edition came out in 1747, in 8 vols; for which he was paid L. 560 . The editions publifhed fince that time, are Dr Johnfon's in 1765 , in 8 pols 8 vo . Stevens's in 1766 , in 4 vols 8 va . Ca pell's in 1768 , in 10 vols, crown 8 vo; for this the au* thor was paid L. 300 . A. fecond edition of Hanmer's in 177r, 6 vols. Johnfon's and Stevens's in 1773, in xo vols \(8 v o\); a fecond edition in 1778 ; a third by Reed in 1785 ; and Malone's crown \(\$\) vo edition in 1989 , in Io vols.

The moft authentic of the old editions is that of 1623. "At lazt (fays Dr Johnfon) an edition was undertaken by Rowe; not becaufe a poet was to be publifhed by a poet, for Rowe feems to have thought very little on correction or explanation, but that our author's works might appear like thofe of his fraternity, with the appendages of a life and recommendatory preface. Rowe has been clamoroufly blamed for not performing what he did not undertake, and it is time that juftice be done him, by confeffing, that though he feems to have had no thought of corruption beyond the printer's errors, yet he has made many emendations, if they were not made before, which his fuccefiors have received without acknowledgment, and which, if they had produced them, would have filled pages with cenfures of the flupidity by which the faults were como mitted, with difplays of the abfurdities which they in. yolved, with oftentatious expofitions of the new reading, and felf-congratulations on the happinefs of difcovering it."

The nation had been for many years content enough with Mr Rowe's performance, when Mr Pope made dhem acquainted with the true flate of Shakefpeare's *ext, fhowed that it was extremely corrupt, and gave reafon to hope that there were means of reforming it. Mr Pope's edition, however, he obferves, fell below his own expectations; and he was fo much offended, when be was found to have left any thing for others to do, that he paffed the latter part of his life in a tate of hoftility with verbal criticifm.

The only talk, ia the opinion of Mr Malone, for which Poge was eminently and indifputably qualified,
was to mark the faults and beautles of his author, \(=\) When he undertook the office of a commentatar, every anomaly of language, and every expreffion that was cur, rentiy in ufe, were confidered as errors or corruptions, and the text was altered or amended, as it was called, at pleafure. Pope is openly charged with being one of the great corrupters of Shakefpeare's text.

Pope was fucceeded by Theobald, who collated the ancient copies, and rectified many errors. He was, however, a man of narrow comprehenfion and of little learning, and what is worfe, in his reports of copies and editions, he is not to be trufted without examination, From the liberties taken by Pope, the edition of Theo. bald was juflly preferred, becaufe he profeffed to adhere to the ancient copies more ftrictly, and illuftrated a few paffages by extracts from the writers of our poet's age. Still, however, he was a confiderable innovator; and while a few arbitrary changes made by Pope were des tedied, innumerable §ophiftications were filently adopto ed.

Sir Thomas Hanmer, who comes next, was a man of critical abilities, and of extenfive learning. His correco tions are commonly juft, but fometimes capricious. He is cenfurable, too, for receiving without examination al. mot all the innovations of Pope.

The original and predominant error of Warburton'o cominentary, is acquiefcence in his firtt thoughts ; that precipitation which is produced by confcioufnefz of quick difcernment ; and that confidence which prefumes to do, by furveying the furface, what labour only can perform, by penetrating to the bottom, His notes exhibit fometimes perverfe interpretations, and fome. times improbable conjectures; he at one time gives the author more profundity of meaning than the fentence admite, and at another difcovers abfurdities where the fenfe is plain to every other reader. But his emendav tions are likewife often happy and juft; and his intero pretation of obfcure paffages learned and fagacious.

It has indeed been faid by his defenders, that his greas object was to difplay his own learning; and certainly, in fpite of the clamour raifed againft hin for fubflituting his own chimerical conceits inftead of the genwine text of Shakefpeare, his work increafed his reputation, But as it is of little value as a commentary on Shake fpeare, fince Warburton is now gone, his work will pros bably foon fink into oblivion,
In 1765 Dr Johnfon's edition, which had long becn impatiently expected, was given to the public. His vi. gorous and comprehenfive underflanding threw mare light on his author than all his predeceffors had done. The character which he gave of each play is generally juft. His refutation of the falle gloffes of Theobald and Warburton, and his numerous explications of involved and difficult paffages, entitle him to the gratitude of every admirer of Shakefpeare.
The laft editor is Mr Malone, who was eight years employed in preparing his edition, By collating the moft authentic copies, he has been careful to purify the text. He has been fo induftrious, in order to difcover the meaning of the author, that he has ranfacked many volumes, and trufts that, belides his additional illuftrau rions, not a fingle yaluable explication of any obscure paflage in thefe plays has ever appeared, which he has not inferted in his edition. He reject日 Titus Andranicubs as well as the three plays formerly mentioned, as

\section*{SH H \(\left[\begin{array}{lll}335 & \mathrm{~S} & \mathrm{SHA}\end{array}\right.\)}
not being the authentic productions of Shakefpeare. To the whole he has added an appendix, and a copious gloffary.-Of this work a lefs expenfive edition has been publithed in 7 vols \(\pm 2 \mathrm{mo}\), in which the general introductory obfervations prefixed to the different plays are preferved, and the numerous notes abridged.

This judicious commentator has certainly done more for the elucidation and correction of Shakefpeare than all who came before him, and has followed with indefatigable patience the only road which a commentator of Shakefpeare ought to obfcrve.

Within 50 years after our poet's death, Dryden fays that he was become " a little obfolete;" and in the beginning of the prefent century Lord Shafterbury complains of his rude unpolifhed ftyle, and his antiquated plirafe and wit. Thefe complaints were owing to the great revolution which the Englifh language has undergone, and to the want of an enlightened commentator. Thefe complaints are now removed, for an enlightened commentator has been found in Mr Malone.

We have only fartheir to add, that in the year 1790 a copious index to the remarkable paffages and words in the plays of Shakefpeare was publifhed by the Reverend Mr Ayfcough ; a gentleman to whom the literary world is mach indebted for feveral very valuable keys of knowledge. In fine, the admirers of Shakefpeare are now, by the labours of feveral eminent men, furnifhed with every help that can enable them to underftand the fenfe and to tafte the beauties of this illuftrious poet.

SHAKLES. See Shackles.
SHALE, in natural hiftory, a fpecies of Schistus. It is a black flaty fubiftance, or a clay hardened into a ftony confiftence, and fo much impregnated with bitumen that it becomes fomewhat like a coal. The acid emitted from fhalc, during its calcination, uniting itfelf to the argillaceous earth of the fhale, forms alum. About 120 tons of calcined firle will make one ton of alum. The thale, after being calcined, is fteeped in water, by which means the alum, which is formed during the calcination of the fhale, is diffolved: this diffolved alum undergoes various operations before it is formed into the alum of the Chops. Watfon's Chemical Effays, vol. ii. p. 3 15. See \(A_{\text {eum. }}\)
This kind of flate forms large ftrata in Derbyfhire; and that which lies near the furface of the earth is of a fofter and more fhivery texture than that which lies eleeper. It is allo found in large ftrata, generally above the coal, in moft coal counties of this kingdon. Dr Slort informs us, that the fhale waftes the lead ore near it, by its ftrong acid; and that it corrodes and deftroys all minerals near it except iron or coal, of whofe vitriol it bartakes.

SHALLOP, Shalloop, or Sloor, is a fmall light veffel, with only a fmall main-maft, and fore-maft, and lug-fails, to hale up, and let down, on occafion.Shallops are commonly good failers, and are therefore often ufed as tenders upon men of war.

SHALLo'T, or Eschalot. See Allium.
SHAMANS are wizards or conjurers, in high repute among feveral idolatrous nations inhabiting different parts of Ruffia. By their enchantments they pretend to cure difeafes, to divert misfortunes, and to foretel futerity. They are great obfervers of dreams, by the interpretation of which they judge of their good
or bad fortune. They pretend likewife to chiromaney, shamhlea, and to foretel a man's good or ill fuccefs by the lines of Sbamois, his hand. By thefe and fuch like means they have a very great afcendency over the undertandings, and a great influence on the conduct, of thofe people.

SHAMBLES, among miners, a fort of niches or landing places, left at fuch diftances in the adits of the mines, that the Chovel-men may conveniently throw up the ore from fhamble to fhamble, till it comes to the top of the mine.

SHAMOIS, Chamois, or Shammy, a kind of leather, either dreffed in oil or tanned, much efteemed for its foftnefs, pliancy, \&c. It is prepared from the fkin of the chamois, or fhamois, a kind of rupicapra, or wild goat, called alio ifard, inhabiting the mountains of Dauphiny, Savoy, Piedmont, and the Pyrenees. Befides the foftuefs and warmth of the leather, it has the faculty of bearing foap without damage ; which renders it very ufeful on many accounts,

In France, \&c. fome wear the fkin raw, without any preparation. Shammy leather is ufed for the purifying of mercury, which is done by pafing it through the pores of this flkin, which are very clofe. The true chamois leather is counterfeited with common roat, kid, and even with fheep fkins, the practice of which makes a particular profeffion, called by the French chamoifure. The laft, though the leaft efteemed, is yet fo popular, and fuch valt quantities of it are prepared, efpecially about Orleans, Marfeilles, and 'L'holoufe, that it may not be amifs to give the method of preparation.

Manner of Jloanoifing, or of preparing Joeep, goat, or kid fkins in oil, in imitation of Shammy. - The flins, being wafhed, drained, and fmeared over with quicklime on the flefhy fide, are folded in two lensthwife, the wool outwards, and laid on heaps, and fo left to ferment eight days, or, if they had been left to dry after flaying, then fifteen days.

Then they are wafhed out, drained, and half dricd; laid on a wooden leg, or horfe, the wool ftripped off with a round ftaff for that purpofe, and laid in a weak pit, the lime whereof had been ufed before, and has loft the greateft part of its force.

After 24 hours they are taken out, and left to drain 24 more; they are then 'put in another ftionger pit. 'This done, they are taken out, drained, and put in again, by turns; which begins to difpofe them to take oil; and this practice they continue for fix weeks in fummer, or three months in winter : at the end whereof they are wathed out, laid on the wooden leg, and the furface of the flkin on the wool fide peeled off, to render them the fofter ; then made into parcels, fteeped a night in the river, in winter more, ftretched fix or feven over one another on the wooden leg, and the knife paffed ftrongly on the flefh fide, to take off any thing fuperfluous, and reader the fikin fmooth. Then they are fteeped, as before, in the river, and the fane operation is repeated on the wool fide ; they are then thrown into a tub of water, with bran in it, which is brewed among the fkins till the greateft part fticks to them, and then feparated into diftinct tubs, till they fwell, and rife of themfelves above the water. By this means the remains of the lime are cleared out; they are then wrung out, hung up to dry on ropes, and fent to the mill, with the quantity of oil neceffary to fcour them : the beft oil is that of flock-fifh. Here they are firft thrown in bundles

\section*{S H A \(\quad[336] \quad \mathrm{S}\) H A}
bundles into the river for 12 hours, then laid in the mill-troush, and fulled without oil till they be well foftened ; then oiled with the hand, one by one, and thus formed into parcels of four fkins each; which are milled and dried on cords a fecond time; then a third ; and then oiled again, and dried. 'This procefs is repeated as often as neceffity requires; when done, if there be any moiture remaining, they are dried in a fove, and made up into parceis wrapped up in wool ; after fome time they are opened to the air, but wrapped up again as before, till fuch time as the oil feems to have loft all its force, which it ordinarily does in 24 hours. The fkins are then returned from the mill to the chamoifer to be fcoured : which is done by putting them in a lixivium of wood-afhes, working and beating them in it with poles, and leaving them to fteep till the ley hath had its effect; then they are wrung out, fteeped in another lixivium, wrung again; and this is repeated till all the greafe and oil be purged out. When this is done, they are half dried, and paffed over a fharp.edged iron inftrument, placed perpendicular in a block, which opens, feftens, and makes them gentle. Laftly, they are thoroughly dries, and paffed over the fame inftrument again; which finifhes the preparation, and leaves them in form of fhammy.

Kid and goat.fkins are fhamoifed in the fame manner as thofe of 'fheep, excepting that the hair is taken off without the ufe of any lime; and that when brought from the mill they undergo a particular preparation called ramalling, the moft delicate and difficult of all the others. It confifts in this, that, as foon as brought from the mill, they are fteeped in a fit lixivium, taken out, ftretched on a round wooden leg, and the hair is fcraped off with the knife; this makes them fmooth, and in working to calt a kind of fine knap. The difficulty is in fcraping them evenly.

SHANK, or \(S_{H A N K}-P a i n t e r\), in a fhip, is a fhort chain faftened under the foremaft-fhroucs, by a bolt, to the fhip's fides, having at the other end a rope faftened to it. On this Mank painter the whole weight of the aft part of the anchor refts, when it lies by the fhip's fide. The rope, by which it is hauled up, is made faft about a timber-head.

SHANK, in the manege, that part of a horfe's fore leg which lies between the knee and the fetlock.

SHANKER, or ChANCRE, in medicine, a malig. nant ulcer, ufually occafioned by fome venereal diforder. \(\therefore\) See Medicine, \(\mathrm{n}^{\text {e }} 350\).

SHANNON, the largeft river in Ireland, and one - of the fireft in the Britifh dominions, not only on account of its rolling 200 miles, but alfo of its great depth in molt places, and the gentlenefs of its current, by which it might be made exceedingly ferviceable to the improvement of the country, the communication of its inkabitants, and confequently the promoting of inland trade, through the greateft part of its long courle. But the peculiar prerogative of the Shannon is its fituation, running from vorth to fouth, and feparating the province of Connaught from Leinfter and Munter, and of confequence dividing the greateft part of Ireland into what lies on the call and that on the welt of the river; watering in its paffage the valuable county of Leitrim, the plentiful fhire of Rofommon, the fruitful county of Galway, and the pleafant county of Clare; the frall but fine fhire of Longford, the King's coun.
ty, and fertile county of Meath in Leinfter, the populous county of 'I'ipperary, the fpacions fhire of Limerick, and the rough but pleafant county of 'Kerry in Munfter ; vifiting ro counties in its paffage, and having on its banks the following remarkable places, viz. Leitrim, Jameftown, Laneforough, Athlone, Clonfert, Killaloe, and Limerick; at 20 leagues below the latter it fpreads gradually feveral miles in extent, fo that fome have confidered its expanfion as a lake. It at laft joins its waters to the fea, being navigable all that way for the largelt veffels.

SHANSCRI'T, the languace of the Bramins of Hindoftan. See Philology, fect. v.
SHARE of a PLOUGH, that part which cuts the ground ; the extremity forwards being covered with a tharp-pointed iron, called the point of the fhare, and the end of the wood behind the tail of the fare.

SHARK, in ichthyology. See Suualus.
SHARON, a name common to three cantons of Pa leftine. The firft lay between mount l'abor and the fea of Tiberias ; the fecond between the city of Crfarea of Paleftine, and Joppa; and the third lay beyond Jordan. To give an idea of perfect beauty, Ifaiah faid, the glory of Lebanon and the beauty of Carmel mura be joined to the abundance of Sharon. (Ifaiah xxxiii. 9. xxxi. 2.) The plains of Sharon are of valt extent; and, when furveyed by the Abbé Mariti a few years ago, they were fown with cucumbers; and he informs us, that fuch a number is annually produced, as not only to fupply the whole neighbourhood, but alfo all the coafts of Cyprus and the city of Damietta. In the middle of the plain, between Arfus and Lydda, rifes a fmall mountain, upon the ridge of which there is a fmall village called Sharou, from the name of the ancient city whofe king was conquered by Jofhua.

SHARP (James), archbithop of St Andrew's, was born of a good family in Banffhire in 1618. He devoted himfelf very early to the church, and was educa. ted for that purpofe in the Univerfity of Aberdeen. When the folemn league and covenant was framed in 1638 , the learned men in that feminary, and young Sharp in particular, declared themfelves decidedly againft it. To avoid the infults and indignities to which he was fubjected in confequence of this conduct, he retired to England, where he contracted an acquaintance with Tome of the moft celebrated divines in that country.

At the commencement of the civil wars he returned to Scotland. During his journey thither, he accidentally met with I.ord Oxenford, who was fo charmed with his converfation, that he invited him to his houfe. While he refided with that nobleman, he became known to the earl of Rothes, who procured him a profefforfhip at St Andrew's. By the intereft of the earl of Crawford he was foon after appointed minifter of Crail; where he conducted himfelt, it is faid, in an exemplary manner.

Sharp had always inclined to the caufe of royalty, and had for. fome time kept up a correfpondence, with his exiled prince. After the death of the protector he began to declare himfelf more openly, and feems to have enjoyed a great thare of the confidence of Monk, who was at that time planning the reftoration of Charles II. When that general marched to 'London, the prefbyterians fent Sharp to attend him in order to fupport their interefts. At the requeft of general Monk and the chief prefbyterians in Scotland, Mr Sharp was foon afo

\section*{S H A [ 337 J S H A}
ter fent over to the king at Breda to procure from him, if poffible, the eftablifhment of prefbyterianifm. On his return, he affured his friends that "he had found the king very affectionate to Scotland, and refolved not to wrong the fettled government of the church: but he apprehended thcy were miftaken who went about to eftablifh the prefbyterian government."

Charles was foon after reftored without any terms. All the laws paffed in Scotland fince the year 163.3 were repealed; the king and his minifters refolved at all hazards to reftore prelacy. Mr Sharp, who had been commiffioned by the Scotch prefbyterians to manage their interefts with the king, was prevailed upon to abandon the party; and, as a reward for his compliance, he was made archbifhop of St Andrew's. This conduct rendered him very odious in Scotland; he was accufed of treachery and perfidy, and reproached by his old friends as a traitor and a renegado. The abfurd and wanton cruelties which were afterwards committed, and which were imputed in a great meafure to the archbifhop, rendered him ftill more detefted. Nor is it probable that thefe accufations were without foundation : the very circumftance of his having been formerly of the prefbyterian party would induce him, after forfaking them, to treat them with feverity. Befides, it is certain, that when after the rout at Pentland-hills he received an order from the king to ftop the executions, he kept it for fome time before he produced it to council.

There was one Mitchell a preacher, and a defperate fanatic, who had formed the defign of taking vengeance for thefe cruelties by affaffinating the archbifhop. He frred a pifol at him as he was fitting in his coach; but the bilhop of Orkney, lifting up his hand at the moment, intercepted the ball. Though this happened in the midft of Edinburgh, the primate was fo much detcited, that nobody ftopped the affafin ; who, having walked leifurcly home, and thrown off his difguife, returned, and mixed unfufpected with the crowd. Somc years after, the archbifhop obferving a man eyeing him with keennefs, fufpected that he was the affaffin, and ordered him to be brought bcfore him. It was Mitchell. Two loaded piftols were found in his pocket. The primate offered him a pardon if he would confefs the crime: the man complied ; but Sharp, regardlefs of his promife, conducted him to the council. The council alfo gave him a folemn promife of pardon if he would confefs his guilt, and difcover his accomplices. They were much difappointed to hear that only one man was privy to his purpofe, who was fince dead. Mitchell was then brouglit before a court of juftice, and ordered to make a third confeffion, which he refufed. He was imprifoned for feveral years, and then tried. His own confeffion was urged againft him. It was in vain for him to plead the illegality of that evidence, and to appeal to the promife Vol. XVII. Part I.
of pardon previoufly given. The council took an oath that they had given no fuch promife; and Mitchell was condemned. Lauderdale, who at that time governed Scotland, would have pardoned him, but the primate infifted on his execution; obferving, that if affaffins were permitted to go unpunifhed, his life muft be centinually in danger. Mitchell was accordingly cxecuted.

Sharp had a fervant, one Carmichael, who by his cruelty had rendered himfelf particularly odions to the \(z\) ealots. Nine men formed the refolution of waylaying him in Magus-muir, about threc miles from St A ndrew's. While they were waiting for this man, the primate himfelf appeared with very few attendants. This they looked upon as a declaration of heaven in their favour ; and calling out, "the Lord has delivered him into our hands," they ran up to the carriage. They fired at him without effect ; a circumftance which was afterwards impu. ted to magic. They then difpatched him with their fwords, regardlefs of the tears and intrcaties of his daughter, who accompanied \(\operatorname{him}(\mathrm{A})\).

Thus fell archbifhop Sharp, whofe memory is even at prefent detefted by the common people of Scotland. His abilities were certainly good, and in the early pa:t of his life he appears with honour and dignity. But his conduct afterwards was too cruel and infincere to merit approbation. His treatment of Mitchell was mean and vindictive. How far he contributed to the meafures adopted againft the prefbyterians is not certain: They were equally cruel and impolitic; nor did their cffects ceafe with the meafures themfelves. The un-heard-of cruelties exercifed by the minifters of Cha. II. againft the adherents of the covenant, raifed fuch a flame of enthufiafm and bigotry as is not yet entirely extinguifhed.

Sharp (Dr John), archbiflop of York, was defcended from the Sharps of Little Norton, a family of Bradford Dale in Yorkflire; and was fon of an eminent tradefman of Bradford, where he was born in IG4t. He was educated at Cambridge, and in 1667 entered into orders. That fame year he became domeftic chap. lain to Sir Heneage Finch, then attorney.general. In I 672 he was collated to the archdeaconry of Berkhire. In 1675 he was initalled a prebendary in the cathedral church of Norwich; and the year following was inftituted into the rectory of St Bartholomew near the Royal Exchange, London. In 168 i he was, by the intereft of his patron Sir Heneagc Finch, then lord high chancellor of England, made dean of Norwich; but in 1686 was fufpended for taking occafion, in fome of his fermons, to vindicate the doctrine of the church of Ensland in oppolition to Popery. In 1688 he was fworn chaplain to king James II. being then probably reftored after his fufpenfion ; for it is certain that he was cha. plain to king Charles II. and attended as a court cha-

plain
(A) Such is the account given by all our liftorians of the murder of archbifhop Sharp; and that he fell by the hands of fanatics, whom he perfecuted, is certain. A tradition, however, has been preferved in differeut families defcended from him, which may be mentioned, and is in itfelt certainly not incredible. The primate, it feems, who, when minifter of Crail, was peculiarly fevere in punifhing the fin of fornication, had, in the plenitude of his archiepifcopal authority, taken notice of a criminal amour carried on between a nobleman high in office and a lady of fome fafhion who lived within his diocefe. This interference was in that licentious age deemed very impertinent; and the archbikop's defcendants believe that the proud peer inftigated the deluded rabble to zurder their anceftor.

\section*{S H A}
plain at the coronation of king James II. In 1689 he was deelared dean of Canterbury ; but never could be perfuaded to fill up any of the vacancies made by the deprived bifhops. Upon the death of Dr Lamplugh, he was promoted to the fee of York. In 1702 he preached the fermon at the coronation of queen Anne; and the fame year was fworn of the privy-council, and made lord almoner to her majefty. He died at Bath in 1713 ; and was interred in the cathedral of York, where a monument is erected to his memory.-His fermons, which were collected after his death and publifhed in 7 vols 8 vo , are juttly admired.

SHARP, in mufic. See Interval.
SHASTER, or BEDANG, the name of a facred book, in high eftimation among the idolaters of Hindoftan, containing all the dogmas of the religion of the bramins, and all the ceremonies of their worfhip; and ferving as a commentary on the Vedam.

The term Shafler denotes "fcience" or "fyftem;" and is applied to other works of aftronomy and philofophy, which have no relation to the religion of the Indians. None but the bramins and rajahs of India are allowed to read the Vedam; the priefts of the Banians, called /buderers, may read the Shafter; and the people, in general, are allowed to read only the Paran or Pouran, which is a commentary on the Shater.

The Shafter is divided into three parts: the firt containing the moral law of the Indians; the fecond, the rites and ceremonies of their religion; and the third, the diftribution of the people into tribes or claffes, with the duties pertaining to eaeh clafs.

The principal precepts of morality contained in the firt part of the Shafter are the following: that no animal be killed, becaufe the Indians attribute fouls to brite animals as well as to mankind; that they neither hear nor fpeak evil, nor drink wine, nor eat flefh, nor touch any thing that is unclean; that they obferve the feafts, prayers, and wathings, which their law prefcribes; that they tell no lies, nor be guilty of deceit in trade; that they neither opprefs nor offer violence to one another; that they celebrate the folemn feafts and fafts, and appropriate certain hours of ordinary fleep to cultivate a difpofition for prayer; and that they do not fteal or defraud one another.
'Ihe ceremonies contained in the fecond part of the Shafter are fuch as thefe: that they wafh often in the rivers, hereby obtaining the pardon of their fins; that they nark their forehead with red, in token of their relation to the Deity; that they prefent offerings and prayers under certain trees, fet apart for this purpofe; that they pray in the temples, make oblatious to their pagodas, or idols, fing hymns, and make proceffions, \&c. that they make pilgrimages to diftant rivers, and efpecially to the Ganges, there to walh themfelves and make offerings; that they make vows to particular faints, according to their refpective departments; that they render homage to the Deity at the firft fight of the fun; that they pay their refpect to the fun and moon, which are the two eyes of the Deity ; and that they treat with particular veneration thofe animals that are deemed more pure than others; as the cow, buffalo, \&c.; becaule the fouls of men have tranfmigrated into thefe animals.

The third part of the Shafer records the diftribution of the people into four claffes : the firlt being that
of the bramins or priefts, appointed to inftruct the people; the fecond, that of the kutteris or nobles, who are the magiftrates; the third, that of the fhudderis or merchants; and the fourth, that of the mechanics. Each perfon is required to remain in the clafs in which he was born, and to purfue the occupation affigned to him by the Shafter. According to the bramins, the Shafter was imparted by God himfelf to Brahma, and by him to the bramins; who communicated the contents of it to the people.

Modern writers have given us very different accounts of the antiquity and importance of the Slafter. Mr Holwell, who had made confiderable progrefs in the tranflation of this book, apprehends, that the mythology as well as the cofmogony of the Egyptians, Greeks, and Romans, were borrowed from the doctrines of the bramins, contained in it, even to the copying of their exteriors of wormip, and the diftribution of their idols, though grofsly mutilated and adulterated. With refpect to the Vedam and Shafter, or fcriptures of the Gentoos, this writer informs us, that Vedam, in the Mala* bar lagguage, fignifies the fame as Shafter in the Shanfcrit; and that the firt book is followed by the Gentoos of the Malabar and Coromandel coafts, and alfo of the inand of Ceylon. The Shafter is followed by the Gentoos of the provinces of Bengal, and by all the Gentoos of the reft of India, commonly called India Proper, along the courfe of the rivers Ganges and Jumna to the Indus. Both thefe books (he fays) contain the inftitutes of their refpective religion and worfhip, as well as the hiftory of their ancient rajahs and princes, often couched under allegory and fable. Their antiquity is contended for by the partifans of each; but he thinks, that the fimilitude of their names, idols, and great part of their worfhip, leaves little room to doubt, nay plainly evinces, that both thefe fcriptures were originally one. He adds, if we compare the great purity and chafte manners of the Shafter with the great abfurdities and impurities of the Vedam, we need not hefitate to pronounce the latter a corruption of the former.

With regard to the high original of thefe fcriptures, the account of the bramins is as follows. Brahma (that is, "Mighty Spirit"), about 4866 years agó, affumed the form of man and the government of Indoftan. He tranflated the divine law (defigned for the reftoration of mankind, who had offended in a pre-exiftent ftate, and who are now in their laft fcene of probation, to the dignity from which they were degraded) out of the language of angels into the well known Shanfrit language, and called his tranflation the Chartab Bhade Shaftab of Birmah, or the Six Scriptures of Divine Words of the Mighty Spirit. He appointed the bramins, deriving their name from him, to preach the word of God; and the doetrines of the Shafter were accordingly preached in their original purity 1000 years. About this time there was publifhed a paraphrafe on the Chartah Bhade; and about 500 years afterwards, a fecond expolition, called the Aughtorrah Bhade Shafta, or Eighteen Books of Divine Words, written in a character com. pounded of the common Indoftan and the Shanfcrit. This innovation produced a fchifm among the Gentoos; on which occafion, it is faid, thofe of Coromandel and Malabar formed a feripture of their own, which they pretended to be founded on the Chartah

\section*{S H A}

\section*{339 ] S H A}

Bhade of Bramah, and called it the Vedam of Birmab, or Divine Words of the Mighty Spirit. The original Chartah Bhade was thrown afide, and at length wholly unknown, except to a few families; who can ftill read and expound it in the Shanferit character. With the eftablifhment of the Aughtorrah Bhade, and Vedam, which, according to the Gentoo account, is 3366 years ago, their polytheifm commenced; and the principles of religion became fo obfcure, and their ceremonies fo numerous, that every head of a family was obliged to keep a bramin as a guide both in faith and practice. Mr Hollwell is of opinion, that the Chartah Bhade, or Original Scriptares, are not copied from any other fyftem of theology, promulgated to or obtruded upon mankind. The Gentoos do not attribute them to Zoroafter; and Mr Holwell fuppofes, that both Zo roafter and Pythagoras vifited Indoftan, not to inftruct, but to be inftructed.

From the account of Mr Dow, we larn, that the books which contain the religion and philofophy of the Hindoos are diftinguifhed by the name of Bedas ; that they are four in number, arid, like the facred writings of other nations, faid to be penned by the Divinity. Beda, he fays, in the Shanfcrit language, literally fignifies fcience ; and thefe books treat not only of religion and moral duties, but of every branch of philofophic knowledge. The bramins maintain, that the Bedas are the divine laws, which Brimha, at the creation of the world, delivered for the inftruction of mankind; but they affirm, that their meaning was perverted in the firf age by the ignorance and wickednefs of fome princes, whom they reprefent as evil fpirits, who then haunted the earth.

The firft credible account we have of the Bedas is, that about the commencement of the Cal Jug, of which era the year 1768 was the 4886 th year, they were written, or rather collected, by a great philofopher and reputed prophet, called Beäfs Muni, or Beäfs the Infpired.

The Hindoos, fays \(\mathrm{Mr}^{-}\)Dow, are divi ed into two great religious fects : the followers of the doctrine of Bedang, which is the original Shafter, or commentary upon the Bedas ; and thofe who adhere to the principles of the Neadirfen. The original Shafter is called Bednng, and is a commentary upon the Bedas. This book, he fays, is erroneoufly called in Europe the \(V_{e}\) dam. It is afcribed to Beäfs Muni, and is faid to have been revifed fome years after by one Serrider Swami, fince which it has been reckoned facred, and not fubject to any farther alterations.

Almoft all the Hindoos of the Decan, and thofe of the Malabar and Coromandel coafts, are of this fect. The followers of the Bedang Shafter do not allow that any phyfical evil cxifts; they maintain that God created all things perfectly good; but that man, being a free agent, may be guilty of moral evil, which may be injurious to himfelf, but can be of no detriment to the general fyftem of nature. God, they fay, being perfectly benevolent, never punifhed the wicked otherwife than by the pain and affliction which are the natural confequences of evil actions; and hell, therefore, is no other than a confcioufnefs of evil.

The Neadirfen Shafter is faid to have been written by a philofopher called Goutam, near four thoufand years ago. The bramins, from Mr Dow's account of their
facred books, appear to believe invariably in the unity, shaner. eternity, omnifcience, and omnipotence of God; and the polytheifm of which they have been acculed is no more than a fymbolical worfhip of the divine attributes, which they divide into three claffes. Under the name of Brimba, they worfhip the wifdom and creative power of God; under the appellation of Bi/ben, his providential and preferving quality; and under that of Sbibah, that attribute which tends to deftroy.
As few of our readers may have an opportunity of perufing the Shafter, we fhall, by way of feecimen, fubjoin a paffage from it, which, though it contains fome metaphyfical myfteries concerning the creation, yet difcovers views of God fo cnlightened that they would nnt difgrace more refined nations. The paffage which we fhall quote is the firft chapter of the Shafter, which is a dialogue between Brimha the Wifdom of the Divinity, and Narud or Reafon, who is reprefented as the form of Brimha. Narud defires to be inftructed by his father; and for that purpofe puts the following queltions to him :
" Narud. O father! thou firt of God, thou art faid to have created the world, and thy fon Narud, aftonifhed at what he beholds, is defiro us to be inftructed how all thefe things were madc.
"Brimba. Be not deceived, my fon! do not imagine that I was the creator of the world, independent of the Divine Mover, who is the great original effence and creator of all things. Look, therefore, only upon me as the inftrument of the great will, and a part of his being, whom he called forth to execute his eternal de figns.
" Narud. What Thall we think of God?
"Brimba. Being immaterial, he is above all conception; being invifible, he can have no form; but, from what we behold in his works, we may conclude that he is eternal, omnipotent, knowing all things, and prefent everywhere.
" Narud. How did God create the world?
"Brimha. Affection dwelt with God from all eternity. It was of three different kinds; the creative, the prcferving, and the deftructive. This firl is reprefented by Brimha, the fecond by Bifhen, and the third by Shibah. You, O Narud! are taught to worfhip all the three in various flapes and likeneffes, as the Creator, the Preferver, and the Deftroyer. Themfection of God then produced power, and power, at a proper conjunction of time and fate, embraced goodnefs, and produced matter. The three qualities then acting upon matter, produced the univerfe in the following manner : From the oppofite actions of the creative and deftructive quality in matter, felf-motion firt arofe. Selfmotion was of thrce kinds; the firft inclining to plafticity, the fecond to difcord, and the third to reft. The difcordant actions then produced the Akafh (a kind of celeftial element), which invifible clement poffeffed the quality of conveying found ; it produced air, a palpable element ; fire, a vifible element; water, a fluid element; and earth, a folid element.
"The Akafh difperfed itfelf abroad. Air formed the atmofphere; fire, collecting itfelf, blazed forth in the hof of heaven; water rofe to the furface of the earth, being forced from beneath by the gravity of the latter element. Thus broke forth the world from the veil of darknefs, in which it was formerly comprehend-

\section*{S H A}

Shaner. ed by God. Order rofe over the univerfe. The feven heavens were formed, and the feven worlds were fixed in their places; there to remain till the great diffolution, when all things thall be abforbed into God.
"God feeing the earth in full bloom, and that vegetation was frong from its feeds, called forth for the firtt time intelleet, which he endued with various organs and Shapes, to form a diverfity of animals upon the earth. He endued the animals with five fenfes; feeling, feeing, fmeiling, tafting, and hearing ; but to man lie gave reflection, to raife him above the beaits of the field.
" The creatures were created male and female, that they might propagate their fpecies upon the earth. Every herb bore the feed of its kind, that the world might be clothed with verdure, and all animals provided with food.
"Narud. What doft thou mean, O father! by Intellect ?
"Brimba. It is a portion of the great foul of the univerfe breathed into all creatures, to animate them for a certain time.
" Narud. What becomes of it after death?
"Brimba. It animates other bodies, or returns, like a drop, into that unbounded ocean from which it firlt arofe.
" Narud. Shall not then the fouls of good men receive rewards? nor the fouls of the bad meet with punifhment?
"Brimba. The fouls of men are diftinguifhed from thofe of other animals; for the firft are endued with reafon, and with a confcioufnefs of risht and wrong. If therefore man fhall adhere to the firf, as far as his powers fhall extend, his foul, when difengaged from the body by death, Thall be abforbed into the divine effence, and fhall never more reanimate fiefh: But the fouls of thofe who do evil are not, at death, difengaged from all the clements. They are immediately clothed with a body of fire, air, and akafh, in which they are for a time punifhed in hell. After the feafon of their grief is over, they reanimate other bodies; but till they fhall arrive at a llate of purity they can ncver be ablorbed into God.
" Narud. What is the nature of that abforbed fate which the fouls of good men enjoy after death ?
"Brimba. It is a participation of the divine nature, where all paffions are interly unknown, and where confcioufnefs is loft in blifs.
" Narud. Thou fayeft, O father, that unlefs the foul is perfeclly pure it cannot be abforbed into God: now, as the actions of the generality of men are partly good and partly bad, whither are their fpirits fent immediately after death ?
"Brimba. They muft atone for their crimes in hell, where they mutt remain for a fpace proportioned to the degree of their iniquities; then they rife to heaven to be rewarded for a time for their virtues; and from thence they will return to the world to reanimate other bodies.

\section*{" Narud. What is time?}
" Brimba. Time exitted from all-eternity with God: but it can only be eftimated fince motion was produ: ced, and only be conceived by the mind, from its own conftant progrefs.
" Narud. How long fhall this world remain?
"Brimbe. Until the four lugs fhall have revolved.

Then Rudder (the fame with Sbibah, the deftroying quality of God), with the ten Spirits of diffolution, fhall roll a comet under the moon, that fhall involve all things in fire, and reduce the world into afhes. God fhall then exit alone, for matter will be totally annihi. lated."

Thofe who defire more information on this fubject may confult Dow's Hifory of Indoflan, and Holvoell's Interefling Hiflorical Events.

SHAW (Dr Thomas), known to the learned world by his travels to Barbary and the Levant, was born at Kendal in Weftmoreland about the year 1692. He was appointed chaplain to the Englifh conful at Algiers, in which ftation he continued for feveral years; and from thence took proper opportunities of travel ling into different parts. He returned in 1733 ; was elected fellow of the Royal Society; and publithed the account of his travels at Oxford, folio, \(173 \%\). In 1740 he was nominated principal of St Edmond-hall, which he raifed from a ruinous ftate by his munificence ; and was regius profeffor of Greek at Oxford until his death, which happened in 1751 . Dr Clayton, Bp. of Clogher, having attacked thefe Travels in his Defcription of the Eaft, Dr Shaw publifhed a fupplement by way of vindication, which is incorporated into the fecond edition of his Travels, prepared by himfelf, and publifhed in 4 to, 1757.

SHAWLS', are woollen handkerchiefs, an ell wide, and near two long. The wook is fo fine and filky, that the whole handkerchief may be contained in the two hands clofed. It is the produce of a Tibet fheep; but fome fay that no wool is einployed but that of lambs torn from the belly of their mother before the time of birth. The molt beautiful fhawls come from Cafhmire : their price is from 150 livres (about fix gnineas) to \(12=0\) livres (or L. 50 Sterling.)
In the ' Tranfactions of the Society for Encouraging Arts, Manufactures, \&c. for the year 1792, we are informed that a fhawl counterpane, four yards fquare, manufactured by Mr P . J. Knights of Norwich, was prelented to the fociety ; and that, upon examination, it appeared to be of greater breadth than any goods of equal finenefs and texture that had ever before been prelented to the lociety, or to their knowledge woven in this country. 'The fhawls of Mr Knights's manufacture, it is faid, can fcarcely be diftinguiihed from In. dian thawls, though they can be afforded at one-twen. tieth part of the price. When the fhawl is 16 quarters fquare, Mr Knights fays it may be retailed at L. 20 ; if it confifted of 12 quarters, and embroidered as the former, it will coit L. 15 ; if plain, with a fringe only, a hawl of 16 quarters fquare may be fold at \(\mathrm{L} .8,8 \mathrm{~s}\); if 12 quarters and fringed, at L. \(6,6 \mathrm{~s}\).
Mr Knights maintans, that his counterpane of four yards fquare is equal in beauty, and fuperior in ftrength, to the Indian counterpanes which are fold at. 200 guineas. The principal confumption of this cloth is in train-dreffes for ladies; as likewife for long fearfs, in imitation of the real Indian fcarfs, which are fold from L. 60 to L. 80 ; whereas fcarfs of this fabric are iold for as many fhillings, and the ladies fquare fhawls in proportion.

SHEADING, a riding, tything, or divifion, in the Ifle of Man; the whole ifland being divided into fix Theadings ; in every one of which is a coroner or chief 2

confable, appointed by the delivery of a rod at the an- able, than the fheep. The fheep fupplies us with food Shieep: nual convention.

SHEARBILL, the Rhynchops Nigra of Linnæus, the Bluck Skimmer of Fernant and Latham, and Cutquater of Cateby. Its bill is much compreffed; the edpes are fharp; the lower mandible is four inches and a half long; the upper only three; the bafe red; the reft is black : the forebead, chin, front of the neck, the breatt, and belly, are white: the head and whole upper pait of the body are black : the wings are of the fame colour: the lower part of the inner webs of the primaries is white: the tail is fhort, and a little forked ; the middle feathers are dunky; the others are white on their fides: the legs are weak and red : the length is one foot eight inches: the extent is three feet Seven inches. It inhabits America from New York to Guiana. It fkims nimbly along the water, with its under mandible juft beneath the furface, feeding on the infecis and fmall fifh as it proceeds. It frequents alfo oyfter. banks; its bill being partly like that of the oyttercatcher, adapted for preying on thof f . Thell-fifl.

SHEATHING, in the fea-language, is the cafing that part of a thip which is to be under water with firboard of an inch thick ; firft laying hair and tar mixed together under the boards, and then nailing them on, in order to prevent worms from eating the hip's bot-tom.-Ships of war are now generally fheathed with copper : but copper fheathing is liable to be corroded by the action of falt water, and fomething is fill wanting to effect this purpofe. It is very probable that tar might anfwer very well.
In the Cornifh mines, copper or brafs pumps are often placed in the deepeft parts, and are confequently expofed to the vitriolic or other mineral waters with which fome of thefe mines abound, and which are known to have a much flronger effect on copper than Sea-water. Thefe pumps are generally about fix. fcet long, and are fcrewed togetber, and made tight by the interpofition of a ring of lead, and the joinings are afterwards tarred. One of thefe pumps was fo much corroded as to render it unfit for ufe; but the fpots of tar, which by accident had dropped on it, preferved the parts they covered from the action of the water. Thefe projected in fome places more than a quarter of an inch; and the joints were fo far defended by the thin coat of tar, that it was as perfect as when it came from the hands of the manufacturer. If tar thus effectually defends copper from thefe acrimonious waters, can there remain a doubt of its preferving it from the much mild. er waters of the fea?

SHEATS, in a fhip, are ropes bent to the clews of the fails; ferving in the lower fails to haul aft the clews of the fail; but in topfails they ferve to haul home the clew of the fail clofe to the yard-arm.

SHEEP, in zoology. See Ovis and Woor.
Amongtt the various animals with which Divine Providence has ftored the world for the ufe of man, none is to be found more innocent, more ufeful, or more valu-
poor at all times and feafons of the year, whereby a sheep \({ }^{\mathrm{I}}\) variety of manufactures of woollen cloth is carried on ferve a without interruption to domeftic comfort and lofs to wonderful friendly fociety or injury to health, as is the cafe with varitty of many other occupations. Every lock of wool that \({ }^{\text {purf ofes. }}\) grows ou its back becomes the means of fupport to faplers, dyers, pickers, \{courers, fcriblers, carders, combers, fpinners, fpoolers, warpers, queelers, weavers, fullers, tuckers, burlers, fhearmen, preffers, clothiers, and packers, who, one after another, tumble and tofs, and twift, and bake, and boil, this raw material, till they have each extracted a livelihood out of it ; and then comes the merchant, who, in his turn, fhips it (in its higheft ftate of improvement) to all quarters of the globe, from whence he brings back every kind of riches to his country, in leturn for this valuable commodity which the fheep affords.

Befides this, the ufeful animal, after being deprived of his coat, produces another againfl the next year ; and when we are hungry, and kill him for food, he gives us his flkin to employ the fell-mongers and parch-ment-makers, who fupply us with a durable material for fecuring our eftates, rights, and poffeffions; and if our enemies take the field againft us, fupplies us, with a powerful inftrument for roufing our courage to reped their attacks.. When the parchment-maker has taken as much of the flkin as he can ufe, the glue-maker comes alter and picks up every morfel that is left, and therewith fupplies a material for the carpenter and cabi-net-maker, which they cannot do without, and which is effentially neceffary before we can have elegant furniture in our houfes; tables, chairs, looking-glafles, and a hundred other articles of convenience : and when the winter nights come on, while we are deprived of the cheering light of the fun, the theep fupplies us with an artificial mode of light, whereby we prelerve every pleafure of domeftic fociety, and with whofe affiftance we call continue our work, or write or read, and improve our minds, or enjoy the focial mirth of our tables. Another part of the flaughtered animal fupplies us with aningredient neceffary for naking good common foap, a ufeful ftore for producing cleanlinefs in every family, rich or poor. Neither need the horns be thrown away; for they are converted by the button-makers and turners into a cheap kind of buttons, tips for bows, and many ufeful ornaments. From the very trotters an oil is extracted ufeful for many purpofes, and they afford good food when baked in an oven.

Even the bones are ufeful alfo; for by a late invention of Dr Higgins, they are found; when reduced to athes, to be an ufeful and effential ingredient in the compofition of the fineft artificial 'tone in ornamental work for chimney-pieces, cornices of rooms, houfes, \&c. which renders the compolition more durable by effectually preventing its cracking (A).

If it is objected to the meek inoffenfive.creature, that
(A) Any curious perfon would be much entertained to fee the manufactory of bone-afh, now carried on by Mr Minifh of White chapel, New Road, wherein the bones of fheep and cows undergo many ingenious procefleso 1. There is a mill to break them ; 2. A cauldron to extract their oil, marrow, and fat; 3. A reverberatory to heat them red-hot; 4. An oven for thofe bones to moulder to athes; 5. A fill to collect the fumes of the burnt

\section*{S H E [ 342 ] S H E}

Sheep. he is expenfive while living, in eating up our grafs, \&c. it may be anfwered that it is quite the contrary ; for he can feed where every other animal has been before him and grazed all they could find; and that if he takes a little grafs on our downs or in our fields, he amply repays us for every blade of grafs in the richnefs of the manure which he leaves behind him. He protects the hands from the cold wintry blaft, by providing them with the fofteft leather gloves. Every gentleman's library is alfo indebted to him for the neat binding of his books, for the fheath of his fword, and for cafes for his inftruments; in fhort, not to be tedious in mentioning the various ufes of leather, there is hardly any furniture or utenfil of life but the fheep contributes to render either more ufeful, convenient, or ornamental.

As the fheep is fo valuable an animal, every piece of information concersing the proper method of managing it muft be of importance. It will not therefore be ufelefs nor unentertaining to give fome account of the manner of managing fheep in Spain, a country famous for

2
Account of In Spain there are two kinds of fheep: the coarfethe Spanifh woolled fheep, which always remain in their native fheep country, and are houfed every night in winter; and the fine-wooled fheep, which are always in the open air, and travel every fummer from the cool mountains of the northern parts of Spain, to feed in winter on the fouthern warm plains of Andalufia, Mancha, and Eftramadura. Of thefe latter, it appears from accurate computations, that there are about five millions (в) ; and that the wool and flefh of a flock of 10,000 meep produce yearly about 24 reals a-head, or about the value of 12 Englifh fixpences, one of which belongs to the owner, three to the king, and the other eight are allowed for the expences of pafture, tythes, fhepherds, dogs, falt, fhearing, \&c. Ten thoufand fheep form a flock, which is divided into ten tribes, under the management of one perfon, who has abfolute dominion over fifty fhepherds and fifty dogs.
M. Bourgoanne, a French gentleman, who refided many years in Spain, and directed his inquiries chiefly to the civil government, trade, and manufactures, of that country, gives the following account of the wandering theep of Segovia. "It is (fays he) in the neigh-

Bourgowels, vol. i. f. 53.
via,

Bune's Tra dering ore or Segovia. "It is (ays he) in the neigh bouring mountains that a part of the wandering fheep feed during the fine feafon. They leave them in the month of October, pafs over thofe which feparate the two Caftiles, crofs New Caftile, and difperfe themfelves in the plains of Eftramadura and Andalufia. For fome years paft thofe of the two Caftiles, which are within reach of the Sierra-Morena, go thither to pafs the win-
ter ; which, in that part of Spain, is more mild: the length of their day's journey is in proportion to the pafture they meet with. They travel in flocks from 1000 to 1200 in number, under the conduct of two fhepherds; one of whom is called the Mayoral, the other the Zagal. When arrived at the place of their deftination, they are diftributed in the paftures previoufly affigned them. They return in the month of April ; and whether it be habit or natural inftinet that draws them towards the climate, which at this feafon becomes moft proper for them, the inquietude which they manifeft might, in cafe of need, ferve as an almanac to their conductors."
Mr Arthur Young, in that patriotic work which he conducted with great induftry and judgment, the Annals of Agriculture, gives us a very accurate and interefting account of the Pyrenean or Catalonian fheep.
"On the northern ridge, bearing to the weft, are of C the paltures of the Spanilh flocks. This ridge is not, lonia however, the whole; there are two other mountains, Anna quite in a different fituation, and the fheep travel from vol. one to another as the pafturage is fhort or plentiful. I \({ }_{\text {p.19 }}\) examined the foil of thefe mountain paftures, and found it in general fony; what in the weft of England would be called a fone brafb, with fome mixt ure of loam, and in a few places a little peaty. 'The plants are many of them untouched by the fheep; many ferns, narciffus, violets, \&c. but burnet (poterium fanguiforba) and the narrow-leaved plantain (plantago lanceolata) were eaten, as may be fuppofed, clofe. I looked for trefoils, but found fcarcely any: it was very apparent that foil and peculiarity of herbage had little to do in rendering thefe heights proper for fheep. In the northern parts of Europe, the tops of mountains half the height of there (for we were above fnow in July) are boys, all are fo which I have feen in our iflands, or at leatt the proportion of dry land is very trifling to that which is ex. tremely wet : Here they are in general very dry. Now a great range of dry land, let the plants be what they may, will in every country fuit fheep. The flock is brought every night to one fpot, which is fituated at the end of the valley on the river I have mentioned, and near the port or paffage of Picada : it is a level fpot fheltered from all winds. The foil is 8 or 9 inches deep of old dung, not at all inclofed : from the freedom from wood all around, it feems to be chofen partly for fafety againft wolves and bears. Near it is a very large ftone, or rather rock, fallen from the mountain. This the fhepherds have taken for a fhelter, and have built a hut againft it ; their beds are fheep.fkins, and their door fo fmall that they crawl in. I faw no place for fire ; but they have it, fince they drefs here the flefh of their fheep,

\section*{S H E [ 343\(]\) S H E}
and in the night fometimes keep off the bears, by whirling fire-brands: four of them belonging to the flock mentioned above lie here. I viewed their flock very carefully, and by means of our guide and interpreter, made fome inquiries of the fhepleerds, which they anfwered readily, and very civilly. A Spaniard at Venafque, a city in the Pyrenees, gives 600 livres French (the livre is \(\mathrm{IO} \frac{1}{2} \mathrm{~d}\). Englifh) a-year for the pafturage of this flock of 2000 fheep. In the winter he fends them into the lower parts of Catalonia, a journey of 12 or 13 days, and when the fnow is melted in the fring, they are conducted back again. They are the whole year kept in motion, and moving from fpot to fpot, which is owing to the great range they everywhere have of pafture. They are always in the open air, never houfed or under cover, and never tafte of any food but what they can find on the hills.
"Four fhepherds, and from four to fix large Spanifh dogs, have the care of this flock: the lacter are in France called of the Pyrenes breed; they are black and white, of the fize of a large wolf, a large head and neck, armed with collars ftuck with iron fpikes. No wolf can ftand againft them ; but bears are more potent adverfaries: it a bear can reach a tree, he is fafe; he rifes on his hind legs, with his back to"the tree, and fets the dogs at defiance. In the night the fhepherds rely entirely on their dogs; but on hearing them bark are ready with fire-arms, as the dogs rarely bark if a bear is not at hand. I was furprifed to find that they are fed only with bread and milk. The head fhepherd is paid 120 livres a-year wages and bread; the others 80 livres and bread. But they are allowed to keep goats, of which they have many which they milk every day. Their food is milk and bread, except the flefh of fuch fheep or lambs as accidents give them. The head fhepherd keeps on the mountain top, or an elevated fot, from whence he can the better fee around while the flock traverfes the declivities. In doing this the fheep are expofed to great danger in places that are ftony; for by walking among the rocks, and efpecially the goats, they move the fones, which, rolling down the hills, acquire an accelerated force enough to knock a man down, and fheep are often killed by them ; yet we faw how alert they were to avoid fuch flones, and cautioufly on their guard againft then. I examined the fheep attentively. They are in general polled, but fome have horns ; which in the rams turn backwards behind the ears and project half a circle forward; the ewes horns turn alfo behind the ears, but do not project : the legs white or reddifh; fpeckled faces, fome white, fome reddifh; they would weigh fat, I reckon, on an average, from 15 lb . to 18 lb . a quarter. Some tails fhort, fome left long. A few black fheep anong them: fome with a very little tuft of wool on their foreheads. On the whole they refemble thofe on the South Downs; their legs are as fhort as thofe of that breed ; a point which merits obfervation, as they travel fo much and fo well. Their flape is very good; round ribs and flat ftraight backs; and would with us be reckoned handfome fheep; all in good order and fleth. In order to be ftill better acquainted with them, I defired one of the fhep. herds to catch a ram for me to feel, and examine the wool, which I found very thick and good of the carding fort, as may be fuppofed. I took a fpecimen of it,
and alfo of a hoggit, or lamb of laft year. In regard to the mellow foftnefs under the fkin, which, in Mr Bakewell's opinion, is a ftrong indication of a good breed, with a difpofition to fatten, he had it in a much fuperior degree to many of our Englinh breeds, to the full as much fo as the South Downs, which are for that point the beft fhort-woolled fheep which I know in England. The fleece was on his back, and weighed, as I gueffed, about 8 lb . Englifh'; but the average, they' fay, of the flock is from four to five, fas I calculated by reducing the Catalonian pound of 12 oz . to ours of 16 , and is all fold to the French at 30 s . the lb . French. This ram had the wool of the back part of his neck tied clofe, and the upper tuft tied a fecond knot by way of ornament; nor do they ever fhear this part of the fleece for that reafon : we faw feveral in the flock with this fpecies of decoration. They faid that this ram would fell in Catalonia for 20 livres. A circumftance which cannot be too much commended, and deferves univerfal imitation, is the extremc docility they accuftom them to. When I defired the fhepherd to catch one of his rams, I fuppofed he wonld do it with his crook, or probably not be able to do it at all; but he walked into the flock, and fingling out a ram and a goat, bid them follow him, which they did immediately; and he talked to them while they were obeying him, holding out his hand as if to give them fomething. By this method he brought me the ram, which I caught, and held without difficulty."

The beft fort of theep for fine wool are thofe bred what fheep in Herefordfhire, Devonfhire, and Worcefterfhire; but produce the they are fmall, and black-faced, and bear but a fmall beft wool. quantity. Warwick, Leicefterfhire, Buckinglaam, and Northamptonfhire, breed a large boned fheep, of the beft fhape and deepef wool we have. The marfhes of Lincolnfhire breed a very large kind of fheep, but. their wool is not good, unlefs the breed be mended by bringing in theep of other counties among them, which is a fcleme of late very profitably followed there. In this county, it is no uncommon thing to give fifty guineas for a ram, and a guinea for the admiffion of an ewe to one of thefe valuable males, or twenty gixineas for the ufe of it for a certain number of ewes during one feafon. Suffolk alfo breeds a very valuable kind of fheep. The northern counties in general breed fheep with long but hairy wool : however, the weol which is taken from the neck and fhoulders of the York fhire fheep. is ufed for mixing with Spanifh wool in fome of their fineft cloths.
Wales bears a fmall hardy kind of theep, which has the beft tafted flefh, but the worf wool of all. Neverthelefs it is of more extenfive ufe than the finefl Segovian fleeces; for the beneft of the flannel manufacture is univerfally known. The fleeep of Ireland vary like thofe of Great Britain : thofe of the fouth and ealt being large and their fieth rank: thole of the north and the mouncainous parts fmall and their feff fweet. The ffeeces in the fame manner differ in dergrees of value. Scotland breeds a fmall kind, and their fceces are coarfe.
But the new Leicefterhire breed is the moft faftionable, and of courfe the mott profitable breed in the ifland. Jofeph Altom of Clifion, who raifed humfelf from a plough-boy, was the firft who diltinguifhed him-

\section*{S H E 「 344 § IK E}
felf in the midland counties of England for a fuperior breed of theep. How he improved his breed is not known ; but it was cuftomary for \(\in\) minent farmers is his time to go to Clifton in fummer to choofe and purchafe ram-lambs, for which they paid two or three guineas. This man was fucceeded by Mr Bakewell; and it may reafonably be fuppofed that the breed, by means of Altom's ftock, had paffed the firft ftage of improvement before Mr Bakewell's time. Still, however, it muft be acknowledged, that the Leicefterfhire breed of fheep owes its prefent high ftate of improvement to the ability and care of Mr Bakewell.
6 "The manner in which Mr Bakewell raifed his fheep

Account of
Mr Bake- to the degree of celebrity in which they defervedly ftand,
breed
Marßall's
Midland
Countics,
vol. i.
p. \(3^{82}\).

How it is
fuppofed he inuproved \(\stackrel{8}{4}\). is, notwithftanding the recentnefs of the improvement, and its being done in the day of thoufands row living, a thing in difpute; even among men high in the profeffion, and living in the very diftrict in which the improvement has been carried on !
"Some are of opinion that he effected it by a crofs with the Wilthire breed; an improbable idea, as their form altogether contradicts it : others, that the Ryeland breed were ufed for this purpofe; and with fome fhow of probability. If any crofs whatever was ufed, the Ryeland breed, whether we view the form, the fize, the wool, the flefh, or the fatting quality, is the moft probable inftrument of improvement.
" Thefe ideas, however, are regiftered merely as matters of opinion. It is more than probable that Mr Bakewell alone is in poffeffion of the feveral minutixe of improvement; and the public can only hope that at a proper time the facts may be communicated for the direction of future improvers.
"Whenever this thall take place, it will moft probably come out that 110 crofs with any alien breed whatever has been ufed; but that the improvement has been effected by felecting individuals from kindred breeds; from the feveral breeds or varieties of long-woolled fheep, with which Mr Bakewell was furrounded on almoft every fide, and by breeding, inandin (c), with this felection: folicitoully feizing the fuperior accidental varieties produced; affociating thefe varieties; and ftill continuing to felect, with judgment, the fuperior individuals.
Defeription "It now remains to give a defcription of the fuperior of his ewes clafs of individuals of this breed, efpecially ewes and and wed- wedders, in full condition, but not immoderately fat. ders.
carcafe, when fully fat, takes a remarkable form; much wider than it is deep, and almoit as broad as it is long. Full on the fhoulder, wideft on the ribs, narrowing with a regular curve towards the tail ; approaching the form of the turtle nearer perhaps than any other animal. The pelt is thin, and the tail fmall. The wool is thorter than long wools in general, but much longer than the middle wools; the ordinary length of ftaple five to feven inches, varying much in finenefs and weight."

This bread furpaffes every other in beauty of form ; Fatt they are full and weighty in the fore quarters; and are marl remarkable for fmallnefs of bone. Mr Marhall, who has been of fo much benefit to agriculture and his country by his publications, informs us, in his Rural Economy of the Midland Counties, that he has feen a rib of a fheep of this breed contrafted with one of a Norfolk fleep: the difparity was friking; the latter nearly twice the fize; while the meat which covered the former was three times the thicknefs: confequently the proportion of meat to bone was in the one incomparably greater than in the other. 'Therefore, in this point of view, the improved breed has a decided preference: for furely white mankind continue to eat flefh and throw away bone, the former muft be, to the confumer at leaft, the more valuable.

The criterions of good and bad flefh while the animal is alive differ in different fpecies, and are not properly fettled in the fame fpecies. One fuperior breeder is of opinion, that if the flefh is not loofe, it is of courfe good; holding, that the flefh of fheep is never found in-a fate of hardnefs, like that of ill-flefhed cattle: while others make a fourfold diftinction of the flefh of fheep; as loofenefs, mellownefs, firmnefs, hardnefs: confidering the firft and the laft equally exceptionable, and the fecond and third equally defirable ; a happy mixture of the two being deemed the point of perfection.

The flefh of fheep, when flaughtered, is well known to be of various qualities. Some is compofed of large coarfe grains, interfperfed with wide empty pores like a fponge : others, of large grains, with wide pores filled with fat ; others, of fine clofe grains, with fmaller pores filled with fat : and a fourth, of clofe grains, without any intermixture of fatnefs.

The flef of fheep, when drefled, is equally well known to poffefs a variety of qualities: fome mutton iscoarfe, dry, and infipid; a dry fponge, affording little or no gravy of any colour. Another fort is fomewhat firmer, imparting a light-coloured gravy only. A third plump, fhort, and palatable; affording a mixture of white and red gravy. A fourth likewife plump and well-flavoured, but difcharging red gravy, and this in various quantities.

It is likewife obfervable, that fome mutton, when dreffed, appears covered with a thick, tough, parch. ment-like integuneut ; others with a membrane comparatively fine and flexible. But thefe, and fome of the other qualities of mutton, may not be wholly owing to breed, but in part to the age and the fate of fatnefs at the time of flaughter. Examined in this light, whe-

\section*{}
thep we confider thic degree of fatneff, or their natural propenfity to a fate of fatnefs, ceen as an early age, the improved breed of Leicefternire fheep appear with many fuperior advantages.

The degree of fatnefs to which the individuals of this breed are capable of being raifed, will perlaps appear incredible to thofe who have not had an opportunity of being convinced by their own obfervation, "I have feen wedders (fays Mr Marfhall) of only two fhear (two to three years old) fo loaded with fat as to be fcarcely able to make a run ; and whofe fat lay fo much without the fone, it feemed ready to be fhaken from the ribs on the fmalleft agitation.
" It is common for the fheep of this breed to have fuch a projection of fat upon the ribs, immediately behind the floulder, that it may be eafily gathered up in the hand, as the flank of a fat bullock. Hence it has şained, in technical language, the rame of the fore-flank; a point which a modern breeder never fails to touch in judging of the quality of this breed of fheep.
"What is, perhaps, till more extraordinary, it is not rare for the rams, at leaft of this breed, to be' cracked on the back; ; that is, to be cloven along the top of the chine, in the manner fat fheep generally are upon the rump. This mark is confidered as an cvidence of the beft bloor.
"Extraordinary, however, as are thefe appearances while the animals are living, the facts are till more friking after they are flaughtered. At Litchtield, in February \({ }_{17}{ }^{5} 5\), I faw a fore quarter of mutton, fatted by Mr Princep of Croxall, and which neafured upon the ribs four inches of fat. It muft be acknewledged, however, that the Leicefterfhire breed do not produce fo much wool as mot other long-woolled fheep."
As the practice of letting ramsly the feaion is now become profitable, it may be ureful to mention the method of rearing them.
"The principal ram-breeders fave annually twenty, thirty, or perhaps forty ram lambs ; caftration being feldom applied, in the firt inflance, to the produce of a viluable ram. for in the choice of thefe lambs they are led more by blood, or parentage, than by form ; on which, at an early age, little dependence can be placed. Their treatment from the time they are weaned, in July or Auguft, until the time of fhearing, the firft week in June, confifts in giving them every indulgence of keep, in order to pulh them forward for the fhow; it being the common prastice to let fuch as are fit to be let the fint feafon, while they are yet yearlings-provincially 'flarhogss'
"Their firll pafture, after weaning, is pretty generally, I believe, clover that has been mown early, and has got a fecond time into head; the heads of clover being confidered as a moft forcing food of fheep. After this goes off, turnips, cabbares, colewort, with hay, and (report โays) with corn. But the ufe of this, the brecters leve. rally dery, though collectively they may be liable to the charge.
"Be this as it may, fomething confiderable depends on the art of making \(u\), not lambs only, but rams of all ages. Fat, like charity, covers a multitude of faults ; and bcfidef, is the beft evidence of their fatting quality which their owners can produce (i.e their natural propenfity to a flate of fatneff), while in the fatuefs of the
tharhogs is icen their degree of inclination to fat at ant early are.

Sheep.
-" Farting quality being the one thing needful in grazing ftock, and being found, in fome confiderable degree at leaft, to be hereditary, the fatteit rams are of courfe the beft; though ocher attachments, well or ill placed, as to form or fafhionable points, will perhaps: have equal or greater weight in the minds of come men, even in this enlightened age. Such fhearlings as will not make up fufficiently as to form and fatnefs, are either kept on to another year to give them a fair chance; or are caftrated, or butchered while fharhogs."

From the firlt letting, about 40 years ago, to the what fum year 1780 , the prices kept gradually rifing from fitteen Mr Bakehillings to a guinea, and from one to ten. In 1780 well reMr Bakewell let feveral at ten guineas each; and, what leeived fer is rather inexplicable, Mr Parkinfon of Quarndon let them. one the fame year for twenty-five guineas; a price which then aftonifned the whole country.

From that time to 1786 Mr Bakewoll's ftock rofe rapidly from ten to a hundred ruineas; and that year he let two thirds of one ram (referving one third of the ufual number of ewes to himfelf) to two principal breeders, for a hundred guineas each, the entire fervices of the ram being rated at three hundred guineas! Mr Bakewell making that year, by letting twenty rams onLy, more than a thoufand pounds !

Since that time the prizes have been ftill rifing. Four hundred guineas have been repeatedly given. Mr Dakewell, this year ( 1789 ) makes, fays Mr Marfhat, twelve hundred guineas by three rams (brothers, we believe); two thoufand of feven; and of his whole letting, full three thoufand guineas!
Befide this extraordinary fum made by Mr Bakewell, there are fix or feven other breeders who make from five hundred to a thoufand guineas each. T'he whole amount of monies produced that year in the Midland Counties, by letting rams of the inodern breed for one fcafon only, is eftimated, by thofe who are adequate to the fubject, at the almoft incredible fum of ten thoufand pounds.

Rams previous to the fearon are reduced from the The tre cumbrous fat fate in which they are fhown. The ufual ment of time of fending them out is the middle of September. the rams 'They are conveyed in carriages of two wheels with and choice fprings, or hung in flings, 20 or 30 miles a-day, fome- ewes. times to the diftance of 200 or 300 miles. They are not turned loofe among the ewes, but kept apart in a fmall inclofure, where a couple of ewes only are admitted at once. When the feafon is over every care is taken to make the rams look as fat and handfome as poffible.

In the choice of ewes the breeder is led by the fame criterions as in the choice of rams. Breed is the firft objest of confideration. Excellency, in any fpecies or variety of live-ftock, cannot be attained with any degree of certainty, let the male be ever fo excellent, unlefs the females employed likewife inherit a large proportion of the genuine blood, be the fpecies or variety what it may. Hence no prudent man ventures to give the higher prices for the Difhley rams, unlefs his ewes are deeply tinctured with the Difhley blood. Next to breed is flefh, fat, form, and wool.

After the lambs are weaned, the ewes are kept in common feeding places, without any alteration of paf-

\section*{S H E [ 346 ] S H E}

Sheep. ture, previous to their taking the ram. In winter they are kept on grafs, hay, turnips, and cabbages. As the heads of the modern breed are much finer than moft others, the ewes lamb with lefs difficulty.

The female lambs, on being weaned, are put to good keep, but have not fuch high indulgence fhown them as the males, the prevailing practice being to keep them from the rams the firf autumn.

At weaning time, or previoufly to the admiffion of the ram, the ewes are culled, to make room for the thaves or fhearlings, whofe fuperior blood and fafhion intitle them to a place in the breeding flock. In the work of culling, the ram-breeder and the mere grazier go by fomewhat different guides. The grazier's guide is principally age, feldom giving his ewes the ram after they are four fhear. The ram-breeder, on the contrary, goes chiefly by merit ; an ewe that has brought him a good ram or two is continued in the flock fo long as fhe will breed. There are inftances of ewes having been prolific to the tenth or twelfth year ; but in peneral the ewes of this breed go off at fix or feven thear.

In the practice of fome of the principal ram-breeders, the culling ewes are never fuffered to go out of their hands until after they are flaughtered, the breeders not only fatting them, but having them butchered, on their premifes. There are others, however, who fell them ; and fometimes at extraordinary prices. Three, four, and even fo high as ten, guineas each have been given for thefe outcafts.

There are in the flocks of feveral breeders ewes that would fetch at auction twenty guineas each. Mr Bakewell is in poffeffion of ewes which, if they were now put up to be fold to the beft bidder, would, it is eftimated, fetch no lefs than fifty each, and perhaps, through the prefent firit of contention, much higher prices.
Infructions The following inftructions for purchafing fheep, we for purcha- hope, will be acceptable to our country readers. fing fhcep.

The farmer fhould always buy his fheep from a worfe land than his own, and they fhould be big-boned, and have a long greafy wool, curling clofe and well. Thefe fheep always breed the fineft wool, and are alfo the moft approved of by the butcher for fale in the market. For the choice of fheep to breed, the ram muft be young, and his fkin of the fame colour with his wool, for the lambs will be of the fame colour with his fkin. He frould have a large long body; a broad forehead, round; and well rifing; large eyes; and ftraight and fhort noftrils. The polled fheep, that is, thofe which have no horns, are found to be the beft breeders. The ewe fhould have a broad back; a large bending neck; fmall, but fhort, clean, and nimble legs; and a thick, deep wool covering her all over.

To know whether they be found or not, the farmer fhould examine the wool that none of it ibe wanting, and fee that the gums be red, the teeth white and even, and the brifket-fkin red, the wool firm, the breath fweet, and the feet not hot. Two years old is the beft time for beginning to breed; and their firft lambs fhould not be kept too long, to weaken them by fuckling, but be fold as foon as conveniently may be. They will breed advantageouny till they are feven years old. The farmers have a method of knowing the age of a fheep, as a horfe's is known, by the mouth. When a cheep
is one fhear, as they exprefs it, it has two broad teeth
before; when it is two fhear, it will have four; when three, fix; and when four, eight. After this their mouths begin to break.

The difference of land makes a very great difference in the fheep. The fat paftures breed ftraight tall theep, and the barren hills and downs breed fquare fhort ones; woods and mountains breed tall and flender fheep; but the beft of all are thofe bred upon new-ploughed land and dry grounds. On the contrary, all wet and moift lands are bad for fheep, efpecially fuch as are fubject to be overflowed, and to have fand and dirt left on them. The falt marfhes are, however, an exception to this general rule, for their faltnefs makes amends for their moifture ; falt, by reafon of its drying quality, being of great advantage to fheep.

As to the time of putting the rams to the ewes, the \(W_{h} \mathrm{r}_{4}\) ra farmer muft confider at what time of the fpring his grafs ought to will be fit to maintain them and their lambs, and whe- be acini ther he has turnips to do it till the grafs comes; for ted to th very often both the ewes and lambs are deftroyed by the want of food; or if this does not happen, if the lambs are only ftinted in their. growth by it, it is an accident that they never recover. The ewe goes 20 weeks with lamb, and according to this it is eafy to calculate the proper time. The beft time for them to yean is in April, unlefs the owner has very forward grafs or turnips, or the fheep are field fheep. Where you have not inclofures to keep them in, then it may be proper they fhould yean-in January, that the lambs may be ftrong by May-day, and be able to follow the dam over the fallows and water-furrows; but then the lambs that come fo early mult have a great deal of care taken of them, and fo indeed fhould all other lambs at their firf falling, elfe while they are weak the crows and magpies will pick their eyes out.

When the fheep are turned into fields of wheat or rye to feed, it muft not be too rank at firft, for if it be, it generally throws them into fcourings. Ewes that are big fhould be kept but bare, for it is very dangerous to them to be fat at the time of their bringing forth their young. They may be well fed, indeed, like cows, a fortnight beforehand, to put them in heart. Mortimer's Hufbandry, p. 243.

The feeding fheep with turnips is one great advantage to the farmers. When they are made to eat turnips they foon fatten, but there is fome difficulty in bringing this about. The old ones always refule them at firit, and will fometimes faft three or four days, till almoft famifhed; but the young lambs fall to at once. The common way, in fome places, of turning a flock of fheep at large into a field of turnips, is very difadvantageous, for they will thus deftroy as many in a fortnight as would keep them a whole winter. There are three other ways of feeding them on this food, all of which have their feveral advantages.

The firt way is to divide the land by hurdles, and allow the fheep to come upon fuch a portion only at a time as they can eat in one day, and fo advance the feedine hurdles farther into the ground daily till all be eaten. fheep This is infinitely better than the former random method; but they never eat them clean even this way, but leave the bottoms and outfides fcooped in the ground : the people pull up thefe indeed with iron crooks, and lay them before the fheep again, but they are common-

\section*{S H E} rot, red-water, foot-rot and hoving, fcab, dunt, rickets, fly-Aruck, flux, and burfing. Of each of thefe we fhall give the beft defcription in our power, with the molt approved remedies.

The rot, which is a very pernicious difeafe, has of late engaged the attention of fcientific farmers. But neither its nature nor its caufe has yet been fully afcertained. Some valuable and judicious obfervations have, however, been made upon it, which ought to be circulated, as they may perhaps, in many cafes, furnifh an antidote for this malignant diftemper, or be the means of leading others to fome more efficacious remedy. Some have fuppofed the rot owing to the quick growth of grafs or herbs that grow in wet places. Without premifing, that all-bounteous Providence has given to evcry animal its peculiar tafte, by which it diftinguifhes the food proper for its prefervation and fupport, if nor vitiated by fortuitous circumftances, it feems very difficult to difcover on philofophical principles why the quick growth of grafs fhould render it nosious, or why any herb fhould at one feafon pro.
duee fatal effects, by the admiffion of pure water only into its component parts, which at other times is perfectly innocent, althongh brought to its utmot ftrength and maturity by the genial influence of the fun. Befides, the conftant practice of moft farmers in the kingdom, who with the greateft fecurity feed their meadows in the fpring, when the grafs fhoots quick and is full of juices, militates directly againft this opinion.

Mr Arthur Young, to whom agriculture is much indebted, afcribes this difeafe to moifture. In confirma. tion of this opinion, which has been generally adopted, we are informed, in the Bath Society papers *, by a cor- * Vol. I. refpondent, that there was a paddock adjoining to his art. xlvi. park which had for feveral years caufed the rot in moft of the Theep which were put into it. In 1769 he drained it, and from that time his fheep were free from this malady. But there are facts which render it doubtful that moifture is the fole caufe. We are told, the dry limed land in Derbyfhire wrill produce the rot as well as water meadows and ftagnant marhes; and that in fome wet grounds theep fuftain no injury for many weeks.

Without attempting to enumerate other hypothefes Its caufe, which the ingenious have formed on this fubject, we Shall purfue a different method in order to difcover the caufe. On diffecting theep that die of this diforder, a great number of infects called flukes (fee Fasciola) are found in the liver. That thefe flukes are the canfe of the rot, therefore, is evident ; but to explain how they come into the liver is not fo eafy. It is probable that they are fwallowed by the fheep along with their food while in the egg ftate. The eggs depofited in the tender germ are conveyed with the food into the ftomach and inteftines of the animals, whence they are received into the lacteal veffels, carried off in the chyle, and pafs into the blood; nor do they meet with any obftruction until they arrive at the capillary veffels of the liver. Here, as the blood filtrates throngh the ex. treme branches, anfwering to thofe of the vena porta in the human body, the fecerning veffels are too minute to admit the impregnated ova, which, adhering to the membrane, produce thofe animalculæ that feed upon the liver and deftroy the theep. They much refemble the flat fifh called plaice, are fometimes as large as a filver two-pence, and are found both in the liver and in the pipe (anfwering to that of the vena cava) which conveys the blood from the liver to the heart.

The common and moft obvious objection to that opinion is, that this infect is never found but in the liver, or in fome parts of the vifcera, of fheep that are difeafed more or lefs; and that they muft therefore be bred there. But this objection will lofe its force, when we confider that many infects undergo feveral changes, and exift under forms extremely different from each other. Some of them may therefore appear and be well known under one fhape, and not known to be the fame under a fecond or third. The fluke may be the laft fate of fome aquatic animal which we at prefent very well know under one or other of its previous forms.

If this be admitted, it is eafy to conceive that fheep may, on wet ground efpecially, take multitudes of thefe ova or eggs in with their food; and that the ftomach and vifcera of the fheep being a proper nidus for them, they of courfe hatch, and appearing in their fluke

\section*{S H E \(\left[\begin{array}{ll}348\end{array}\right] \quad\) S H E}
or laft ftate, feed on the liver of the animal, and occafion this diforder.

It is a fingular fact, "that no ewe ever has the rot while the has a lamb hy her fide." The reafon of this may be, that the impregnated ovum paffes into the milk, and never arrives at the liver. The rot is fatal to fheep, hares, and rabbits, and fometimes to calves ; but never infefts animals of a larser fize.

Miller fays that parfey is a good remedy for the rot in fheep. Perhaps a ftrong decoction of this plant, or the oil extracted from its feeds, might be of fervice. Salt is alfo a ufeful remedy. It feems to be an acknowledged fact that falt marfhes never produce the rot. Salt indeed is perraicious to mott infects. Common falt and water expel worms from the human body; and fea-weed, if laid in a garden, will drive away infeeto; but if the falt is feparated by fteeping it in the pureft fpring-water for a few days, it abounds with animalcule of various fpecies.

Lifle, in his book of hufloandry, informs us of a farmer who cured his whole flock of the rot by giving each Theep a handful of Spanifh falt for five or fix mornings fucceffively. The hint was probably taken from the Spaniards, who frequently give their fheep falt to keep them healthy. On fome farms perhaps the utmoft caution cannot always prevent this diforder. In wet and warm feafons the prudent farmer will remove his fheep from the lands liable to rot. Thofe who have it not in their power to do this may give each theep a fpoonful of common falt, with the fame quantity of flour, in a quarter of a pint of water, once or twice a-week. When the rot is recently taken, the fame remedy given four or five mornings fucceffively will in all probability effect a cure. The addition of the flour and wàter (in the opinion of Mr Price of Salifbury, to whofe excellent paper in the Bath Society's Tranfactions we own ourfelves much indebted) will not only abate the pungency of the falt, but dif. pofe it to mix with the chyle in a more gentle and eflicacious manner.

A farmer of a confiderable lordhhip in Bohemia vifiting the hot-wells of Carlfoad, related how he preferved his flocks of fheep from the mortal dittemper which raged in the wet year 1769 , of which fo many perifhed. His prefervative was very fimple and very cheap: "He fed thers every night, when turned under a fhed, cover, or fables, with hafhed fodder ftraw ; and, by eating it greedily, they all efcaped."
" Red-zvater is a diforder moft prevalent on wet grounds. I have heard (fays Mr Arthur Young) that it has fometimes been cured by tapping, as for a dropfy. This operation is done on one fide of the belly towards the flank, juft below the wool.
"The foot-rot and boving, which is very common on low fenny grounds, is cured by keeping the part clean, and lying at reft in a dry pafture."
The \(f=a b\) is a cutaneous difeafe owing to an impurity of the blood, and is moft prevalent in wet lands or in rainy feafons: - It is cured by tobacco-water, brim-
ftone, and alum, boiled together, and then pubbed over the flacep. If only partial, tar and greafe may be fufficient. But the fimpleft and moft efficacious.remedy for this difeafe was communicated to the Society for the Encouragement of Arts, \&c, by Sir Jofeph Banks.
"Take one pound of quickfilver, half a pound of Rem Venice turpentine, half a pint of oil of turpentiue, and cona four pounds of hogs lard (c). Let them be rubbed in a ed b mortar till the quickfilver is thoroughly incorporated Jofe with the other ingredients ; for the proper noode of doing which, it may be proper to take the advice, or even the affitance, of fome apothecary or other perfon ufed to make fuch mixtures.
"The method of ufing the ointment is this: Beginning at the head of the fheep, and proceecing from between the ears along the back to the end of the tail, the wool is to be divided in a furrow till the firin caa be touched; and as the furrow is made, the finger flightly dipped in the ointment is to be drawn along the bottom of it, where it will leave a blue flain on the fkin and adjoining wool : from this furrow fimilar ones mult be drawn down the floulders and thighs to the legs, as far as they are woolly; and if the aniumal is much infected, two more flould be drawn along each fide parallel to that on the back, and one down eachs fide between the fore and hind legs.
" Immediately after being dreffied, it is ufual to tura the fheep among other flock, without any fear of the infection being communicated; and there is fcarcely an inftance of a fheep fuffering any injury from the application. In a few days the blotches dry up, the iacho ing ceafes, and the animal is completely cured : it is generally, however, thought proper not to delay the operation beyond Michaelmas.
" The hippobofra ovina, called in Lincolnfhire /heep fagg, an animal well known to all fhepherde, which lives among the wool, and is hurfful to the thriving of fleep both by the pain its bite occafions: and the blood it fucks, is deffroyed by this application, and the wool is not at all injured. Our wool-buyers purchafe the flecees on which the flain of the ointment is vifible, rather in preference to others, from an opinion that the ufe of it having preferved the animal from bein! vexed either with the fcab or faggs, the wook is lefs. liable to the defects of joints or knots; a fault obferved to proceed from every fudden flop in the thriving of the animals either from want of food or from difeafe.
"This mode of curing was brought into that part of Lincolnfhire where my property is fituated about 12 years ago, by Mr Steplenfon of Mareham, and is now fo generally received, that the fcab, which ufed to be the terror of the farmers, and which frequently deterred the more careful of them from taking the advantage of pafturing their fheep in the fertile and extenfive commons with which that diltrict abounds, is uo longer regarded with any apprehenfion: by far the moll of them have their flock anointed in autumn, when they return from the common, whether they fhow any fymptons of fcab or not ; and having done fo, conclude
thens
(c) By fome unaccountable miftake the laft ingredient, the four pounds of hogs lard, is omitted in the rereipt publifhed in the Tranfactions of the Society; a circumftance that might be productive of bad effects. The leaf which contained the receipt has fince been cancelled, and a new one printed.

\section*{S H I [ 349 ] S H E}
them fafe for fome time from either giving or receiving infection. There are people who employ thentelves in the bufinels, and contrast to anoint our large fleep at five fillings a fcore, infuring for that price the fuccefs of the operation; that is, agreeing, in cafe many of the fheep break out afrefh, to repeat the operation gratis even fome months afterwards."
The dunt is a diftemper caufed by a bladder of water gathering in the head. No cure for this has yet been difcovered.

The rickets is a hereditary difeafe for which no antidote is known. The firf fymptom is a kind of lightbeadednefs, which makes the affected fheep appear wilder than ufual when the fhepherd or any perfon approaches him. He hounces up fuddenly from his lare, and runs to a diftance, as though he were purfued by dogs. In the fecond face the principal fymptom is the fheep's rubbing himfelf againft trees, \&c. with fuch fury as to pull off his wool and tear away his flefh. " The diftreffed animal has now a violent itching in his fkin, the effect of an highly inflamed blood; but it does not appear that there is ever any cutaneons eruption or falutary critical difcharge. In fhort, from all circumftances, the fever appears now to be at its heiglit." The latt flase of this difeafe "feems only to be the progrefs of diffolution, after an unfavourable crifis. The poor animal, as condemned by Nature, appears ftupid, walks irregularly (whence probably the name rickets), generally: lies, and eats little: thefe fymptoms increafe in degree till death, which follows a general confumption, as appears upon diffection of the carcafe; the juices and even folids having fuffered a general diffolution."
In order to difocover the feat.and nature of this difeafe, fheep that dic of it ought to be diffected. This is faid to have been done by one gentleman, Mr Beal; and he found in the brain or membranes adjoining a maggot about a quarter of an inch lorg, and of a browniff colour. A few experiments might eafily determine this fact.

The fly:fruck is cured by clipping the wool: off as far as infected, and rubbing the parts dry with lime or wood-athes ; curriers oil will heal the wounds, and prevent their being ftruck any more; or they may be citred with care, without clipping, with oil of turpentine, which will kill all the vermin where it goes; but the former is the fureft way.
'The flux is another difeafe to which. Theep are fubject. The beft remedy is faid to be, to houfe the theep imnediately when this diftemper appears, to keep them very warm, and feed them on dry hay, giving them frequent glifters of warm milk and water. Thee caufe of that diffemper is either their feeding on wet lands, or on grafs that is become moffy by the lands having been fed many years without being ploughed. When the farmer perceives his fheep-walks to become moffy, or to produce bad grafs, he flould either plough or manure with hot lime, making kilus either very near or in the fheep walks, becaufe the hotter the lime is put on, the fweeter the grafs comes up, and that early in the year.
Burfing, or as it is called in fome places the blaft, attacks fheep when driven into fref grafs or young clover. They overeat themfelves, foam at the mouth, fwell exceedingly, breathe very: quick and fhort, then jump up, and infantly fall down dead. In this cafe \({ }_{3}\)
the oniy chañee of faying their life is by fabbing them in the maw with an interineat made for the purpofe. The influment is a hollow tube, with a asiated weapon paffing through it. A hole is made with ins pointed weapon; which is immediately withdrawn, and the hole is kept open by inferting the tube till the wind is difcharged.
Sheep are infefted with worms in their nofe called Account of affrus oves, and produced from the egg of a large two. the nofewinged fly. The frontal linufes above the nofe in theep whith in and other aumals are the places where thefe worms live fict fheep. and attain their full growth. Thefe finsufes are always full of a foft white matter, which furninhes thefe worms with a proper nourifliment, and are fuffeciently large for their habitation; and when they have here acquired their deftined growth, in which they are fit to undergo their changes for the fly-ftate, they leave their oid habitation, and, falling to the earth, bury themfelves there; and when thefe are hatched into flies, the female, when fhe lias been impregnated by the male, knows that the nofe of a fheep or other animal is the only place for her to depofit her egrs; in ot der to thein coming to maturity. Mr Vallifuieri, to whom the world owes fo many difcoveries in the infeet clafs, is the firft who has given any true account of the origin of thefe worms. But though their true hiftory had been till that time unknown, the creatures themflves were very early difcovered, and many ages fince were efteemed great medicines in epilepfies.

The fly produced from this worm has all the time of its life a very lazy difpofition, and does not like to make any ufe either of its legs or wings. Its head and corfelet together are about as long as its body, which is compuled of five rings, ftreaked on the back; a pale yellow and brown are there difpoled in irregular fpots; the belly is of the fame colours, but they are there more regularly difpofed, for the brawn here makes three lines, one in the middle, and one on eacl fide, and all the intermediate fpaces are yellow. The wings are nearly of the fame length with the body, and are a little inclinerd in their pofition, fo as to lie upon the body : they do not, however, cover it ; but a naked fpace is left between them. 'The ailerons or petty wings which are found under each of the wings are of a whitifh colour, and per fectly cover the balancers, fo that they are not to be feen without lifting up thefe.

The fly will live two months a'ter it is firf produced, but will take no nourifment of any kind; and porfibly it may be of the fame nature with the butterfies, which never take any food during the whole time of their living in that ftate. Reaumur, Hift. Inf. vol iv. P. 552 , \&c.

T'o find a proper compofition for marking fheep is compuia matter of great importance, as great quantities of wool tion for are every year rendered ufelefs by the pitch and tar marking with which they are ufually marked. 'The requifite fheep. qualities for fuch a compofition are, that it be cheap, that the colour be ftrong and lafting, fo as to bear the changes of weather, and not to injure the wool. Dr Lewis recommends for this purpofe melted tallow, with fo much charcoal in fine powder firred into it as is fufu ficient to make it of a full black colour, and of a thick confiftence. This mixture, being applied warm with a marking iron, on pieces of flannel, quickly fixed or haro dened, bore moderate rubbing, refifted the fun and rain,

\section*{S H E [ \(\left.35^{\circ}\right] \quad \mathrm{SHE}\)}
and yet could be wafhed out freely with foap, or ley, or fale urine. In order to render it ftill more durable, and prevent its being rubbed off, with the tallow may be melted an eighth, fixth, or fourth, of its weight of tar, which will readily wafh out along with it from the wool. Lewis's Com. Phil. Techn. p. 361.

Shefe-Stealing. See 'Theft.
SHEERING, in the fta-language. When a fhip is not fteered fteadily, they fay the fheers, or goes fheering; or when, at anchor, fhe goes in and out by means of the current of the tide, they alfo fay fhe fheers.

SHEERNESS, a fort in Kent, feated on the point where the river Medway falls into the Thames. It was built by king Charles II. after the infult of the Dutch, who burnt the men of war at Chatham. The buildings belonging to it, in which the officers lodge, make a pretty little neat town; and there is alfo a yard and a dock, a chapel and a chaplain. Mr Lyons, who failed with the Honourable Captain Phipps in his voyage towards the pole, fixed the longitude of Sheernefs to \(0.48^{\prime}\). E. its latitude \(5 \mathrm{I}^{\circ} 25^{\prime}\).

SHEERS, a name given to an engine ufed to hoift or difplace the lower mafts of a thip. The fheers employed for this purpofe in the royal navy are compofed of feveral long mafts, whofe heels reft upon the fide of the luulk, and having their heads declining outward from the perpendicular, fo as to hang over the veffel whofe mafts are to be fixed or difplaced. The tackles, which extend from the head of the malt to the fheerheads, are intended to pull in the latter toward the maft head, particularly when they are charged with the weight of a maft after it is raifed out of any fhip, which is performed by ftrong tackles depending from the fheer-heads. The effort of thefe tackles is produced by two capfterns, fixed on the deck for this purpofe.

In merchant fhips this machine is compofed of two mafts or props, erected in the fame veffel wherein the maft is to be planted, or from whence it is to be removed. The lower ends of thefe props reft on the oppofite fides of the deck, and their upper parts are faftened acrofs, fo as that a tackle which hangs from the interfection may be almoft perpendicularly above the ftation of the maft to which the mechanical powers are applied. Thefe fheers are fecured by ftays, which extend forward and aft to the oppofite extremities of the veffel.

\section*{SHeet.Lead. See Plumbery.}

Sheet, in fea-language, a rope faftened to one or both the lower corners of a fail, to extend and retain it in a particular ftation. When a thip fails with a lateral wind, the lower comer of the main and fore fail are faftened by a tack and a fheet; the former being to windward, and the latter to leeward; the tack, however, is entirely diffufed with a ftern wind, whereas the fail is never fpread without the affiftance of one or both of the fheets. The ftay-fails and fludding-fails have only one tack and one fheet each : the ftay-fail tacks are always faftened forward, and the fheet drawn aft; but the ftud-ding-fail tack draws the under clue of the fail to the extremity of the boom, whereas the fheet is employed to extend the inmoft.

SHEFFIELD, a town in the welt riding of Yorkfhire, about 1.62 miles from London, is a large, thriving, populous town on the borders of Derbyfhire; bas a fine ftone bridge over the Don, and another over the Sheaf, and a church built in the reign of Henry I.

It had a cafte built in the reign of Henry III, in sho which, or elfe in the manor-houfe of the Park, Mary Queen of Scots was prifoner 16 or 17 years; but after the death of Charles I. it was, with feveral others, by: order of parliament demolifhed. In 1673 ars hofpital was erected here, and endowed with 2001 . a-year. 'There is a charity. fchool for 30 boys, and another for 30 girls. This town has been noted feveral hundred years for cutlers and fmiths manufactures, which were encouraged and advanced by the neighbouring mines of iron, particularly for files and knives, or whittles; for the laft of which efpecially it has been a ftaple for above 300 years; and it is reputed to excel Birmingham in thefe wares, as much as it ?s furpaffed by it in locks, hinges, nails, and polifhed fteel. The firt mills in England for turning grindfones were alfo fet up here. The houfes look black from the continual fmoke of the forges. Here are 600 matter cutlers, incorporated by the fyle of the Cutlers of Hallamßire (of which this is reckoned the chief town), who employ not lefs than 40,000 perfons in the iron manufactures; and each of the mafters gives a particular tamp to his wares. There is a large market on Tuefday for many commodities, but efpecially for corn, which is bought up here for the whole Weft Riding, Derbyfhire, and Nottinghamfhire. It has fairs on Tuefday after Trinity-Sunday, and November 28. In the new market-place, erected by the Duke of Norfolk, the fhambles are built upon a moft excellent plan, and ftrongly inclofed. There are feveral other new good buildings, fuch as a large and elegant octagon chapel belonging to the hofpital or almshoufes; likewife a good affembly-room and theatre. We muft not omit the large fteam-engine, lately finifhed, for the purpofe of polifhing and grinding the various forts of hardware. The parifh being very large, as well as populous, Mary I. incorporated 12 of the chief inhabitants, and their fucceffors for ever, by the ftyle of the Trwelve Capital Burgeffes of Sheffield, empowering them to elect and ordain three priefts to affitt the vicar, who were to be paid out of certain lands and rents which the gave out of the crown; and fince this fettlement two more chapels have been built in two hamlets of this parifh, which are ferved by two of the affiftants, while the third, in his turn, helps the vicar in his parifh.church. James I. founded a free grammar-fchool here, and appointed I3 fchool burgeffes to manage the revenue, and appoint the matter and ufher. A new chapel was built lately by the contributions of the people of the town and of the neighbouring nobility and gentry. Water is conveyed by pipes into Sheffield, whofe inhabitants pay but a moderate rent for it. In the neighbourhood there are fome mines of alum. The remains of the Roman fortification between this town and Rotheram, which is fix miles lower down the river, are ftill vifible; and here is alfo the famous trench of five miles long, by fome called Devil's or Dane's Bank, and by others Kemp Bank and Temple's Bank. W. Long. 1. 29. N. Lat. 53. 20.
Sheffielt (John), duke of Buckinghamhire, an eminent writer of the laft and prefent century, of great perfonal bravery, and an able minifter of fate, was born about 1650 . He loft his father at nine years of age ; and his mother marrying lord Offulfton, the care of his education was left entirely to a governor, who did not greatly improve him in his ftudies. Finding that he was deficient in many parts

\section*{S H E [ 35 I\(] \quad \mathrm{S}\) H E}
, of literature, he refolved to devote a certain number of hours every day to his fudies; and thereby improved himfelf to the degrec of learning he afterwards attained. Though poffeffed of a good eftate, he did not abandon himfelf to pleafure and indolence, but entered a volunteer in the fecond Dutch war; and accordingly was in that famous naval engagement where the duke of York commanded as admiral : on which occafion his lordhip behaved fo gallantly, that he was appointed commander of the Royal Catharine. He afterward made a campaign in the French fervice under M. de Turenne. As ' Tangier was in danger of being taken by the Moors, he offered to head the forces which were fent to defend it ; and accordingly was appointed to command them. He was then earl of Mulgrave, and one of the lords of the bed-chamber to king Charles II. The Moors retired on the approach of his majefty's forces; and the refult of the expedition was the blowing up of Tangier. He continued in feveral great pofts during the fhort reign of king James II. till that unfortunate prince was dethroned. Lord Mulgrave, though he paid his refpects to king William before he was advanced to the throne, yet did not accept of any poft in the government till fome years after. In the fixth year of William and Mary he was created marquis of Normanby in the county of Lincoln. He was one of the moft active and zealous oppofers of the bill which took away Sir John Fenwick's life ; and exerted the utmoft vigour in carrying through the Treafon Bill, and the bill for Triennial Parliaments. He enjoyed fome confiderable pofts under king William, and enjoyed much of his favour and confidence. In 1702 he was fworn lord privy-feal; and in the fame year was appointed one of the commiffioners to treat of an union between England and Scotland. In 1703 he was created duke of Normanby, and foon after duke of Búckinghamfliire. In 171 he was made fteward of her majefty's houfehold, and prefident of the council. During queen Anne's reign he was but once out of employment ; and then he voluntarily refigned, being attached to what were called the Tory principles. Her majefty offered to make him lord-chancellor; but he declined the office. He was inftrumental in the change of the miniftry in 1710. A circumftance that reffects the higheft honour on him is, the vigour with which he acted in favour of the unhappy Catalans, who afterward were fo inhumanly facrificed. He was furvived by only one legitimate fon (who died at Rome in 1735) ; but left feveral natural children. His worft enemies allow that he lived on very good terms with his laft wife, natural daughter to king James II. the late duchefs of Buckingham, a lady who always behaved with a dignity fuit. able to the daughter of a king. He died in 172 y . He was adnired by the poets of his age ; by Dryden, Prior, and Garth. His Effay on Poetry was applauded by Addifon, and his Rehearfal is ftill read with pleafure. His writings were fplendidly printed in 1723 , in two volumes 4 to ; and have fince been reprinted in 1729 , in two vols 8 vo . The firft contains his poems on various fubjects: the fecond, his profe works; which confift of hiftorical memoirs, fpeeches in parliament, characters, dialogues, critical obfervations, effays, and letters. It may be proper to obferve, that the edition of 1.729 is caftrated ; fome particulars relating to the revolution in that of 1723 having given offence.

SHEFFIELDIA, in botany; a genus of plants
belonging to the clafs of pentandria, and to the order of monogynia. The corolla is bell-fhaped; the filaments are 10 , of which every fecond is barren. The capfule confifts of one cell, which has four valves. There is only one fpecies, the repens.

SHEIK, in the oriental cuftoms, the perfon who has the care of the mofques in Egypt ; his duty is the fame as that of the imams at Conftantinople. There are more or fewer of thefe to every mofque, according to its fize or revenue. One of thefe is head over the reft, and anfwers to a parih-prieft with us; and has. under him, in large mofques, the readers, and people who cry out to go to prayers; but in fmall mofques. the fheik is obliged to do all this himfelf. In fuch it is their bufinefs to open the mofque, to cry to prayers, and to begin their fhort devotions at the head of the congregation, who ftand rank and file in great order, and make all their motions together. Every Friday the fheik makes an harangue to his congregation.
\(S_{\text {HEIK-Bellet, }}\) the name of an officer in the Oriental nations. In Egypt the fheik-bellet is the head of a city, and is appointed by the pacha. The bufinefs of this officer is to take care that no innovations be made which may be prejudicial to the Porte, and that they fend no orders which may hurt the liberties of the people. But all his authority depends on his credit: and interef, not his office : for the government of Egypt is of fuch a kind, that often the people of the leaft power by their pofts have the greateft influence; and a caia of the janizaries or Arabs, and fometimes one of their meaneft officers, an oda-bahha, finds means, by his parts and abilities, to govern all things.

SHEILDS. See Shields.
SHEKEL, the name of a weight and coin current among the ancient Jews. Dr Arbuthnot makes the weight of the fhekel equal to 9 pennyweights \(2 \frac{4}{7}\) grains: Troy weight ; and the value equal to \(2 \mathrm{~s} .3 \frac{3}{8} \mathrm{~d}\). Stexling. The golden thekel was worth L. I: \(6: 6\).

SHELDRAKE, in ornithology. See Anas.
SHELF, among miners, the fame with what they otherwife call faft ground or faft country; being that part of the internal fructure of the earth which they find lying even and in an orderly manner, and evidently retaining its primitive form and fituation.

SHELL, in natural hiftory, a hard, and, as it were, fony covering, with which certain animals are defended, and thence called hell-fifa.

The fingular regularity, beauty, and delicacy in the Formation ftructure of the fhells of animals, and the variety and of fhelis. brilliancy in the colouring of many of them, at the fame time that they frike the attention of the moft incurious obfervers, have at all times excited philofophers to inquire into and detect, if poffible, the caufes and manner of their formation. But the attempts of naturalifts, ancient and modern, to difcover this procefs, have confantly proved unfuccefsful. M. de Reaumur hitherto appears alone to have given a plaufible account, at leaft; of the formation of the fhell of the garden-fnail in particular, founded on a courfe of very ingenious experiments, related in the Paris Memoirs *. He there * See Memso endeavours to fhow, that this fubftance is produced de l'Acad: merely by the perfpirable matter of the animal conden-anné \(1709_{0}\). fing and afterwards hardening on its furface, and accord- p. 4\%5. ingly taking the figure of its body, which has perform- Ectit. de ed the office of a mould to it; in fhort, that the fhell in 12 mo . of a fnail, and, as he fuppofed, of all other animals pof-
feffed

\section*{S H E 「 352 〕思}

Teffed of mells，was asly the produet of a vifeous tranf－ udation from the body of the animal，containing earthy particles united by mere juxtapofition．This hypo－ thefig，however，is liable to very great and infur－ mountable difficulties，if we apply it to the formation of fome of the noft common thells：for how，accord－ ing to this fyftem，it may be afked，сан the oyfter， for inftance，confidered fimply as a mould，form to it－ relf a covering fo much exceeding its own body in di． mentions？

M．Heriffant，in the Memoirs of the Academy of Sciences for 1766 ，has difcovered the iftricture of thells to be organical．In the numerous experiments that he made on an immenfe number，and a very great va－ riety，of animal fhells，he conftantly found that they were compofed of two diftinct fubftances ；one of which is a cretaceous or earthy matter；and the other ap－ peared，from many experiments made upon it by burning，diftilation，and otherwife，to be evidently of an animal nature．Thefe two fubftances he dexterour－ ly feparated from each other by a very eafy chemical analylis；by the gentle operation of which they were exhibited diftinctly to view，withotat any material alte． ration from the action of the folvent，or inftrument em． ployed for that purpofe．On an entire fhell or a fragment of one，contained in a glafs veffel，he poured a fufficient quantity of the nitrous acid，conficterably diluted either with water or－\｛pirit of wine．After the ＊quor has diffolved all the earthy part of the fhell （which may be collected after precipitation by a fixed or volatile alkali），there remaine foating in it a foft fub－ tance，confiting of innumerable membranes of a reti－ form appearance，and difpofed，in different thells，in a wariety of pofitions，which conftitutes the animal－part of it．This，as it has not been affected by the folvent， retains the exact figure of the fell；and，on being view－ ed through a microfcope，exhibits fatisfactory proofs of a vafcular and organical fructure．He fhows that this membranous fubftance is an appendix to the body of the animal，or a continuation of the tendinous fibres that compofe the ligaments by which it is fixed to its thell； and that this laft owes its hardnefs to the earthy par． ticles conveyed through the veffels of the animal，which fix themfelves into，and incruft，as it ware，the mefhes formed by the reticular filaments of which this mem－ branous fubftance is compofed．In the：fhell called por－ celaine，in particular，the delicacy of thefe membranes was fo great，that he was obliged to put it into fpirit of wine，to which he had the patience to add a fingle drop of fpirit of nitre day by day，for the fpace of two months；left the air generated，or let loofe by the ac－ tion of the acid on the earthy fubtance，fhould tear the compages of its fine membranous ftructure into that． ters；as it certainly would have done in a more hafty and lefs gentle diffolution．The delicate reticulated film，left after this operation，had all the tenuity of a fpider＇s web；and accordingly he does not attempt to delineate its organization．In other thells he employed even five or fix months in demonftrating the complica－ ted membranous fructure of this animal－fubftance by this kind of chemical anatomy．In general，however，the
procefs does not require much time．

Of the many fingular configurations and appearances of the membranous part of different thells，which are defribed in this memoir，and are delineated in feveral well executed plates，we fall mention only，as a fpe．
cimen，the eurions membranous Arusture obferees ha the lamine of mother－of－pearl，and other fhella of the fame kind，after having been expofed to the operation of the auther＇s folvent．Befide the great variety of fixed or permanent colours with which he found the animal－flaments of thefe thells to be adorned，it is known，that the fhell iffelf．prefents to the view a fue－ ceffion of rich and changeable colours，the production of which he eafily explaius from the contigurations of their membranes，Nature，he obferves，always mas． nificent in her defigns，but fingularly frugal in the exe－ cution of them，produces thefe brilliant decorations at a very fmall expence．The menibranous fubitance av bove－mentioned is plaited and rumpled，as it were，in fuch a manner，that its exterior laminw，incrufted with their earthy and femi－tranfparent matter，form an infi－ nite number of little prifms，placed in all kinds of direc． tions，which refract the rays of light，and produce all the changes of colour obfervable in thefe fhells．

With refpect to the figures and colours of fhella，it is obferved，that river thells have not fo agreeable or di－ verfified a colour as the land and fea fhells；but the vis riety in the fisure，colours，and other characters of fen Thells，is almoft infinite．The number of diftimet fyecies we find in the cabinets of the curious is very great；and doubtlefs the decp bottoms of the fea，and the thores yet unexplored contain multitudes fill unknown to us． Even the fame fpecies differ in fome degree in almoit every indlvidual ；fo that it is rare to find any two fhells which are alike in all refpects．

This wonderful variety，lowever，is not all the pro－whe duce of one fea or one country；the different parts of the the world afford us their different beauties，Bonaniheau obferves，that the mof beautiful fhells we are acquaint the！ ed with come from the Eaft Indies and from the Red \({ }^{\text {ob }}\) fea．This is in fome degree countenanced by what is found to this day；and from the general obfervations of the curious，it feems，that the fun，by the great heat that it gives to the countries near the line，exalts the colours of the fhells prodnced there，and gives them a luttre and brilliancy that thofe of colder climates always want：and it may be，that the waters of thofe vait reas， which are not lebject to be weakened by fref rivers， give a nourifhment to the fifh，that may add to the brilo liancy of their flells．

The fhores of Affa furnifh us with the pearl－oyfters shesl and fcallops in great perfection．Abont Amboyna are fount fornd the moft beautiful fpecimens of the cabbage－fhell，A fia． the arroloir，the ducal mantle，and the coral oytrers，or eclimated oyfters．Here alfo are found a great variety of extremely beautiful mufcles，telline，and volutes； fome fine buccinums，and the fhell called the Ethiopian crown，in its greateft perfection．The dolia，the mu． rices，and the caffandre，are alfo found on thefe coafts in great beauty．Many elegant fuails and fcrew－fheils are alfo brought fiom thence；and finally，the ferapion and fpider－hetls．The Maldive and Philippine illands， Bengal，and the coait of Malabar，abound with the mot elegant of all the－fpecies of fnails，and furnith many other kinds of mells in great abundance and perfection．China abounds in the finett fpecies of porcelain fhells，and has alfo a great variety of beautiful fnails．Japan furnifhes us with all the thicker and larger bivalves；and the ifle of Cyprus is famous above all other parts of the world for the beauty and varicty of the putella or limpet found there．

\section*{S H E [ \(\begin{array}{lll}353 & ] & \text { S II E }\end{array}\)}

America affords many very clegant fhells, but neither in fo great abundance nor beauty as the thores of Afia. Panama is famous for the cylinders or rhombi, and we have befide, from the fame place, fome good porcelains, and a very fine fpecies of dolium, or concba glolofa, called from this place the Panama purple foell. One of the moft beautiful of the cylinders is alfo known among our naturalits under the name of the Ponama Bell. About Brafil, and in the gulf of Mexico, there are found murices and dolia of extreme beauty : and alfo a great variety of porcelains, purpure, pectens, neritix, bucardiz or heart-fhells, and clegant limpets. The ifle of Cayenne affords one of the moft beautiful of the buccinum kind, and the Midas ear is found principally about this place. Jamaica and the ifland of Barbadoes have their thores covered with porcelains, chame, and buccina; and at St Domingo there are found almolt all the fame fpecies of fhells that we have from the Eatt Indies; only they are lefs beautiful, and the colours more pale and dead. The pearl-oytter is found alfo on this coaft, but finallew than in the Perfian gulf. At Martinico there are found in general the fame fhells as at St Domingo, but yet lefs beantifu!. About Canada are found the violet chame, and the lakes of that country abound with mufcles of a very elegant pale blue and pale red colours. Some fpecies of thefe are remarkahly light and thin; others are very thick and heavy. . The Creat Bank of Newfoundland is very barren in fhells: the principal kind found there are mufcles of feveral fpecies, fome of which are of confiderable beauty. A. bout Carthagena there are many mother-of-pearl fhells, but they are not of fo brilliant colours as thofe of the Perfian gulf. The ifland of Magellan, at the fouthern point of America, furnilhes us with a very remarkable fpecies of mufele called by its name; and feveral very degant fuecies of limpets are found there, particulally the \(p\) yramidal.

In Africa, on the coaft of Guinea, there is a prodigious quantity of that fmall Tpecies of porcelain which is ufed there as money; and there is another fpecies of porcelain on the fame coalt which is all over white: the women make bracelets of thefe, and the people of the Levant adorn their hair with them. The coaft of Zanguebar is very rich in thelis: we find there a vat variety of the large porcelains, many of them of great beauty; and the nux maris or fea-nur is very frequent there. Befude thefe, and many other fhells, there are found on this coalt all the fpecies of nautili, many of which are very beautiful. The Canary ifles abound with a vaft varicty of the murices, and fome other good thells; and we have from Madeira great vaw riety of the echini or fea-eggs different from thofe of the European feas. Several fpecies of mufcles are alfo common there, and the auris marina is nowhere more abundant.: The Red fea is beyond all other parts of the world abundant in fhells, fcarce any kind is wanting there; but what we principally have from thence are the purpurse, porcelaina, and echini marini.

The Myditerranean and Northern ocean contain a great variety of fhells, and many of very remarkable ele. gance and beauty ; they are upon the whole, however, greatly inferior to thofe of the Eaft Indies. The Me. diterranean abounds much more in fhells than the Ocean. The gulf of Tarentum affords great variety of purpurse, of porcelains, nautili, and elegant oyfters; the coatts of Naples and Sardinia afford alfo the fame, and Vob. XXVII. Sart. I.
with them a vat number of the folens of all the known
Shells. fpecies. The ifland of Sicily is famous for a very ele. gant kind of oyfter which is white all over; pinnæ ma. rine and porcelains are alfo found in great plenty there, with telline and chamæ of many fpecies, and a great variety of other beantiful flells. Corfica is famous, beyond all other places, for vait quantities of the pinne marinæ; and many nther very beantiful fhells are found there. (Litter, Hift. Conchyl.) About Syracufe are found the gondola fhell, the alated murex, and a great varicty of elegant fnails, with fome of the dolia and nerite. The Adriatic fea, or gulf of Venice, is lefs furnifhed with frells than almott any of the feas thereabout. Mufcles and oyfters of feveral fpecies are however found there, and fome of the cordiform or heartfhells; there are alfo fome tellinæ. About Ancona there are found vatt numbers of the pholades buried in ftone; and the aures marine are particularly frequent about Puzzoli. (Bonani, Recreat. Ment. et Ocul).

Ihe ports of Marfeilles, Toulon, and Antibes, are full of pinne marinx, mufcles, tellinx, and chamæ. The coatts of Bretagne afford grear numbers of the conchæ anatiferes and pouffepicds; they are found on old rotten boards, on fea fubftances, and among cluAters of fponges. The other ports of France, as Rochelle, Dunkirk, Breft, St Maloes, and others, furnifh oyfters excellent for the table, but of the common kind, and of no beauty in their fhells ; great numbers of mufcles are alfo found there; and the common tellinæ, the onion-peel oyfters, the folens, and conchæ anatifere, are alfo frequent there. At Granville, in Lower Normandy, there are found very beautitul pectens, and fome of the cordiform or heartfhells.
Our own Englifh coatts are not the lealt fruitful in of Britaing Thells, tho' they do not produce fuch elegantly painted ones as the Indies. Abont Plymouth are found oytters, mufcles, and folens, in great abundance; and there, and on moft of our other fhores, are numbers of the atures marinæ and dentalia, with pectens, which are excellent food; and many elegant fpecies of the chamæ and tellinæ are fifhed up in the fear about Scarborough and other places. Ireland affords us great numbers of mufcles, and fome very elegant fcallop-fhells in great abundance, and the pholades are frequent on molt of our fhores. We have alfo great variety of the buccina and cochlex, fome volutas 3 and, on the Guernfey coaft, a peculiarly beautiful fnail, called thence the Guernjey-fnail.

The coatts of Spain and Portugal afford much the Of Spaia fame fpecies of Thells with the Eaft Indies, but they are and Portuof much fainter colours, and greatly inferior in beauty. \(\mathrm{gal}^{2}\) \& c . There are, according to Tavernier and others, fome rivers in Bavaria in which there are found pearls of a fine water. About Cadiz there are found very large pinno marina, and fome fine buccina. The ines of Majorca and Minorca afford a great variety of extremely elegant Thells. The pinnx marinz are alfo very numerous there, and their filk is wrought into gloves, fluckings, and other thing3. The Baltic affords a great many beautiful Species, but particulaly an orange-coloured pecten, or fcallop-fhell, which is not found in any other part of the world.

The frefh water fhells are found much more fre-fert, wa quently, and in much greater plenty than the feater fhells. kinds; there is fcarce a pond, a ditch, or a river of freh water in any part of the world in which there

\section*{S H E [ 354 ] S H E}

Shells. are not found valt numbers of thefe fhells with the fifh living in them. All thefe fhells are fmall, and they are of very little beauty, being ufually of a plain greyifh or brownifh colour. Our ditches afford us chamæ, buccina, neritæ, and fome patellæ; but the Nile, and fome other rivers, furnifhed the ancients with a feccies of tellina which was large and eatable, and fo much fuperior to the common fea tellina in flavour, that it is commonly known by the name of teilina regia, "the royal tellina." We have a fmall fpecies of buccinum common in our frefh waters, which is very elegant, and always has its operculum in the manner of the larger buccina; a fmall kind of mufcle is alfo very common, which is fo extremely thin and tender, that it can hardly be handled withont breaking to pieces. The large frefh water mufcle, commonly called in England the horfe-mu/cle, is too well known to need a defcription; and the fize fufficiently diftinguifhes it from all other frefh water fhells.

In collecting fhells, it is moft advifable, whenever it can be done, to get thofe which have in them the living animals; becaufe we fhall thus obtain the natural hiftory of the animals, and the fhells themfelves in their natural beauty, and the full glow of their colours. Shells fhould be alfo procured from the deeper parts of their reforts, and immediately after ftorms on the fea beaches and fhores; becaufe, by being much expofed to the fun, their colours fade, and they are liable to other accidents that injure them. In order to kill the fifh that inhabits them, Mr Da Cofta advifes to give them a quick dip in boiling water, and "when they are cooled, to lay them in cold water till they are cleaned and in this operation they fhould not be touched with aquafortis, or any other acid, nor expofed to the heat of the fire and fun.

The art of polifhing fhells arrived but lately at its prefent ftate of perfection; and as the love of fea-fhells is become fo common among us, it may not be difagrecable to the reader to find fome inftructions in executing fo pleafing a method of adding to their natural beauty, the rules for which are at prefent fo little known, though the effect of them be fo much efteemed.
Among the immenfe variety of fhells which we are acquainted with, fome are taken up out of the fea, or found on its fhores in all their perfection and beauty; their colours being all fpread by nature upon the furface, and their natural polifh fuperior to any thing that art could give. Where nature is in herielf thus perfect, it were madnefs to attempt to add any thing to her charms: but in others, where the beauties are latent and covered with a coarfer outer fkin, art is to be called in; and the outer veil being taken off, all the internal beauties appear.

Among the fhells which are found naturally polifhed are the porcelains, or cowries; the caffanders; the dolia, or conchæ globofæ, or tuns; fome buccina, the volutes, and the cylinders, or olives, or, as they are generally though improperly called, the rhombi; excepting only two or three, as the tiara, the plumb, and the butter-tub rhombus, where there is an urpromifing film on the furface, hiding a very great fhare of beauty within. Though the generality of the fhells of thefe genera are taken out of the fea in all their beauty, and in their utmoft natural polifh, there are feveral other genera, in which all or moft of the fpecies are taken up naturally rough and foul, and covered with an epidermis, or coarfe
outer fkin, which is in many rough and downy or hairy. The tellinx, the mufcles, the cochlex, and many others, are of this kind. The more nice collectors, as naturalifts, infift upon having all their fhells in their native and genuine appearance, as they are found when living at fea; but the ladies, who make collections, hate the difagreeable outfides, and will have all fuch polifhed. It would be very advifable, however, for both kinds of collectors to have the fame fhells in different fpecimens both rough and polifhed : the naturalif would by this means, befides knowing the outfide of the fhell, be better acquainted with its internal characters than he otherwife could \(b e\), and the lady would have a pleafure in comparing the beauties of the fhell, in its wrought ftate, to its coarfe appearance as nature gives it. How many elegancies in this part of the creation muft be wholly loft to us, if it were not for the affiftance of ans art of this kind! Many fhells in their native ftate are like rough diamonds; and we can form no juft idea of their beautics till they have been polifhed and wroughr into form.

Though the art of polihing fhells is a very valuable one, yet it is very dangerous to the fhells; for without the utmoft care, the means ufed to polifh and beautify a fhell often wholly deftroy it. When a fhell is to be polifhed, the firft thing to be examined is whether it have naturally a fmooth furface, or be covered with tubercles or prominences.

A fhell which has a fmooth furface, and a naturai dull polifh, need only be rubbed with the hand, or with a piece of chamoy leather, with fome tripoli, or fine rotten ftone, and will become of a perfectly bright and fine polif. Emery is not to be ufed on this occafion, becaufe it wears away too much of the fhell. This operation requires the hand of an experienced perfon, that knows how fuperficial the work mult be, and where he is to flop; for in many of thefe fhells the lines are only on the furface, and the wearing away ever fo little of the fhell defaces them. A thell that is rough, foul, and crufty, or covered with a tartareous coat, muft be left a whole day fteeping in hot water: when it has imbiked a large quantity of this, it is to be rubbed with rough emery on a ftick, or with the blade of a knife, in orcier to get off the coat. After this, it may be dipped in diluted aquafortis, fpirit of falt, or any other acid; and after remaining a few moments in it, be again plunged into common water. This will add greatly to the fpeed of the work. After this it is to be well rubbed with linen cloths, impregnated with commons foap; and when by thefe feveral means it is made perfectly clean, the polifing is to be finihhed with fine emery and a hair-brufh. If ater this the fhell whens dry appears not to have fo good a polifh as was defired, it muft be rur'ied over with a folution of gum arabic; and this will add greatly to irs glofs, without doing it the fmalleft injury. The gum-water mult not be too thick, and then it gives no fenfible coat, only heightening the colours. The white of an egg anfwers this purpofe alfo very well; but it is fubject to turn yellow. If the fhell has an epidermis, which will by no means admit the polifhing of it, it is to be dipped feveral times in diluted aquafortis, that this may be eater off; and then the fhell is to be polifhed in the ufual way with putty, fine emery, or tripoli, on the hair of a fine brufh When it is only a pellicle that hides the colours, the fhells mult be fteeped in hot water, and after that the

\section*{S H E [ 355 ] S H E}

Akin worked off by degrees with an oid file, This is the cafe with feveral of the cylinders, which have not the natural polifh of the reft.

When a fhell is covered with a thick and fatty epidermis, as is the cafe with feveral of the mufcles and tellinx; in this cafe aquafortis will do no fervice, as it will not touch the fkin: then a rougl brufh and coarfe emery are to be ufed; and if this does not fucceed, feal-fkin, or, as the workmen call it, fib-jkin and pu-mice-flone, are to be employed.

When a thell has a thick cruft, which will not give way to any of thefe means, the only way left is to plunge it feveral times into flong aquafortis, till the tubborn cruft is wholly eroded. The limpets, auris marina, the helmet-fhells, and feveral other fpecies of this kind, muft have this fort of management; but as the defign is to how the hidden beauties under the crult, and not to deftroy the natural beatuty and polifh of the infide of the fhell, the aquafortis mult be ufed in this manner: A long piece of wax mutt be provided, and one end of it made perfectly to cover the whole mouth of the fhell ; the other end will then ferve as a handle, and the mouth being fopped by the wax, the liquor cannot get in to the infide to fpoil it ; then there mult be placed on a table a veffel full of aquafortis, and another full of common water.

The fhell is to be plunged into the aquafortis; and after remaining a few minutes in it, is to be taken out, and plunged into the common water. The progrefs the aquafortis makes in eroding the furface is thus to be carefully obferved every time it is taken out: the point of the fheil, and any other tender parts, are to be covered with wax, to prevent the aquafortis from eating them away; and if there be any wormholes, they alfo mult be ftopped up with wax, otherwife the aquafortis would foon eat through in thofe places. When the repeated dippings into the aqua: fortis how that the coat is fufficiently eaten away, then the fhell is to be wrought carefully with fine emery and a brufh ; and when it is polifhed as high as can be by this means, it muft be wiped clean, and rubbed over with gum-water or the white of an egg. In this fort of work the operator mult always have the caution to wear gloves; otherwife the leaft touch of the aquafortis will burn the fingers, and turn them yellow; and often, if it be not regarded, will eat off the fkin and the nails.

Thefe are the methods to be ufed with fhells which require but a moderate quantity of the furface to be taken off; but there are others which require to have a larger quantity taken off, and to be uncovered deeper: this is called entirely fcaling a fhell. This is done by means of a horizontal wheel of lead or tin, impregnated with rough emery; and the fhell is wrouglit down in the fame manner in which ftones are wronght by the lapidary: Nothing is more difficult, however, than the performing this work with nicety: very often fhells are cut down too far by it, and wholly fpoiled; and to avoid this, a coarfe vein mult be often left flanding in fome place, and taken down afterwards with the file, when the cutting it down at the wheel would have ipoiled the adjacent parts.

After the fhell is thus cut down to a proper degree, it is to be polifhed with fine emery, tripoli, or rotten flone, with a wooden wheel turned by the fame machine
as the leaden one, or by the common method of work- Shells, ing with the hand with the fame ingredients. When a thell is full of tubercles, or protuberances, which mutt be preferved, it is then impoffible to ufe the wheel: and if the common way of dipping into aquafortis be attempted, the tubereles being harder than the reft of the fhell, will be eat through before the reft is fufficiently fcaled, and the fhell will be fpoiled. In this cafe, indultry and patience are the only means of effecting a polifh. A camel's-hair pencil muft be dipped in aquafortis; and with this the intermediate parts of the fhell mult be wetted, leaving the protuberances dry: this is to be ofter repeated; and after a few moments the fhell is always to be plunged into water to ftop the erofion of the acid, which would otherwife eat too deep, and deftroy the beauty of the fhell. When this has fufficiently taken off the foulnefs of the fhell, it is to be polifhed with emery of the finett kind, or with tripoli, by means of a fmall ftick, or the common polifhing-ftone ufed by the goldfmiths may be ufed.

This is a very tedious and troublefome thing, efpecially when the echinated oyfters and murices, and fome other fuck fhells, are to be wrought: and what is worft of all is, that when all this labour has been employed, the bufinefs is not well done; for there ftill remain feveral places which could not be reached by any inftrument, fo that the fhell mutt neceffarily be rubbed over with gum-water or the white of an egg afterwards, in order to bring out the colours and give a glofs; in fome cales it is even neceffary to give a coat of varnifh.

Thefe are the means ufed by artifts to brighten the colours and add to the beauty of fhells; and the changes produced by polifhing in this manner are fo great, that the fhell can fcarcely be known afterwards in polifh. to be the fame it was; and hence we hear of new fhells to be in the cabinets of collecters, which have no real exiftence known, as feparate fpecies, but are fhells well known, difguifed by polifhing. To caution the reader againft errors of this kind, it may be proper to add the moft remarkable fpecies thus ufually altered.

The onyx-fhell or volute, called by us the purple or The onyma violet-tip, which in its natural ftate is of a fimple pale fhell. brown, when it is wrought Aightly, or polifhed with juft the fuperficies taken off, is of a fine bright yellow; and when it is eaten away deeper, it appears of a fine milk-white, with the lower part bluifh : it is in this Itate that it is called the onyx-foell ; and it is preferved in many cabinets in its rough ftate, and in its yellow appearance, as different fpecics of thells.
The violet Jells, fo common among the curious, is violet a fpecies of porcelain, or common cowry, which does not appear in that elegance till it has been polifhed; and the common auris marina fhows itfelf in two or three different forms, as it is more or lefs deeply wrought. In its rough fate it is dufky and coarfe, of a pale brown on the outfide, and pearly within; when it is eaten down a little way below the furface, it fhows variegations of black and green ; and when till farther eroded, it appears of a fine pearly hue within and without.
The nautilus, when it is polifhed down, appears all over of a fine pearly colour; but when it is eaten away but to a fmall depth, it appears of a fine yellowifh colour with dufky hairs. The burgan, when entirely cleared of its coat, is of the molt beautiful pearl-com Y y.z
lour:

\section*{S HE}
lonr ; but when but fightly eroded, it appears of a variegated mixture of green and red; whence it has been called the parroquet foell. The common helmetfhell, when wrought, is of the colour of the fineft agate; and the mufcles, in general, though very plain fhells in their common appearance, become very beautiful when polifhed, and fow large veins of the moft elegant colours. The Perfian hell, in its natural ftate, is all over white, and covered with tubercles; but when it has been ground down on a wheel, and polifhed, it appears of a grey golour, with fpots and veins of a very bright and highly polifhed white. The limpets, in general, become very different when polifhed, moft of them flowing very elegant colours; among thefe the tortoif-fhell limpet is the principal ; it does not appear at all of that colour or tranfparence till it has been wrought.

That elegant fpecies of fiell called the junquil-chama, which has deceived fo many judges of thefe things into an opinion of its being a new fpecies, is only a white chama with a reticulated furface; but when this is polifhed, it lotes at once its reticular work and its colonr, and becomes perfectly fmooth, and of a fine bright yellow. The violet coloured chama of New England, when worked down and polifhed, is of a fine milk white, with a great number of blue veins, difoofed like the variegations in agates.
'Ihe affesear fbell, when polifhed after wouking it down with the file, becomes extremely glofly, and obtains a fine rofe-colour all about the mouth. Thefe are fome of the moft frequent among an endlefs variety of changes wrought on fhells by polifhing; and we find there are many of the very greateft beautics of this part of the creation which muft have been loft but for this method of fearching deep in the fubflance of the fhell for them.

The Dutch are very fond of fhells, and are very nice in their manner of working them: they are under no reftraint, however, in their works; but ufe the moft violent methods, fo as otten to deftroy all the beanty of the fhell. 'They file them down on all fides, and often take then to the wheel, when it mult deftroy the very characters of the fpecies. Nor do they fop at this ; but, determined to have beauty at any fate, they are for improving upon nature, and frequently add fome lines and colours with a pencil, afterwards covering them with a fine coat of varnifh, fo that they feem the natural lineations of the fhell : the Dutch cabinets are by thefe means made very beautiful, but they are by no means to be regarded as intructors in natural hiftory. There are fome artificers of this nation who have a way of covering ihells all over with a different tinge from that which nature gives them ; and the curions are often enticed by thefe tricks to purchafe them for new fpecies.

There is another kind of work beftowed on certain fpecies of fhells, particularly the nautilus; namely, the engraving on it lines and circles, and figures of fars, and other things. This is too obvious a work of art to fuffer any one to fuppofe it natural. Buonani lias figured feveral of thefe wrought fhells at the end of his work; but this was applying his labour to very little purpofe; the fhells are fpoiled as objects of natural hiftory by it, and the engraving is feldom worth any thing. They are principally done in the Eaft Indies.

Shells are fubject to feveral imperfections; fone of which are natural and others accidental. The natural defects are the effect of age, or ficknefs in the fifh. The greateft mifchief happens to flells by the fifh dying in them. The curious in thefe things pretend to be al- fhe ways able to diftinguifh a fhell taken up with the fifh alive from one found on the fhores: they call the firft a living, the fecond a dead fhell; and fay that the colours are always much fainter in the dead Mells. When the flells have lain long dead on the fhores, they are fubject to many injuries, of which the being eaten by fea-worms is not the leaft: age renders the fineft fhells livid or dead in their colours.

Befides the imperfections arifing from age and ficknels in the fifh, fhells are fubject to other deformities, fuch as morbid cavities, or protuberances, in parts where there fhould be none. When the fhell is valuable, thefe faults may be hid, and much added to the beauty of the Specimen, withont at all injuring it as an object of natural hiftory, which fhould always be the great end of collecting thefe things. The cavities may be filled up with maftic, diffulved in \{pirit of wine, or with ifinglafs : thefe fubftances mult be either coloured to the tinge of the fhell, or elfe a pencil dipped in wa-ter-colours mult finifh them up to the refemblance of the reft; and then the whole fhell being rubbed over with gum-water, or with the white of an egg, fcarce any cye can perceive the artifice: the fame fubftances may alfo be ufed to repair the battered edge of a fhell provided the pieces chipped off be not too large. And when the excrefcences of a fhell are faulty, they are to be taken down with a fine file. If the lip of a fhell be fo battered that it will not admit of repairing by any cement, the whole muft be filed down or ground on the wheel till it become even.

Foffil Shells. Thole found buried at great deptha in the earth.

Of thefe fome are found remaining almoft entirely: in their native ftate, but others are valiouny altered by being impregnated with particles of ftone and of other foffils ; in the place of others there is found mere flone or fpar, or fome other native mineral body, expreffing all their lineaments in the moft exact manner, as having been formed wholly from them, the fhell liaving been firt depofited in fome folid matrix, and thence diffolved by very: flow degrees, and this matter left in its place, on the cavities of flone and other folid fubftances, out of which fhells had been diffolved and wafhed away, being afterwards filled up lefs flowly with thefe different fubitances, whether fpar or whatever elfe: thefe fubftances, fo filling the cavities, can neceffarily be of no other form than that of the fhell, to the abfence of which the cavity was owing, though all the nicer lineaments may not be fo exactly expreffed. Befides thefe, we have alfo in many places maffes of ftone formed within various fhells; and thefe having been received into the cavities of the fhells while they were perfectly fluid, and having therefore nicely filled alt their cavities, muft retain the perfect figures of the internal part of the fhell, when the fhell itfelf fhould be worn away or perifhed from their outfide. The various fpecies we find of thefe are, in many genera, as numerous as the known, recent ones; and as we have in our own ifland not only the fhells of our own fhores, but thofe of many other very diftant ones, fo we have 8

\section*{S H E [ 357 ] S H E}
alfo many fpecies, and thofe in great numbers, which are in their recent flate, the inhabitants of orher yel unknown or unfearched feas and fhores. The cockles, maifles, oyfters, and the other common bivalves of our own feas, are very abundant : but we have alfo an amazing number of the nautilus kind, particularly of the nautilus gracorum, which though a fhell not found living in our own or any neighbouring feas, yet is found buried in all our clay-pits about London and elfewhere; and the mooft frequent of all foffil fhells in fome of our counties are the conelix anomix, which yet we know not of in any part of the world in their recent fate. Of this fort alfo are the cornua ammonis and the gryphita, with feveral of the cchinitx and others.
The exact fimilitude of the known fhells, recent and fofiil, in thcir feveral kinds, will by no theans fufficr us to belicve that thcfe, though not yet known to us in their living ftate, are, as fome have idly thought, a fort of lufus naturc. It is certain, that of the many known fhores, very few, not even thofe of our own illand, have been yet earefully fearched for the fhell-fifh that inhabit them; and as we fee in the nautilus greeorum an inftance of fhells being brought from very diftant parta of the world to be buried here, we cannot wonder that yet unknown fhores, or the unknown bottoms of deep feas, fhould have furnifhed us with many unknown fhell-fifh, which may have been brought with the reft; whether that were at the time of the general deluge, or the effect of any other cataftrophe of a like kind, or by whatever other means, to be left in the yet unlardened matter of our ftony and clayey ftrata.
Shells, in gunnery, are hellow iron balls to throw out of mortars or howitzers, with a fufe-hole of about an inch diameter, to load them with powder, and to receive the fufe. The bottom, or part oppolite to the fufe, is made thicker than the reft, that the fure may fall uppermof. 1)ut in fmall elevations this does not allways lappen, nor indeed is it neceffary; for; let the fhell fall as it will, the fufe fets fire to the powder within, whieh burfts the fhell, and caufes great devaltation. The fhells had much better be of an equal thieknefs ; for then they burt into more pieces.
Meffage SHELLS, are nothing more than howitz.fhells, in the infide of which a letter or other papers are put; the fufe hole is fopped up with wood or cork, and the fhells are fired out of a royal or howitz, either into a garrifon or camp. It is fuppoled, that the perfon to whom the letter is fent knows the time, and accordingly appoints a guard to look out for its a arrival.

SHFLL-Fijb. Thefe animals are in general oriparous, very few inftanees having been found of fuch as are viviparous. Among the oviparous kinds, anatomilts have found that fome fpecies are of different fexes, in the differeit individuals of the fame fpecies; but others are hermaphrodites, every one being in itfelf both male and fermale. In both eafes their increafe is very numerous, and fcarce inferior to that of plants, or of the mofl fruitful of the infect clafs. The eggs are very fmall, and are hung together in a fort of clufters by means of a glutinous lumour, whieh is always placed about them, and is of the nature of the gelly of frog's fpawn. By means of this, they are not only kept together in the parcel, but the whole clufter is fattened to the rocks, fhells, or other folid fubitances; and thus
they are prefervedfrom being driven on fhore by thewaves, and left where they eannot fuceeed. See Testacea. \(S_{\text {hfil. }}\) Gold. See Gold.
SHELIIE, a fmall but Atrong kind of horfe, fo called from Shetland, or Zetland, where they are produced.

SHELVES, in fea-language, a general name given ta any dangerous fhallows, fand banks, or rocks, lying inmediately under the furface of the water, fo as to intercept any hip in her paffage, and endanger her defruction.

SHENAN. See Dying of Leather, vol. ix. p. 750, fnot-nete.
SHENSTONE (William), an admired Engliftr poet, the eldeft fon of a plain conntry gentleman, who farnced his own eftate in. Shropfhire, was born ia November 1714. He learned to read of an old dame, whom his poem of the "Sehool miffrefs" has delivered to pofterity ; and foon received fuch delight from books, that lre was always ealling for new entertainment, and expected that, when any of the family wont to market, a new book fhould be brought him, whicl, when it came, was in fondnefs carried to bed, and laid by him. It is faid, that when his requelt had been neglected, his mother wrapped up a piece of wood of the fame form, and paeified him for the niglit. As he grew older, he went for a while to the grammar-fehool in Hales.Owen, and was placed afterwards with Mr Crumpton, an eminent fchool-mafter at Solihul, where he diftinguifhed himfelf by the quicknefs of his progrefs. When the was young (June 1724), he was deprived of his father ; and foon after (Augult 1726) of his grandfather; and was, with his brother, who died afterwards unmarried, left to the eare of his grandmother, who managed the eftate. From fehool he was fent, in 1732 , to "Pembroke college in Oxford, a fociety which for half a century has been eminent for Englifh poctry and elegant literature. Here it appears that he found delight and advantage ; for he continued his name there ten years, though he took no degree: After the firft four years he put on the eivilian's gown, but without fhowing any intention to engage in the profeffion. About the time when he went to Oxford, the death of his grandmother devolved his affairs to the care of the reverend Mr Dolman, of Brome, in Staffordfhire, whofe attention he always mentioned with gratitude. - At Oxford he applied to Englifh poctry ; and, in 1737, publifned a fmall Mifcellany, without his name. He then for a time wandered about, to acquaint himfelf with life, and was fometimes at London, fometimes at Bath, or any place of publie refort; but he did not forget his poetry. He publifhed, in 1740, his " Judgment of Hercules," addreffed to Mr Lyttleton, whofe interef he fupported with great warmth at an election; this was two years afterwards followed by the "School miftrefs." Mr Dolman, to whofe care he was indebted for his eafe and leifure, died in 1745 , and the eare of his fortune now fell upon himfelf. He tried to efcape it a while, and lived at his houfe with his tenants, who were difantly related; but, finding that imperfect poffeffion ineonvenient, he took the whole eftate into his own hands, an event which rather improved its beauty than increafed its produce. Now began lis delight in rural pleafures, and his paftion of rural elegance; but in time his expences
occafioned

\section*{S H E}

Sherfone occafioned clamours that overpowered the lamb's bleat
and the linnet's fong, and his groves were haunted by beings very different from fawns and fairies. He fpent his eftate in adorning it, and his death was probably haftened by his anxieties. He was a lamp that fpent its oil in blazing. It is faid, that if he had lived a little longer, he would have been affifted by a penfion; fuch bounty could not have been more properly beftowed, but that it was ever afked is not certain ; it is too certain that it never was enjoyed.He died at the Leafowes, of a putrid fever, about five on Friday morning, Feb. 11. \(1_{2} 63\); and was buried by the fide of his brother, in the churchyard of HalesOwen.
- In his private opinions, our author adhered to no particular fect, and hated all religious difputes. Tendernefs, in every fenle of the word, was his peculiar claracteriftic ; and his friends, domeftics, and poor neighbours, daily experienced the effects of his benevolence. This virtue he carried to an excefs that feemed to border upon weaknefs; yet if any of his friends treated him ungenerounly, he was not eafily reconciled. On fuch occafions, however, he ufed to fay, "I never will be a revengeful enemy; but \(I\) cannot, it is not in my nature, to be half a friend." He was no economitt ; for the generofity of his temper prevented his paying a proper regard to the ufe of money : he exceeded therefore the bounds of his paternal fortune. But, if we confider the perfect paradife into which he had converted his eftate, the hofpitality with which he lived, his charities to the indigent, and all out of an eftate that did not exceed 3001 . a-year, one fhould rather wonder that he left any thing behind him, than blame his want of economy : he yet left more than fufficient to pay all his debts, and by lis will appropriated his whole eftate to that purpofe. Though he had a high opinion of many of the fair fex, he forbore to marry. A paffion he entertained in his youth was with difficulty furmounted. The lady was the fubject of that admirable paftoral, in four parts, which has been fo univerfally and fo juftly admired, and which, one would have thought, muft have foftened the proudeft and moft obdurate heart. His works have been publifhed by Mr Dodfley, in 3 vols 8 vo. 'The firft volume contains his poetical works, which are particularly diftinguifhed by an amiable elegance and beautiful fimplicity; the fecond volume contains his profe works; the third his letters, \&c. Biograpbical Diaionary.

SHEPPEY, an ifland at the mouth of the river Medway, about 20 miles in circumference. It is feparated from the main land by a narrow channel, and has a fertile foil, which feeds great llocks of theep. The borough-town of Queenborough is feated thereon ; befides which it has feveral villages.

SHERARDIA, in botany : A genus of the monogynia order, belonging to the tetrandria clafs of plants; and in the natural method ranking under the 47 th order, Stellato. The calyx is fmall, quadrieentate; the corolla monopetalous, long, and funnel-fhaped. The two feeds are naked, and crowned with the calyx. There are three fpecies, viz, 1. Arventis ; 2. Muralis; 3. Fruticofa.

SHERBET, or Sherbit, a compound drink, firtt brought into England from Turkey and Perfia, confirting of water, lemon-juice, and fugar, in whish are dif-
folved perfumed cakes made of excellent Damafcus fruit, containing an infufion of fome drops of rofe water. Another kind of it is made of violets, honey, juice of raifins, \& e,

SFIERIDAN ('Thomas), D. D. the intinate friend of Dean Swift, is faid by Shield, in Cibber's "Lives of the Poets," to have been born about 1684 , in the county of Cavan, where, according to the fame authority, his parents lived in no very elevated ftate. They are defcribed as being unable to afford their fon the advantages of a liberal education; but he, being obferved. to give early indications of genius, attracted the notice of a friend to his family, who fent him to the college of Dublin, and contributed towards his fupport while be remained there. He aftewards entered into orders, and fet inp a fchool in Dublin, which long maintained a very high degree of reputation, as well for the attention beftowed on the morals of the fcholars as for their proficiency in literature. So great was the eftimation in which this feminary was held, that it is afferted to have produced in Come years the fum of L. 1000. It does not appear that he had any confiderable preferment ; but his intimacy with Swift, in 1725 , procured for him a living in the fouth of Ireland worth about L. \({ }^{150}\) a-year, which he went to take poffeffion of, and, by an act of inadvertence, deftroyed all his future expectations of rifing in the church; for being at Corke on the itt of Auguft, the anniverfary of King George's birth-day, he preached a fermon, which had for its text, "Sufficient for the day is the evil thereof." On this being known, he was ftruck out of the lift of chaplains to the lord lieutenant, and forbidden the callle.

This living Dr Sheridan afterwards changed for that of Dunboyrie, which, by the knavery of the farmers, and power of the gentlemen in the neighbourhood, fell fo low as L. 80 per annum. He gave it up for the free fchool of Cavan, where he might have lived well in fo cheap a country on L. 80 a-year falary, befides his fcholars; but the air being, as he faid, too moift and unwholefome, and being difgutted with fome perfons who lived there, he fold the fchool for about L. 400 ; and having foon fpent the money, he fell into bad health, and died Sept. 10. 1738, in his 55 th year.

Lord Corke has siven the following character of him: " Dr Sheridan was a fchool-mafter, and in many inftances perfectly well adapted for that fation. He was deeply verfed in the Greek and Roman languages, and in their cuftoms and antiquities. He had that kind of good nature which abfence of mind, indolence of body, and careleffnefs of fortune, produce ; and although not over ftrict in his own conduct, yet he took care of the morality of his fcholars, whom he fent to the univerfity remarkably well founded in all kinds of claffical learning, and not ill inftructed in the focial duties of life. He was flovenly, indigent, and cheerful. I-Ie knew books much better than men; and he knew the value of money leait of all. In this fituation, and with this difpolition, Swift faftened upon him as upor a prey with which he intended to regale himfelf whenever his appetite fhould prompt him." His Loordfhip then mentions the event of the unlucky fermon, and adds: " 'This ill-ftarred, good-natured, improvident man, returned to Dublin, unhinged from all favour at court, and even banifhed from the caftle. But ftill he remain. ed a punfter, a qquibbler, a fiddler, and a wit. Not a

\section*{S H.E}
day paffed without a rebus, an anagram, or a madrigal. His pen and his fiddleftick were in continual motion; and yet to little or no purpofe, if we may give credit to the following verfes, which fhall ferve as the conclufion of his poetical character :
"With mufic and poetry equally blefs'd,
" A bard thus A pollo moft humbly addrefs'd ;
" Great author of poetry, mufic, and light,
" Inftructed by thee, I both fiddle and write;
" Yet unheeded I fcrape, or I fcribble all day,
"My tunes are neglected, my verle flung away.
"Thy fubftitute here, Vice-A pollo difdains
" T'o vouch for my numbers, or lift to my ftrains.
" I'hy manual fign he refufes to put
" To the airs I produce from the pen or the gut :
"Be thou then propitious, great Phœbus, and grant
" Relief, or reward, to my merit or want.
"'Tho' the Dean and Delany tranfcendently fhine,
"O ! brighten one folo or fonnet of mine :
" Make one work immortal, 'tis all I requeft.
"A Apollo look'd pleas'd, and refolving to jeft,
"R Replied-Honeft friend, I've confider'd your cafe,
"Nor diflike your unmeaning and innocent face.
" Your petition I grant, the boon is not great,
" Your works fhall continue, and here's the receipt,
"On rondeaus hereafter your fiddle-ftrings fpend,
"Write verfes in circles, they never fhall end."
" One of the volumes of Swift's mifcellanies confifts almoft entirely of letters between him and the Dean. He publifhed a profe tranflation of Perfius; to which he added the beft notes of former editors, together with many judicions ones of his own. This work was printed at London, 1739 , in 12 mo . Biographical Ditionary.

Sheridan (Mrs Frances), wife to Thomas Sheridan, M. A. was born in Ireland about the year 1724 , but defcended from a good Englifh family which had removed thither. Her maiden name was Chamberlaine, and the was grand-daughter of Sir Oliver Chamberlaine. The firt literary performance by which the diftinguifhed herfelf was a little pamphlet at the time of a violent party-difpute relative to the theatre, in which Mr Sheridan had newly embarked his fortune. So well timed a work exciting the attention of Mr Sheridan, he by an accident difcovered his fair patronefs, to whom he was foon afterwards married. She was a perfon of the moft amiable character in every relation of life, with the mo:t engaging manners. After lingering fome years in a very weak ftate of health, fhe died at Blois, in the fouth of France, in the year 1767 . Her "Sydney Biddulph" may be ranked with the firft productions of that clafs in ours or in any other language. She alfo wrote a little romance in one volume called Nuurjabad, in which there is a great deal of imagination productive of an admirable moral. And the was the authorefs of two comedies, "Ihe Difcovery" and "The Dupe."

SHERIFF, an officer, in each county in England, nominated by the king, invefted with a judicial and minifterial power, and who takes place of every nobleman in the county during the time of his office.

The fheriff is an officer of very great antiquity in this kingdom, his name being derived from two Saxon words, fignifying the reeve, bailiff, or officer of the fhire He is called in Latin vice-comes, as being the deputy of the earl or comes, to whom the cuftody of

\section*{359 ]}

\section*{S H E}
the fhire is faid to have been committed at the firf divifion of this kingdom into counties. But the earls, in procefs of time, by reafon of their high employments and attendance on the king's perfon, not being able to tranfact the bufinefs of the county, were delivered of that burden ; referving to themfelves the honour, but the labour was laid on the fheriff. So that now the fheriff does all the king's bufinefs in the county; and tho' he be ftill called vice-comes, yet he is entirely independent of, and not fubject to, the earl ; the king, by his letters patent, committing cuflodiam comitatus to the fheriff, and to him alone.

Sheriffs were formerly chofen by the inhabitants of the feveral counties. In confirmation of which it was ordained, by fatute 28 Edw. I. c. 8. that the people fhould have an election of fheriffs in every fhire where the fhrievalty is not of inheritance: For anciently in fome counties the theriffs were hereditary; as wee apprehend they were in Scotland till the fatute 20 Geo. II. c. 43; and fill continue in the county of Weftmoreland to this day ; the city of London having alfo the inheritance of the fhrievalty of Middlefex vefted in their body by charter. The reafon of thefe popular elections is affigned in the fame ftatute, c. I3. "that the commons might choofe fuch as would not be a burden to them." And herein appears plainly a ftrong trace of the democratio cal part of our conftitution; in which form of government it is an indifpenfable requifite, that the people fhould choofe their own magiftrates- This election was in all probability not abfolutely vefted in the commons, but required the reyal approbation. For in the Gothic conftitution, the judges of their county-courts. (which office is executed by the fheriff) were elected by the people, but confirmed by the king: and the form of their election was thus managed; the people, or incole territorii, chofe twelve electors, and they nominated three perfons, ex quibus rex unum confirmabat. But, with us in England, thefe popular elections, growing tumultuons, were put an end to by the ftatute 9 . Edw. II. At. 2. which enacted, that the fheriffs fhould from thenceforth be affigned by the chancellor, treafurer, and the judges; as being perfons in whom the fame truft might with confidence be repofed. By ftatutes 14 Edw. III. c. 7. 23 Hen. V.l. c. 8. and 21 Hen. VIII. c. 20. the chancellor, treafurer, prefident of the king's council, chief jultices, and chiet baron, are to make this election; and that on the morrow of All Souls, in the exchequer. And the king's letters patent, appointing the new fheriffs, ufed commonly to bear date the fixth day of November. 'The fatute of Cambridge, 12 Ric. II. c. 2. ordains, that the chancellor, treafurer, keeper of the privy feal, fteward of the king's houfc, the kiug's chamberlain, clerk of the rolls, the juftices of the one bench and the other, barons of the exchequer, and all other that fhall be called to ordain, name, or make juftices of the peace, fheriffs, and other officers of the king, fhall be fworn to act indifferently, and to name no man that fueth to be put in office, but fuch only as they fhall judge to be the beft and moft fufficient. And the cultom now is (and has been at lealt ever fince the time of Fortefcue, who was chief juftice and chancellor to Henry the fixth), that all the judges, together with the other great officers, meet in the exchequer chamber on the morrow of All Souls yearly, (which day is now altered to the morrew.

\section*{S H E [ 360 ] S H E}
of St Martin by the laft act for abbreviating Michael. mas term), and then and there propofe three perfons to the king, who alterwards appoints one of them to be fheriff. This cuftom of the twelve judges propofing three perfons feems borrowed from the Gothic contitution before-mentioned: with this difference, that among the Goths the 12 nominors were firt elected by the people themfelves. And this ufage of ours, at its firt introduction, there is reafon to believe, was found. ed upon fome fatute, though nor now to be fonnd among our printed laws; firf, hecaufe it is materially different from the direction of all the fatutes beforer mentioned; which it is hard to conceive that the judges would have countenanced by their concurrence, or that Fortefcue would have inferted in his book, unlefs by the authority of fome ftatute ; and allo, becaufe a flatute is exprefsly referred to in the record, which Sir Eid ward Coke tells us he tranfcribed from the, council-book of 3 d March, 34 Hen. VI, and which is in fubtance as follows. The king had of his own authority appointed a man theriff of Lincolnfhire, which office be refufed to take upon him; whereupon the opinions of the judges were taken, what thouid be done in this behalf. And the two chief juftices, Sir John Fortefue and Sir John Prifot, delivered the unanimous opinion of them all; " that the king did an error when he made a perfon theriff that was not chofen and prefented to him according to the ftatute; that the perfon refufing was liable to no fine for difobedience, as if he had been one of the three perfons chofen according to the tenor of the flatute; that they would advife the king to have recourfe to the three perfons that were chofen according to the ftatute, or that fome other thrifty man be intreated to occupy the office for this year; and that, the next year, to efchew fuch inconveniences, the order of the ftatute in this behalf made be obferved." But, notwith ftanding this unanimous refolution of all the judges of England, thus entered in the councilbook, and the flatute 34 and 35 Hen. VIII. c. \(26 . \oint 61\), which exprefsly recognizes this to be the law of the land, fome of our writers have affirmed, that the king, by his prerogative, may name whom he pleafes to be fheriff, whether chofen by the judges or not. This is grounded on a very particular cafe in the fifth year of queen Elizabeth, when, by reafon of the plague, there was no Michael. mas term kept at Wefmimiter; fo that the judges could not meet there in crafino animaram to nominate the fheriffs: whereupon the queen named them herfelf, with. out fuch previous affembly, appointing for the moft part one of two remaining in the laft year's lift. And this cafe, thus circumfanced, is the only authority in our books for the making thefe extraordinary fheriffs. It is true, the reporter adds, that it was held that the queen by her prerogative might make a fheriff without the election of the judges, non obfante aliguo fatuto in contra. rium ; but the doctrine of non olfantes which fets the prerogative above the laws, was effectually demolifhed by the bill of righte at the revolution, and abdicated Weftminfter-hall when king James abdicated the kincdom. However, it muft be acknowledged, that the practice of occafionally naming what are called pocked Jberiffs, by the fole authority of the crown, hath univ formly continued to the reign of his prefent majelty; in which, it is belicved, few (if any) inflances have occurred.

Sheriffs, by virtue of feveral old 〔tatutes, are to con-
tinue in their nffice no longer than one year 1 and yat it hath been faid that a heriff may bo appointed duranto bene placito or during the king's picaiure: and fo is the form of the royal writ. Therefore, till a new fheriff he named, his office canant be determined, unlefs by his own death. or the demife of the king ; in which lat cafe it was ufual for the fucceffor to fend a new writ to the old fherift ; but now, by fatute I Anne f. I. c. 8, all officers appointed by the preceding king may hold their offices for fix months after the king's demife, unlefs fooner difplaced by the fucceffor. We may farther obferve, that by fatute 1 Ric. II. c. 18. no man that has ferved the office of theriff for one year can be compelled to ferve the fame again within three years after.
We fhall find it is of the utmoft importance to have the fheriff appointed according to law, when we confider his power and duty. Thefe are either as a judge, as the keeper of the king's peace, as a miniterial officer of the fuperior courts of juitice, or as the king'e bailift.

In his judicial capacity he is to hear and determine all caufer of 40 fhillinvs valne and under, in his cor tycourt: and he has alio a judicial power in divers ather civil cafes. He is likewife to decide the elections of knights of the Thire, (fubject to the controul of the Houfe of Commons), of coroners, and of verderors; to judge of the qualification of voters, and to returs fuch as he fall determine to be duly elected.

As the keepers of the king's peace, both by common law and fpecial commifion, he is the firt man in the county, and fuyerior in rank to any nobleman therein, during his office. He may apprehend, and commit to prifon, all perfons who break the peace, or attempe to break it ; and may bind, any one in a recoge nizance to keep the king's peace. He may, and is bound, ex officio, to purfue and take all traitors, murw derers, felons, and other middoers, and commit them to gaol for fate cuftody. He is allo to defend his county againtt any of the king's enemies when thry come into the land; and for this purpofe, as well as for keeping the peace and purfuing felons, he may conso mand all the people of his county to attend him; which is called the pofle comitatus, or power af the county: which fummons, every perfon above 5 years old, and under the degree of a peer, is bound to attend upon warning, under pain of fine and imprifonment. But though the fheriff is thus the principal confervator of the peace in his county, yet, by the exprefs directions of the great charter, he, together with the conftable, coroner, and certain other officers of the king, are form bidden to hold any pleas of the crown, or, in othes words, to try any criminal offence. For it would be highly unbecoming, that the executioners of juftice Should be alfo the judges ; fhould impofe, as well as levy", fines and amercements; flould one day condern a mas to death, and perfonally execute him the next. Neither may he act as an ordinary juftice of the peace during the time of his office; for this would be equally inconfiltent, he being in many refpects the fervant of the jufo tices.

In his minitterial capacity, the fheriff in bound to ex: ecute all procefs iffuing from the king's courts of jufo tice. In the commencement of civil caufers he is to ferve the writ, to arrelt, and to take bail; when the caufe comes to trial, he mult fummon and return the jury; when it is determined, he muft fee the juagment

\section*{S H E}
of the court carried into execution. In criminal matters, he alfo arrefts and imprifons, he returns the jury, he has the cuftody of the delinquent, and he executes the fentence of the court, thoughit extend to deathitfelf.

As the king's bailiff, it is his bufinefs to prelerve the rights of the king within his bailiwick ; for fo his county is frequently called in the writs: a word introduced by the princes of the Norman line; in imitation of the French, whofe territory is divided into bailiwicks, as that of England into counties. He mult feize to the king's ufe all lands devolved to the crown by attainder or efcheat ; muft levy all fines and forfeitures, muft feize and keep all waifs, wrecks, eftrays, and the like, unlefs they be granted to fome fubjeet ; and muft alfo collect the king's rents within his bailiwick, if commanded by procefs from the exchequer.

To execute thefe various offices, the fheriff has under him many inferior officers; an under-fheriff, bailiffs, and gaolers, who muft neither buy, fell, nor farm their offices, on forfeiture of 500 l .

The under-fheriff ufually performs all the duties of the office; a very few only excepted, where the per. fonal prefence of the high-fheriff is neceffary. But no under-fheriff fhall abide in his office above one year; and if he does, by ftatute 23 Hen. VI. c. 8 . he forfeits 2001 . a very large penalty in thofe early days. And no under-fheriff or fheriff's-officer thall practife as an attorney during the time he continues in fuch office: for this would be a great inlet to partiality and oppreffion. But thefe falutary regulations are fhamefully evaded, by practifing in the names of other attorneys, and putting in fham deputies by way of nominal under-fheriffs: by reafon of which, fays Dalton, the under-fheriffs and bailiffs do grow fo cunning in their feveral places, that they are able to deceive, and it may well be feared that many of them do deceive, both the king, the high-fheriff, and the county.

Sheriff, in Scotland. See Law, Part iii. fect. 3.
SHERLOCK (William), a learned Englifh divine in the \(17^{\text {th }}\) century, was born in 1641 , and educated at Eaton fchool, where he diftinguihed himfelf by the vigour of his genius and his application to ftudy. Thence he was removed to Cambridge, where he took his degrees. In 1669 he became rector of the parifh of St George, Botolph-lane, in London; and in 168 r was collated to the prebend of Pancras, in the cathedral of St Paul's. He was likewife chofen mafter of the Temple, and had the rectory of Therfield in Hertfordfhire. After the Revolution he was fufpended from his preferment, for refufing the oaths to king William and queen Mary ; but at laft he took them, and publicly juftified what he had done. In 1691 he was inftalled dean of St Paul's. His Vindication of the. Doctrine of the Trinity engaged him in a warm controverfy with Dr South and others. Bifhop Burnet tells us, he was " a clear, a polite, and a ftrong writer; but apt to affume too much to himfelf, and to treat his adverfaries with contempt." He died in 1707. His works are very numerous; amony thefe are, 1. A Difcourfe concerning the Knowledge of Jtfas Chrift, againft Dr Owen. 2. Several pieces againit the Papits; the Socinians, and Diffenters. 3: A practical Treatife on Death, which is much admired. 4. A practical Dif* courfe on Providence. 5. A practical Difcourfe on the future Judgment; and many other works.

Vol. XVII. Part I.

Sherlock (Dr Thomas), bihop of London, was Sheriock. the fon of the preceding Dr William Sherlock, and was horn in 1678 . He was educated in Catharine hall, Cambridge, where he took his degrees, and of which he became mafter: he was made mafter of the Temple very young, on the refignation of his father; and it is remarkable, that this mafterhip was held by father and fon fucceffively for more than 70 years. He was at the head of the oppofition againft Dr Hoadley bifhop of Bangor; during which contelt he publifhed a great number of pieces. He attacked the famous Collins's "Grounds and Reafons of the Chriftian Religion," in a courfe of fix fermons, preached at the Temple church, which he intitled "The Ufe and Intent of Prophecy in the feveral Ages of the World." In 1728, Dr Sherlock was promoted to the bifhopric of Bangor; and was tranflated to Salifbury in 1734 . In 1747 he refufed the archbifhopric of Canterbury, on account of his ill ftate of health; but recovering in a good degree, accepted the fee of London the following year. On occafion of the earthquakes in 1750, he publified an excellent Paftoral Letter to the clergy and inhabitants of London and Weftminfter: of which it is faid there were printed in 4 to, 5000 ; in \(8 \mathrm{vo}, 20,000\); and in 12 mo , about 30,000 ; befide pirated editions, of which not lefs than 50,000 were fuppofed to have been fold. Under the weak ftate of body in which he lay for feveral years, he revifed and publifhed 4 vols of Sermons in 8vo, which are particularly admired for their ingenuity andelegance. He died in 1762, and by report worth 150,0001. "His learning," fays Dr Nicholls, "was very extenfive : God had given him a great and an underttanding mind, a quick comprehenfion, and a folid judgment. Thefe advantages of nature he improved by much induftry and application. His fkill in the civil and canon law was very confiderable; to which he had added fuch a knowledge of the common law of England as few clergymen attain to. This it was that gave him that influence in all caufes where the church was concerned ; as knowing precifely what it had to claim from its conftitutions and canons, and what from the common law of the land." Dr Nicholls then mentions his conftant and exemplary piety, his warm and fervent zeal in preaching the duties and maintaining the doctrines of Chriftianity, and his large and diffu'ive munificence and charity ; particularly by his having given large fums of money to the corporation of clergymens fons, to feveral of the hofpitals, and to the fociety for propagating the gofpel in foreign parts: alfo his bequeathing to Catha-rine-hall in Cambridge, the place of his education, his valuable library of books, and his donations for the founding a librarian's place and a fcholarlhip, to the amount of feveral thoufand pounds.

SHERRIFFE of Mecca, the title of the defeen:dants of Mahomet by Haffan Ibn Ali. Thefe are divided into feveral branches, of which the family of Ali Bunemi, conlifting at leaft of three hundred individuals, enjoy, the fole right to the throne of Mecca. The Als Bunemi are, again, fubdivided into two fubordinate branches, Darii Sajid, and Darii Barkad; of whom fometimes the one, fometimes the other, have given fo:vereigns to Mecca and Medina, when thele were fepio rate ftates.
Not only is the Turkifh Sultan indifferent about the order of fucceffion in this family, but he feems even to
foment

\section*{S H E \\ S H E}

Sherrific. foment the diffenfons which arife among them, and favours the ftrongeit, merely that he may weaken them all. As the order of fucceffion is not determinately fixed, and the fherriffes may all afpire alike to the fovereign power, this uncertainty of right, aided by the intrigues of the Turkifh officers, occalions frequent revolutions. The grand fherriffe is feldom able to maintain himfelf on the throne; and it ftill feldomer happens that his reign is not difturbed by the revolt of his neareft relations. There have been inftances of a nephew fucceeding his uncle, an uncle fucceeding his nephew; and fometimes of a perfon, from a remote branch, coming in the room of the reigning prince of the ancient houfe.

When Niebuhr was in Arabia, in 1763, the reigning Sherriffe Mefad had fitten fourteen years on the throne, and, during all that period, had been continually at war with the neighbouring \(A\) rabs, and with his own neareft relations fomerimes. A few years before, the Pacha of Syria had depoled him, and raifed his younger brother to the fovereign dignity in his ftead. But after the departure of the caravan, Jafar, the new fherriffe, not being able, to maintain limfelf on the throne, was obliged to refign the fovereignty aoain to Mefad. Achmet, the fecond brother of the therriffe, who was much beloved by the Arabs; threatened to attack Mecca while Niebuhr was at Jidda. Our traveller was foon after informed of the termination of the quarrel, and of Achmet's return to Mecca, where he continued to live peaceably in a private character.

Thefe examples fhow that the Muffulmans obferve not the law which forbids them to bear arms againft their holy places. An Egyptian Bey even prefumed, a few years fince, to plant fome frall cannons with in the compafs of the Kaba, upon a fmall tower, from which he fired over that facred manfion, upon the palace of Sherriffe Mefad, with whom he was at variance.

The dominions of the fherriffe comprehend the cities of Mecca, Medina, Jambo, Taaif, Sadie, Ghunfude, Hali, and thirteen others lefs confiderable, all fituated in Hedjas. Near Taaif is the lofty mountain of Gazvan, which, according to Arabian authors, is covered with fnow in the midft of fummer. As thefe dominions are neither opulent nor extenfive, the revenue of their fovereign cannot be confiderable.

He finds a rich refource, however, in the impofts levied on pilgrims, and in the gratuities offered him by Muffulman monarchs. Every pilgrim pays a tax of from ten to an hundred crowns, in proportion to his ability. The Great Mognl remits annually fixty thoufand roupees to the fherriffe, by an affignment upon the government of Surat. Indeed, fince the Englifh made themfelves mafters of this city, and the territory belonging to it, the Nabob of Surat has no longer been able to pay the fum. The fherriffe once demanded it of the

Englifh, as the poifeffors of Surat; and, till they thould sherlane fatisfy him, forbade their captains to leave the port of Jidda. But the Englifh difregarding this prohibition, the fherriffe complained to the Ottoman Porte, and they communicated his complaints to the Englifh ambaffador. He at the fame time opened a negociation with the nominal Nabob, who refides in Surat. But thefe fteps proved all fruitlefs: and the fovereign of Mecca feems not likely to be ever more benefited by the contribution from India.

The power of the fherriffe extends not to fpiritual matters; thefe are entirely managed by the heads of the clergy, of different fects, who are refident at Mecca. Rigid Muffulmans, fuch as the Turks, are not very favourable in their fentiments of the fherriffes, but fufpect their orthodoxy, and look upon them as fecretly attached to the tolerant fect of the Zeidi.

SHETLAND, the name of certain iflands belonging to Scotland, and lying to the northward of Orkney. There are many convincing proofs that thefe iflandswere very early inhabited by the Picts, or rather by thofe nations who were the original poffeffors of the Orkneys; and at the time of the total deffruction of thefe nations, if any credit be due to tradition, their woods were entirely ruined (A). It is highly probable that the people in Shetland, as well as in the Orkneys, flonrihed under their own princes dependent upon the crown of Norway; yet this feems to have been rather through what they acquired by fifhing and commerce, than by the cultivation of their lands. It may alfo be reafonably prefumed, that they grew thinner of inhabitants after they were annexed to the crown of Scotland; and it is likely that they revived again, chiefly by the very great and extenfive improvements which the Dutch made in the herring-fifhery upon their coafts, and the trade that the crews of their buffes, then very numerous, carried on with the inhabitants, neceffarily refulting from their want of provifions and other conveniences, which in thofe days conld not be very confiderable.

There are many reafons which may be affigned why thefe iflands, though part of our dominions, have not hitherto been better known to us. They were commonly placed two degrees too far to the north in all the old maps, in order to make them agree with Ptolemy's defcription of Thule, which he afferted to be in the latitude of \(\sigma_{3}\) degrees; which we find urged by Camden as a reafon why Thule muft be one of the Shetland ifles, to which Speed alfo agrees, though from their being thus wrong placed he could not find room for them in his maps. A nother, and that no light caufe, was the many falfe, fabulous, and impertinent relations publifhed concerning them ( \(в\) ), as if they were countries inhofpitable and uninhabitable; and laftly, the indolence, or rather indifference, of the natives, who, contenting themfelves
(A) The tradition is, that this was done by the Scots when they deftroyed the Piets; but is more probably referred to the Norwegians rooting out the original poffeffors of Shetland.
(в) They reprefented the climate as intenfely cold ; the foil as compofed of crags and quagmire, fo barren as to be incapable of bearing corn; to fupply which, the people, after drying fifh-bones, powdered them, then kneaded and baked them for bread. The larger finh-bones were faid to be all the fuel they had. Yet, in fo dreary a country, and in fuch miferable circumftances, they were acknowledged to be very long-lived, cheerful, and conso tented.

\section*{S H E [ 363 1 S H E}

6hethand. themfelves with thofe neceffaries and conveniences procured by their intercourfe with other nations, and conceiving themfelves neglected by the mother country, have feldom troubled her with their applications.
? There are few countries that have gone by more names than thefe inands; they were called in Iflandic, Hialtlandia, from bialt, the "s hilt of a fword ;" this might be poffibly corrupted into Hetland, Hitland, or Hethland, though fome tell us this fignifies a "high land." They have been likewife, and are ftill in fome maps, called Zetland and Zealand, in reference, as has been fuppofed, to their fituation. By the Danes, and by the natives, they are ftyled \(Y_{e a l t a l a n d \text {; and not- }}\) withflanding the oddnefs of the orthography, this differs very little, if at all, from their manner of pronouncing Zetland, out of which pronunciation grew the modern names of Shetland and Shotland.

The iflands of Shetland, as we commonly call them, are well fituated for trade. The nearelt continent to them is Norway ; the port of Bergen lying 44 leagues eaft, whereas they lie 46 leagues north north-eaft from Buchannefs; ealt north-eaft from Sanda, one of the Orkneys, about 16 or 18 leagues; fix or feven leagues north-ealt from Fair Ine ; 58 leagues eaft from the Ferroe ifles; and at ncarly the fame diftance north-ealt from Lewis. The fouthern promontory of the main land, called Sumburgh Head, lies in 59 degrees and 59 minutes of north latitude; and the northern extremity of Unft, the moft remote of them all, in the latitude of 61 degrees 15 minutes. The meridian of London paffes through this laft ifland, which lies about 2 degrees 30 minutes weft from Paris, and about 5 degrees 15 mi . nutes eaft from the meridian of Cape Lizard. According to Gifford's "Hiftorical Defeription of Zetland," the inhabited iffands are 33, of which the principal is Atyled Main Land, and extends in length from north to fouth about 60 miles, and is in fome places 20 broad, though in others not more than two.

It is impofiible to fpeak with precifion; but, according to the beft computation which we have been able to Form, the Shetland ifles contain near three times as nuch land as the Orkneys: they are confidered alfo as equal in fize to the ifland of Madeira ; and not inferior to the provinces of Utrecht, Zealand, and all the reft of the Dutch iflands taken together; but of climate and foil they have not much to boaft. The longeft day in the iffand of Unft is 19 hours 15 mi nutes, and of confequence the thortef day 4 hours and 45 minutes. The fpring is very late, the fummer very flort; the autumn alfo is of no long duration, dark, foggy, and rainy ; the winter fets in about November, and lafts till April, and fometimes till May. 'They have frequently in that feafon forms of thunder, much rain, but little froft or fnow. High winds are indeed very frequent and very troublefome, yet they feldom produce any terrible cffects. The aurora borealis is as common here as in any of the northern countries. In the winter feafon the fea fwells and rages in fuch a manner, that for five or fix months their ports are inacceffible, and of courfe the people during that fpace have no correfpondence with the reft of the world.

The foil in the interior part of the main land, for the moft part, is mountainous, moorifh, and boggy, yet not to fuch a degree as to render the country utterly impaffable; for many of the roads here, and in fome of
the northern ifles, are as good as any other natural shetland. roads, and the pcople travel them frequently on all occafions.' Near the coaft there are fometimes for miles together flat pleafant fpots, very fertile both in patture and corn, The mountains produce large crops of very nutritive grafs in the fummer; and they cut confiderable quantities of hay, with which they feed their cattle in the winter. They might with a little attention bring more of their country into cultivation: but the people are fo much addicted to their fifhery, and feel fo little neceffity of having recourfe to this method for fubfilience, that they are content, how frange foever that may feem to us, to let four parts in five of their land remain in a fate of nature.
They want not confiderable quantitics of marle in different iflands, though they ufe but little; hitherto there has been no clalk found; limeftone and freettone there are in the fouthern parts of the main land in great quantities, and alfo in the neighbouring iflands, particularly Fetlar ; and confiderable quantities of flate, very good in its kind. No mines have been hitherto wrought, though there are in many places vifible appearances of feveral kinds of metal. Some folid pieces of filver, it is faid, have been turned up by the plough. In fome of the finaller ifles there are ftrong appearances of iron; but, through the want of proper experiments being made, there is, in this refpect at leaft, hitherto nothing certain. Their meadows are inclefed with dikes, and produce very good grals. The little corn they grow is chiefly barley, with fome oats ; though even in the northern extremity of Unft the little land which they have is remarkable for its fertility. The hills abound with medicinal herbs ; and their kitchen-gardens thrive as well, and produce as good greens and roots, as any in Britail. Of late years, and fince this has been attended to, fome gentlemen have had even greater fuccefs than they expected in the cultivating of tulips, rofes, and many other flowers. They have no trees, and hardly any fhrubs except juniper, yet they have a tradition that their country was formerly overgrown with woods; and it feems to be a confirmation of this, that the roots of timber-trees have been, and arc ftill, dug up at a great depth; and that in fome, and thofe too inacceffible, places, the mountain afh is fill found growing wild. That this defect, viz. the want of wood at prefent, does not arife entirely from the foil or climate, appears from feveral late experiments; fome gentlemen having raifed afh, maple, horfe.chefnuts, \&c. in their gardens. Though the inhabitants are without either wood or coals, they are very well fupplied with fuel, having great plenty of heath and peat. The black cattle in this country are in general of a larger fort than in Orkney, which is owing to their having more extenfive paftures; a clear proof that ftill farther improvements might be made in refpeet to fize.' Their horfes are fmall, but ftrong, flout, and well fhaped, live very hardy, and to a great age. They have likewife a breed of fmall fwine, the flefh of which, when fat, is efteemed very delicious. They have no goats, hares, or foxes; and in general no wild or venomous creatures of any kind except rats in fame few iflands. They have no moor-fowl, which is the more remarkable, as there are everywhere immenfe quantities of heath; but there are many forts of wild and water fowl, particular: ly the dunter-goofe, clack-goofe, folan-goofe, fwans,
ducke,

\section*{S H E}
rents generally in butter at Lammas, and in money at Martinmas. As to manufactures, they make a ftrong coarfe cloth for their own ufe, as alfo linen. They make likewife of their own wool very fine fockings. They export, befides the different kinds of fifh already mentioned, fome herrings, a confiderable quantity of butter and train-oil, otter and feal fkins, and no inconfiderable quantity of the fine flockings juft mentioned. Their chief trade is to Leith; London, Hamburgh, Spaim, and to the Straits. They import timbers, deals, and fome of their beft oats, from Norway; corn and flour from the Orkneys, and from North Britain ; fpirits and fome other things from Hamburgh ; cloths and better fort of linen from Leith ; grocery, houfehold furniture, and other neceffaries, from London. The fuperior-duties to the earl of Morton are generally let in farm; and are paid by the people in butter, oil, and money. The remains of the old Norwegian conflitution are ftill vifible in the divifion of their lands; and they have fome udalmen or freeholders amongft them. But the Scots laws, cuftoms, manners, drefs, and language, prevail; and they have a fheriff, and other magiftrates for the adminitration of jultice, as well as a cuftomhoufe, with a proper number of officers. In reference to their ecclefiatical concerns, they have a prefibytery, 12 minifters, and an itinerant for Foula, Fair Ifland, aad the Skerries. Each of thefe minitters has a flipend of between 40 and 50 pounds, befides a houfe and a glebe free from.taxes. The number offouls in thefe iflands may be about 20,000 .

SHEW-bREAD, the loaves of bread which the prieft of the week put every Sabbath-day upon the goldentable in the fanctuary, before the Lord, in the temple of the Jews. They were twelve in number, and were offered to God in the name of the twelve tribes of Ifrael. They were fhaped like a brick, were ten palms long and five broad, weighing about tight pounds each. They were unleavened, and made of fine flour by the Levites. The priefts fet them on the table in two rows, fix in a row, and put frankincenfe upon them to preferve them from moulding. They, were changed every Sabbath, and the old ones belonged to the prieft upon duty. Of this bread none but the priefts might eat, except in. cafes of neceffity. It was called the bread of faces, becaule the table of the fhew.bread, being almoft overagainft the ark of the eovenant, the loaves might be faid to be fet before the face of God. The original table was carried away to Babylon, but a new one was made for the fecond temple. It was of wood overlaid with gold. This, with the candleftick and fome other fpoils, was carried by 'fitus to Rome.

SHIELD, an ancient weapon of defence, in form of a light buckler, borne on the arm to fend off lances, darts, \&c. The form of the fhield is reprefented by the efcutcheon in coats of arms. The fhield was that part of the ancient armour on which the perfons of diftinction in the field of battle always had their arms painted ; and moft of the words ufed at this time to exprefs the fpace that holds the arms of families are derived from the Latin name for a : hield, foutum. The French efou and efruffion, and the Englifh word efcutcbeon, or, as we commonly fpeak it, fcutcheon, are evidently from this origin; and the Italian foudo lignifies both the fhield of arms and that ufed in war. The Latin nam clypeus, for the fame thing, feems alfo to be derived from

\section*{S H I [ 365\(]\) S H I}
the Greek word raupur, to engrave; and it had this name from the feveral figures engraved on it, as marks of diftinction of the perfon who wore it.
'Ihe Thield in war, among the Greeks and Romans, was not only ufeful in the defence of the body, but it was allo a token, or badge of honour, to the wearer ; and he who returned from battle without it was always treated with infamy afterwards. People have at all times thought this honourable piece of the armour the propereft place to engrave, or fiyure on the figns of dignity of the poffeffor of it; and hence, when arms came to be painted for families in aftertimes, the heralds always chofe to reprefent them upon the figure of a fhield, but with leveral exterior additions and ornaments; as the helmet, fupporters, and the relt.

The form of the Thield has not only been found diffe. rent in various nations, but even the people of the fame nation, at different times, have varied its form extremely; and among feveral people there have been fhields of feveral forms and fizes in ufe, at the fame period of time, and fuited to different occafions. The moft ancient and univerfal form of fhields, in the earlier ages, feems to have been the triangular. This we fee inftances of in all the monuments and gems of antiquity : our own moft early monuments fhow. it to have been the moft antique fhape alfo with us, and the heralds have found it the moft convenient for their purpofes, when they had any odd number of figures to reprefent; as if shree, then two in the broad bottom part, and one in the narrow upper end, it held them very well; or if five, they food as: conveniently, as three below, and two above. The other form of a fhield, now univerfally ufed, is fquate, rounded, and pointed at the bottom: this is taken from the figure of the Samnitic fhield ufed by the Romans, and fince copied very generally by the Englifh, French, and Germans.

The Spaniards and Portugnefe have the like general form of firields, but they are round at the bottom without the point ; and the Germans, befide the Samnitefhield, have two others pretty much in ufe : thefe are, 3. The bulging fhield, diftinguified by its fwelling or bulging out at-the flanks; and, 2. The indented fhield, or hield chancree, which hias a number of notches and indentings all round its fides. The ufe of the ancient flield of this form was, that the notches ferved to relt the lance upon, that it might be firm while it gave the thruft; but this form being lefs proper for the receiving armorial figures, the two former have been thuch more ufed in the heraldry of that nation.

Befide this different form of the fhields in heraldry; we find them alfo often diftinguifhed by their different pofitions, fome of them ftanding erect, and others flanting various ways, and in different degrees; this the heralds exprefs by the word pendant; "hanging," they fcoming to be hung up not by the centre, but by the right or left corner. The French call thefe ecu-pendant, and the common antique triangular ones etu ancien. ' T he Italians call this fouto pendente \(;\)-and the reafon given for exhibiting the fhield in thefe figures in heraldry is, that in the ancient tilts and tournaments, they who were to juft at thefe military exercifes, were obli, ed to hang up theirfhields with their armories, or coats of arms on them; out"at the windows and balconies of the houfes near the place; or upon trees, pavilions, or the barriers of the
ground, if the exercife was to be performed in the field.

Thofe who were to fight on foot; according to Columbier, had their fhields hung up by the right corner, and thofe who were to fight: on horfeback had theirs hung up by the left. This pofition of the finields in heraldry is called couche by fome writers, thongh by the generality pendant.

It was very frequent in all parts of Europe, in arms given between the 11 th and 14 th centuries ; but it is to be obferved, that the hanging by the left corner, as it was the token of the owner's being to fight on horfeback, fo it was efteemed the molt honourable and noble, fituation ; and all the pendant fields of the fons of the royal family of Scotland and England, and of our nobility at that time, are thus hanging from the left corner. The hanging from this corner was a token of the owner's being of noble birth, and having fought in the tournaments before; but no fovereign ever had a fhield pendant any way, but always erect, as they never formally entered the lifts of the tournament.

The Italians generally have their fhields of arms of an oval form; this feems to be done in imitation of thole of the popes and other dignified clergy : but thair herald Petro Sancto feems to regret the ufe of this fie gure of the fhield, as an innovation brought in by the painters and engravers as moft convenient for holding the figures, but derogatory to the honour of the poffeffor, as not reprefenting either antiquity or honours won in war, but rather the honours of fome citizen or perfon of learning. Some have carried it fo far as to fay, that thofe who either have no ancient title to nobility, or have fullied it by any unworthy action, cannot any longer wear their arms in fhields properly figured, but were obliged to have them painted in an cval or round fhield.

In Flanders; where this author lived, the round and oval fhields.are in the difrepute he fpeaks of; but in Italy, befide the popes and dignificd prelates, many of the firft fámilies of the laity have them.

The fecular princes, in many other countries, alis. retain this' form of the fhield, as the moft ancient and truly expreflive of the Roman clypcus.

SHIELD, in heraldry, the efcutcheon or field on which the bearings of coats of arms are placed. See Heraldry. SHIEEDRAKE, in ornithology. See Anas.
SHIELDS, North and Soutlo, two fea-port townes the one north of the Tyne in Northumberland, the other on the fouth of the Tyne in the county of Durham. South Shields contains above 200 falt-pans, and on both batiks of the river are many convenient houfes for the entertainment of feamen and colliers', -moft of the Newcattle coal fleet having their ftation here ufually till their coals are brought down in the barges and lighters from Newcaftle. A very large Roman altar, of one entire ftone, was found fome years ago near this place, and put into the hands of the learnee Dr Lifter, who, in his account of it fent to the Royal Society, fays it was erected to Marcus Aurelius Antoninus Caracalla, when he took upon him the command of the empire and the whole army (after his father's death at York), for his fafe return from his fuccefsful expedition againtt the Scots and Picts: W. Long. 1. 12. N. Lat. \(53 \cdot 44!\)

SHIFIERS,
who are cons. water in which the flefh or fifh is put, and laid for fome time, in order to fit it for the kettle.

SHIFTING a tacxie, in fea-language, the act of removing the blocks of a tackle to a greater diftance from each other, on the objcet to which they are applied, in order to give a greater fcope or extent to their purchafe. This operation is otherwife called fleeting. Shifting the helm denotes the alteration of its pofition, by puihing it towards the oppofite fide of the fhip. Shifting the voyal, fignifies changing its pofition on the capterñ, from the right to the left, and vice ver \(\int a\).

SHILLING, an Englifh filver coin, equal to twelve perice, or the twentieth part of a pound.

Freherus derives the Saxon foilling, whence our fhilling, from a corruption of fliqua; proving the deriva. tion by feveral texts of law, and, among others, by the 26 th law, De annuis legatis. Skinner deduces it from the Saxon foild "fhield," by reafon of the efcutcheon of arms thereon.

Bifhop Hooper derives it from the A rabic fchecle, fignifying a weight; but others, with greater probability, deduce it from the Latin ficilicus, which fignified in that language a quarter of an ounce, or the 48 th part of a Roman pound. In confirmation of this etymology it is allegred, that the fhilling kept its original fignification, and bore the fame proportion to the Saxon pound, as ficilicus did to the Roman and the Greek, being exactly the 48 th part of the Saxon pound; a difcovery * Explicotio which we owe to Mr Lambarde*.

Rerum \(t t\)
Verborum in Leg. Sax. ves. Libra.

However, the Saxon laws reckon the pound in the ronnd number at 50 fhillings, but they really coined out of it only 48 ; the value of the fhilling was five- pence ; but it was reduced to forrpence above a century before the conqueft ; for feveral of the Saxon laws, made in Athelfan's reign, oblige us to take this eftimate. Thus it continued to the Norman times, as one of the Conqueror's laws fufficiently afcertains; and it feems to have been the common coin by which the Englifh payments were adjufted. After the conquctt, the French folidus of twelvepence, which was in ufe among the Normans, was called by the Englifh name of fhilling; and the Saxon Milling of fourpence took a Norman name, and was called the groat, or great coin, becaufe it was the largeft Englifh coin then known in England.

It has been the opinion of the bihops Fleetwood and Gibfon, and of the antiquaries in general, that, though the method of reckoning by pounds, marks, and fhillings, as well as by pence and farthings, had been in conttant ufe even from the Saxon times, long before the Norman conqueit, there never was fuch a coin in England as either a pound or a mark, nor any fhilling, till the year 1504 or 1505, when a few filver fhillings or twelverpences were coined, which have long fince been folely confined to the cabinets of collectors.

Mr Clarke combats this opinion, alleging that fome coins mentioned by Mr Folkes, under Edward I. were probably Saxon fhillinge new minted, and that arch:
\(+G\) ram.
Saxon,
p. 52. bihop Aelfric exprefsly fayst, that the Saxons had three names for their money, viz. mancufes, ihillings, and pennies. He alfo urges the different value of the Saxon filling at different times, and its uniform progortion to the pound, as an argument that their hil-
ling was a coin; and the teftimony of the Sawon gof, shath pels, in which the word we have tranflated pieces of filver is rendered faillings, which, he fays, they would hardly, have done, if there had been no fuch coin as a thilling then in ufe, Accordingly the Saxons expreffed their fhilling in Latin by ficlus and argenteus. He farther adds, that the Saxon fhilling was never expreffed by folidus till after the Norman fettlements in England; and howfoever it altered during the long period that elapfed from the conquelt to the time of Henry VII. it was the moft conitant denomination of maney in all payments, though it was then only a fpecies of account, or the twenticth part of the pound Sterling: and when it was again revived as a coin, it leffened gradually as the pound Sterling leffened, from the 28th of Edward III. to the 43 d of Elizabeth.

In the year 1560 there was a peculiar fort of fhilling flruck in Ireland, of the value of ninepence Englifh, which paffed in Ireland for twelvepence. The motto on the reverfe was, pofui Deum adjutorem meum. Eighty-two of thefe flillings, according to Maim lynes, went to the pound ; they therefore weighed 20 grains, one-fourth each, which is fomewhat heavier in proportion than the Englifh thilling of that time, 62 whereof went to the poiud, each weighing 92 grains feven-eighths; and the Irifh fhilling being valued at the Tower at ninepence Englifh, that is, one-fourth part lefs than the Englifh Ailling, it fhould therefore proportionably weigh one fourth part lefs, and its full wcight be fomewhat morc than 62 grains; but fome of them found at this time, though much worn, weighed 69 grains. In the year 1598 , five different pieces of money of this kind were ftruck in England for the fervice of the kingdom of Ireland. Thefe were fhillings to be current in Ireland at twelvepence each; half thillings to be current at fixpence, and quarter fillings at threepence. Pennies and halfpennies were alfo ftruck of the fame kind, and fent over for the payment of the army in Ireland. The money thus coined was of a very bafe mixture of copper and filver; and two years after there were more pieces of the fame kinds ftruck for the fame fervice, which were ftill worfe; the former being three ounces of filver to nine ounces of copper ; and thefe latter only two ounces eighteen pennyweights to nine ounces two pennyweights of the alloy.
The Dutch, Flemifh, and Germans, have likewife their fhilling, called fobelin, fchilling, fcalin, scc. but thefe not being of the fame weight or finenefs with the Engo lifh milling, are not current at the fame value. The Englim fhilling is worth about 23 French fols; thofe of Holland and Germany about in fols and an half; thofe of Flanders about nine. The Dutch thillings are alfo called fols de gros, becaufe equal to twelve gros. The Danes have copper fhillings worth about onefourth of a farthing Sterling.
SHII.OH is a term famous among interpreters and commentators upon Scripture. It is found (Gen. xlix. 10.) to denote the Meffiah, The patriarch Jacob foretels his coming in thefe wards; "The fceptre Ahall not depart from Judah, nor a lawgiver from between his feet, until Shiluh come; and unto him fhall the gathering of the people be." The Hebrew text reads, mentators agree, that this word ought to be underftood of the Meffiah, or Jefus Chrift ; but all are not agreed about

\section*{\(\mathrm{S} H \mathrm{H} \quad\) [367] S H I}
about its literal and grammatical fignification. St Jerome, who tranflates it by Q \(^{\prime}\) i mittendus eff, manifertly reads Shiloach " fent," inftead of Shiloh. The Septuarint have it
 (as if they had read intead of \(\pi\) ) , i. e. "Until the coming of him to whom it is refcrved;", or, "Till. we fee arrive that which is referved for him."

It mult be owned, that the lignification of the He . brew word Shilob is not well known. Some tranflate, "the fceptre thall not depart from Judah, till he comes
 thers, " till the coming of the peace-maker;" or, "the pacific ;" or, " of profperity," profperatus eft. Sha-lab tignifies, " to be in peace, to be in profperity;" others, "till the birth of him who fhall be born of a woman that fhall conceive without the knowledge of a man," שול שלא fecundina, fluxus \(\dagger\); otherwifc, " the fceptre fhall not depart from Judah, till its end, its ruin ; till the downfal of the kingdom of the Jews," שא or \(\pi\) new it has ceafed, it bas fini/bed IT. Some Rabbins have taken the name Silob or Sbiloh, as if it fignified the city of this name in Paleftine: "The fceptre fhall not be taken away from Judah till it comes to Shiloh; till it Thall be taken from him to be given to Saul at Shiloh." But in what part of Scripture is it faid, that Saul was acknowledged as king or confecrated at Shiloh ? If we would underttand it of Jeroboam the fon of Nebat, the matter is fill as uncertain. The Scripture mentions no aftembly at Shiloh that admitted him as king. A more modern author derives Shilob from nbw, fatigare, which fometimes fignifies to be weary, to fuffer; "till his labours, his fufferings, his paffion, fhall happen."

But not to anufe ourfelves about feeking out the granmatical fignification of Shiloh, it is fufficient for us to fhow, that the ancient Jews are in this matter agreed with the Chriftians: they acknowledge, that this word flands for the Melflab the King. It is thus that the paraphrafts Onkelos and Jorrathan, that the ancient Hebrew commentaries upon Genefis, and that the Talmudifts themfelves, explain it. If Jefus Chrit and his apoftles did not make ufe of this paffage to prove the coming of the Mefliah, it was becaufe then the completion of this prophecy was not fufficiently manifeft. The fceptre ftill continued among the Jews; they had ftill kings of their own nation in the perfons of the Herods; but foon after the fceptre was entirely taken away from them, and has never been reftored to them fince.

The conceited Jews feek in vain to put forced meanings upon this prophecy of Jacob; faying, for example, that the fceptre intimates the dominion of ftrangers, to which they have been in fubjection, or the hope of feeing one day the fceptre or fupreme power fettled again among themfelves. It is eafy to perceive, that all this is contrived to deliver themfelves out of perplexity. In vam likewife they take refuge in certain princes of the captivity, whom they pretend to have fubfifted beyond the Euphrates, exercifing an authority over their nation little differing from abfolute, and being of the race of David. This pretended fucceffion of princes, is perfectly chimerical; and though at certain times they could fhow a fucceffion, it continued but a fhort time, and their authority was too obfcure, and too much li-. mited, to be the object of a prophecy fo remarkable as this was.

SHINGLES, in building, fmall pieces af wood, or quartered oaken boards, fawn to a certain feantling, or,
\(\qquad\) as is more ufual, cleft to about an inch thick at one end, and made like wedges, four or five inches broad, and eight or nine inches long.

Shingles are ufed inftead of tiles or flates, efpecially for churches and fleeples; however, this covering is dear ; yet, where tiles are very fcarce, and a light covering is required, it is preferable to thatch; and where they are made of good oak, cleft, and not fawed, and well feafoned in water and the fun, they make a fure, light, and durable covering.

The building is firft to be covered all over with boards, and the fhingles nailed upon them.

SHIP, a general name for all large veffels, particularly thofe equipped with three mafts and a bowfprit: the mafts being compofed of a lowermaft, topmaft, and top-gallant-malt: each of thefe being provided with yards, fails, \&c. Ships, in general, are either employ. ed for war or merchandize.

SHIPS of. War are veffels properly equipped with ar. tillery, ammunition, and all the neceffary martial weapons and inftruments for attack or defence. They are diftinguifhed from each other by their feveral ranks or claffcs, called rates, as follows: Ships of the firft rate mount from 100 guns to 110 guns and upwards; fecond rate, from 90 to 98 guns; third rate, from 64 to 74 guns; fourth rate, from 50 to 60 guns; fifth rate, from 32 to 44 guns; and fixth rates, from 20 to 28 guns. See the article Rate. Veffels carrying lefs than 20 guns arc denominated lloops, cutters, fire-fbips, and bombs. It has lately been propofed to reduce the number of thefe rates, which would be a faving to the nation, and alfo productive of feveral material advantages.

In Plate CCCCL. is the reprefentation of a firft rate, with rigging, \&c. the feveral parts of which are as follow:

Parts of the hull.-A, The cathead; B, The fore-chain-wales, or chains; C, The main-chains; D, The mizen-chains; \(E\), The entering port; \(F\), The hawfeholes; G, The poop-lanterns; H, The chefs-tree; I, The head ; K, The ftern.

Fig. 2. Plate CCCCLI. is a vertical longitudinal fection of a firt rate fhip of war, with references to the principal:parts; which are as follow:

A, Is the head, containing, - , The ftem ; 2, The \&nee of the head or cutwater. ; 3, The lower and upper cheek ; 4, The trail-board; 5, The figure ; 6 , The gratings; 7 , The brackets; 8, The falfe. Atem; 9 , The breaft hooks; 10, The haufe holes ; 11, The bulkhead forward; 12, The cat-head: 13, The cat-hook; 14, Neceffary feats; 15 , The manger within board; 16 , The bowfprit.

B, Upon the forecattle-17, The gratings; 18 , The partners of the maft; 19, The gunwale; 20, The belfry ; 21, The funnel for fmoke; 22, 'The gangway going off the forecaftle; 23 , The forecaftle guns.

C, In the forecaftle-24, The door of the bulkhead forward; 25, Officers cabins; 26, Staircafe; 27, Fore-top-fail theet bits; 28, The beams; 29, The carlings.

D, 'Ithe middle gundeck forward- 30 , The forejeer bits.; 3 , The oven and furnace of copper; 32, The captain's cook room; 33, The ladder or way to the forecaftle.

E, The lower gun-deck forward - 34, The knees fore and aft; 35, The Spirketings, or the firf Atreak next
to each deek, the next under the beams being ealled Ship, clamps; 36, The beams of the middle gun deck fore and aft ; 37, The carlings of the middle gun-deck fore and aft ; 38, The fore-bits; 39, The after or main bits; 40, The hatchway to the gunner's and boatfwain's tore-rooms; 41, The jeer capttan.

F, The orlop-42,43, 44, 'The gunner's, boatrwain's and carpenter's ftore-rooms; 45, The beams of the lower gun-deck; 46, 47, The pillars and the riders, fore and aft; 48 , The bulkhead of the ftore-reoms.

G, The hold \(-49,50,51\), The foot-hook rider, the floor rider, and the ftandard, fore and aft; 52 , The pillars; 53, The ftep of the foremaft; 54 , The kelfon. or falfe keel, and dead rifing; 55, The dead-wood.

H, At midhips in the hold - 56 , The floor timbers ; 57, The keel; 58, The well ; 59, The chair-pump; \(6 \approx\), The ftep of the mainmaft; 61,62, Beams and ear lings of the orlop, fore and aft.

1, The orlop amidfhips -63 , The cable tire ; 64, The main hatchway.

K, The lower gun-deck amidmips-65, The ladder leading up to the middle gun-deck; 66, The lower tire of ports.
L, The middle gun-deck amidmip-67, The middle tire of ports; 68, The entering port ; 69, The main jeer bits; 70, Twitted pillars or flanchions; \(7 x\), The capftan; 72, Gratings ; 73, The ladder leading to the upper deck.
M, The upper gun-deck amidfhips - 74, The maintop-fail-fheet bits; 75, The upper partners-of the mainmaft; 76 , The gallows on which fpare topmatts \&c. are laid; 77, The foremeet blocks; 78, The rennets; 79, The gunwale; 80, The upper gratings; 81 , The drift brackets; 82 , The pifs date; 83 , The captan pall.

N, Abaft the mainmaft-84, The gangway off the quarterdeck; 85 , The bulkhead of the coach; 86 , The flaircafe down to the middle gun-deck; 87, The beams of the upper deck; 88 , The gratings about the mainmaft ; 89 , The coach or council-chamber; 90 , The ftaircafe up to the quarterdeck.

O, The quarterdeck-91, The beams ; 92, The carlings; 93 , 'The partners of the mizenmatt; 94 , The gangway up to the poop; 95, The bulkhead of the cuddy.

P, The poop-96, The trumpeter's cabin ; 97, The tafforel.
Q , The captain's cabin.
R, The cuddy, ufually divided for the mafter and feo cretary's officers.

S, The ftate-room, out of which is made the bedchamber and other conveniences for the commander in chief; 98 , The entrance into the gallery ; 99, The bulkhead of the great cabin; 100, The ftern lights and ufter galleries.

T , The ward-room, allotted for the lieutenants and marine officers: 101, The lower gallery; 102, The feerage and bulkhead of the wardroom; 103, The whip. ftaff, commanding the tiller; 104, The after ftaircafe. leading down to the lower gun-deck.

V, Several officers cabins abaft the mainmat, where the foldiers generally keep guard.
W, The gun-room-105, The tiller commanding the rudder; 106, The rudder; 107, The flern-poft; 108, The tiller-tranfom; 10.9, The feveral tranfoms, viz. is \(2,3,4,5 . ; 110\), 'The gun-room ports, or Atern-chafe;

\section*{S H I \\ S H I}
ini, The bread-roon fcuttle, out of the gun-room ; II2, The main capftan; IIR, The pall of the capftan; 1 14, The partner; 115. The bulkhead of the breadroom.

X, The bread-room.
Y, The fteward's room, where all provifions are weirhed and ferved out.

Z, 'The cockpit, where are fubdivifions for the purfer, the furgeon, and his mates.

AA, The platform or orlop, where provifion is made for the wounded in the time of fervice; 116 , The hold abaft the main-maft; 117, The fep of the mizen-maft ; 118 , The kelfon, or falfe keel ; 119, The dead wood, or rifing.

Ships of war are fitted out either at the expence of the ftate or by individuals. Thofe fitted out at the public expence are called King's 乃ips, and are divided into Bips of the line, frigates, loops, \&c. For an account of each of thefe, fee the refpective articles. Ships of war fitted out by individuals are called privateers. See the article Privateer.

Armed.Ship. See Armed-Ship.
Bomb-Ship. See Bomb-Veffels.
Double-Ship. See Ship-Building.
Fire-Ship. See Firk-Ship.
Hofpital. Ship, a veffel fitted up to attend on a fleet of men of war, and receive their fick or wounded; for which purpofe her decks fhould be high, and her ports fufficiently large. Her cables ought alfo to run ripon the upper deck, to the end that the beds or cradles may be more commodioufly placed between decks, and admit a free paffage of the air to difperfe that which is offenfive or corrupted.

Merchant-SHIP, a veffel employed in commerce to carry commodities of various forts from one port to another.

The largeft merchant fhips are thofe employed by the different companies of merchants who trade to the Eaft Indies. They are in general larger than our 40 gun fhips; and are cornmonly mounted with 20 guns on their upper-deck, which are nine pounders ; and fix on their quarter-dicck, which are fix pounders.

Regiler-Ship. See Register-Ship.
Stare-S \(S_{\text {HIP }}\), a veffel employed to carry artillery or naval fores for the ufe of a fleer, fortrefs, or garrifon.

Tranfport-SHIP, is generally ufed to conduct troops from one place to another.

Befides the different kinds of flaips abovementioned, which are denominated from the purpofe for which they are employed, veffels have alfo, in general, been named according to the different manner of rigging them. It would be an endlefs, and at the fame time an unneceffary tafk, to enumerate all the different kinds of weffels with refpect to their rigging; and therefore a few only are here taken notice of. Firg. 3. Plate CCCCLI. is a fisip which would be converted into a bark by itripping the mizen malt of its yards and the fails belonging to them. If each maft, its correfponding topmalt and topgallant-maft, inttead of being compofed of feparate pieces of wood, were all of one continued piece, then this veffel with very little alteration would be a polucre. Fig. 4. repiefents a fnowe ; fig. 5. a bilander; fig. 6. a brig; fig. 7. a ketch; fig. 8. a fchooner; fig. 9. a \(\Omega\) op; fig. 10. a zebec; fig. 11. a galliot; fig. 12. a dogger; fig. 13. a galley under fail; fig. 14. ditto rowing.
VoL. XVII. Part I.
Ships are alfo fometimes named according to the different modes of their conftruction. Thus we fay, a catbuilt Thip, \&c.

To SHIP, is either ufed actively, as to embark any perfon or put any thing aboard fiip: or paflively, to receive any thing into a flip ; as, "we fhipped a heavy fea at three o'clock in the morning."
To SHIP, alfo implies to fix any thing in its place: as, to fhip the oars, that is, to put themun their rowlocks; to fhip the fwivel guns, is to fix them in their fockets; to fhip the handfpokes, \&c.

Machine for drawing Bolts out of Ships, an inftrument invented by Mr William Hill for this purpofe.
\(\qquad\) Ship.

His account of which is as follows*.
"Firlt, The ufe of this machine is to draw the kelfon and dead wond bolts out, and to draw the knee of the head bolts. - Secondly, The heads of the kelfon bolts heretofore were all obliged to be driven thro' the kelfon,解, Arts, \&\&c. oor-timbers, and keel, to get them out: by this means vol, \(\mathbf{x}\). the kelfon is often entirely deftroyed, and the large hole the head makes materially wounds the floors; and frequently, when the bolt is much corroded, it fcarfs, and the bolt comes out of the fide of the keel. - Thirdly, The dead-wood bolts that are driven with two or three drifts, are feldom or never got out, by which means the dead-wood is condemned, when fome of it is really ferviceable. - Fourthly, In drawing the knee of the headbolts, fometimes the knee ftarts off, and cannot be got to again, but furs up, and with this machine may be drawn in; for it has been proved to have more power in ttarting a bolt than the maul."

In fig. 1. "A, A, reprefent two ftrong male fcrews,

 working in female fcrews near the extremities of

Plate wor extremities of the CCCCLitio cheeks, againft plates of iron E, E. C C is the bolt to be drawn ; which, being held between the chaps of the machine at DD , is, by turning the forews by the lever \(B\), forced upwards out of the wood or plank of the fhip. F, F, are two dogs, with hooks at their lower extremities; which, being driven into the plank, ferve to fupport the machine till the chaps have got faft hold of the bolt. At the upper part of thefe dogs are rings paffing thro' holes in a collar, moveable near the heads of the fcrews. Fig. 2. is a view of the upper fide of the cheeks when joined together; \(a, a\), the holes in which the fcrews work; \(b\), the chaps by which the bolts are drawn. Fig. 3. The under fide of the check: \(a, a\), the holes in which the ferews work; \(b\), the chaps by which the bolts are drawn, and where the teetli that gripe the bolt are more diftinctly fhown. Fig. 4. One of the cheeks feparated from the other, the letters referring as in fig. 2 . and 3 .

This machine was tried in his majefty's yard at Deptford, and was found of the greateft utility.-"Firft, it drew a bolt that was driveri down fo tight as only to go one inch in fixteen blows with a double-headed maul, and was well clenched below : the bolt drew the ring a confiderable way into the wood, and wire drew itfelf through, and left the ring behind. Secondly, it drew a bolt out of the Venus's dead-wood that could not be got out by the maul. 'Ihat part of it which went through the keel was bent clofe up to the lower part of the dead-wood, and the machine drew the bolt ftraight, and drew it out with eafe. It alfo drew a kelfon bolt out of the Stanley Weft Indiaman, in Meffrs Wells's yard, Deptford; whieh being a bolt of two drifts, could not be driven out.

How the yardsough
to be braced.

Riding
windward
tide in dan
ger of
breaking
her fheer.
\({ }^{4}\)
Tending to leeward when the fhip muft be fet a. head.

Management of Ships at fingle anchor, is the method of taking care of a fhip while riding at fingle anchor in a tide-way, by preventing her from fouling her anchor, \&c. The following rules for this purpofe, with which we have been favoured by Mr Heury Thaylor* of North Shields, will be found of the utmoft confequence.

Riding in a tide-way, with a frefh-of-wind, the fhip fhould have what is called a foort or windward fervice, fay 45 or 50 fathoms of cable, and always fheered to windward (A), not always with the helm hard down, but more or lefs fo according to the ftrength or weaknefs of the tide. It is a known fact, that many fhips fheer their anchors home, drive on board of other fhips, and on the fands near which they rode, before it has been difcovered that the anchor had been moved from the place where it was let go.
When the wind is crofs, or nearly crofs, off fhore, or in the oppofite direction, hips will always back. This is done by the mizen-topfail, affifted, if needful, by the mizen ftayfail; fuch as have no mizen-topfail commonly ufe the main-topfail, or if it blows frefh, a top-gallant-fail, or any fuch fail at the gaff.
In backing, a fhip fhould always wind with a taught cable, that it may be certain the anchor is drawn round. In cafe there is not a fufficiency of wind for that purpofe, the fhip fhould be hove apeak.
Riding with the wind afore the beam, the yards fhould be braced forward; if abaft the beam, they are to be braced all aback.

If the wind is fo far aft that the fhip will net back (which fhould not be attempted if, when the tide eales, the fhip forges ahead, and brings the buoy on the lee quarter), fhe muft be fet ahead: if the wind is far aft, and blows frefh, the utmoft care and attention is neceffary, as fhips riding in this fituation often break their fheer, and come to windward of their anchors again. It fhould be obferved, that when the fhip lies in this ticklifh fituation, the after-yards muft be braced forward, and the fore-yards the contrary way: The will lay fafe, as the buoy can be kept on the lee quarter, or fuppofe the helm is aport, as long as the buoy is on the larboard quarter. With the helm thus, and the wind right aft, or nearly fo, the ftarboard main and fore braces fhould be hauled in. This fuppofes the main braces to lead forward.

When the fhip begins to tend to leeward, and the buoy comes on the weather-quarter, the firft thing to be done is to brace about the fore-yard; and when the wind comes near the beam, fet the fore-ftayfail, and
keep it fanding until it fhakes; then brace all the yards fharp forward, efpecially if it is likely to blow trong. If laying in the aforefaid pofition, and the breaks her fheer, brace about the main-yard inmediately; if fhe recovers and brings the buoy on the lee or larboard quar- when ter, let the main-yard be again braced about; but if the hip br come to a fheer the other way, by bringing the buoy on the other quarter, change the helm and brace the fore-yard to.

Riding leeward tide with more cable than the wind- When ward fervice, and expecting the fhip will go to wind-long te ward of her anchor, begin as foon as the tide eafes to vice is fhorten in the cable. This is often hard work; but it fhip is is neceffary to be done, otherwife the anchor may bely to fouled by the great length of cable the Thip has to draw windw round ; but even if that could be done, the cable would be damaged againft the bows or cut-water. It is to be obferved, that when a fhip rides windward tide the cable fhould be cackled from the fhort fervice towards the anchor, as far as will prevent the bare part touching the fhip.

When the chip tends to windward and muft be fet ahead, hoift the fore-fayfail as foon as it will ftand, and when the buoy comes on the leequarter, haul down the fore-ftayfail, brace to the fore-yard, and put the helm a-lee; for till then the helm mult be kept a-weather and the yards full.

When the fhip rides leeward tide, and the wind in- How \({ }^{7}\) creafes, care fhould be taken to give her more ca- manag ble in time, otherwife the anchor may ftart, and pro- a forr bably it will be troublefome to get her brought up again; and this care is the more neceffary when the thip rides in the haufe of another thip. Previous to giving a long fervice it is ufual to take a weather-bit, that is, a turn of the cable over the windlafs end, fo that in veering away the fhip will be under commend. The fervice ought to be greafed, which will prevent its chafing in the haufe.

If the gale continues to increafe, the topmafts fhould be ftruck in time; but the fore-yard fhould feldom, if ever, be lowered down, that in cafe of parting the forefail may be ready to be fet. At fuch times there fhould be more on deck than the common anclor-watch, that rio accident may happen from inattention or falling \(a_{\text {a }}\) fleep.

In a tide-way a fecond anchor fhould never be let go but when abfolutely neceffary; for a fhip will fome. times ride eafier and fafer, efpecially if the fea runs high, with a very long fcope of cable and one anchor, than with
(A) It has been thought by fome theorifts, that fhips fhould be fheered to leeward of their anchors; but experience and the common practice of the beft informed feamen are againft that opinion: for it is found, that when a fhip rides leeward tide and fheered to windward, with the wind two or three points upon the bow, and blowing hard in the interval between the fqualls, the fheer will draw her towards the wind's eye; fo that when the nex \(t\) fquall comes, before fhe be preffed aftream of her anchor, it is probable there will be a lall again, and the fpring which the cable got by the fheer will greatly eafe it during the fquall.

Every feaman knows that no fhip without a rudder, or the helm left loofe, will wear ; they always in fuch fituations fly to: this proves that the wind preffing upon the quarter and the helm alee, a fhip will be lefs liable to break her fheer than when the helm is a-weather. Befides, if the helm is a-lee when fhe breaks her fheer, it will be a-weather when the wind comes on the other quarter, as it ought to be until fhe either fwing to leeward; or bring the buoy on the other quarter. Now if the fhip breaks her fheer with the helm a-weather, it throws her head to the wind fo fuddenly as fcarce to give time to brace the yards about, and very probably fhe will fall over her anchor before the fore-ftayfail can be got up.

\section*{S H I [ 37 I\(] \quad \mathrm{S}\) H I}
lefs length and two cables; however, it is advifable, as a preventive, when fhips have not room to drive, and the night is dark, to let fall a fecond anchor under foot, with a range of cable along the deck. If this is not thought neceffary to be done, the deep-fea lead fhould be thrown overboard, and the line frequently handled by the watch, that they may be affured the rides faft.

If at any time the anchor-watch, prefuming on their own knowledge, fhould wind the Chip, or fuffer her to break her fheer without calling the mate, he fhould im. mediately, or the very firft opportunity, oblige the crew to heave the anchor in fight ; which will prevent the commifion of the like fault again; for befides the fhare of trouble the watch will have, the reft of the cirew will blame them for neglecting their duty.

Prudent mates feldom lie a week in a road-ftead without heaving their anchor in fight; even though they have not the leaft fufpicion of its being foul. There are other reafons why the anchor fhould be looked at ; fometimes the cable rectives damage by fweeping wrecks or anchors that have been loft, or from rocks or ftones ; and it is often neceffary to trip the anchor, in order to take a clearer birth, which fhould be done as often as any fhip brings up too near.

Metbod for the fafe removal of fuch SHIPs as bave been driven on hore. For this purpofe empty cafks are ufually employed to float off the veffel, efpecially if the is fmall, and at the fame time near the port to which it is propofed to conduct her. In other cafes, the following - method adopted by Mr Barnard * will anfwer.
er On January 1. 1779 (fays Mr Barnard), in a moft dreadful form, the York Eaft Indiaman, of eight hundred tons, homeward bound, with a pepper cargo, parted her cables in Margate roads, and was driven on Shore, within one hundred feet of the head and thirty feet of the fide of Margate pier, then drawing twenty-two feet fix inches water, the flow of a good fpring tide being only fourteen feet at that place.
"On the third of the fame month I went down, as a fhip-bnilder, to affit, as much as lay in my power, my worthy friend Sir Richard Hotham, to whom the fhip belonged. I found her perfectly upright, and her fhere (or fide appearance) the fame as when firft built, but funk to the twelve feet water-mark fore and aft in a bed of chalk mixed with a ftiff blue clay, exactly the fhape of her body below that draft of water; and from the rudder being torn from her as the ftruck coming on Thore, and the violent agitation of the fea after her being there, her ftern was fo greatly injured as to admit free accefs thereto, which filled her for four days equal to the flow of the tide. Having fully informed myfelf of her fituation and the flow of fpring-tides, and being clearly of opinion the might be again got off, I recommended, as the firt neceffary ftep, the immediate difcharge of the cargo ; and, in the progrefs of that bufinefs, I found the tide always flowed to the fame height on the fhip; and when the cargo was half difcharged, and I knew the remaining part fhould not make her draw more than eighteen feet water, and while I was obferving the water at twenty.two feet fix inches by the fhip's marks, fhe inftantly lifted to feventeen feet eight inches; the water and air being before excluded by her preffure on the clay, and the atmofphere acting upon mer upper part equal to fix hundred tons, which is the
weight of water difplaced at the difference of thefe two drafts of water.
" The moment the mip lifted, I difcovered the had received more damage than was at firft apprehended, her leaks being fuch as filled her from four to eighteen feet water in an hour and a half. As nothing effectual was to be expected from pumping, feveral fcuttles or holes in the fhip's fide were made, and valves fixed thereto, to draw off the water at the loweft ebb of the tide, to facilitate the difcharge of the remaining part of the cargo ; and, after many attempts, I fucceeded in an external application of fheep-fkins fewed on a fail and thrult under the bottom, to ftop the body of water from rufhing fo furiounly into the fhip. This bufirefs effected, moderate pumping erabled us to keep the fhip to about fix feet water at low water, and by a vigorous effort we could bring the fhip fo light as (when the cargo fhould be all difcharged) to be eafily removed into deeper water. But as the external application might be difturbed by fo doing, or totally removed by the agitation of the Ship, it was abfolutely neceffary to provide fome permanent fecurity for the lives of thofe who were to navigate her to the river Thames. I then recommended as the cheapeft, quickeft, and moft effectual plan, to lay a deck in the hold, as low as the water could be pumped to, framed fo folidly and fecurely, and caulked fo tight, as to fwim the fhip independent of her own leaky bottom.
" Beams of fir-timber twelve inclies fquare were placed in the hold under every lower-deck beam in the fhip, as low as the water would permit ; thefe were in two pieces, for the conveniency of getting them down, and alfo for the better fixing them of an exact length, and well bolted together when in their places. Over thefe were laid long Dantzic deals of two inches and an half thick, well nailed and caulked. Againft the fhip's fide, all fore and aft, was well nailed a piece of fir twelve inches broad and fix inches thick on the lower and three inches on the upper edge, to prevent the deck from rifing at the fide. Over the deck, at every beam, was laid a crofs piece of fir timber fix inches deep and twelve inches broad, reaching from the pillar of the hold to the fhip's fide, on which the fhores were to be placed to refift the preffure of the water beneath. On each of thefe, and againt the lower-deck beam, at equal diftances from the fide and middle of the fhip, was placed an upright fhore, fix inches by twelve, the lower end let two inches into the crofs piece. From the foot of this fhore to the fhip's fide, under the end of every lower deck beam, was placed a diagonal fhore fix inches by twelve, to eafe the fhip's deck of part of the ftrain by throwing it on the fide. An upright fhore of three inches by twelve was placed from the end of every crofs piece to the lower deck beams at the fide, and one of three inches by twelve on the midfhip end of every crofs piece to the lower deck beam, and nailed to the pillars in the hold. Two firm tight bulkheads or partitions were made as near the extremes of the fhip as poffible. The ceiling or infide plank of the fhip was very fecurely caulked up to the lower deck, and the whole formed a complete fhip with a flat bottom within fide, to fwim the outfide leaky one ; and that bottom being depreffed fix feet below the external water, refifted the fhip's weight above it equal to five hundred and eighty-one tons, and fafely conveyed her to the dry-dock at Deptiord."

\section*{S H I P-B U I L D I N G.}

SFIIP-bUILDING, or Naval Architecture, is the art of conftructing a fhip fo as to anfwer a particular purpofe either of war or merchandife.

\section*{Hiftory.}

To whom the world is indebtedfor the invention of hips,
is, like all other things of equal antiquity, uncertain.

A very fmall portion of art or contrivance was feen in the frit fhips: they were neither ftrong nor durable; but confilted only of a fcw planks laid together, withont beauty or ornament, and jult fo compacted as to keep out the water. In forme places they were only the hulks or focks of trees hollowed, and then confifted only of one piece of timber. Nor was wood atone applied to this ufe; but any other buoyant materials, as the Egyptian reed papyrus; or leather, of which the primitive fhips were fiequently compofed; the bottom and fides being extended on a frame of thin battens or fcantlings, of flexible wood, or begirt with wickers, fuch as we have frequently beheld amongtt the American favages. In this manner they were often navigated upon the rivers of Ethiopia, Egypt, and Sabæan Arabia, even in latter tines. But in the firft of them, we find no mention of any thing but leather or hides fewed together. In a veffel of this kind, Dardanus fecured his retreat to the country afterwards called Troas, when he was compelled by a terrible deluge to forfake his former habitation of Samothrace. According to Virgil, Charon's infernal boat was of the fame compofition.

But as the other arts extended their influence, naval architecturc likewiie began to emerge from the gloom of ignorance and barbarifm ; and as the fhips of thofe agcs were increafed in bulk, and better proportioned for commerce, the appearancc of thofe foating citadels of unufual form, full of living men, fly ing with feemingly expanded wings over the furface of the untravelled ocean, Kruck the ignorant pcople with terror and aftoniflment: and hence, as we are teld by Ariftophanes, arofe the fable of Perfeus flying to the Gorgons, who was actually carried thither in a fhip! Hence, in all probability, the famous ftory of Triptolemus riding on a winged dragon is deduced, only becaufe he failed from Athens, in the time of a great dearth, to a more plentiful country, to fupply the neceffities of his people. The fiction of the flying horfe Pegafus may be joined with thefe, who, as feveral mythologifts report, was nothing but a thip with fails, and thence faid to be the offspring of Neptune the fovereign of the fea; nor does there appear any other foundation for the ftories of griffins, or of Thips transformed into birds and fifhes, which we fo often meet with in the ancient poets. So acceptable to the firt ages of the world were inventions of this nature, that whoever made any improvements in navigation or naval architecture, building new fhips better fitted for ftrength or fwiftnefs than thofe ufed before, or rendered the old more commodious by additional contrivances, or difcovercd countries unknown to former travellers, were thought worthy of the greateft honours, and often affociated into the number of their deified heroes. Hence we have in aftronomy the figns of Aries and Taurus, which were no other than two Mips: the former tranf.
ported Phryxus from Greece to Colchos, and the lat. ter Europa from Phœnicia to Crete. Argo, Peqafus, and Perfeus, were likewife new thips of a different fort from the former, which being greatly admired by the barbarous and uninftructed people of thofe times, were tranflated amongit the ftars, in commemoration of their inventors, and metamorphofed into conflellations by the poets of their own and of fucceeding ages.

The chief parts, of which thips anciently confifted, were three, viz. the belly, the prow, and the ftern: thefe were again compofed of other Imaller parts, which hail be briefly defcribed in their order. In the defcription, we chiefly follow Scheffer, who hath fo copioufly treated this fubject, and with fuch induftry and learning collected whatever is neceffary to illuftratc it, that very little room is left for enlargement by thofe who incline to purfue this inveftigation.
I. In the belly, or middle part of the fhip, there was: tpowts, carina, or the "keel," which was compofed of wood: it was placed at the bottom of the fhip, being defigned to cut and glide through the waves, and therefore was not broad, but narrow and fharp; whence it: may be perceived that not all thips, but only the \(\mu \alpha \times \rho \alpha t\), which thips of war were called, whofe bellies were flraight and of a fmall circumference, were provided with keels, the reft having ufually flat bottoms. A round the outfide of the keel were fixed pieces of wood, to prevent it from being damaged when the fhip was firt launched into the water, or afterwards ftruck on any:

Next to the keel was \(q \times \lambda x i s\), the "pump-well, or well-room," within which was contained the avrisov, or " pump;" through which water was conveycd out of the fhip.
After this, there was diviepe rpputs, or the "fecond keel," fomewhat refembling what is now called the kelfon; it was placed beneath the pump, and called
 fed to be the fame with \(q \alpha \lambda \times 15\).

Above the pump was an hollow place, called by Herodotus xoran Tns unos, by Pollux xurocand \(\gamma \alpha 5 \rho \alpha\), becaufe \(^{\text {a }}\) large and capacious, after the form of a belly ; by the Latins, tefudo. This was formed by crooked ribs, witha which it was furrounded, which were pieces of wood: rifing from the keel upwards, and called by Hefychius voмะis, and by others, \&ixoitia, the belly of the thip being contained within them: in Latin, cofla; and in Englith, timbers. Upon thefe were placed certain plankg. which Ariftophanes calls svifpariacs, or evtepavisa
'The waivpa', latera, or "fides" of the fhip, encomepaffed all the former parts on both hands; thefe were compofed of large rafters extended from prow to ftcrn, and called \(\zeta \omega \varsigma n \rho \xi \varsigma\), and \(\zeta \omega \mu \alpha \mu \alpha \tau \alpha\), becaufe by them the whole fabric was begirt or furrounded.

In both thefe fides the rowers had their places; call: ed \(\tau 0 \cdot \chi^{\circ}\) and \(\varepsilon \delta \omega \lambda \iota \alpha\), in Latin fori and tranfira, placed. above one another; the loweft was called : \(\sim \lambda \alpha \mu \circ \varsigma\), and thofe that laboured therein \(\uparrow \alpha \lambda a \mu\) or the middle, \(\zeta \nu \gamma \alpha\), and the men 广ursos; the uppermott Tparot, whence the

\section*{S H I P-B U}
rowers were termed Opawfat. In thefeapartments were fpaces through which the rowers put their oars: thefe were fometimes one continued vacuity from one end to the other, called \(\tau \rho \alpha \neq n \xi\), but more ufually diftinct holeas, each of which was defigned for a fingle oar ; thefe
 not unlike the eyes of living creatures. All of then were by a more general namc termed \(\gamma \gamma \times \omega \pi \alpha\), from containing the oars; but trvawir feems to have been another thing, fignifying the fpaces between the banks of oars on each fide, where the paffengers appear to have been placed. On the top of all there was a paffage or place to walk,
 or uppermoft bank of oars.
2. \(\Pi_{\zeta \leftrightarrow \beta x}\), the " prow or fore-deck," whence it is fométimes called \(\mu\) itan:v, and commonly diftinguifhed by otlrer metaphorical titles taken from human faces. In fome flips there is mention of two prows, as alfo two Iterns; fuch was Danaus's Ship adorned by Minerva when he fled from Egypt. It was ufual to beautify the prow with gold and various forts of paint and colours ; in the primitive times red was moft in ufe; whence Homer's fhips were commonly dionified with the titles of \(\mu\) intoto \(\alpha\) gnos, and forvorowapn", or "red faced;" the blue likewife, or fky-colour, was frequently made ufe of, as bearing a near refemblance to the colour of the fea; whencewe find fhips called by Homer xuxvoupapor, by Ariftophanes xuavipionot. Several other colours were alfo made ufe of; nor were they barely varnifhed over with them, but very often annealed by wax melted in the fire, fo as neither the fun, winds, nor water, were able to deface them. The art of doing this was called
 is deferibed by Vitruvius, and mentioned in Ovid.
> ———Picka coloribus uflis
> Caruleam matrem concava puppis habet.
> The painted fhip with melted wax anneal'd Had 'Iethys for its deity -

In thefe colours the various forms of gods, animals, plants, \&c. were ufually drawn, which were likewife often added as ornaments to other parts of the fhips, as plainly appears from the ancient monuments prefented to the world by Bayfus.

The fides of the prow were termed wiffa, or " wings," and \(\varpi \alpha_{p} t x\), according to Scheffer, or rather \(\begin{aligned} & \text { aptian ; for }\end{aligned}\) fince the prow is commonly compared to a human face, it will naturally follow that the fides fhould be called cheeks. Thefe are now called bows by our mariners,
3. If ourn, "the hind-deck or poop"," fometimes called soc, the "tail," becaufe the hindmoft part of the fhip; it was of a figure more inclining to round than the prow, the extremity of which was fharp, that it might cut the waters ; it was alfo built higher than the prow, and was the place where the pilot fat to fteer; the
 to our term quarter.

They had various ornaments of fculpture on the prow; as helmets, animals, triumphal wreaths, \&c.The ftern was more particularly adorned with wings, thields, \&c. Sometimes a little maft was erected whereon to hang ribbands of divers colours, which ferved in ftead of a flag to diftinguifh the fhip; and a weathercock, to fignify the part from whence the wind blew.

\section*{1 L D I N G.}

On the extremity of the plow was placed a round piece of wood, called the wluxts, from its bending ; and fometimes ed in the fore-deck; on this was inferibed the name of the fhip, which was ufually taken from the figure painted on the flag. Hence comes the frequent mention of Mips called Pegafi, Scylla, bulls, rams, tigers, \&c. whichthe poets took the liberty to reprefent as living creatures that tranfported their riders from one country to, another.
'The whole fabric being completed, it was fortified' with pitch, and fometimes a mixture of rofin, to fecure the wood from the waters; whence it comes that Homer's fhips are everywhere mentioned with the epithet. of \(\mu: \varepsilon\) 凤. aval, or "black." The firt that made ufe of pitcll were the inlabitants of Phæacia, fince called Corfica; fometimes wax was employed in the fame ufe: whence Ovid,

\section*{Carulea ceratas accipit unda rates.}

The azure waves receive the waxed fhips.
After all, the fhip being bedecked with garlandsand flowers, the mariners allo adorned with crowns, fhe was launched into the fea with loud acclamations and other expreffions of joy ; and being purified by a prieft with a lighted torch, an egg and brimftone, or after fome other manner, was confectated to the god whofe image the bore.

The fhips of war of the ancients were diftinguifhed from other kinds of veffels by various turrets and acceffions of building, fome to defend their own foldiers, and others to annoy the enemy; and from one another, in latter ages, by feveral degrees or ranks of oars, the moft ufual number of which was four or five, which appeat not to have been arranged, as fome imagine, on the fame level in different parts of the fhip; ner yet, as others have finppofed, directly above one another's heads; but their leats being placed one behind another, afcended gradually, like itairs. Ptoleny Philopater, urged by a vainglorious defire of exceeding all the world belides in naval architecture, is faid to have farther enlarged the number of banks to 40 ; and the fhip being otherwife in equal proportion, this aifed her to fuch an enormous bulk, that fhe appeared at a diftance like a floating mountain or inland; and, upon a nearer view, like a prodigious caftle on the ocean. She was 280 cubits long, 38 broad, and 48 high (each cubit being 1 Englifh foot \(5 \frac{1}{2}\) inches), and carried 400 rowers, 400 failors, and 3000 foldiers. Another which the fame prince made to fail on the Nile, we are told, was half a ftadium long. Yet thefe were nothing in comparifon of Hiero's fhip, built under the direction of Archimedes; on the ftructurc whereof Mofchion wrote a whele volume. There was wood enough cmployed in it to make 50 galleys; it had all the variety of apartments of a palace; fuch as banqueting-rooms, galleries, gardens, fifh-ponds, ftables, mills, baths, and a temple to Venus. The floors of the middle apartment were all inlaid, and reprefented in various colours the ftories of Homer's Iliad. The ceilings, windows, and all other parts, were finifhed with wonderful art, and embellifhed with all kinds of ornaments. In the uppermoft apartment there was a fpacious gymnafium, or place for ex. ercife, and water was conveyed to the garden by pipes,
fome
fome of hardened clay, and others of lead. The floors of the temple of Venus were inlaid with agates and other precious ftones; the infide lined with cyprefs wond ; the windows adorned with ivory paintings and fmall ftatues. There was likewife a library. This veffel was adorned on all fides with fine paintings. It had 20 benches of oars, and was encompaffed with an iron rampart, eight towers, with walls and bulwarks, furnifhed with machines of war, particularly one which threw a ftone of 300 pounds, or a dart 12 cubits long, the fpace of half a mile, with many other particulars related by Athenæus. Caligula likewife built a veffel adorned with jewels in the poop, with fails of many colours, and furnifhed with large porticoes, bagnios, and banquet-ing-rooms, befides rows of vines, and fruit-trees of various kinds. But thefe, and all fuch monftrous fabrics, ferved only for fhow and oftentation, being rendered by their valt bulk unwieldy and unfit for fervice. A thenæus informs us, the conmon names they were known by, were Cyclades, or Etna, i. e. "illands, or mountains," to which they feemed nearly equal in bignefs ; confiting, as fome report, of as many materials as would have compofed 50 triremes, or hips of three banks.

The veffels employed by the northern nations appear to have been itill more imperfect than thofe of the Romans; for a law was enacted in the reign of the emperor Honorius, 24th September, A. D \(41^{18}\), inflicting capital punifhment on any who fhould inftruct the barbarians in the art of fhip-building ; a proof at once of the great eftimation in which this fcience was then held, and of the ignorance of the barbarians with regard to it.

The fleet of Richard I. of England, when he weished anchor for the holy war from Meffina, in Sicily, where he had paffed the winter, A. D. 1190.1 , is faid to have confifted of 150 great chips and 53 galleys, befides barks, tartans, \&c. What kinds of fhips thefe werc is not mentioned. To the crufades, however pernicious in other refpects, this fcience feems to owe fome improvements; and to this particular one we are indebted for Richard's marine code, commonly called the Laws of Oleron, from the name of a fmall ifland on the coaft of France, where he compored them, and which moft of the nations in Europe have made the bafis of their maritime regulations. Thofe hips, if they merited the name of fhips, were probably very fmall, as we find that fo long after as the time of Edward I. anno 1304, 40 men were deemed fufficient to man the
13. vol. iv. beft and largeft veffels in England; and that Edward

the Third, anno 1335, ordained the mayor and fheriffs of London to " take up all fhips in their port, and all
other ports in the kingdom, of the burden of 40 tons of London to "take up all fhips in their port, and all
other ports in the kingdom, of the burden of 40 tons and upwards, and to furnifh the fame with armed men
and other neceffaries of war, againtt the Scots his cneand upwards, and to furnifh the fame with armed men
and other neceffaries of war, againft the Scots his cnemies, confederated with certain perfons of foreign na-
tions." Edward the Third's fleet before Calais, anno tions." Edward the Third's fleet before Calais, anno 1347, confifted of \(73^{8}\) Englifh fhips, carrying 14,956 mariners, being on an average but 20 men to each fhip; mariners, being on an average but 20 men to each hip;
15 hips and 459 mariners, from Bayonne in Guienne, being 30 men to each fhip; 7 fhips and 184 men from Spain, which is 26 men to each fhip ; one from Ireland, carrying 25 men; 14 from Flanders, with 133 men,
being fcarcely 10 men to each fhip ; and one from Guel derland, with 24 mariners. Fifteen of thefe were called the king's own hips, manned with 419 mariners, being fomewhat under 17 to eacli thip.

Hiftorians reprefent the veffels of Venice and Genoa as the largeft and the beft about this time, but they were foon exceeded in fize by the Spanifh veffels called carricks, fome of which carried cannon; and thefe again were exceeded by the veffels built by the northern people, particularly thofe belonginy to the Hanfe-towns. In the 14th century, the Hanfiatics were the fovereigns of the northern feas, as well without as within the Baltic ; and their flips were fo large, that foreign princes often hired them in their wars. According to Hakluyt, an Englifh Thip from Newcaftle, of 200 tons burden, was feized in the Baltic by thofe of Wifmar and Roftock, anno 394 ; and another Englifh veffel of the Federd, fame burden was violently feized in the port of Lifbon, vol. vii anno 1412.

Soon after thips of a much larger fize were con-Ib. vol flructed. It is mentioned that a very large fhip was 10258. built, anno 1449, by John 'Taverner of Hull ; and in \(l b\). vol. the year 1455 , king Henry IV. at the requelt of \(1 \cdot 3^{64}\) Charles king of Sweden, granted a licence for a Swedifh fhip of the burden of a thoufand tons or under, laden with merchandize, and having 120 perfons on board, to come to the ports of England, there to difpofe of their lading, and to relade back with Englifh merchandize, paying the ufual cuftoms. The infcription on the tomb of William Canuing, an eminent merchant, who lad been five times mayor of Briftol, in Ratcliff-church at Briftol, anno 1474, mentions his having forfeited the king's peace, for which he was condemned to pay 300 merks ; in lieu of which fum, king Edward IV. took of him \(247^{\circ}\) tons of Chipping, amongt which there was one fhip of 900 tons burden, another of 500 tons, and one of 400 tons, the reft being fmaller.

In the year 1506, king James IV. of Scotland built the largeft fhip which had hitherto been feen, but which was loft in her way to France in the year 1512, owing probably to a defective conitruction, and the unfkilfulnefs of the crew in managing fo large a fhip. About thîs time a very large fhip was likewife built in France. In the fleet fitted out by Henry VIII, anno 1512 , there was one Mip, the Regent, of ICOO tons burden, one of 500 , and three of 400 each. A fhip fill larger than the Regent was built foon after, called Henri Grace Dieu! In the year 1522 the firft voyage round the globe was finifhed.
The Englifh naval hiftorians think that fhips carried cannon on their upper decks only, and had not gunports before the year 1545 : and it is certain that many of the largeft fhips in former times were fitted out from harbours, where fhips of a moderate fize now would not have water enough to float them. In 1575 the whole of the royal navy did not exceed 24 hhips , and the number of merchant.fhips belonging to Enigland amounted to no more than 135 veffels above 100 tons, and 656 between 40 and 100 tons. At queen Eliza- Monfon' beth's death, anno 1603 , there were not above four Tracis merchant-fhips in England of 400 tons burden each. The largeft of queen Elizabeth's fhips of war was 1000 tons burden, carrying but 340 men, and 40 guns, and

\section*{S H I P-B U I L D I N G.}
the fmallet 600 tons, carrying 150 men and 30 guns. Smaller veffels were occafionally hired by her from private owners.

In the memorable fea-fight of Lepanto between the Turks and Chrittians, anno 1571, no veffels were employed but galleys; and it would appear from the carcafes of fome of them, which are ttill preferved in the arfenal at Venice, that even thefe were not fo large or fo well conftructed as thofe of our times. The Invin cible Armada, as Spanif vanity fyled it, once the terror and admiration of nations, in the pompous and exaggerated defcriptions of which the Spanifl authors of thofe times dwelt with fo much apparent pleafure, confifted of 130 fhips, near 100 of which were the ftatelieft that had yet been feen on the ocean. The largeft of thefe, however, would be no more than a third rate veffel in our navy, and they were fo ill conftructed, that they would neither move eafily, fail near the wind, nor be properly worked in tempeftuous weather. The whole of the naval force collected by Queen Elizabeth to oppofe this formidable fleet, including hired veffels, tenders, fore-fhips, \&c. amounted to no more than 143.

Ship-building began now to make a confiderable progrefs in Britain. Both war and trade required anl increafe of fhipping; fo that, in the year 1670 , the annual charge of the navy was reported to be L. 500,000 ; and in 1678 the navy confifted of 83 fhips, of which 58 were of the line. At this time the exports amounted to ten millions per annum; and the balance of trade was two millions. In 1689 there were 173 fhips, great and fmall, in the royal navy, and it has been conftantly increafing; fo that in 1761 the fhips in the navy amounted to 372 , of which 129 were of the line; and in the begisning of the year 1795, the total amount was above 430 .

As fhips of the common conftruction are found to be very defective in many particulars, various methods have therefore from time to time been propofed to re. move fome of the bad qualities they poffeffed. - As it would be an endlefs tafik to enumerate the different inventions for this purpofe, therefore a few of them only will be mentioned.
In \(166_{3}\) Sir William Petty conftructed a double fhip, or rather a fingle flaip with a double bottom, which was found to fail confiderably fatter than any of the fhips with which it had an opportunity of being tried. Her firt voyage was from Dublin to Holyhead; and in her return " fhe turned into that narrow harbour againft wind and tide, among rocks and fhips, with fuch dexterity as many ancient feamen confeffed they had never feen the like." This veffel with 70 more were loft in a dreadful tempeft:

This fubject was again revived by Mr Gordon, in his Principles of Naval Architecture, printed at Aberdeen anno 1784 ; where, having delivered his fentiments on the conftruction of large matts, he fays: "Thefe ex-
periments likewife point out to us methods by which two veffels may be laterally connected together, though at a confiderable diftance from each other, in a manner fufficiently ftrong, with very little increafe of weight or expence of materials, and without expoling much furface to the action or influence of the wind or the waves, or obftructing their motion in any confiderable degree, and confequently without being much oppofed by then on that account under any circumftances; and if velfels are judicioufly conftructed with a view to fuch a junction, it would be no eafy matter to enumerate all the advantages that may be obtained by this means." He then enumerates the advantages that double veffels would have over thofe of the common conffruction. And lately Soon after double fhips were aetually built by Mr Mil-confructed ler of Dalfwinton. by MrMilAnother plan was propofed by Mr Gordon to make \({ }_{\text {Prin }}^{\text {ler. }}\) a fhip fail faft, draw little water, and to keep a good Princifles wind. For this purpofe, " the bottom (he fays) fhould Arcbitecbe formed quite flat, and the fides made to rife perpen- ture, p. 76.
dicular from it, without any curvature ; which would
8 be formed quite flat, and the fides made to rife perpen- ture, p. 760

7 the moft effectual method of auginenting the velocity inconvewith which veffels go before the wind; yet, as it pro-niency of portionally diminifhes their hold of the water, it ren-this plan. ders them extremely liable to be driven to leeward, and \(\begin{gathered}10 \\ \text { Remedied }\end{gathered}\) altogether incapable of keeping a good wind. This bemaugdefect may, however, be remedied, in a fimple and ef-menting fectual manner, by proportionally augnenting the the depth depth of keel, or, as fo large a keel would be inconve- of the keel, nient on many accounts, proportionally increafing their Or by in \({ }^{11}\) number; as, in place of adding a keel eight feet deep creafing to a veffel drawing fix feet water, to affix to different the nume parts of her flat bottom, which would be well adapted ber of for receiving them, fix different keels of two feet deep \({ }^{\text {keels. }}\) each at equal ditances from each other, with proper intervals between; which will be found equally effectual for preventing thefe pernicious effects. Four fuch, indeed, would have anfwered the purpofe as well as the eight feet keel, were it not for the fuperior pref. fure or refiftance of the lower water (A).

Thus then it appears, that a veffel drawing eight feet water only, keels and all, may be made to keep as good a wind, or be as little liable to be driven to leeward, as the fharpeft built veffel of the fame length drawing 14 , nay 20 or upwards, if a few more keels are added, at the fame time that the would be little more refifted in moving in the line of the keels than a veffel drawing fix feet water only. Thefe keels, befides, would ftrengthen the veffel confiderably, would render her more fteady, and lefs liable to be overfet, and thereby enable.
(A) This is frequently repeated on the authority of Mr Gordon and others. Theory fays otherwife; and theexperiments of Sir Ifaac Newton fhow in the moft unexceptionable manner, that the refiftance of a ball de fcending through the water is the fame at all depths; nay, the heaping up of the water on the bow, occafioning a hydroftatical preffure in addition to the real refiftance, will make the whole oppofition to an equal furfaces. but of greater horizontal dimenfions, greater, becaufe it bears a greater proportion to the refiftance.
enable her to carry more fail; and Mr Gordon then enumerates the feveral advantages that a fhip of this conftruction will poffefs.

This plan has lately been put into execution by Captain Schank, with this difference only, that inftead of the keels being fixed as propofed by Mr Gorcon, Captain Scliank conftructed them fo as to flide down to a certain depth below the bottom, or to be drawn up within the thip as occafion might require.

Captain Schank having communicated his plans to the Navy Board, two veffels were in confequence ordered to be built of 13 tons each, and fimilar in dimenfions, one on the old confruction, and the other flatbottomed, with fliding keels. In 1790 a comparative trial in prefence of the commiffioners of the navy was made on the river Thames, each having the fame quantity of fail; and although the veffel on the old conftruction had leeboards, a greater quantity of ballaft, and two Thames pilots aboard, yet Captain Schank's veffel with three fliding keels beat the other veffel, to the aftonifhment of all prefent, one half of the whole diftance failed; and no doubt fhe would have beat her much more had fhe been furnifhed with a Thames pilot.

This trial gave fo much fatisfaction, that a king's cutter of 120 tons was immediately ordered to be built on the fame conftruction, and Captain Schank was requefted to fuperintend its building. This veffel was launched at Plymouth in 1791, and named the Trial. The length of this veffel is 66 feet, breadth 21 feet, and depth of the hold feven feet : her bottom is quite flat, and draws only fix feet water, with all her guns, ftores, \&c. whereas all other veffels of her tonnage on the old conftruction draw i 4 feet; fo that fhe can go with fafety into almolt any harbour or creek. She has three fliding keels inclofed in a cafe or well; they are each 14 feet in length; the fore and the after keels are three feet broad each, and the middle keel is fix feet broad. The keels are moveable by means of a winch, and may be let down feven feet below the real keel ; and they work equally well in a form as in fill water. Her hold is divided into feveral compartments, all water-tight, and fo contrived, that fhould even a plank or two ftart at fea in different parts of the veffel, fhe may be navigated with the greatef fecurity to any place. If the thould be driven on thore in a gale of wind, fhe will not foon become a wreck, as her keels will be driven up into their cafes, and the fhip being flat-bottomed, will not be eafily overfet; and being able to go into fuch fhallow water, the crew may all be eatily faved. By means of her fliding keels the is kept fteady in the greateft gale; fhe is quite eafy in a great fea, does not ftrain in the leaft, and never takes in water on her deck ; and when at anchor, fhe rides more upright and even than any other fhip can do: fhe fails very faft either before or upon a wind; no veffel the has ever been in company with, of equal fize, has been able, upon maniy trials, to beat her in failing; and yet her fails feem too fmall.

It has alfo been propofed to conftruft veffels of other materials than wood; and lately a veffel was built whofe bottom, inftead of being plank, was copper.

\section*{I L D I N G.}

Book I. Containing the Method of delineating the feveral Sections of a Ship.

\section*{Chap. I. Of the Properties of Ships:}

A ship ought to be conftucted fo as to anfwer the par- Genera ticular purpofe for which fhe is intended. It would be an princip eafy matter to cetermine the form of a hip intended to if fhip fail by means of oars; but, when fails are ufcd, a fhip is then acted upon by two elements, the wind and water : and therefore it is much more difficule than is commonly imagined to afcertain the form of a fhip fo as to anfwer in an unfavourable as well as a favourable wind; the fhip at the fame time having a cargo of a certain, weight and magnitude.

Every fhip ought to fail well, but particularly when proper \({ }^{36}\) the wind is upon the beam; for this purpofe a confider- chat a able length in proportion to the breadth is neceffary, muft pe and the plane of refiftance fhould be the leaft poffible. fers to The main frame fhould alfo be placed in a proper fitua- er. tion ; but according to the experiments of Mr Chapman *, its plane is variable with the velocity of the * Trai fhip : the mean place of the main frame has, however, \({ }^{\text {la }}\) Conf been generally eftimated to be about one-twelfth of the \({ }_{\text {tan des }}^{\text {taux }}\) length of the keel before the middle. Without a fuf-ficient-degree of fability a thip will not be able to carry a prefs of fail: a great breadth in proportion to the length and low upper-works will augment the ftability. The following particulars being attended to, the above property will be gained, and the fhip will alfo fteer well. The wing tranfom thould be carried pretty high; the fafhion-pieces well formed, and not full below the load water-line : the lower part of the ftem to be a portion of a circle, and to have a confiderable rake: the fternpoft to be nearly perpendicular to the keel ; and all the upper works kept as low as poffible.

Many fhips from conltruction are liable to make much \(\mathrm{To}^{17}{ }^{17}\) leeway. This may in a great meafure be avoided by gi- a fhip ving the fhip a long keel, little breadth, and a confider-a good able depth in the hold: whence the bow will meet with wind, little refiftance in comparifon to the fide, and therefore the fhip will not fall much to the leeward.

Anther very great retardation to the velocity of a And to 18 fhip is her pitching. The principal remedy for this is to fimoth increafe the length of the keel and floor, to diminifh w thou the rifing afore and abaft, and to conftruct the hull in hard. fuch a manner that the contents of the fore-body may be duly proportioned to the contents of the afterbody.

In a fhip of war the lower tier of guns ought to be In fhip of a fufficient height above the water, otherwife it will wawer th be impoffible to work the lee-guns when it blows hard. cower to 'This property will be obtained by giving her a long fafficie floor-timber, little rifing, a full miditip frame, light up. ign ab per works, and the wing tranfom not too high: And in every thip the extreme breadth oupht always to be higher afore and abaft than at midfhips.
A merchant fhip, befides being a faft failer, ought Proper to carry a confiderable cargo in proportion to its of a me length, to fail with little ballaft, and to be navisated \({ }^{\text {chant } 1}\) with few hands.
That a fhip may take in a confiderable cargo, it To tak \({ }^{25}\) 8
tiesfhould have a great breadth and depth in proportion to its lengtl!, a full bottom, and a long and flat floor. But a thip: of this confruction will neither fail faft, nor carry much fail.

If a thip be filled out much towards the line of floatation, together with low upper works, the will require little ballaft: and that fhip which is ftiff from conftruction is much better adapted for failing falt than one which, in order to carry the fame quantity of canvas, is obliged to be loaded with a much greater weight : for the refiftance is as the quantity of water to be remaved, or nearly as the area of a tranfverfe fection of the immerfed part of the body at the midfhip frame; and a body that is broad and fnallow is much ftiffer than one of the fame capacity that is narrow and deep. " The advantages (fays Mr Gordon) are numerous, important, and obvious. For it is evident, that by enlarging, perhaps doubling, the breadth of veffels, and forming their bottoms flat and well furnithed with keels, they muft, in the firft place, become much fteadier, roll little, if any, and be enabled to carry grcatly more fail, and that in better direction, at the fame time that they would be in no danger of being difmafted or overfet, unlefs the mafts were of a moft extraordinary heirht indeed. Secondly, They would have little or no occafion for ballaft, and if any was ufed, could incur lefs danger from its 角ifting. Thirdly, That there would be much more room upon deck, as well as accommodation below; the breadth being fo much increafed without any diminution of the height above the doad-water line. Fourthly, That they would deviate much lefs from the intended courfe, and penetrate the water much eafier in the proper direction: for doubling the breadth, without any increafe of weight, would diminifh the depth or draught of water one half; and thounh the extent of the directly oppofing furface would be the fame as before, yet the veffel in moving would meet with half the former refiftance only: for fo great is the difference between the preffure, force, or reaction, of the upper and the under water. Fifthly, That they, would by this means be adapted for lying unfupported in docks and harbours when dry, be rendered capable of being navigated in fhallow water, and of being benefited by all the advantages attending that very important circumftance ; and it is particularly to be obferved, that makings veffels which may be navigated in thallow water, may, in many refpects, jultly be reparded as a matter of equal importance with increafing the number of harbours, and improving them, as having identically the fame effects with regard to naviyation; at the fame time, that the benefits which wonld refult from fuch circumftances are obtained by this means without either expence, trouble, or inconveniency: befides, it would not only enable veffels to enter many rivers, bays, and creeks, formerly inacceffible to thips of burden, but to proceed to finch places as are molt land-locked, where they can lie or ride moft fecure, and with leaft expence of men and ground tackle. As Ships of war would carry their guns well by being fo Iteady, there could be but little occafion for a high topfide, or much-height of lull above water; and as little or no ballaf would be required, there would be no neceffity, as in other weffels, for increafing their weight on that account, and thereby prefin'y them deeper into the water. Thefe-are very inportant circumVob. XVII. Part I.

Atances, and would contribute much to improve the failing of fuch veffels." Fiom whence it appears, that there would be united, what has hitlierto been deemed irreconscileable, the greateft poffible ftability, which is nearly as the area of a tranverfe lection of the immerfed pait o: the bady at the midfhip frame : and a body that is broad and fhallow is much ftiffer than one of the fame capdcity that is narrow and deep. A mip of this couftruction may take in a confiderable cargo in proportion to her fize ; but if deeply loaded will not fail faft, for then the area of a fection of the immerfed part at the midfhip frame will be very confiderable; and as the fails of fuch a thip muft neceffarily be large, more hands will therefore be required.

The lefs the breadth of a thip; the fewer hands will And to be be neceflary to work her; as in that cafe the quantity naviqated of fail will be lefs, and the anchors alfo of hefs weight. hith fe We fhall gain much (fays M. Bouguer) by making the Traité du extreme breadth no more than the fifth or fixth part Nuvire. of the length, if, at the fame time, we diminifh the depth proportionally ; and likewife this mot furprifing circumitance, that by diminifling thefe two dimentions, or by increafing the length, a hip may be made to go fometinies as faft as the wind.

In order to obtain the preceding properties, very op-Impoffille pofite rules mult be followed; and hence it appears to \({ }^{\circ}\) ourite all be impoffible to conftruct a fhip fo as to be poffeffed of the quali. them all. The body, however, mult be fo formed, that fame firip. as many of thefe properties may be retained as poffible, always obferving to give the preference to thofe which are moft required. If it is known what particular trade the fhip is to be employed in, thofe qualities are then principally to be adhered to which are mott effentially neceffary for that employment.

It may eafily be demonftrated that fmall finiss will small fips not have the fame advantages as large ones of a finilar inferior to form, when employed in the fame trade: for a large inge ones fhip will not only fail fafter than a fmall one of a fimi- failing, \&c, lar form, but will alfo require fewer hands to work her. Hence, in order that a fmall fhip may poffers the fame advantages as a large one, the correfponding dimenfions will not be proportional to each other. The reader will fee in Chapman's Architeifura Navalis Mercatoria ample tables of the feveral dimenfions of flips, of different claffes and fizes, deduced from theory combined with experiment. 'Tables of the dimenfions of the principal fhips of the Britifh navy, and of other fhips, are contained in the Ship-builder's Repolitory, and in Murray's Treatife on Ship-building.

\section*{Chap. II. Of the different Plans of a Ship.}

When it is propofed to build a flip, the proportional fize of every part of her is to be laid down ; trom whence the form and dimenfions of the timbers; and of every particular piece of wood that enters into the com ftruction, is to be found. As a fhip has length, breadth, and depth, three different plans at leaft are neeceflary to exhibit the form of the feveral parts of a thip: thefe are ufually denominated the Jheer plan, the balf breadth and lody plans.

The Jbeer plan or: draught, othervide called the plan heer? of elevation, is that fection of the finip which is made draught, os by a vertical plave paffing throngh the keel. Upon elevatio. this plan are laid down the length of the keel ; the height and rake of the ftem and flernpolt; the fituation

plan or horizontal plane.

\section*{29}

Body plan, or projec:ion.

30
The various lines laid down on thefe ghlans.

\section*{S H I P-B U}
and height of the midflip and other frames; the place of the matts and channels ; the projection of the head and quarter gallery, and their appendages; and in a thip of war the pofition and dimenfions of the gun-ports. Several imaginary lines, namely, the upper and lower height of breadth lines, water lines, 3cc. are alfo drawn in this plan.

The balf brendth or floo plan, or, as it is frequently called, the borizontal plane, contains the feveral half. breadths of every frame of timbers at different heights; ribbands, water lines, \&c. are alfo defrribed on this plane.
The body plan, or plane of projection, is a fection of the thip at the midnhip frame or broadeft place, perpendicular to the two former. The feveral breadths, and the particular form of every frame of timbers, are defcribed on this plane. As the two fides of a fhip are fimilar to each other, it is therefore unneceflary to lay down both; hence the frames contained between the main frame and the ftem are defrribed on one fide of the middle line, commonly on the right hand fide, and the after frames are defcibed on the other fide of that line.
Several lines are defcribed on thefe planes, in order the more readily to affift in the formation of the timbers; the principal of which are the following:
The top-timber line, is a curve limiting the height of the flip at each timber.

The top-timber balf breadtb line, is a fection of the fhip at the height of the top-timber line, perpendicular to the plane of elevation.
The beight of breadthb lines, are two lines named the upper and lower heights of breadth. Thefe lines are defribed on the plane of elevation to determine the height of the broadent part of the fhip at each timber ; and being defcribed in the body plan, limits the height aud breadth of each frame at its broadeft part.
Main balf breadth, is a fection of the flip at the broadeft part, perpendicular to the fheer plan, and seprefents the greateft breadth at the outfide of every timber.

Water lines, are lines fuppofed to be defcribed on the bottom of a Alip when afloat by the furface of water ; and the uppermoft of thefe lines, or that defcribed by the water on the Thip's bottom when fufficiently loaded, is called the load vater line. According as the fhip is lightened, fhe will rife higher out of the water; and hence new water lines will be formed. If fhe be li, htened in fuch a manner that the keel may preferve the fame inclination to the furface of the water, thefe lines will be parallel to each other; and if they are parallel to the keel, they will be reprefented by ftraight lines parallel. to each other in the body plan ;, otherwife by curves. In the half breadth plan, thefe lines are curves limiting the half breadth of the thip at the height of the correfoonding lines in the fheer plan. In order to diftinguif thefe lines, they are ufually drawn in green.
Ribband lines, are curves on a flip's bottom by the interfection of a plane inclined to the plane of elevation; and are denominated diagonal or borizontai', according as they are meafured upon the diagonial, or in a direc. tion perpendicular to the plane of elevation. Both thefe anfwer to the fame curve on the flip's bottom, but give very different curves when defcribed on the half breadth plan.

I L D. I N G.
Frames, are circular pieces of timber bolted together, and raifed upon the keel at certain diftances, and to which the planks are faftened. A frame is compofed of one floor-timber, two or three futtocks, and a toptimber on each fide : which being united together, form \(F\) a circular inclofure, and that which inclofes the greateft com fpace is called the mid/bip or main frame. The arms flo of the floor.timber of this frame form a very obtufe ber angle; but in the other frames this angle decreafes with orod the dittance of the frame from midfhips. Thofe floor top timbers which form very acute angles are called crutcles. The length of the midnhip floor timber is in general about half the length of the main frame.

A frame of timbers is commonly formed by arches 5 ww of circles called fweeps. There are generally five th fweeps: \(1 / f\), The floor \(f\) weep \(;\) which is limited by a line \({ }_{f r}\) in the body plan perpendicular to the plane of elevation, a little above the keel; and the height of this line above the keel at the midfhip frame is called the dead ri/ang. The upper part of this arch forms the head of the floor timber. 2d, The lower breadth foweep; the centre of which is in the line reprefenting the lower height of breadth. \(3^{d}\), The reconciling fweep. This fweep joins the two former, without interfecting cither ; and makes a fair curve from the lower height of breadth to the rifing line. If a ftraight line is drawn from the upper edge of the keel to touch the back of the floor fweep, the form of the midhip frame below the lower height of breadth will be obtained. \(4^{\text {th }}\), The upper breadth fweep; the centre of which is in the line reprefenting the upper height of breadth of the timber. This fiweep defcribed upwards forms the lower part of the top timber. 5 th, The top timber fweep is that which forms the hollow of the top timber. This hollow is, however, very often formed by a mould, fo placed as to touch the upper breadth fweep, and pafs through the point limiting the half breadth of the top timber.

The main frame, or as it is ufually called dead-fat, is Na denoted by the character \(\oplus\). The timbers before dead fra flat are marked A, B, C, \&c. in order; and thofe abaft dead-flat by the figures \(\mathrm{I}, 2,3\), \&cc. The timbers adjacent to dead-flat, and of the fame dimenfions nearly, are diftinguifhed by the characters (A), (B), \&c. and (1), (2), \&c.. That part of the fhip abatt the main frame is called the after body; and that before it the fore body.

All. timbers are perpendicular to the half breadth plan. 'Thofe timbers whofe planes are perpendicular to the fheer plan, are called Square timbers; and thofe whofe planes are inclined to it are called canted timbirs...

The rifing line, is a curve drawn in the theer plan, at the heights of, the centres of the floor fweeps in the body plan. As, however, this line, if drawn in this manner, would extend beyond the upper line of the figure, it is therefore ufually lo drawn that its lower part may touch the upper edge of the keel. This is performed by taking the heights of each of the centres in the. body plan, from the height of the centre of the fweep of dead-flat, and fetting them off on the correciponding timbers in the. fleer plan from the upper edge of the keel.
Half breadth of the rijng, is a curve in the floor plan, which limits the diftances of the centres of the floor fiweeps from the middle line of the body plan.

\section*{S II I P-B U}

The rifing of the floor, is a curve drawn in the fheer s of a plan, at the height of the ends of the floor timbers, It is limited at the main frame or dead flat by the dead rifing, and in flat fhips is nearly parallel to the keel for fome timbers afore and abaft the midfhip frame; for which reafon thefe timbers are called flats: but in tharp Ships it rifea gradually from the main frame, and ends on the ftem and poit.

Cutting dozon line, is a curve drawn on the plane of elevation. It limits the depth of every floor timber at the middle line, and alfo the height of the upper part of the dead wood afore and abaft.

Timber and room, or romm and space, is the diftance between the moulding cdges of two timbers, which muft always contain the breadth of two timbers and an interval of about two or three inches between them. In forming the timbers, one mould ferves for two, the forefide of the one being fuppofed te unite with the aftlide of the other, and fo make only one line, which is called the joint of the timbers.

In order to illuftrate the above, and to explain more particularly the principal pieces that compofe a fhip, it will be neceffary to give a defcription of them. Thefe pieces are for the moft part reprefented according to the order of their difpofition in fig. I. Plate CCCCL.IV.

A, Reprefents the pieces of the keel to be fecurely bolted together and clinched.
\(B\), The fternpolt, which is tenanted into the keel, and connected to it by the knee G.

E, The back of the poft, which is allo tenanted into the keel, and fecurely bolted to the poft ; the intention of it is to give fufficient breadth to the port, which feldom can be got broad enough in one piece. C is the falfe poft, which is fayed ( \(B\) ) to the fore part of the fternpoft.

C, The ftem, in two pieces, to be fcarfed together. The ftem is joined to the fore foot, which makes a part of both.

H , The apron, in two pieces, to be fcarfed together, and fayed on the iufide of the ftem, to fupport the fcarf thercof; and therefore the fcarf of the apron muft be at fome diftance from that of the ftem.

I, The ftemfon, in two pieces, to fupport the fcarf of the apron.

D, The beams which fupport the decks; and F the knees by which the beams are faftened to the fides of the fhip.

K , The wing tranfom: it is fayed acrofs the fternpoft, and bolted to the head of it, and its extremities are faftened to the fathion pieces. L, Is the deck tranfom, parallel to the wing tranfom. M, N, Two of the lower tranfoms: thefe are faftened to the fternpoft and fafhion pieces in the fame manner as the wing tranfom. Q, The knee which faftens the tranfom to the fhip's fide. And, \(O\), The fafhion piece, of which there is one on each fide. The keel of the fathion piece is connected with the dead-wood, and the head is faftened to the wing tranfom.

R, S, Breaft-hooks : thefe are fayed in the infide to the ftem, and to the bow on each fide of it, to which they are faftened with proper bolts. 'I'here are gene-

I I. D I N G.
rally four or five in the hold, in the form of that mark. cd \(R\), and one in the form of that marked \(S\), into which the lower deck planks are rabbeted: There is alfo one immediately under the haufe holes, and another under the fecond deck.
' 1 ', The rudder, which is joined to the fternpoft by the rudder irons, upon which it turns round in the googings, faftened to the fernpoft for that purpofe. There is a mortife cut in the head of the rudder, into which a long bar is fitted called the tiller, and \(b_{j}\) which the rudder is turned.

U, A floor timber: it is laid acrofs the keel, to whicl it is faftened by a bolt through the middle. V, V, V, V, The lower, the fecond, third, and fourth futtocks. W, W, The top timbers. Thefe reprefent the length and fcarf of the feveral timbers in the midfhip frame.

X, The pieces which compofe the kelfon. They are fcarfed together in the fame manner as the keel, and placed over the middle of the floor timbers, being feored about an inch and a half down upon each fide of them, as reprefented in the figure.

Y, The feveral pieces of the knee of the head ; the lower part of which is fayed to the ftem, and its keel is fcarfed to thic head of the forefoot. It is faftened to the bow by two knees, called cheeks, in the form of that reprefented by Z ; and to the ftem, by a knee called a fandard, in the form of that marked \(\bigoplus\).
\(a\), The cathead, of which there is one on each fide of the bow, projecting fo far as to keep the anchor clear of the hip when it is hove up.
\(b\), The bits, to which the cable is faftened when the fhip is at auchor.
\(d\), The fide connter-timbers, which terminate the fhip abaft within the quarter gallery.
\(e, e\), Two pieces of dead wood, one afore and the other abaft, fayed on the keel.
Fig. 2. is a perfpective reprefentation of a fhip framed and ready for the planking; in which \(A, A\) is the keel ; B, the fternpoit ; C , the ftem; K, L, M, the tranfoms ; F, F, F, F, F, F, the ribbands.

\section*{Chap. III. Containing Preliminary Problems, \& c.}

The general dimenfions of a chip are the length, breadth, and depth.
To afcertain thofe dimenfions that will beft anfwer Piopor the intended purpofe is, no doubt, a problem of confi-tional dio derable difficulty; and, from theory, it may be fhown of a fhip that there are no determinate proportions fubfifting be- of a thip tween the lengtl, breadth, and depth, by which thefe To be indimenfions may be fettled; yet, by combining theory ferred from and practice, the proportional dimenfions may be ap- combin proximated to pretty nearly.
As \({ }^{*}\) hips are conftructed for a variety of different tice; purpofes, their principal dimenfions mult therefore be altered accordingly, in order to adapt them as nearly as poffible to the propofed intention; but fince there is no fixed ftandard whereby to regulate thefe dimenfions, the methods therefore introduced are numerous, and in a great meafure depend upon cuftom and fancy.

With regard, however, to the proportional dimen-
3 B 2 fions,
(B) To fay, is to join two pieces of timber clofe together.

Prelinina- fions, they perhaps may be inferred from the circle. ry Pro- Thus, if the extreme breadth be made equal to the diablerns.
\(\dagger\) Prablical Seumunßip, page is. meter, the length at the load water line, or the diftance between the rabbets of the Rem and poft at that place, may be made equal to the circumference of the fame circle ; and the cepth of the hold equal to the radius, the upper works being continued upwards according to circumfances. A flip formed from thele dimenfions, with a botnom more or lefs full accoreling as may be judged neceffary, will no doubt anfwer the propofed intention. Neverthelefs, one or other of thefe dimenfions may be varied in order to gain fome effential property, which the trade that the weffl is intended for may require.
The following hiats are given by Mr Hutchinfen \(\dagger\) towards fising rulcs for the beft confruction of thips bottoms.
1. "I would recommend (fays hc), to prevent fhips * Sec Bnok bottoms from hooging * upwards amicfhip, to have the ii. Chap. 2. fore and after part of their keels deep enough, that the u:pper part may be made to adinit a rabbet fur the garboard ftreak, that the main body and bearing part of the fhips bottoms may be made to form an arch downwards in their length, fuppofe with the fame fneer as their bends, at the rate of about 2 inches for every 30 feet of the extreme lencth of the keel towards the midfhip or main frame, which may be reckoned the crown of the arch; and the lower part of the kcel to be made ftraight, but laid upon blocks fo that it may form a regular convex curve downwards at the rate of an inch for every 30 feet of the extreme length of the keel, the loweft part exactly under the main frame; which curve, I reckon, is only a fufficient allowance for the keel to become ftraight below, after they are launched afloat, by the preffure of the water upward againft their floors amidfhip, which caufes their tendency to hog. And certainly a flraight keel is a great advantage in failing, as well as to fupport them when kid upon level ground or on fraight blocks in a repairing dock, without taking damage.
2. "As fquare flemed thips, from expcrience, are found to anfwer all trades and purpofes better than round or pink fterned fhips, I would recommend the fore part of the fternpoft, on account of drawing the water lines in the dranght, only to have a few inches rake, that the after part may fland quite upright perpendicular to the keel : and for the rake of the ftem I would propofe the rabbet for the hudding ends for the entrance, and bows from the keel upwards, to form the fame curve as the water line from the ftem at the harpin towards the main breadth, and the bows at the harpin to be formed by a fweep of a circle of half the threefourths of the main breadth; and the main tranfom to be three-fouths of the main-breadth; and the buttocks, at the load or failing mark aft, to be formed, in the fame manner as the bows at the harpin, with a fwcep of a circle of half the three fourths of the main breadth, to extend juit as far from the ftem and ftern poft as to admit a regular convex curve to the main frame, and from thefe duwn to the keel to form regular convex waterlines, withont any of thofe unnatural, hollow, concave, ones, either in the entrance or run ; which rules, in my opinion, will agree with the main body of the hip, whether fhe is detigned to be built full for burden or flarp below for failing.
3. "This rule for raking the fem will admit all the

I L D I N G.
water-lines in the fhip's entrance to form convex curve3 Preli all the way from the ftem to the midhip or main frame, which anfwers much better for failing as well as mat. king a thip more eafy and lively in bad weather. And the bows fhould flange off, rounding in a circular form from the bends up to the gunwale, in order to meet the main breadth the fooner, with a fweep of half the main breadth at the gunwale amidhips; which will not only prevent them greatly from beins plunged under water in bad weather, but fpread the fanding fore-riaging the more, to fupport thefe material mafts and fails forward to much greater advantage than in thofe over fharp bowed fhips, as has been mentioned. And as the failing trim of fhips in general is more or lefs by the ftern, this makes the wvater lines of the entrance in proportion the fharper to divide the particles of water the eafier, fo that the fhip may prefs through it with the leaft refiltance.
4. "The run ought to be formed fhorter or longer, fuller or fharper, in proportion to the entrance and main body, as the fhip is defigned for burden or failing faft. The convex curves of the water lines thould leffen gradually from the load or failing mark aft, as has been mentioned, downwards, till a tair ftraiglt taper is formed from the after part of the floor to the fternpof below, without any concavity in the water lincs; which will not only add buoyancy and burden to the after body and run of the fhip, but, in my opinion, will help both her failing and ftecring motions ; for the preffure of the water, as it clofes and rifes upon it to come to its level again, and fill up that hollow which is made by the fore and main body being preffed forward with fail, will impinge, and act with more power to help the fhip forware in her progreffive motion, than upon thofe unnatural concave runs, which have fo much more flat dead wood, that muft, in proportion, be a hinderanceto the ftern being turned fo eafily by the power of the helm to fteer the flip to the greateft advantage."

Many and varions are the methods which are employed to defcribe the feveral parts of a fhip. In the following problems, however, thofe methods only are given. which appear to be moft eafily applied to practice, and which, at the fame time, will anfwer any propofed purpofe.

Prob. I. To defcribe in the plane of clevation the fheer or curvature of the top timbers.

Let QR (iig. 3.) be the length of the fhip between the wing tranfom and the rabbet of the ftem. Then fince it is generally agreed, efpecially by the French \({ }^{38}\) conftructors, that the broadeft part of the thip ought of the to be about one-twelfth of the length before the main main frame or dead flat ; therefore make \(R(\oplus)\) equal to five - about \(t\) welfths of \(Q R\), and \(\#\) will be the ftation of the main tore the frame; fpace the other frames on the keel, and from middle thefe prints let perpendiculars be drawn to the keel. the flit Let \(\otimes P\) be the height of the flip at the main frame, VF the height at the aftermoft frame, and RK the Meflat height at the ftem. Through P draw EPL paral. the to lel to the keel ; defcribe the quadrants PGI, PMN, the ber lir radius being \(P \oplus\); make \(P H\) equal to \(E F\), and \(P O\) equal KL, and niraw the parallels GH, OM : Divide GH fimilar to \(\oiint_{C}\), and OM fimilar to \(\bigoplus R\). I hrough thefe points of divifion draw lines perpendicular to EL, and the feveral portions of thefe perpendiculars contained between EL and the arch will be the rifings of the

\section*{ook I. \\ S HIP-B U}
climina top-timber line above EL. A curve drawn through
Pro- thefe points will forin the toptimber line.
This line is more eafily drawn by means of a curved or bent ruler, fo placed that it may touch the three points \(\mathrm{F}, \mathrm{P}\), and K .
Prob. II. To defcribe the flem:
Let K (fig. 3.) be the upper part of the ftem, thro' which draw \(K S\) patallel to the keel, and equal to twice \(K R\) : Through the termination of the wales on the ftem draw TW parallel to QR. Then from the centre S , with the diftance SK , defcribe an arch: 'Take an extent equal to the neareft diftance between the parallels \(W T, Q R\); and find the point \(W\), fuch that one point of the compafs being placed there, the rither point will juift touch the neareft part of the above arch; and from this point as a centre defribe an arch until it meets the keel, and the fem will be formed.
Prob. 1II. 'To deleribe the fternpoft.
Set off QV (fig. 3.) for the rake of the poft: draw VX perpendicular to the keel, and equal to the height of the wint tranfom, join QX, and it will reprefent the aft fide of the poft.
\(P_{\text {rob. }}\) 1V. To defcribe the half breadth line.
Let MN (fig. 4.) be the given length : Make \(N \otimes\) equal to five-twelfths of MN ; draw the line \(\Theta P\) perpendicular to MN , and equal to the propofed extreme half breadth. Let ME be the round aft of the ftern or wing tranfom ; make EO perpendicular to MN , and equal to the given half breadth at the ftern, which is frenerally between two-thirds and three-fourths of the main half breadth; and defcribe the arch MO, the centre of which is in the middle line. Space the frames (A) A, B, \&c. and (1), , 2, \&c. From the centre ( \()^{2}\) ), with the radius 6 P , defcribe the quadrant PRS; defcribe alfo the quadrant PCT. Through the point O draw ORU parallel to MN ; divide the ftraight line RU fimilar to \(\mathrm{M} \otimes\); and through thefe points of divilion draw lines perpendicular to MN , and meeting the arch. Transfer thefe lines to the correfpondent frames each to each, and a curve drawn through the extremities will reprefent that part of the fide contained between the main fraine and the ftern. Again, thro' O, the extremity of the foremoft frame, draw QV parallel to MN. Or make PV a fourth or third part of PU, according as it is intended to make the fhip more or lefs full towards the bow. Divide VC fimilar to 8 C ; through thefe points draw lines perpendicular to MN, and terminating in the quadrantal arch: Transfer thefe lines to the correfponding timbers in the fore part, and a curve drawn through the extreme points will limit that part of the fhip's fide contained between \(P\) and Q. Continue the curve to the next timber at X . From \(Q\) draw QZ perpendicular to QX ; make the angle \(Z N Q\) equal to \(Z Q N\), and the point \(Z\) will be the centre of the arch forming the bow. Remark, if it is propofed that the breadth of the thip at the frames actjacent to the main frame fhall be equal to the breadth at the main frame ; in this cafe, the centres of the quadrantal arches will be at the points of interfection of thefe frames with the line MN ; namely at (A) and (1). Alfo, if the height of the hip at the frames (A) and ( 1 ) is to be the fame as at dead flat, the quadrantal arches in fig. 3. are to be defcribed from the points of interfection of thefe frames with the line EIs

\section*{I L D I N G.}

Thefe rules, it is evident, are variable at pleafure ; and Pre'iminaany perfon acquainted with the firt principles of mathematics may apply calculation to find the radii of the ry 以rofeveral fweeps.

Prob. V. To defcribe the main frame or deadfiat.

This frame is that which contains the greateft fpace, of the 43 and the particular form of each of the other frames de-midhip. pends very much on it. If the fhip is intended to carry a great burden in proportion to her prinsipal dimenfrons, this frame is made very full; but if the is intended to fail fatt, it is ufually made Masp. Hence arifes diverfity of opinions refpecting its form ; each conftructor ufing that whieh to him appears preferable. In order to fave repetition, it is judged proper to explain certain operations which neceffarity enter into ail the different methods of conftructing this frame.
In the plane of the upper lice of the keel produced, draw the line \(A 3\) (fig. \(5 \cdot\) ) equal to the propofed breadth of the hip; bifect \(A B\) in \(C\), and draw \(A D, C E\), and 1BI, perpendicular to AB . 'Then, fince the two fides vF a fhip are fimilar, it is therefore thought fufficient to defcribe the half of each frame between the main frame and the feern on one fide of the middle line CE, and the half of each of thufe before the main frame on the other fide of it. The firft lall is called the after-body, and the other the fore-body. The after-body is commonly defcribed on the left fide of the middle line ; and the fore-body on the right fide of it : hence the line AD is called the fode line of the after body, and BF the fide line of the fore body. Make AD and BF each equal to the height of the flip at the main frame. Make AG, BG, and AH, BH, equal to the lower and uppet heights of breadth refpectively, taken from the fheer plan. Let II be the load water line, or line of floatation when the fhip is loaded, and KK the height of the rifing line of the floor at this frante. Make CN, CO , each equal to half the length of the floor timber, and \(\mathrm{N}, \mathrm{O}\), will be the heads of the floor timber, thro which draw perpendiculars to AB . Make \(\mathrm{C} m, \mathrm{E}_{\mathrm{m}}\). each equal to half the thickrefs of the fternpoft, and \(\mathrm{C} n_{9}\). \(\mathrm{E}_{\mathrm{n}}\), equal to half the thicknefs of the ftern, and join \(m m, n n\).
Method I. Of defiribing a main frame.-Fiom the centre a (fig. 5.), in the lower breadth line, defcribe the lower breadth fweep \(G e\); make \(N\) e equal to the \({ }^{-}\) propofed radius of the floor fweep, and from the centre \(b\) defrribe the floor fweep \(N f\). Let the radius of the reconciling fweep be \(A g\), equal to about the half of \(A C\); then make \(A b\) equal to \(N b\), and \(A\) miz equal to G \(a\). Now from the centre \(a\), with an extent equal to \(g m\), defcribe an arch, and from the centre \(b\), with the extent \(g b\), defcribe an arch interfecting the former in \(c\), which will be the centre of the reconciling fweep ef. Join \(N \cdot m\) by an inverted curve, the centre of which may be in the line 6 N produced downwards; or it may be joined by two curves, or by a ftraight line if there is: little rifing; and hence the lower part of the main frame will be deferibed.

In order to form the top timber, make \(\mathrm{F} k\) equal to. fuch part of the half breadth, agreeable to the propofed round of the fide, as one-feventh; join \(\mathrm{H} k\), and: make \(k i\) equal to about two-thirds of \(H k\) : make the angle \(H\) il equal to \(i H_{2}\), and from the centre \(l\) at the
didarse :

Prelimina- diflance \(/ \mathrm{H}\) deficribe the arclı \(\mathrm{H} i\); and from, the cenry Pro tre \(o\), the interfection of \(l i\) and \(k F\) produced, defcribe
the arch \(i k\), and the top timber will be formed.
II. To defcribe a muin frame of an intermediate capacity, that is, neither too flat nor too Barp. - Divide the line AX (fig. 6), which limits the head of the floor timber, into three equal parts ; and make \(a b\) equal to one of them. Divide the line \(d \mathrm{~B}\), the perpendicular diftance between the load water line and the plane of the upper fide of the keel, into feven equal parts; and fet off one of thefe parts from \(d\) to \(c\), and from \(c\) to \(m\). Let GH be the lower deck, join G \(m\), and produce it to \(q\). Draw the ftraight line \(\mathrm{V} a\), bifeet it in \(n\), and from the points \(n, a\), defcribe arches with the radius \(\mathrm{G} q\) interfecting each other in P , which will be the centre of the arch \(n a\). The centre of the anch \(V n\) is found by defcribing arches downwards with the fame radius.

With an extent equal to once and a half of \(\mathrm{B} e\), defcribe arches from the points \(b, e\), interfecting each other in A, and from this point as a centre defcribe the arch \(e b\); make \(a l\) equal to \(d m\), and join A \(m\), A \(l\). 'I hen, in order to reconcile two arches \(\mathrm{f}_{\mathrm{o}}\) as to make a fair curve, the centres of thefe arches and of the points of contact mult be in the fame ftraight line. Hence the point \(k\) will be the centre of the arch \(d m\), and o the centre of the arch \(a l\). The arch \(l m\) is defcribed from the centre A.

To form the top timber, fet back the tenth part of the half breadth from K to S upon the line of the fecond deck ; then with an extent equal to two-thirds of the whole breadth defcribe an arch through the points S and H , the upper height of breadth. Again, make MI equal to the fifth part of the half breadth; defcribe an arch of a circle through the points S and T , taking the diagonal GB for the radius. As this arch is inverted in refpect of the arch \(d \mathrm{~S}\), the centre will be without the figure. Hence one-half of the main frame is formed, and the other half is defcribed by fimilar. operations.

Remark. This frame may be made more or lefs full by altering the feveral radii.
III. To defcribe a main frame of a circular form.Let the feveral lines be drawn as before: Then make

\section*{Plate}
cccocur. \({ }^{5}\) \(\mathrm{O} a\) (fig. 7.) equal to the half breadth \(G a\), and from the centre \(a\), with the radius \(\mathrm{G} a\), defcribe the arch \(b \mathrm{G} c \mathrm{O}\). Let \(d\) be the head of the floor-timber, and \(d x\) the rifing. Affume the point \(f\) in the arch, according to the propofed round of the fecond futtock, and deicribe the arch \(d f\); the centre of which may be found as in the former method: from the centre \(a\), with the diftance \(a d\), defribe the arch \(d c O\); make \(d c\) equal to orie-third of \(d \mathrm{O}\), and the angle \(d c b\) equal to \(c d b\), and from the centre \(b\) defcribe the arch \(d c\). The inverted arch \(c \mathrm{O}\) may be defrribed as before.
IV. To defcribe a very full main frame.-Let the vertical and horizontal lines be drawn as before : let \(b\), fig. 8. be the floor-head, and \(b x\) the rifing. Divide \(\mathrm{G} c\) into two equal parts in the point \(d\), and upon \(c d\) deforibe the fquare \(d b a c\), in which infcribe the quadrant \(d e a\). Divide the line \(b d\) into any number of equal parts in the points \(\mathrm{O}, \mathrm{N}, \mathrm{M}, \mathrm{L}\), and draw the lines \(\mathrm{L} m, \mathrm{M}\) e, \(\mathrm{N} n, \mathrm{O} b\), perpendicular to \(d b\). Divide the line GC , the depth of the hold, the rifing being deducted, into the fame number of equal parts in the points \(\mathrm{E}, \mathrm{F}, \mathrm{I}, \mathrm{K}\), and make the lines \(\mathrm{E} p, \mathrm{~F} q, I r, \mathrm{~K} s\), in the frame,

I L D I N G.
equal to the lines \(\mathrm{O} b, \mathrm{~N} n, \mathrm{Me}, \mathrm{L} m\), in the fquare, each Prelimi to each refpectively; and through the points \(G, p, q, r\), \(s, b\), defcribe a curve. The remaining part of the frame may be defcribed by the preceding methods.
V. To defcribe the main frame of a flip intended to be a faft failer. - The principal lines being drawn as before, let the length of the floor-timber be equal to half the breadth of the fhip, and the rifing one-fifth or one-fixth of the whole length of the floor-timber, which lay off from \(x\) to E, fig. 9. Through the point E draw the line \(\mathrm{T} x\) perpendicular to GC , and \(d \mathrm{E}\) perpendicular to \(\mathrm{A} G\). Join \(\mathrm{T} d\), which bifect in B , and draw BF perpendicu. lar thereto, and meeting \(C G\) produced in \(F\), from the centre F , at the diftance \(\mathrm{F}^{\prime} \mathrm{I}\) ', defcribe the femicircle T \(d \mathrm{D}\). Divide G I into any number of parts, V W , \&c. and bifect the intervals DV, DW, \&c. in the points X, Z, \&c. ; then, from the centre X, with the extent XV , defcribe the femicircle \(\mathrm{D} b \mathrm{~V}\), interfecting \(A G\) in \(b\). Let VP be drawn perpendicular to GT, and \(b P\) perpendicular to AG, and the point of interfection P will be one point through which the curve is to pafs. In like manner proceed for the others, and a curve drawn through all the points of interfection will be part of the curve of the main frame. The remaining part of the curve from \(E\) to \(Y\) will be compofed of two arches, the one to reconcile with the former part of the curve at E , and the other to pafs through the point \(Y\), the centre of which may be found by any of the preceding methods. In order to find the centre of that which joins with the curve at \(E\), make TR equal to the half of GD, and join ER, in which a proper centre for this arch may be eafily found.

The portion \(G \nLeftarrow E\) of the curve is a parabola, whofe vertex is \(G\) and parameter GD.

For GD: G \(b:: \mathrm{G} b: \mathrm{GV}\) by conftruction.
Hence DG \(\times G V=G b^{2}\), which is the equation for a parabola.
VI. To defcribe a main frame of a middling capacity.Let the length of the floor timber be equal to one-half of the breadth of the fhip. Make Od , fig. ro. equal to one-fourth of the length of the floor timber, and draw the perpendicular \(d c\) equal to the rifing, and divide it into two equal parts in the point \(e\). Defcribe an arch through \(e\), and the extremity \(a\) of the floor timber, the radius being equal to the half breadth, or more or lefs according to the propofed round of the floor head.Then with the radius \(\mathrm{O} /\), half the length of the floor timber, defcribe the arch \(e \mathrm{Y}\).

Draw \(l m\) perpendicular to OA: bifect \(\mathrm{A}_{n}\) in \(p\), and draw the perpendicular \(p q\). From the middle of A \(f\) draw the perpendicular \(r s\), and from the middle of A \(r\) draw the perpendicular \(t u\). Make \(n z, p g\), each equal to \(l n\) : make the diftances \(p y, r b\), each equal to \(a g ; r \mathrm{~F}, t \mathrm{E}\), each equal to \(a b\); and \(t x\) equal to \(a \mathrm{E}\). Then a curve drawn through the points \(a, z, y\), \(\mathrm{F}, x, \mathrm{~T}\), will form the under part of the midhip frame.

We flall finifh thefe methods of defcribing the main frame of a fhip with the following remark from \(M\). Vial du Clairbois \(\dagger\). "It feems (fays he) that they have affected to avoid ftraight lines in naval architecture; yet, geometrically fpeaking, it appears that a main frame formed of ftraight lines will have both the advantage and fimplicity over others." To illuftrate this, draw the ftraight line M N (fig. g.) in fuch a manner that the mixtilineal fpace \(M\) ad may be equal to the

\section*{ook I.}

\section*{S H I P-B U} mixtilineal fpace D N Y. Hence the capacity of the main frame formed by the ftraight lines MN, NY will be equal to that of the frame formed by the curve \(\mathrm{M} a\) D Y; and the frame formed by the fraight lines will for the mof part be always more fufceptible of receivirg a bow that will eafily divide the fluid. It is alfo evident, that the cargo or ballaft, being lower in the frame formed of flaiglt lines than in the other, it will therefore be more advantageounly placed, and will enable the flip to carry more fail (c) ; fo that having a bow equally well or better formed. fhe will fail fater.

Prob. VI. To defcribe a ftern having a fquare tuck.
Let AB (fig. ir.) be the middle line of the poft, and let CD be drawn parallel thereto at a diftance equal to half the thicknefs of the pof. Make CE equal to the height of the lower part of the fathionpiece above the kecl : make CT equal to the height of the extremity G of the tranfom above the plane of the keel produced, and CH equal to the height of the tranfom on the poft, HT being equal to above one-ninth or one-tenth of GT, and defcribe the arch GH, the centre of which will be in BA produced: make EK equal to five-twelfths of ET: through K draw KL perpendicular to CD, and equal to EK ; and with an extent equal to EL defrribe the arch EL. Make GI equal to the half of ET, and from the centre I defcribe the arch GM, and draw the reconciling curve ML. Let the curve of the fahion-piece be produced upwards to the point reprefenting the upper height of breadth, as at \(O\). Make ON equal to the height of the toptimber, and BN equal to the half breadth at that place, and join ON . Through N and the upper part of the counter, let arches be defcribed parallel to GH . The tafferel, windows, and remaining part of the ftern, may be finithed agreeable to the fancy of the artift.

In fig. I 22 the projection of the flern on the plane of elevation is laid down, the method of doing which is obvious from infpection.

If the tranfom is to round aft, then fince the fathion pieces are always fided ftraight, their planes will interfect the fheer and floor planes in a fraight line. Let \(\mathrm{G} g\) (fig: 14.) be the interfegtion of the plane of the fafhion-piece with the floor plane. From the point \(g\) draw \(g\) W perperdicular to \(g \mathrm{M}\) : make \(y k\) equal to the height of the tuck, and \(\mathrm{W} k\) being joined will be the interfection of the plane of the fathion-piece with the fheer plane. Let the water lines in the fheer plane produced meet the line \(k W\) in the points \(a, s, b\), and draw the perpendicularsa \(a,(s, b b\). From the points \(a, s, b\) (fig. 14.) draw lines parallee to \(\mathrm{G} . g\) to interfect each correlponding water line in the floor plane in the points \(3,2,1\). From the points \(G, 3,2,1\) in the floor plane draw lines perpendicular to \(g \mathrm{M}\), interfecting the water lines (fig. 13.) in the points G, \(3,2,1\); and through thefc points defcribe the curve G \(321 k\); and WG 32 , 3 . \(k\) will be the projection of the plane of the fafhionpiece on the fheer plane. Through the points \(G, 3,2\), 1 (fig. 13.) draw the lines GF, 3 A, 2 S, 1 H, perpendicular to \(\mathrm{W} k\); and make the lines \(\mathrm{WF}, a \mathrm{~A}, s \mathrm{~S}\),

\section*{I L D I N G.}
\(b \mathrm{II}\), equal to the lines \(g \mathrm{G}, a_{3}, 32, b \geq\) (fig. 14.) refpectively, and WFASH \(k\) will be the true form of the plane of the aft fide of the fathion-piece. When it is in its proper pofition, the line WF will be in the fame plane with the fheer line; the line a A in the fame plane with the water line \(a 3\); the line s \(S\) in the fame plane with the water line \(s 2\); and the line \(b \mathrm{H}\) in the fame plane with the water line \(b 1\). Iflines be drawn from the feveral points of interfection of the water lines withthe rabbet of the port (fig. 13), perpendicular to \(g \mathrm{M}\), and curved lines being drawn from thefe points to \(G_{\text {, }}\) \(3,2,1\) (fig. 4.) refpectively, will give the form and dimenfions of the tuck at the feveral water lines.

Prob. VII. 'To bevel the fathion-piece of a fquare tuck by water-lines-

As the fafhion-piece both rakes and cants, the planes of the water-lines will therefore interfect it higher on the aft than on the fore-fide: but before the heights on the fore-fide can be found, the breadth of the timber muft be determined; which let be \(b n\) (fig. 15.) Then, as it cants, the breadth in the direction of the waterline will exceed the true breadth. In order to find the true breadth, form the aft-fide of the fafhion-piece as directed in the laft problem.

Let \(t 5\) (fig. 13.) be the aft-fide of the rabbet on the outfide of the poit, WM the common fection of the plan of the fafhon-piece and the fheer-plan. Before this laft line can be deternined, the feveral water-lines \(1,2,3,4\), and 5 , mult be drawn parallel to the keel, which may reprefent fo many tranfoms.Let thefe water lines be formed and ended at the aftfide of the rabbet, as in fig. 14, where the rounds aft of the feveral tranfoms are defcribed, limiting the curves of the water lines. Now the line WM muft rake fo as to leave room for half the thicknefs of the poft, at the tuck: in order to which, produce \(\mathrm{W} g\) to \(r\); make \(r g\) half the thicknefs of the poft; through \(r\) draw a line parallel to \(g \mathrm{M}\) to interfect. \(g \mathrm{G}\) in \(b\) : then with the sa. dius \(r b\), from \(x\) the point of the tuck as a centre, defcribe an arch, and draw the line WMI juft to touch the: back of that arch.

The line WM being drawn, let any point \(k\) in it. be affumed at pleafure: from \(k\) draw \(k y\) perpendicular to \(g \mathrm{M}\) : through \(y\) draw \(y f\) (fig. : 4, parallel to \(g \mathrm{G}\), interfecting the line \(\mathrm{MI} f\) drawn perpendicular to \(g \mathrm{M}\) in the point \(f\). From M draw \(\mathrm{M} i\) perpendicular to \(y f\), and from \(y\) draw \(y n\) perpendicular to W.M (fig. 13.) Make M \(n\) (fig. 15.) equal to Mi (fig. 14.) ; then MI (fig. 15.) being equal to \(y k\) (fig. 13), join \(n \mathrm{I}\), and the angler \(n \mathrm{M}\) will be the beveling to the horizontal? plane. Again, make \(\mathrm{Mz}, \mathrm{Mf}\) (fig. 15.) refpectively equal to \(y n\) (fig. 13.) and. M \(f\) (fig. 14.), and join \(z f\); and: the angle \(\mathrm{M} z f\) will be the bevelling to the fheer plane.

The bevelling being now found, draw the line \(a b\) (fig. 15.) parallel to \(z n, a \approx\) or \(b n\) being the fcant ling of the timber.. Ther \(n x\) will be the breadth of the timber on the horizontal plane, and \(z e\) its breadth on the fheer plane, and \(a c\) what. it is within a fquare.

Now as, the lines \(g \mathrm{G}, a_{3}, s 2, b \mathrm{f}, y\), reprefent 1.

Prelimina-
ry Pron
blems.
blems.
?relimina- the aft fide of the fafhion-piece on the horizontal plane ry l'ro- (fig. 14.), dotted lines may be drawn parallel to them blems. to reprefent the fore-fide, makins \(n x\) (fig. 15.) the
perpendicular diftance between the lines reprefentin: fore and aft fides of the fathion-piece. By thefe lines form the fore-fide of the fafhion-picce in the fame manner as the aft. fide was formed. The water lines on the fore-fide of the plane of the fafhion piece mult, however, be firt drawn in fig. 1 . thus : Draw the lines \(e b, c d\) parallel to W M, and whofe perpendicular diftances therefrom may be equal to \(a c\) and \(z e\) (fig. 15.) refpectively. Draw a line parallet to WF (fig. 13.) through the point where the line \(c d\) interfects the fitth water line. Draw a line parallel to a A through the point where the fourth water line interiects the line \(c d\); in like manner proceed with the other water lines. The fore-fide of the fafhion-piece is now to be defcribed by means of thefe new water lines, obferving that the diftances in the floor plane mult be fet of from the line \(e b\), and not from WM, as in the former cafe; and a curve defcribed through the points \(5,3,2,1\), where thefe diftances reach to, will reprefent the fore-fide of the fafhion piece.

The nearef diftance between the points \(5,3,2,1\) and the aft fide of the fafhion-piece is what the bevelling is beyond the fquare when both ftock and tongue of the bevel are perpendicular to the timber. Make M \(p\) (fig. 16) equal to the breadth of the timber, and \(\mathrm{M}_{5}\) equal to the perpendicular diftance of the point 5 (fig. 13.) from the aft fide of the faflion piece, and join \(5 p\). In like manner proceed with the others, and the bevellings at thefe parts will be obtained; but, in order to avoid confufion, the perpendiculars \(4,3,2\), (fig. 13.), inftead of being laid off from M (fig. 16.), were fet off from points as far below \(M\) as the other extremities of the lines drawn from thefe points are below the point \(p\).

Prob. VIII. To defcribe the tranfoms of a round poop.

The tranfoms are faftened to the Atern-pof in the fame manner that the floor-timbers are faftened to the keel, and have a rifing called the fight fimilar to the rifing of the floor-timbers. The upper tranfom is called the wing tranfom, the next the deck tranfom, and the others the firf, fecond, and third tranfoms in order. The wing tranfom has a round aft and a round up: the round up of the deck tranfom is the fame as that of the beams.

The faflion-piece of a fquare tuck mult be firft defcribed, together with the three adjacent frames, by the method to be explained. The part of the ftern above the wing tranfom is to be defcribed in the fame manner as before, and may therefore be omitted in this place. The part below the keel of the fafhion-piece is allo the
Plate cecchull fame in both cafes. Let fig. \({ }^{17}\) reprefent the fathionpiece of a fquare tuck, and the three adjoining frames. Divide the interval \(A B\) into four equal parts in the points \(C, D, E\), and draw the perpendiculars \(A F, C G\), \(\mathrm{DH}, \mathrm{LI}\), and BK: thefe will be portions of water lines anfwering to the feveral tranfoms.

Let thefe water lines be defcribed on the floor plan (fig. 18.), in which \(A B C\) reprefents the wing tranforn. Defcribe the arch \(b \mathrm{C}\) to reconcile the cuives \(A . b\) and CE. Let LFG be the water line anfwering to the lower part of the fafion-piece, the diftance be-

\section*{I L D I N G.}
tween the points \(L\) and \(A\) being equal to the excefs of prelim the projection of the point \(A\) beyond that of \(B\) (fig. 20.). Draw CL (fig. 19.) perpendicular to AM, and make the angle KCM equal to about 25 degrees, and CN will be the projection of the fahion piece on the floor-plane. Make \(A B\) (fig. 19.) equal to \(A B\) (lig. 17.) Divide it into four equal parts, and draw the perpendiculars AF, CH, DI, EK, and EG. Make AF equal to CM, and BG equal to \(M N\), and draw the curve FHIKG, laving a lefs curvature than the fafhion-picce of the fquare tuck scpgn. Make MO, MP, MQ, equal to \(\mathrm{CH}, \mathrm{DI}\), and EK refpectively. Divide AL (tig. 18.) into four equal parts, and to thefe points of divifion draw curves through the points \(0,1, Q, f o\) as to partake partly of the curvature of A \(b\) CE and partly of that of INFF, but moft of the curvature of that to which the propofed curve is neareft ; and hence the form of the feveral tranfoms will be obtained.

In order to reprefent the curve of the fafhion-piece on the plane of projection, make the lines \(\mathrm{AF}, \mathrm{CO}\), DH, EI, and BK (fig. 17.) refpectively equal to the perpendicular diftance of the points \(\mathrm{C}, \mathrm{Q}, \mathrm{P}, \mathrm{Q}\), and N . From the line AN(fir:18.), and through the extremities of thefe lines, draw the curve FGHIK.

It remains to lay down the projection of the famionpiece on the plane of elevation. In order to which, divide the line \(A B\), fig. 20. (equal to \(A B\); fig. 1\%.) into four equal parts, and throngh the points of divifion draw the perpendiculars \(\mathrm{AF}, \mathrm{CG}, \mathrm{DH}, \mathrm{EI}\), and BK ; make AF (fig. 20.) equal to the perpendicular ditance of the point C from the line BL (fig. 18.) In like manner make the lines CG, DH, EI, and BK (fig. 20.) refpectively equal to the perpendicular diftances of the points \(\mathrm{O}, \mathrm{P}\), \(Q\), and \(N\), from the line \(B L\) (fig. 18.) ; and a curve drawn through thefe points will be the projection of the fafkionpiece on the plane of elevation.

Prob. IX. To defcribe the intermediate frames in the after body.

For this purpofe the midhip and ftern frames mult be drawn in the plane of projection. As the main frame contains the greateft capacity, and the ftern frame is that having the leaft, it hence follows that the form and dimenfions of the intermediate frames will be between thefe; each frame, however, partaking moft of the form of that to which it is neareft.

Let ACDE (fig. 21.) be the main frame on the plane of projection, and FGH the ftern frame; and let there be any convenient number of intermediate frames, as nine. Draw the floor ribband CF, and the breadth ribband GD. Divide the carves CD, FG, each into the fame number of equal parts, as three, in the points \(\mathrm{K}, \mathrm{M} ; \mathrm{L}, \mathrm{N}\); and draw the fecond and third ribhands KL, MN. In order to divide thefe ribbands \(f 0\) as to form fair curves in different lections, various inethods have been propoled. One of the beft of thefe, being that which is chiefly employed by the French conftruc. tors, is by means of an equilateral triangle, which is confructed as follows.

Draw the line ME (fig. 22.), limited at M, but produced towards \(E^{\prime}\) : take \(\mathrm{M}_{1}\) equal to any convenient extent ; make 1,2 equal to thrice that extent, 2,3 equal to five times, and 3,4 equal to feven tinses the above extent; and continue this divifion to E, always increafing by two until there be as many points as there
inina- are frames, including the main and ftern frames. Up on ME defcribe the equilateral triangle MSE, and draw lines from the vertex \(S\) to each point of divition; then the line SM will be that anfwering to the main frame, and SE that correfponding to the poft; and the other lines will be thofe anfwering to the intermediate frames in order.

Let fig. 23 . be the projection of part of the ftern on the plane of elevation, together with the eighth and ninth frames. From the points \(\mathrm{L}, \mathrm{N}, \mathrm{G}\), (fig. 21.) draw the lines LO, NP, GQ, perpendicular to the plane of the upper edge of the keel. Make AB (fig. 23.) equal to \(A F\) (fig. 21.), and draw the water line BCD. Draw the line BC (fig. 22.) fo that it may be parallel to the bafe of the triangle, and equal to CD (fig. 23.), which produce indefinitely towards H. Make \(B D\) equal to \(B C\) (fig. 2 2.), and draw the dotted line SD (fig. 22.). The ribband FC (fig. 2 I.) is to be applied to the triangle, fo that it may be parallel to the bafe, and contained between the line MS and the dotted line SD. Let of reprefent this line; then transfer the feveral divifions from of to the ribband CF (fig. 21.), and number them accordingly. Again, make EF (fig. 23.) equal to LO (fig. 21.), and draw the water line FGH; make BF (fig. 22.) equal to FG (fig. 23.), and draw the dotted line SF; apply the fecond ribband LK to the triangle, fo that the extremity K may be on the line SM, and the other extremity \(L\) on the dotted line SF, and making with SM an angle of about \(62 \frac{1}{2}\) degrees. Let \(k l\) be this line, and transfer the divifions from it to the ribband KL. In like manner make IK (fig. 23.) equal to NP (fig. 21.), and draw the water line KLM. Make BG (fig. 22.) equal to KL (fig. 23.), and draw the dotted line SG; then the ribband MN is to be applied to the triangle in fuch a manner that its extremities M and N may be upon the lines SM, SG refpectively, and that it may make an angle of about 68 degrees with the line SM ; and the divifions are to be transferred from it to the ribband MN. The fame procefs is to be followed to divide the other ribbands, obferving to apply the fourth ribband to the triangle, fo that it may make an angle of 86 degrees with the line SM ; the fifth ribband to make an angle of 65 degrees, and the fixth an angle of 60 degrees with the line SM.
'The quantities of thefe angles are, however, far from being precifely fixed. Some confructors, in applying the ribbands to the triangle, make them all parallel to its bafe ; and others vary the meafures of thefe angles according to fancy. It may alfo be remarked, that a different method of dividing the bafe of the triangle is ufed by fome. It is certainly proper to try different methods; and that is to be preferred which beft anfwers the intended purpofe.

Befide the frames already mentionded, there are other two laid down by fome conftructors in the feveral plans, called balance frames. The after balance frame is placed at one fourth of the length of the fhip before the fternpoft; and the other, commonly called the loof frume, at one fourth of the fhip's length aft of a perpendicular to

Vol. XVII. Part I.
the keel from the rabbet of the ftem: Let the dotted Preliminaline at X , between the fifth and fixth frames, (fir. 23.) be the place of the after balance frame in the plane of elevation. Then, in order to lay down this frame in the plane of projection, its reprefentation muft be previoufly drawn in the triangle. To accomplith this, draw the line SV (fig. 22.) To that the interval 5 V may have the fame ratio to 56 (fig. 22.) that 5 X has to 56 (g.g. 23.) (D). Then the feveral points in the ribbands in the plane of projection anfwering to this frame are to be found by means of the triangle in the fame manner as before.

The loof frame is nearly of the fame dimenfions as the after balance frame, or rather of a little greater capacity, in order that the centre of gravity of that part of the thip may be nearly in the plane of the midfhip frame. Hence the loof frame may be eafily drawn in the plane of projection, and hence alfo the other frames in the fore body may be readily defcribed.
\({\underset{D}{r}}^{\mathrm{P}_{\mathrm{B}}}\). X. To defcribe the frames in the fore body.
Draw the middle line of the ftem AB (fig. 24.) : make \(\mathrm{AC}, \mathrm{BD}\) each equal to half the thicknefs of the ftem, and draw the line CD; defcribe alfo one half of the main frame CEFGHI. Let \(\epsilon \mathrm{E}, f \mathrm{~F}, g \mathrm{G}, b \mathrm{H}\), be water lines at the heights of the ribbands on the main frame ; alfo let \(a\) be the termination of the floor ribband, and \(b\) that of the breadth ribband on the ftem. Divide the interval \(a b\) into three equal parts in the points \(c, d\), and draw the ribbands \(a \mathrm{E}, c \mathrm{~F}, d \mathrm{G}\), and \(b \mathrm{H}\). Make \(e i, f k, g l, b m\) (fig. 24.) equal to \(e i, f k, g l, b m\) (fig. 21.) refpectively, and draw , the curve C iklm, which will be the projection of the loof frame. Or fince it is neceffary that the capacity of the loof frame fhould be a little greater than that of the after balance frame, each of the above lines may be increafed by a proportional part of itfelf, as one-tenth or one-twentieth, as may be judged proper.

Conftruct the triangle (fig. 25.) in the fame manner as fig. 22. only obferving, that as there are fewer frames in the fore than in the after body, its bafe will therefore be divided into fewer parts. Let there be eight frames. in the fore body, then there will be eight divifions in the bafe of the triangle befide the extremes.

Let fig. 26. reprefent the ftem and part of the forebody in the plane of elevation, and let \(O\) be the place of the loof frame. Divide the interval 4, 5 (fig. 25.) fo that 4,5 may be to 4 Z as 4,5 to 4 , a (fig. 26.), and draw the dotted line SZ, which will be the line denoting the loof frame in the triangle.

Draw the lines AB, CD, EF, GH (fig. 26.) paral lel to the keel, and whofe perpendicular diftances therefrom may be equal to \(\mathrm{C} a, \mathrm{C} c, \mathrm{C} d, \mathrm{C} b\), (fig. 24.) the interfections of thefe lines with the rabbet of the ftem, namely, the points \(I, K, I, M\) will be the points of termination of the feveral ribbands on the ftem. in the plane of elevation. Divide 8 A (fig. 25.) fo that 8 B , \(8 \mathrm{C}, 8 \mathrm{D}\), and 8 E , may be refpectively equal to \(\mathrm{BI}_{\text {, }}\) \(\mathrm{DK}, \mathrm{FL}\), and HM (fig. 26.), and draw the dotted lines SB, SC, SD, SE (fig. 25.) Apply the edge of a \(\Omega_{\mathrm{i}} \mathrm{p}\) of card to the firft ribband (fig. 24.), and mark 3 C thereon
(D) It is evident, from the method ufec to divide the bafe of the triangle, that this proportion does not agree exactly with the conftruction: the difference, however, being fmall, is therefore neglected in practice.

Prelimina thercon the extremities of the ribband \(a, \mathrm{E}\), and alfo sy Pro- the point of interfection of the loof frame. Then apblems. ply this flip of card to the triangle in fuch a manner that the point a may be on the dotted line Si 3 , the point E on the line SM, and the point anfwering to the loof frame on the dotted line SZ; and mark upon the card the feveral points of interfection of the lines \(\mathrm{Si}_{\mathrm{I}}\), \(S_{2}, \& c\). Now apply the card to the ribband \(: E\) (fir. 24.) as before, and transfer the feveral points of divifion from it to the ribband. In like manner proceed with the other ribbands; and lines drawn throngh the correfponding points in the ribbands will be the projection of the lower part of the frames in the fore body. The projections of the top-timbers of the feveral frames may be taken from the half breadth plan; and hence each top-timber may be eafily defcribed.

In large fhips, particularly in thofe of the French navy, a different method is employed to form the toptimbers in the fore body, which is as follows:
Plate

\section*{ccccclix}

Let BI (fig. 27.) be one fourth of the breadth of the fhip, and draw IK parallel to AB. Take the height of the foremof frame from the plane of elevation, and lay it off from \(A\) to \(B\) : from the point \(B\) draw BH perpendicular to AB , and equal to half the length of the wiug tranfom. Let E be the place of the breadth ribband on the main frame, and \(\mathbf{F}\) its place on the flem at the height of the wing traniom. With a radius equal to five.fixtlis of half the greatefl breadth of the fhip defcribe the quadrant EFG (fig. 28.): Make EH equal to FG (fig. 27.), the point F being at the height of the wing tranfom. Through H draw HO perpendicular to EH , and interfecting the circumference in O ; then draw OL parallel to HE, and EL parallel to HO. Divide EL into as many equal parts as there are frames in the fore body, including the main frame, and from thefe points of divilion draw the perperdiculars 11, 22, \&c. meeting" the circumference as in the' figure. Take the diftance 11, and lay it off from G (fig. 27.) towards F to the point 1 ; and from the fame point \(G\) lay off towards \(F\) the feveral perpendiculars contained between the ftraight line and the curve to the points 2,3 , \&c. and through thefe points draw lines paralled to EG .

Take any line AB (fig. 29.) at pleafure : divide it equally in two in the point 8 ; divide 8 B in two parts in the point 7 , and contime this method of divifion until there are as many points as there are frames in the fore body, including the main frame. Upon AB conftruct the equilateral trianyte ACB , and draw the lines C8, C7, \&c. Place a flip of card on the parallel a K 8 (fig. 27.), and mark thereon the points oppofite to \(a, \mathrm{~K}\), and 8 ; and let them be denoted accordingly. Then apply this lip of card to the triangle, fo that the point \(a\), which is that anfwering to the rabbet of the ftem, may be on the line AC; that the point anfwering to K may be on C 8 , and the extremity 8 on the line CB ; and mark on the card the points of interfection of the lines \(\mathrm{C} 7, \mathrm{C} 6, \& \mathrm{c}\). and number thein accordingly. Now apply this fip of card to the feventh parallel (fig. 23.), the point a being on the line CD, and mark on this parallel the point of interfection 7 ; fide the card down to the fixth paralle, to which tranffer the point \(\mathrm{n}^{\circ} 6\). In like manner proceed with the other paraliels.

The point K , at the interfection of the line IK with
the eighth parallel, is one point through which the eighth frame paffes. From this point upwards a curve is to be defribed fo as to reconcile with the lower part of this frame already defcribed, and the upper part, forming an invetted arch, which is to terminate at H . This top-timber may be formed by two fweeps, whofe radii and centres are to be determined partly from circumitances and partly according to fancy. It however may be more readily formed by hand.

Let LM (fig. 27.) be the line of the fecond deck at the main frame, and let LN be the difference of the draught of water, if any. Make GN (fig. 28.) equal to LN : draw NM perpendicular to GN, meeting the circle in M ; and through the points G and M draw the parallels GV and MV ; divide GN as before, and from the feveral points of divifion draw perpendiculars terminating in the curve. Transfer thefe perpendiculars from L upwards (fig. 27.), and through the points thus found draw the lines \(\mathrm{It}, 22\), \& c . parallel to LM. Apply a flip of card to the eighth parallel, and mark upon it the point anfwering to the flem, the eighth and main frames : carry this to the triangle, and place it fo that thefe points may be on the correfponding lines. Then the points of interfection of the lines C \(7, \mathrm{C} 6\), \&c. are to be marked on the card, which is now to be applied firt to the eighth parallel (fig. 27.), then te the feventh, \&c. transferring the feveral points of divifion in order as before.
1)raw the line HO (fig. 27.) ; mark its length on a flip of card, and apply it to the triangle, fo that it may be parallel to its bafe, and its extremities one on the eighth and the other on the main frame : mark on the card the points of interfection of the feveral intermediate lines as before; then apply the card to HO, and transfer the divifions.

There are now three points determined through which each top-timber muft pafs, namely, one in the breadth ribband, one in the fifth, and one in the upper ribband. Through thefe curves are to be defcribed, fo as to reconcile with the lower part of the frame, and paitake partly of the curvature of the eiphth frame, and partly of that of the main frame, but moll of that of the frame to which it is neareft : and hence the plane of projection is fo far finifhed, that it only remains to prove the feveral framies by water lines.

A nother method of defrribing the frames in the body plan is by fweeps. In this method it is neceffary, in the firt place, to defcribe the height of the breadth lines, and the rifing of the floor, in the plane of elevation. The half breadth lines are next to be defcribed in the floor plan. The main frame is then to be defcribed by three or more fweeps, and giving it fuch a form as may be moft fuitable to the fervice the fhip is defigned for. The lower, upper, and top-timber heights of breadth, and the rifings of the floor, are to be fet upon the middle line in the body plan, and the feveral half breadths are then ta be laid off on lines drawn through thefe points perpendicular to the middle line. A mould may then be made for the main frame, and laid upon the feveral rilings, as in whole mouldings, explained in Chapter V. with this difference, that here an under breadth fweep is defcribed to pafs through the point which limits the half breadth of the timber, the centre of which will be in the breauth line of that timber. The proper centres for all the frames being found, and

\section*{k I.} \(S\) H I \(\mathrm{P}-\mathrm{B} \quad \mathrm{Y}\)
imina the arches deferibed, the bend mould muft be fo placed on the rifing line of the floor, that the back of it may touch the back of the under breadth fweep. But the general practice is, to defcribe all the floor fweeps with compaffes, as well as the under breadth fweeps, and to reconcile thefe two by a mould which is an arch of a circle, its radius being the lame with that of the reconciling fweep by which the midfhip frame was formed. It is ufual for all the floor fweeps to be of the fame radius; and in order to find their centres a line is formed on the floor plan for the hall breadth of the floor. As this line cannot be deferibed on the furface of a hip, it is therefore only an imaginary line. Inftead of it fome make ufe of a diagonal in the body plane to limit the half breadth of the floor upon every rifing line, and to erect perpendiculars at the leveral interfections, in the fame manner as for the midfhip frame.

After the fweeps are all defcribed, recpurfe is had to moulds, or fome fuch contrivance, to form the hollow of the timbers, much in the fame manner as in whole moulding; and when all the timbers are formed, they mult be proved by ribband and water lines, and altered, if neceffary, to make fair curves.

The preceding methods of deferibing the feveral planes or fections of a hip being well underftood, it will be a very eafy matter to conflruct draughts for any propofed fhip: and as the abové planes were defcribed feparately and independent of each other, it is therefore of litcle confequence which is firft defcribed. In the following application, however, the plane of clevation will be frift drawn, then part of the floor plan, and laftly the body plan: and in connecting thefe plans the molt rational and fimple methods will be employed.

Chap. IV. Application of the foregoing Rules to the Conflruction of Ships.

Sect. I. To confruct a Ship intended to carry a confiderable Burden in Proportion to her general Dimenfions, and to draw litlle Water.

\section*{I L D I N G.}

Draw the line \(a b\) (fig. 3 2.) equal to 80 feet, from Aptleation a convenient lcale: divide it into as many equal parts of the foreplus one as there are to be franaes, which let be 16 , goi g Rule and through each point of divifion draw perpendiculars. to the cotion of Make \(b c\) equal to 17 feet, the perpendicular height of the top of the ftem above the upper edge of the keel, and defcribe the Item by Prob. II. Make a \(d\) equal to \(1 O_{\frac{1}{2}}\) feet, the height of the middle line of the wales at the ftern, and \(a e\) equal to the propofed rake of the po:, which may be about 2 feet; join \(d e\); and draw the line \(f g\) reprefenting the aft-lide of the poit. Defribe the counter and itern by Problem VI. and VII. Make \(\Theta b\) equal to 14 feet, the top-timber height at the main frame, and \(i k\) equal to 18 feet, the height at the Itern; and through the three points \(c, h, k\), deicribe the curve limiting the top-timbers by Problem I. Make \(b d\) equal to 10 feet, the height of the middle line of the wales at the ftem, and \(\fallingdotseq H\) equal to 6 feet 10 inches, the height at the main frame; and the curve \(d \mathrm{H} d\) being defcribed will reprefent the middle line of the wales. At the diftance of \(\mathrm{I} \circ \frac{\pi}{2}\) inches on each fide of this line draw two curves parallel thereto, and the wales will be completed in this plan. Make \(b l\) equal to \(i 3_{2}^{\lambda}\) feet, the height of the breadth line at the ftem; \(a m\) equal to \(12 \frac{\frac{3}{4}}{}\) feet, the height at the Itern; and \(\mathrm{I} \oplus\) \(\mathrm{K} \oplus\) equal to 5 feet 10 inches and 7 feet 4 inches refeectively; and draw the upper breadth line \(l \mathrm{~K} m\) and lower breadth line / I m. From the line ablay down. wards the breadth of the keel, which may he about one foot, and draw the line \(\mathrm{L} t\) parallel to \(a b\).

Let the line L. \(r\), which is the lower edge of the \(\mathrm{keel}_{2}\) reprefent alfo the middle line of the floor plan. Prodiuce all the perpendiculars reprefenting the frames: make \(\otimes M\) (fis: 31.) equal to 11 feet, the main half breadth at midhips; through \(m\) (fig. 30.) draw the line \(m \mathrm{~N}\) perpendicular to \(a b\), and make \(p \mathrm{~N}\) equal to \(7 \frac{1}{2}\) feet, and draw the main hall breadtl line NM \(r\) by Problem IV. Defcribe alfo the top-timber half breadth line PO \(r, \uplus 0\) being equal to \(10 \frac{1}{6}\) feet, and form the projecting part of the ftem \(q\) rst.

In order that the top-timber line may look fair on the bow, and to prevent the foremoft. top-timbers from being too tho:t, it is neceffary to lift or raife the fheer from the round of the bow to the ftem. For this purpofe the following method is ufually employed: Produce the circular fheer before the ftem in the plane of elevation at pleafure; then place a batton to the round of the bow in the half breadth plan, and mark on it the ftations of the fquare timbers and the fide of the ftem ; apply the batton to the fheer plan, and place it to the: fheer of the fhip, keeping the fations of the timbers on the batton well with thole on the fheer plan for feveral timbers before dead-flat, where they will not alter ; then mark the other timbers and the ftem on the fheer line produced; through thefe points draw lines parallel. to the keel, to interfeet their correfponding timbers. and the ftem in the fheer plan: then a curve defcribed. thefe laft points will be the fheer of the fhip round. the bow, lifted as requifed : and the heights of the timbers thus lengthened are to be transferred to the body plan as before.

Draw the line AB (fig. 32.) equal to. 22 feet, the: whole breadth; from the middle of which draw the: perpendicular \(C D\) : make \(C E\) equal to half the thicknefs.

\section*{S I I P-B U} Apoication of the poit, and \(C F\) equal to half that of the ftem, and of the fore from the points \(\mathrm{A}, \mathrm{E}, \mathrm{F}, \mathrm{B}\), draw lines parallel to CD . going Rules Make AG,BG each equal to 14 feet, the height at to the Con- the main frame, and draw the line GG parallel to AB.

Ships, Make GH, GH each equal to half a foot, the difference between the main and top timber half breadths. From \(A\) and \(B\) fet up the heights of the lower and upper breadth lines to \(I\) and \(K\), and draw the ftraight lines IK, IK. Let CL be the rifing at the main frame, and \(\oplus\), \(\oplus\) the extremities of the floor timber. Henca, as there are now five points determined in each half of the main frame, it may be very eafily defcribed.

Make CM equal to \(L \oplus\), join \(M \oplus\), and draw the other ribbands NO, PQ . In order, however, to fimplify this operation, the rectilineal diftance \(\oplus I\) was trifeeted, and through the points of divifion the lines NO, PQ were drawn parallel to the floor ribband \(M \oplus\).

Take the diftance \(b c\) (fig. 30.), and lay it off from F to (fig. 32.) ; alfo make \(F \vec{b}\) (fig. 32.) equal to Fu (fig. 30.) ; through \(b\) draw \(b c\) parallel to \(A B\), and equal to FR (fig. \(3^{\mathrm{T}}\) ). In like manner take the heights of each top-timber from fig. 30 . and lay them off from C towards D (fig. 32); through thefe points draw lines parallel to \(A B\), and make them equal each to each, to the correfponding half breadth lines taken from the floor plan: Then through the feveral points \(a, c\), \&cc thus found, draw a line ac H , which will be the projection of the top-timber line of the fore body in the body plan. Proceed in the fame manner to find the top-timber line in the after body.

Transfer the height of the main breadth line on the stem \(b\) ! (fig. 30.) from F to \(d\) (fig. \(3^{2}\) ). 'Transfer allo the heights of the lower and upper breadth lines at timber \(\bar{F}\) (fig. 30 .), namely, \(F W, F X\), from \(F\) to \(e\) and \(f\) (fig. 32.) ; through which draw the parallels e \(g\), \(f b\); make them equal to FS (fig. 3 I.) , and draw the ftraight line \(g b\). In this manner proceed to lay down the portions of the extreme breadth at each frame, both in the fore and in the after body in the body plan, and draw the upper and lower breadth lines \(d b \mathrm{~K}, d g \mathrm{I}\) in the fore body and \(\mathrm{K} i, \mathrm{I} i\) in the after body. Hence the portions of the feveral top-timbers contained between the top-timber and main breadth lines may be eafily defcribed. It was before remarked that their forms were partly arbitrary. 'the midfhip top-timber has generally a hollow, the form of which is left entirely to the artif, though in fome fhips, efpecially fmall ones, it has none. It is the common practice to make a mould for this hollow, either by a fweep or fome other contrivance, which is produced confiderably above the top-timber line, in a Araight line or very near one; The midhip top-timber is formed by this mould, which is fo placed that it breaks in four with the back of the upper breadth fweep. The other top-timbers are formed by the fame mould, obferving to place it fo that the straight part of it may be parallel to the ftraight part of the midfhip timber, and moved up or down, ftill keeping it in that direction till it juft touches the back of the upper breadth fweep. Some conftructors begin at the after timber, after the mould is made for the midThip top-timber, becaufe they think it eafier to keep the Araight part of the mould parallel to this than to the midinip timber; and by this means the top fide is 2ept from winding. Others, again, make a mark upon

\section*{I L D I N G:}
the mould where the breadth line of the midnip tim- Applic ber croffes it, and with the fame mould they form the of the after timber : this will occafion the mark that was made zoing on the mould when at the main frame to fall below the fructi breadth line of the after timber, and therefore another mark is made at the height of the brcadth line at the after timber ; the ftraight part of the mould is then laid obliquely acrofs the breadth lines of the top-timbers, in fuch a manner that it may interfect the breadth line of the midihip timber at one of thefe marks and the breadth line of the after timber at the other mark; then the feveral interfections of the breadth lines of the timbers are marked upon the mould; which mult now be fo placed in forming each timber, that the proper mark may be applied to its proper breadth, and it muft be turned about fo as juft to touch the upper breadtk fweep. Any of thefe methods may make a fair fide, and they may be eafily proved by forming another intermediate half breadth line.

The remaining parts of the frames may be defcribed by either of the methods laid down in Problems IX. and X . In order, however, to illuftrate this fill farther, it is thought proper to fubjoin another method of forming the intermediate frames, the facility of which will recommend it.

Take FZ (fig. 30.), and lay it from F to \(k\) (fig. 32.) ; then defcribe the lower part of the foremoft frame, making it more or lefs full according as propofed; and interfecting the ribbands in the points \(l, m, n\). Defcribe alfo the aftermof frame \(o, p, q\). Make \(\kappa \beta\) (fig. 30.) equal to Fr (fig. 32.), and produce it to a (fig. 31.); alfo draw \(\gamma \delta\), and \(\varepsilon \zeta\) (fig. 30.) equal to \(\mathrm{E} r\) and \(\mathrm{E} s\) (fig. 32.) refpectively ; and produce them to \(b\) and \(c\) : Make \(\mathbf{F e}, \mathrm{F} f\), FR (fig. 3I.) equal to \(\mathrm{M}!, \mathrm{N} m, \mathrm{P} n\) (fig. 32.) each to each. Let alfo \(\oplus h, \oplus^{i}, \oplus h\), and \(91,9 m, 9^{n}\) (fig. 31.) be made equal to \(\mathrm{M} \oplus, \mathrm{NO}, \mathrm{PQ}\), and \(\mathrm{Mo}, \mathrm{N} q, \mathrm{P}_{p}\) (fig. 32 ); then through thefe points trace the curves aenblb, rfimc, and \(r \mathbf{R} k n p\), and they will be the projections of the ribbands in the floor plane. Now transfer the feveral intervals of the frames contained between the middle line and the ribbands (fig. 31.) to the correfponding ribbands in the body plan (fig. 32). Hence there will be five points given in each frame, namely, one at the lower breadth line, one at each ribband, and one at the keel; and confequently thefe frames may be eafily defcribed. In order to exemplify this, let it be required to lay down the frame \(E\) in the plane of projection. Take the interval En (fig. 3r.), and lay it from M to \(u\) (fig. 32). Lay off alfo \(\mathrm{E} v\), Ee (fig. 31.) from N to \(v\) and from P to \(n\) (fig. 32.) ; then through the points \(\mathrm{F}, u, v, n\) and the lower breadth line defcribe a curve, and it will be the reprefentation of the frame E in the body plan. In like manner the other frames may be defcribed.

The ribbands may now be transferred from the body plan to the plane of elevation, by taking the feveral heights of the interfection of each ribband with the frames, and laying them off on the correfponding frames in the floor plan; and if the line drawn through thefe points make a fair curve, it is prefumed that the curves of the frames are rightly laid down in the body. plan. Only one of thefe ribbands, namely, the firft, is laid down in fig. 30. Thefe curves may alfo be farther proved, by drawing water lines in the plane of ele-
carion vation, and in the body plan, at equal difances from the fore- upper edge of the keel. Then the diftances between the Rules middle line of the body plan, and the feveral points of ion of interfection of thefe lines with the frames, are to be laid off from the middle line in the floor plan upon the correfponding frames; and if the line drawn through thefe points form a fair curve, the frames are truly drawn in the body plan:

In figs. 30 . and 32 . there are drawn four water lines at any equal diftances from the keel, and from each other. Thefe lines are then transferred from fig. 32 , to fig. 31 ,; and the lines paffing through thefe points make fair curves.

The tranfoms are defcribed by Problem VIIl. it is therefore unneceffary to repeat the procefs. A rifing line of the floor timbers is commonly drawn in the plane of elevation.

As this is intended only as an introductory example, feveral particulars have therefore been omitted; which, however, will be exemplified in the following fection.
Sect. IV. To defcribe the feveral Plans of a Ship of
War propofed to carry 80 Guns upon two Decks. War propofed to carry 80 Guns upon two Decks.
As it is propofed in this place to thow the method of defcribing the plans of a hip of a very confiderable fize, it therefore feems proper to give the dimenfions of every particular part neceffary in the delincation of thefe plans. The feveral plans of this fhip are contained in Plate CCCCLXI. figs 33, and 34. But as it would very much confufe the figures to have a reference to every operation, and as the former example is deemed a fufficient illuftration, the letters of reference are upon thefe accounts omitted in the figures.

* Rifing height in fect 10 inches at dead flat, from which all the other rifings muft be fet off.

Diagonal Lines for both the Fore and After Bodies.

\section*{Fore and After Bodies.}

\section*{I. Of the Sbeer Draught or Plane of Elevation.}

Draw a ftraght line (fig. 33.) to reprefent the upper edge of the keel, erect a perpendicular on that end to the right, and from thence fet off 182 feet, the length on the gun-deck, and there ereet another perpendicular ; that to the right is called the foremof \(/\) perpendicular, and the other the after one: upon thefe two perpendiculars all the foremoft and aftermort heights mult be fet off, which are exprefled in the dimenfions.
Then fet off the diflance of the main frame or dead flat from the foremoft perpendicular, and at that place ereet a third perpendicular, which muft be ditinguifhed by the character \(\oplus\). From dead flat the room and fpace of all the timbers mult be fet off; but it will only be neceflary to erect a perpendicular at every frame timber; which in the fore body are called dead flat, A, C, E, \&c. and in the after body (2), \(1,3,5, \& \mathrm{c}\). : hence the dittance between the frame perpendiculars will be double the room and fpace expreffed in the dimenfions. Then fet off the heights of the gun-deck afore at midhhip or dead flat, and abaft from the upper fide of the keel ; and a curve defcribed through thefe three points will be the upper fide of the gun-deck. Set off the thicknefs of the gun-deck plank below that; and another curve being drawn parallel to the former, the
gun-deck will then be defcribed at the middle line of the fheer plan.

The centre of the ftem is then to be laid down by means of the table of dimenfions; from which centre, with an extent equal to the nearelt ditance of the upper edge of, the keel, defcribe a circle upwards : defcribe alfo another circle as much without the former as the ftem is moulded. Then fet off the height of the head of the ftem, with the diftance afore the perpendicular, and there make a point; and withis that fet off the moulding of the ftem, and there make another point: from this laft mentioned point let a line pafs downwards, interfecting the perpendicular at the height of the gundeck, and breaking in fair with the inner circle, and the after part of the ftern is drawn. Draw another line from the foremoit point downwards, parallel to the former, and breaking in fair with the outer circle ; then the whole ftem will be formed, except the after or lower end, which cannot be determined till hereafter.
The ftern-poft muft be next formed. Set off on the upper edge of the keel a fpot for the aft part of the rabbet taken from the dimenfions, and from that forward fet off another point at the ditance of the thicknefs of the plank of the bottom, which is \(4 \frac{1}{2}\) inches : and from this laft mentioned point draw a line upwards interfecting the perpeudiculars at the height of the lower

Application deck; then fet up the perpendicular the height of the of the fore wing tranfom, and draw a level line, and where that going Rules
to the Con - line interfects, the line firft drawn will be the aft fide of ftruction of the wing tranfom: on the upper. part of the middle line
Shipe. fet off from that place the diftance of the aft fide of the ftern-poft ; fet off alfo the diftance of the after part from the rabbet on the upper edge of the keel, and a line drawn through thefe two points will be the aft fide of the poft. A line drawn parallel to the firft drawn line at the diftance of \(4 \frac{\pi}{2}\) inches, the thicknefs of the plank on the bottom, will be the aft fide of the rabbet : and hence the ftern-poft is defcribed, except the head, which will be determined afterwards.

From the dimenfions take the feveral heights of the upper deck above the gun-deck, afore, at midmip, and abaft, and fet them off accordingly; through thefe points defcribe a curve, which will be the under fide of the upper deck; defcribe alfo another curve parallel thereto, at the diftance of the thicknefs of the plank, and the upper deck will be then reprefented at the middle line of the fhip.

Set off the height of the lower counter, at the middle line, from the upper edge of the keel, and draw a horizontal line with a pencil; then on the pencil line fet off the diftance the touch of the lower counter is abaft the aft fide of the wing tranfom: from this point to that where the fore part of the rabbet of the fternpoft interfects the line drawn for the upper part of the wing tranfom, draw a curve at pleafure, which curve will reprefent the lower counter at the middle line. The height of the upper counter is then to be fet off from the upper edge of the keel, and a horizontal line is to be drawn as before, fetting off the diftance the touch of the upper counter is abaft the aft fide of the wing tranfom; and a curve defcribed from thence to the touch of the lower counter will form the upper counter at the middle line.

Both counters being forméd at the middle line, the upper part of the ftern timber above the counters is to be defcribed as follows: On the level line drawn for the upper fide of the wing tranfom fet off the diftance of the aft fide of the ftern timber at the middle line from the aft fide of the wing tranfom, at the height of the toptimber line, and erect a perpendicular: then upon this perpendicular, from the upper edge of the keel, fet off the height at the middle line of the top-timber line at the after fide of the ftern timber; through this point draw a ftraight line to the touch of the apper counter, and the upper part of the ftern timber will be defcribed.

As the ftern rounds two ways, both up and aft, the ftern timber at the fide will confequently alter from that at the middle line, and therefore remains to be reprelented. Take the round up of the upper counter from the dimenfions, and fet it below the touch at the middle, and with a pencil draw a level line; take alfo the round aft, and fet it forward from the touch on the touch line, and fquare it down to the pencil line laft drawn, and the point of interfection will be the touch of the upper counter at the fide. In the fame manner find the touch of the lower counter ; and a curve, \(\mathrm{f}_{1}\) milar to that at the middle line, being defcribed from the one touch to the other, will form the upper counter at the fide.

Take the round up of the wing tranfom, and fet it off below the line before drawn for the height of the

\section*{1 L.D I N G.}
wing tranfom, and draw another horizontal line in pen- Ap cil: then take the round aft of the wing tranfom, and of fet it forward on the upper line from the point repre- \({ }^{\text {go }}\) ferting the aft fide of the wing tranfom; fquare it down to to the lower line, and the interfection will be the touch of the wing tranfom: then a curve, fimilar to that at the middle line, being drawn from the touch of the wing tranfom to the touch of the lower counter at the fide, will be the lower counter at the fide. Draw a line from the upper counter upwards, and the whole ftern timber at the fide will be reprefented. But as the ftraight line drawn for the upper part of the fide timber fhould not be parallel to that at the middle line, its rake is therefore to be determined as follows.

Draw a line at pleafure, on which fet off the breadth of the itern at the upper counter; at the middle of this line fet off the round aft of the upper counter, then through this point and the extremities of the ftern defcribe a curve. Now take the breadth of the ftern at the top-timber line, and through the point where that breadth will interfect the curve for the round aft of the ftern draw a line parallel to that firft drawn, and the diftance from the line laft drawn to the curve at the middle of the line is the diftance that the fide timber mult be from the middle line at the height of the top-timber line.

The fheer is to be defcribed, which is done by fetting off the heights afore, at midhips, and abaft, and a curve defcribed through thefe three points will be the fheer. But in order that the fheer may correfpond exactly with the dimenfions laid down, it will be neceffary to proceed as follows : The perpendicular reprefenting timber dead flat being already drawn, fet off from that the diftances of the other frame timbers, which is double the room and fpace, as the frames are only every other one ; and erect perpendiculars, writing the name under each : then on each of thefe perpendiculars fet off the correfponding heights of the toptimber line taken from the table of dimenfions for conftructing the bodies; and through thefe points a curve being defcribed, will reprefent the fheer of the fhip or top timber line agreeable to the dimenfions.

The quarter-deck and forecafle are next to be defcribed, which may be done by taking their refpective heights and lengths from the dimenfions, and defcribing their curves. In the fame manner alfo, the roundhoufe may be drawn. The decks being defcribed reprefenting their heights at the middle, it is then neceffary to reprefent them alfo at the fide. For this purpofe take the round of the decks from the dimen. fions, and fet them off below the lower line drawn for the middle, and a curve defcribed both fore and aft, ob* ferving to let it be rather quicker than the former, will. be the reprefentation of the decks at the fide.

The ports come next under confideration. In the placing of them due attention mult be paid, fo as to preferve ftrength; or that they fhall be to difpofed as not to weaken the fhip in the leaft, which is often done by cutting off principal timbers, placing them in too large openings, having too fhort timbers by the fide of them, \&c. The frames reprefented by the lines already drawn muft be firft confulted. Then with a pencildraw two curves, for the lower and upper parts of the lower deck polts, parallel to the line reprelenting the lower deck; the diftances of thefe lines from
ationthe deck are to be taken from the dimenfions, obfer-fore-ving; however, to add to thefe heights the thicknefs of Cules the deck, as the deck line at the fide reprefents the
Con on of under part of the deck.

The foremolt port is then to be defcribed, obferving to place it as far aft as to give fufficient room for the manger : the mof convenient place will therefore be to put it between the frames \(R\) and \(I\) ', and equally difant from each. It will then be placed in the mof confpicuous point of ftrength, as it will have a long top-timber on the aft fide and a long fourth futtock on the fore fide of it. The fecond port may be placed in like manner between the next two frames, which will be eçually well fituated for ftrength as the former; and by proceeding in this manner, the ports on the gun-deck may alfo be placed, taking care to have two frames between every two ports, all fore and aft.

The upper deck ports are then to be defcribed; and in order to difpofe of them in the ftrongeft fituation poffible, they muft be placed over the middle between the gun-deck ports, fo that every frame in the thip will run up to the top of the fide, by their coming between a gun and upper deck port ; and every port will be between the frames, which will in a great meafure contribute towards the ftrength of the fhip. With regard to the ports on the quarter deck, it is not of fuch material confequence if they cut the head of the frame, as in placing them the fituation of the dead eyes muft be confidered, placing a port where there is a vacancy between the dead eyes large enough to admit of one; obServine always to place them as nearly as poffible at equal diftances from each other; and where it happens that they do not fall in the wake of a frame, then that frame muift by all means be carried up to the top of the fide.

The neceffary length of the round houle being dekermined in the dimenfons, it may be fet off; obferving, however, to let it be no longer than is juft fufficient for the neceffary accommodations, as the fhorter the round-houfe the works abaft may be kept lower, and a low fnug ftern is always accounted the handfomen. Then fet off the round of the deck at the foremoft.end, below the line drawn; the deck at the fide may be defcribed by another curve drawn quite aft. Now, from the point for the round of the deck to the ftern timber, draw a curve parallel to the top-timber line, and that will be the extreme height of the top of the fide abaft, which height continues to, range fair along to the foremoft end of the round houfe, and at that place may have a fall about 14 inches, which may be turned off with a drift fcroll. At the fore part of the quarterdeck, the topfide may have a rife of 14 inches, which may alfo be turned off with a fcroll. But as the raifing of the topfide only 14 inches at that place will not be fufficient to unite with the heights abaft, it will therefore be neceffary to raife 14 inches more upon that, and break it off with a fcroll inverted on the firft fcroll, and continue the fe two lines, parallel to the top-timber line, to the diftance of about feven feet aft. At the foremoft end of the round-hnufe there is a break of 14 inches already mentioned; and in order to make that part uniform with the breaks at the foremoft end of the quarter-deck, there mutt be fet down 14 inches more below the former; and at theefe two heights continue two

Vol. XVII. Part I.

\section*{I L D I N G.}
curves parallel to the top-timber line, from the aft part Application of the ftern to the ends of the two curyes already drawn of the f-reat the foremoft end of the quarter.deck. If they fhould toing Rules happen not to break in fair with them, they muft be truction of turned off with a round; but to make them appear ships. more handfome, the lower line may be turned off with a \(\underbrace{\text { sppear. }}\) fcroll. Thefe lines', being drawu will reprefent the upper edges of the rails.

The height of the top fide at the fore part of the fhip muft next be confidered; which, in order to give proper height for the forecaftle, mult have a rife there of if inches, the break being at the after end of the forecaftle, and turned off as before. But as this part of the fhip is ftill confiderably lower than the after part, it will be neceffary to give another of eight inches upon the former, and turn it off with a fcroll inverted. Hence this part of the thip will appear more uniform to the afo, ter part.

The finifhing parts, namely the wales, ftern, head, rails, \&c. remain to be defcribed. The wales may be firft drawn; and as the frength of the Mip depends very much on the right placing of them, great care muft therefore be taken that they may be as little as poffible wounded by the lower deck ports, and fo placed that the lower deck bolts fhall bolt in them, and allo that they come as near as poffible on the broadeft part of the fhip. In the firft place, therefore, the height of breadth lines muft be chofen for our guide. Thefe heights of breadth are to be taken from the dimenfions, and fet off on the refpective frames, and curves drawn through thefe points will be the upper and lower heights of breadth lines. The height of the wales may now be determined ; which in general is in fuch a manner that the upper height of breadth line comes about fix inches below their upper edge, and the wales are then placed right upon the breadth lines. Take the heights and breadths of the wales afore, at midfhips; and abaft from the table of dimenfions; draw curves through the points thus found, and the wales will be reprefented.

The channel wales are then to be defcribed. They are principally intended to ftrengthen the top fide, and mult be placed between the lower and upper deck ports; and the lower edge of them at midhips fhould be placed as low as poffible, in order to prevent them from being cut by the upper deck ports afore and abaft. Take their heights and breadtls from the dimenfions; lay them off, and defcribe curves through the correfponding points, and the channel wales will be reprefented.
Lay off the dimenfions of the wafte rail found in the table; and through the points draw a line parallel to the top-timber line all fore and aft. This rail terminates the lower part of the paint, work in the top fide, as all the work above this rail is generally painted, and the work of the top fide below it payed with a varnih, ex. cept the main wales, which are always payed with pitch.

Take the draught of water from the dimentions, and draw the load water-line, which is always done in green. Divide the diftance between the load water-line and the upper edge of the keel into five equal parts, and through thefe points draw four more water-lines.

Set off the centres of the maits on the gun-deck; their rake may likewife be taken from the dimenfions, Set off alfo the centre of the bowfrit, letting it be
four

\section*{S H I P-BU} Application four feet from the deck at the after part of the ftem, of the fore- which will give fufficient height for a light and airy figoj g Rules sgure.
fruvelion of. Draw the knight-heads fo as to be fufficiently high ships. above the bowfprit to admit of a chock between them for the better fecurity of the bowfprit. The timber heads may alfo be drawn above the forecaftle, obferving to place the moft convenient for the timbers of the frame, being thofe which come over the upper deck ports, as they may be allowed long enough to form handfome heads. There fhould be one placed abaft the cat-head, to which the foremoit block is to be bolted, and there may be two ports on the ferecafle formed by them, and placed where it is moft convenient to the dead eyes.

Defcribe the channels, taking their lengths and thickneffes from the dimenfions, and place their upper edges well with the lower edge of the fheer rail. The dead eyes may then be drawn, obferving to place them in fuch a manner that the chains may not interfere with the ports; and the preventer plates muft all be placed on the channel wales, letting them be of fuch a length that the preventer bolt at each end may bolt on each edge of the channel wales. It muft alfo be obferved to give each of the chains and preventer plates a proper rake, that is, to let them lie in the direction of the fhrouds; which may be done in the following manner: Produce the malt upwards, upon which fet off the length of the maft to the lower part of the head ; thefe fraight lines drawn from that point through the centre of each dead eye will give the direction of the chains and preventer braces.

The fenders may be then drawn, obferving to place them right abreaft of the main hatchway, in order to prevent the thip's fide from being hurt by whatever may be hoifted on board. The proper place for then will therefore be at timber 3 ; and the ditance between them may be refulated by the diftance between the ports. The chelt-tree may alfo be drawn, which muft be placed at a proper diftance abaft the foremaft, for the conveniency of hauling home the fore tack. It may therefore be drawn at the aft fide of timber C, from the top of the fide down to the upper edge of the channel wales; and the fenders may reach from the top of the fide down to the upper edge of the main wales. As the fenders and cheft-tree are on the outide of the planks, wales, \&c. the lines reprefenting the wales, \&c. fhould not be drawn through them.

Draw the fteps on the fide, which muft be at the fore part of the main drift or break, making them as long as the diftance between the upper and lower deck ports will admit of. They may be about fix inches afunder, and five inches deep, and continued from the top of the fide down to the middle of the main wales.
In order to defcribe the head, the height of the beakhead mult be firft determined, which may be about two feet above the upper deck. At that place draw a horizontal line, upon which fet off the length of the beak-head, which may be \(\frac{7}{2}\) feet abaft the fore part of the ftem, and from thence fquare a lise up to the forecaftle deck ; which line will'reprefent the aft part of the beak-head, and will likewife terminate the foremoft end of the forecaftle. The length of the head may now be determined, which by the proportions will be found to be 15 feet fix inches from the fore part of the ftem. Set it off from

\section*{I L D I N G.}
the fore part of the ftem, and erect a perpendicular, which will be the utmof limits of the figure forward : thern take the breadth of the figure from the proportions, which is four feet four inches, and fet it off forward; and amother \(\{\) perpendicular being drawn will thow the utmoft extent of the hair bracket forward, or aft part of the figure. Then draw the lower cheek, letting the upper edge be well with the upper edge of the main wales, and the afteer end ranging well with the beak-head line ; fet off the deppth of it on the ftem; which is about is inches, and let a ccurved line palf from the after end through the point oon the ftem , and to break in fair with the perpendiculaar firlt drawn for the length of the head, the fore part cof the curve will then reprefent the pofition of the figure..

The upper cheek may be next drawn ; but, in orrder to know the exact place of it on the ftem, the place of the main rail mult firlt be fet off on the tem, the upper edge of which may be kept on a level with the beakhead ; then fetting off the depth of it below thaat, the place for the upper cheek may be deternined, Hetting it be exactly in the middle between that and the: lower cheek : then, by drawing curves for the uppeer and lower edges of the cheek from the after end paraallel to the lower cheek, to break in fair with the perpendiicular, drawn for the back of the figure : then the upper cheek will be formed. The upper part may run in a féerpentine as high as where the fhoulder of the figure is ffuppofed to come, at which place it may be turned offf with a fcroll. The diftance from the fcroll to the thecl of the figure is called the hair-bracket.

The head of the block may be formed by contiinuing the line at thie breaft round to the top of the hairr-bracket, obferving to keep the top of it about fix iinches clear of the under fide of the bowiprit.
Having the diftance fet off on the ftem for placieng the main rail, it may next be defribed, keeping the tbag of it as level as poffible for the conveniency of the graatings, and letting the foremoft end rife gradually accordling to the rife of the upper cheek and hair-bracket, and may turn off on the round of the fcroll before drawn ffor the hair-bracket. To form the after end, fet off the fize of the head of the rail abaft the beak-head linee, and ereet a perpendicular ; then defcribe the arch of aa circle from that perpendicular to break in fair with the: lower fide of the rail in the middle, and alfo another from the beak-head perpendicular, to break in fair with the upper fide of the rail at the middle, obferving to comntinue the head of it fufficiently high to range with thae tim. ber heads above the forecaftle.
The head timbers are next to bedrawn, placing the ftem timber its own thicknefs abaft the ftem, and the forremoft muft be fo placed that the fore fide may be up andd down with the heel of the block or figure, which has not yet been fet off. Take therefore the diftance from the breaft to the heel on a fquäre which is feven feeet, and ereet a perpendicular from the lower part of thee lower cheek to the lower part of the upper cheek; whicch perpendicular will terminate the foremoft end of the: lower cheek and the heel of the figure, and will alfo , terminate the lower end of the hair-bracket : then, by continuing the fame perpendicular from the upper ppart of the lower deck to the under part of the main raail, the fore fide of the foremoft head timber will be defceribed; and by fetting off its thicknefs aft, the other ficide may be drawn. The middle head timber may be fpacced between the two former ones; and there may alfo, be one
tion timber placed abaft the ftem, at a diftance from the e- ttem, equal to that between the others, and the lower end of if may ftep on the upper edge of the lower of rail.

To defcribe the midcle and lower rails, divide the diftance between the lower part of the main rail and the upper part of the upper cheek equally at every head timber; and curves being defcribed through thefe points will form the middle and lower rails. The after end of the lower rail muft terminate at the after edge of the after head timber.

The cat thead ought to be reprefented in fuch a manner as to come againft the aft fide of the head of the main rail, to rake forward four inches in a foot, and to fteeve up \(5^{\frac{2}{2}}\) inches in a foot, and about one foot fix inches fquare. The lower part of it comes on the plank of the deck at the fide, and the fupporter under it muft form a fair curve to break in with the after end of the middle rail.

The hawfe holes muft come between the cheeks, which is the moft convenient place for them; but their place fore and aft cannot be exactly determined until they are laid down in the half-breadth plan.

The knee of the head is to project from the breaft of the figure about two inches; and particular care muft be taken that in forming it downwards it be not too full, as it is then liable to rub the cable very much : it may therefore have no more fubstance under the lower cheek at the heel of the figure than is juit fufficient to admit of the bobftay holes, and may be \(3^{\frac{1}{2}}\) feet diftant from the fem at the load water-line, making it run in an agreeable ferpentine line from the breaft down to the third water line, where it may be \(1 \frac{1}{2}\) feet from the ftem. By continuing the fame line downwards, keeping it more diftant from the ftem as it comes down, the gripe will be formed. The lower part of it muft break in fair with the under part of the falfe keel; and the breadth of the gripe at the broadeft place will be found by the proportions to be \(4 \frac{1}{2}\) feet. As the aft part of the gripe is terminated by the fore foot, or foremoft end of the keel, it will now be proper to finifh that part as folllows: From the line reprefenting the upper edge of the keel fet down the depth of the keel, through which draw a line parallel to the former, and it will be the lower edge of the keel. From that point, where the aft fide of the ftem is diftant from the upper edge of the keel by a quantity equal to the breadth of the keel at midfhips, erect a perpendicular, which will limit the foremoft end of the keel ; and the after or lower end of the ftem may be reprefented by fetting off the length of the fcarf from the foremoft end of the keel, which may be fix feet. Set down from the line reprefenting the lower edge of the keel the thicknefs of the falle keel, which is feven inches; and a line drawn through that point parallel to the lower edge of the keel will be the under edge of the falfe keel, the foremoft end of which may be chree inches afore the foremoft end of the main keel.

The head being now finifhed, proceed next to the ftern, the fide and middle timbers of which are already drawn. From the fide timber fet off forward 14 feet, the length of gallery, and draw a pencil line parallel to the fide timber; draw allo a line to interfect the touch of the upper counter at the fide, producing it forwards paralled to the fheer as far as the pencil line firft drawn;
and this line will reprefent the upper edge of the gal. Application lery rim. From which fet down eight inches, the of the forebreadth of the gallery rail, and draw the lower edge going Rules of the rail. At the diftance of eight inches from the fruction of fore fide of the fide timber draw a line parallel thereto ; Ships. and from the point of interfection of this line with the upper edge of the gallery rim, draw a curve to the middle timber parallel to the touches of the upper counter, which line will reprefent the upper edge of the upper counter rail as it appears on the fheer draught. The lower edge of this rail may be formed by fetting off its depth from the upper edge. In the fame manner the lower counter rail may be defcribed : then take the diftance between that and the upper counter rail, and fet it off below the rim rail; and hence the rail that comes to the lower ftool may be drawn, keeping it parallel to the rim rail. Underneath that, the lower finifhing may be formed, making it as light and agreeable as poffible.

Set off from the middle timber on the end of the quarter-deck the projection of the balcony, which may be about 2 feet, and draw a line with a pencil parallel to the middle timber. On this line fet off a point \(1 \frac{x}{2}\) inches below the under fide of the quarter-deck, from which draw a curve to the fide timber parallel to the upper counter rail, which curve will reprefent the lower fide of the foot fpace rail of the balcony as it appears in the fheer draught.
Take the diftance between the point of interfection of the upper edge of the upper counter with the middle line, and the point of interfection of the under fide of the foot fpace rail with the middle line, which fet up on a perpendicular from the upper edge of the rim rail at the foremoft end. Through this point draw a line parallel to the rim rail to interfect the lower part of the foot fpace rail, and this line will reprefent the lower edge of the rail that comes to the middle fool, and will anfwer to the foot fpace rail. Then between this line and the rim rail three lights or fafhes may be drawn, having a muntin or pillar between each light of about 14 inches broad, and the lower gallery will be finifhed. Set off the depth of the middle ftool rail above the line already drawn for the lower edge, and the upper edge may be drawn. Then fet off the fame depth above the curve drawn for the lower edge of the foot fpace rail, and the upper edge of that rail may then be drawn.
The quarter-piece muft be next defcribed, the heel of which mult ftep on the after end of the middle ftool. Draw a line with a pencil parallel to the middle timber, and at a diftance therefrom, equal to the projection of the balcony. Upon this line fet up from the round houfe deck the height of the upper part of the ftern or taff rail, which may be four feet above the deck. At that height draw with a pencil a horizontal line, and from its interfection with the line frift drawn defcribe a curve to the middle ftool aail, obferving to make the lower part of this curve run nearly paralled to the fide timber, and the lower part about three inches abaft the fide timber; and this curve will reprefent the aft fide of the quarter piece at the outfide. There fet off the thicknefs of the quarter-piece, which is one foot fix inches, afore the curve already drawn; and another curve being defcribed parallel to it from the lower part to the top of the fheer, and the quarter-piece
\(3 \mathrm{D}_{2}\)

Application at the outfide will be reprefented. On the horizontal of the fore- to the Con. forwaid the thickñefs of the taff-rail, which is one foot; Atruetion of then draw a curve down to the head of the quarterShips. piece paralled to the firft, and that part of the taff-rail will be defcribed. Inftead of a fair curve, it is cuftomary to form the upper part of the taff-rail with one or two breaks, and their curves inverted. Either way may, however, be ufed according to fancy.
Set off the depth of the tàff rail, which may be about \(3 \frac{1}{2}\) feet, on the line drawn for the projection; from the upper part, and from this point, defcribe a curve as low as the heel of the quarter-piece, and about five inche's abaft it at that place; obferving to make it run nearly parallel to the after edge of the quarter-piece; and the after part of the quarter-piece, which coines nearelt to the fide, will be reprefented.

Set up on the line drawn for the projection of the balcony the heicht of the upper part of the balcony or breaft rail, which is \(3 \frac{1}{\frac{1}{2}}\) feet from the deck ; fet off the thicknefs of the rail below that, and defribe the balcony, keeping it parallel to the foot fpace rail, and terminating it at the line drawn for the after part of the quarter-piece neareft the fide; and the whole balcony will then be reprefented.

The upper gallery is then to be defcribed: In order to this, its length muft be determined, which may be II feet. Set off this diftance from the fide timber forward with the flieer; and at this point draw a Iine parallel to the fide timber, which line will reprefent the fore part of the gallery. Then take the diftance between the upper part of thie foot fpace rail and the upper part of the breart rail on a perpendicular, and fét it off on a perperidicular from the upper part of the middle fool rail on the line drawn for the fore part of the gallery, from which to the fore part of the quarter piece draw a ftraight line parallel to the rail below, which line will be the upper edge of the upper rim rail; and its thicknefs being fet off, the lower edge may alfo be drawn. From the upper edge of that rail fet up an extent equal to the diftance between the lower im rail and middle ftool rail, and defrribe the upper ftool rail, the after end of which will be determined by the quarter piece, and the fore end by the line for the length of the gallery. There may be three fafhes drawn between thefe two ralls as before; and hence the upper gallery will be formed.

The upper finifhing thould be next drawn, the length of which may be \(\frac{1}{2}\) foot lefs than the upper gallery. Draw a line parallel to the rake of the flern for the fore end of it, and let the upper part of the top fide be the upper part of the upper rail, from which fet down three inches for the thicknefs of the rail, and defrribe it. Defcribe alfo another rail of the fame length and thicknefs as the former, and eight inches below ; from the end of which a ferpentine line may be drawn down to the upper ftool rail, and the upper finifing will be completed.

The flern being now finifhed, the rudder only remains to be drawn. The breadth of the rudder at the lower part is to be determined from the proportions, and fet off from the line reptefenting the aft part of the flernpoft; which line allo reprefents thie fore part of the ruchder. Then determine on the lower hance, letting it be no higher than is juft fufficient, which may be about

\section*{I L D I N G.}
one foot above the load water-line, and fet off its breadth \(A\) at that place taken from the proportions. Then a line \({ }^{\text {o }}\) drawn from thence to the breadth fet off at-the lower part will be the aft fide of the rudder below the lower itr hance. There maysalfo be another hance about the height of the lower deck. The ufe of thefe breaks or hances is to reduce the breadth as it rifes toward the head. The aft part may be drawn above the lower hance, the break at the lower hance being about ten inches, and the break at the upper hance lix inches.The back may be then drawn. It is of elm, about four inches thick on the aft part. That thicknefs being fet off, and a line drawn from the lower hance to the lower end, will reprefent the back. The head of the rudder fhould be as high as to receive a tiller above the upper deck. Therefore fet off the fize of the head above the upper deck, and draw a line from thence to the break at the upper hance, and the aft part of the rudder will be reprefented all the way up. The bearding fhould be drawn, by fetting off the breadth of it at the keel from the fore fide of the rudder, which may be nine inches. Set off alfo the breadth at the head of the wing tranfom, which may be a foot. Then a line being drawn through thefe two points; from the lower part of the rudder to about a foot above the wing tranfom, and the bearding will be reprefented. As the bearding is a very nice point, and the working of the rudder depending very much upon it, it fhould always be very particularly confidered. It has been cultomary to beard. the rudder to a fharp edge at the middle line, by which the main piece is reduced more than neceffary. The rudder fhould, however, be bearded from the frde of the pintles, and the fore fide made to the form of the pintlés.

The pintles and braces may next be drawn. In order to which determine the place of the upper one, which mult be fo difpofed that the ftraps fhall come round the head of the ftandard, which is againft the head of the ftern-poft on the gun-deck, and meet at the middleline. By this means there is double fecurity both to the brace and ftandard. To obtain thofe advantages, it muft therefore be placed about four inches above the wing tranfom; the fecond mult be placed jult below the gui-deck fo as to bolt in the middle of the deck tranfom, and the reft may be fpaced equally between the lower one, which may be about fix inches above the upper edge of the keel. The number of them are generally feven pair upon this clafs of fhips; but the number may be regulated by the diftance between the fecond and upper one, making the diftance between the reft nearly the fame. . The length of all the braces will be found by fetzing off the length of the lower one, which may be eight feet afore the back of the flern-poft, and alfo the length of the third, which is four feet and a half afore the back of the ftern-poft; and a line drawn from the one extremity to the other will limit the internediate ones, as will appear on the fheer draught. The braces will feem to diminifh in length very much as they go up; but when meafurgd or viewed on the Thape of the body, they will all be rearly of an equal length. 'The length of the ftraps of the pintles which come upon the rudder may all be within four inches of the aft fide of the rudder ; and the rudder being a fa: furface, they will all appear of the propier lengthe.
II. Of the 'balf-breadth and body plans...The half-
breadth plan muft be firft drawn. Then produce the lower edige of the keel both ways, and let it alfo reprefent the middle line of the half-breadth plan. Produce all the frames dowwards, and alfo the fore'and after perpendiculars. 'Then from the place in the fleerplan, where the height of breadth-lines interfect the Atem, \{quare down to the middle line the fore and aft part of the rabbet and the tore part of the ftem. Take from the dimenfions what the flem is fided at that place, and fet off half of it from the middle line in the half-breadth plan, through which draw a line parallel to the middle line through the three lines fquared down, and the half-breadth of the fem will be reprefented in the half-breadth plan. Take the thicknefs of the plank of the bottom, which is \(4 \frac{1}{2}\) inches, and defcribe tbe rabbet of the ftem in the half-breadth plan.

From the points of interfection of the leight of breadth lines with the counter timber at the fide, and with the connter timber at the middle line, draw lines perpendicular to the middle line of the half-breadth plan, from which fet off the half breadth of the counter on the line firft drawn; and from this point to the interfection of the line laft drawn, with the middle line draw a curve, and the half breadth of the counter will be reprefented at the height of breadth, which will be the broadeft part of the ftern.

Take the main half breadth of timber dead flat from the dimeufions, and lay it off from the middle line on dead flat in the half-breadth plan. Take alfo from the dimentions the main half breadth of every timber, and fet off each from the middle line on the correfponding timbers in the half-breadth plan. Then a curve drawn from the end of the line reprefenting the half breadth of the counter through all the points, fet off on the timbers, and terminating at the aft part of the ftern, will be the main half breadth line. Take from the dimenfions the top-timber half breadth, and defcribe the toptimber half-breadth line in the half-breadth plan, in the fare e manner as the main half-breadth line.

Take from the dimenfions the half breadth of the rifing, and fet it off from the middle line on the correfponding timbers in the half-breadth plan, obferving, where the word outfide is expreffed in the tables; the half breadth for that timber muft be fet off above or on the outfide of the middle line. Then a carve drawn through thefe points will be the half breadth of rifing in the half-breadth plan.

It will now be neceffary to proceed to the body plan. Draw a horizontal line (fig. 35. ), which is called the bafe line, from the right hand extremity of which erect a perpendicular. Then fet off on the bale line the main half breadth at dead flat, and erect another perpendicular, and from that fet off the main half breadth again, and erect a third perpendicular. The firtt perpendicular, as already obferved, is called the fide line of the fore body; the fecond the middle line; and the third the fide lirre of the after body.

Take from the dimenfions the heights of the diagoals up the middle line, and fet them from the bafe up the middle line in the body plan. Take alfo their dittances from the middle line on the bafe, and fet them off. Sct off alfo their heights up the fide lines, and dratw the diagonals. Then take from the theer plan the heights of the lower height of breadth lime, and fet them off upon the middle line in the body plan; through thefe
points lines are to be drawn parallel to the bafe, afid Application terminating at the fide lines. In like manner procced of the forewith the upper height of breadth line.

The rifing is next to be fet off on tlie Body plan; it to the Conmuft, however, be firft defcribed in the lheer plan: ships. Take, therefore, the heights from the dimenfions, and fet them off on the correfponding timbers in the fheer plan, and a curve defcribed through thefe points will be the rifing line in the fheer plan. Then take from the dimenfiens the rifing heights of dead flat. Set it off in the body plan, and draw a horizontal lire. Now take all the rifing heights from the fheer plan, and fet them off in the body plan from the lin drawn for the rifing height of dead flat, and draw horizontal lines through thefe points. 「 「ake from the half-breadth: plan the half breadths of the rifing, and fet them off from the middle line in the body plan, and the centres of the floor lweeps of the correfponding timbers will be obtained.

From the half.breadth plan take the main halfbreadth lines, and fet them off from the middle line in the body plan on the correfponding lines before draws for the lower height' of breadth; and from the extre. mities of thefe lines fet off towards the middle line the leugths of the lower breadth fweeps refpectively.

Take from the dimenfions the diftance of each frame from the middle line on the diagonals, and fet them off from the middle line on their refpective diagonal lines. Now thefe diftances being fet off, and the lower breadth and floor fweeps defcribed, the fhape of the frames below the breadth line may eafily be drawn as follows: Place one point of a compafs in the diftance fet off for the length of the lower breadth fweep, and extend the other to the point which terminates the breadth; and defcribe an arch of a circle downwards, which will interfect the points fet off on the upper diagonal lines, letting it pafs as low as convenient. Then fix one point of the compaffes in the centre of the floor fweep, and extend the other to the point fet off on the fourth dia. gonal, which is the floor fread; and defcribe a circle to interfect as many of the points fet off on the diagonals as it will. Then draw a curve from the back of the lower kreadth fweep, through the points on the diagonals, to the back of the floor fweep. Defcribe alfo another curve from the back of the floor fweep through the points on the lower diagemals, and terminating at the apper part of the rabbet of the keel, and that part of the frame below the breadth will be formed. In like manner defcribe the other frames.

Through the extremities of the frames at the lower height of breadth draw lines paralleI to the middle line, and terminating at the upper leieight of breadth line, and from thence fet off the upper breadth fweeps; now fix one point of the compafs in the centres of the upper breadth fweeps fucceffively, and the other poist to the extremities of the frames, and deferibe circles upwards. Then from the fheer plan take off the heights of the top-timber lines, and fet them off in the body plan, drawing horizontal lines; upon which fet off the top-timber half breadths taken from the correfponding timbers in the half-breadth plan; and by defcribing curves from the back of the upper breadth fweeps through the points fet off on the leventh or upper diagonal ; and interfecting the top-timber half breadths, the timbers will then be formed from the

Application keel to the top of the fide. The upper end of the of the fore - timbers may be determined by taking the feveral going Rulks himbits of the upper part of the top fide above the firuetion of tep-timber line, and fetting them off above the topShips. timber line on the correfponding timbers in the body plan. The lower parts of the timbers are ended at the rabbet of the keel as follows:- With an extent of \(4 \frac{1}{2}\) inches, the thicknefs of the bottom, and one leg of the comparfes at the place where the line for the thicknefs of the keel interfects the bafe line ; with the other leg defcribe an arch to interfect the keel line and the bafe. Then fix one point at the interfection of the arch and keel, and from the point of interfection of the keel and bafe defcribe another arch to interfect the former. Then from the interfection of thefe arches draw one ftraight line to the interfection of the keel and bafe, and another to the interfection of the lower arch and the keel, and the rabbet of the keel will be defribed at the main frame. All the timbers in the middle part of the fhip which have no rifing terminate at the interfection of the upper edge of the rabbet with the bafe line; but the lewer part of the timbers, having a rifing, end in the centre of the rabbet, that is, where the two circles interfect. 'Thofe timbers which are near the after end of the keel muft be ended by fetting off the half-breadth of the keel at the port in the halfbreadth plan, and defribe the tapering of the keel. Then at the correfponding timbers take off the half. breadth of the keel ; fet it off in the body plan, and defcribe the rabbet as before, letting every timber end where the two circles for its refpective rabbet interfect.
To defribe the fide counter or ftern timber, take the height of the wing tranfom, the lower counter, upper counter, and top-timber line at the fide; from the theer plan transfer them to the body plan, and through thefe points draw horizontal lines. Divide the diftance between the wing tranfom and lower counter into three equal parts, and through the two points of divifion draw two horizontal lines. Draw alfo a horizontal line equiditant from the upper counter and the top-timber line in the fheer plan, and transfer them to the body plan.

Now, from the point of interfection of the aft fide of the ftern timber at the fide, with the wing tranfom at the fide in the fheer plan, draw a line perpendicular to the middle line in the half-breadth plan. Draw alfo perpendicular lines from the points where the upper and lower.tranfoms touch the ftern-poft ; from the points of interfection of the flern timber with the two horizontal linesdrawn between, and from the interfection of the ftern timber with the horizontal line drawn between the upper counter and top-timber line. Then curves muft be formed in the half-breadth plan for the fhape of the body at each of thefe heights. In order to which, begin with the horizontal or level line reprefenting the height of the wing tranfom in the body plan. Lay a flip of paper to that line, and mark on it the middle line and the timbers \(37,35,33\), and 29 ; transfer the 1 ip to the half-breadth plan, placing the point marked on it for the middle line exactly on the middle in the hall-breadth plan, and fet off the half-breadths on the correfponding timbers \(37,35,33\), and 29 , and defcribe a curve through thefe points, and to interfect the perpendicular drawn from the fheer plan. In like manner proceed with the horizontal lines at the heights of the counters, between the lower counter and wing tranfom,
above the upper counter and top timber line ; and from A ppication the interfections of the curve drawn in the half-breadth of the foreplan, with the perpendicular lines drawn from the fheer oing Ruten plan, take the diftances to the middle line, and fet foruction of them off on the correfponding lines in the body plan; Ships. then a curve defcribed through the feveral points thus fet off will be the reprefentative of the ftern timber.

The round-up of the wing tranfom, upper and lower counter, may be taken from the fheer draught, and fet off at the middle line above their refpective level lines in the body plan, by which the round-up of each may be drawn. The round aft of the wing tranfom may alfo be taken from the fheer plan, and fet off at the middle line, abaft the perpendicular for the wing tranfom in the half-breadth plan, whence the round aft of the wing tranfom may be defcribed:

The after body being now finifhed, it remains to form the fore body; but as the operation is nearly the fame in both, a repetition is therefore unneceffary, except in thofe parts which require a different procefs.

The foremoft timbers end on the ftem, and confequently the method of defcribing the ending of them differs from that ufed for the timbers ufed in the after body. Draw a line in the body plan parallel to the middle line, at a diftance equal to the half of what the ftem is fided. In the fheer plan take the height of the point of interfection of the lower part of the rabbet of the ftem with the timber which is required to be ended, and fet it off on the line before drawn in the body plan. Then take the extent between the points of interfection of the timber with the lower and upper parts of the rabbet, and with one leg of the compaffes at the extremity of the diftance laid off in the body plan defcribe a circle, and the timbers may then pafs over the back of this circle. Now, by applying a fmall fquare to the timber, and letting the back of it interfect the point fet off for the lower part of the rabbet, the lower part of the rabbet and the ending of the timbers will be defcribed.

The foremoft timbers differ alfo very much at the head from thofe in the after body: For fince the fhip carries her breadth fo far forward at the top-timber line, it therefore occafions the two foremof frames to fall out at the head beyond the breadth, whence they are called knuckle timbers. They are thus defribed: The height of the top-timber line being fet off in the body plan, fet off on it the top half breadth taken from the half-breadth plan, and at that place draw a perpendicular; then from the fheer plan take the height of the top of the fide, and fet it off on the perpendicular in the body plan : Take alfo the breadth of the rail at the top-timber line in the fheer plan, and fet it off below the top-timber line at the perpendicular line in the body plan, and the ftraight part of the knuckle timber to be drawn will be determined. Then from the laft mentioned point fet off defribe a curve through the points fet off for the timber down to the upper breadth, and the whole knuckle timber will be formed. It will hence be feen that thofe timbers forward will fall out beyond the main breadth with a hollow, contrary to the reft of the top fide, which falls within the main breadth with a hollow.
The fore and after bodies being now formed, the water lines muft next be defcribed in the half-breadth plan, in order to prove the fairnefs of the bodies. In this draught the water lines are all reprefented parallel to

Application the keel; their heights may, therefore, be taken from of the fore the theer plan, and transferred to the body plan, drawoing Rules ing horizontal lines, and the water lines will be repreBruction of fented in the body plan. In hips that draw more waShips ter abaft than afore, the water lines will not be parallel to the keel ; in this cale, the heights mult be taken at every timber in the fheer plan, and fet off on their correfponding timbers in the body plan ; and curves being defcribed through the feveral points, will reprefent the water lines in the body plan.

Take the diftances from the middle line to the points where the water lines interfect the different timbers in the body plan, and fet them off on their correfponding timbers in the half-breadth plan. From the points where the water lines in the fheer plan interfects the aft part of the rabbet of the fternpoft draw perpendiculars to the middle line of the half-breadth plan, and upon thefe perpendiculars fet off from the middle line the half thicknefs of the fterrpoft at its correfponding water line; which may be taken from the body plan, by fetting off the lize of the poift at the head and the kecl, and drawing a line for the tapering of it ; and where the line fo drawn interfects the water lines, that will be the half thicknefs required: then take an extent in the compaffes equal to the thicknefs of the plank, and fix one point where the half thicknefs of the poft interfects the perpendicular, and with the other defcribe a circle, from the back of which the water lines may pals through their refpective points fet off, and end at the fore part of the half breadth plan, proceeding in the fame manner as with the after part. A line drawn from the water line to the point fet off for the half thicknefs of the poit will reprefent the aft part of the rabbet of the poff; and in like manner the rabbet of the ftem may be reprefented. The water lines being all defcribed, it will be feen if the body is fair; and if the timbers require any alteration, it hould be complied with.

The cant timbers of the after body may next be defcribed in the half-breadth plan ; in order to which the cant of the fafhion-piece mult firft be reprefented. Ha. ving therefore the round aft of the wing tranfom reprefented in the half-breadth plan, and alfo the fhape of a level line at the height of the wing tranfom; then fet off the breadth of the wing tranfom at the end, which is one foot four inches, and that will be the place where the head of the fafhion-piece will come: now to determine the cant of it, the fhape of the body mult be confidered ; as it muft be canted in fuch a manner as to preferve as great a ftraightnefs as is poffible for the thape of the timber, by which means the timber will be much ftronger than if it were crooked; the cant must alfo be confidered, in order to let the timber have as little bevelling as poffible. Let, therefore, the heel of the timber be fet off on the middle line, two feet afore timber 35 ; and then drawing a line from thence to the point fet off on the level line for the wing tranform, the cant of the fafnion piece will be defcribed, and will be found fituated in the beft manner poffible to anfwer the before mentioned purpofes.

I'he cant of the fafhion piece being reprefented, the cant of the other timbers may now be eaflly determined. Let timber 29 be the foremoft cant timber in the after body, and with a pencil draw timber 28 ; then oblerve how many frames there are between timber 28

\section*{I L D I N C.}
and the fafhionpiece, which will be found to be nine, Anplication namely, 29, 30, \(31,32,33,34,35,36\), and 37 . Now of the frem. divide the diftance berween timber 28 and the fahion- yoing Rules piece on the middle line into 10 equal parts: Divide truction of alfo the correfponding portion of the main half breadth Sbips. lines into the fame number of equal parts; and ftraight lines joining the correfponding points at the middle line with thofe in the half-breadth line will reprefent the cant timbers in the after body.

The line drawn for the cant of the fafhion-piece reprefents the aft fide of it, which comes to the end of the tranfoms; but in order to help the converfion with regard to the lower tranfoms, there may be two more fafhion-pieces abaft the former; therefore the foremoft fathion-piece, or that which is already defcribed in the half-breadth plan, may only take the ends of the three upper tranfoms, which are, the wing, filling, and deck: the middle fafhion-piece may take the four next, and the after fafhion piece the lower ones: therefore fet off in the half-breadth plan the fiding of the middle and after fafhion-piece, which may be 13 inches each; then by drawing lines parallel to the foremoft fafhion-piece, at the aforefaid diftance from each other, the middle and after fafhion-piece will be reprefented in the half-breadth plan.

The fathion-piece and tranfoms yet remain to be re. prefented in the fheer plan; in order to which, let the number of tranfoms be determined, which, for fo large a buttock, may be feven below the deck tranfom: draw them with a pencil, beginning with the wing, the upper fide of which is reprefented by a level line at its height; fet off its fiding below that, and draw a level line for the lower edge. The filling tranfom follows; which is merely for the purpofe of filling the vacancy between the under edge of the wing and the upper part of the deck plank : it may therefore be reprefented by draifing two level lines for the upper and lower edge, leaving about two inches between the upper edge and lower edge of the wing tranfom, and four inches between the lower edge of the gun. deck plank; then the deck tranfom mult be governed by the gun.deck, letting the under fide of the gun-deck plank reprefent the upper fide of it, and fetting off its fiding below that ; the under edge may alfo be drawn: the tranfoms below the deck may all be fided equally, which may be 11 inches; they muft alfo have a fufficient diftance between to admit the circulation of the air to preferve them, which may be about three inches.

The tranfoms being now drawn with a pencil, the fa-fhion-piece mult next be defcribed in the fheer plan, by which the length of the tranfoms as they appcar in that plan will be determined. As the forems ft faltionpiece reaches above the upper tranforn, it may therefore be filft deferibed: in order to which, draw a fufficient number of level lines in the fheer plan; or, as the water. lines are level, draw therefore one line between the upper water line and the wing tranfom, and one above the wing traniom at the intended height of the head of the fafhion-piece, which may be about five feet: then take the height of thefe two level lines, and tranffer them to the body plan; and take off two or three timbers and run them in the half-breadth plan, in the fame manner as the water lines were done; then from the point where the line drawn for the cant of the fa-mion-piece, in the half-breadth plan, interfects the le

Application vel line drawn for the head of the fafhion-piece, draw of the fore up a perpendicular to the faid line in the fheer plan, to the Con- making a point. Again, from the interfection of the flructien of cant line, with the level line for the wing tranfom in

Ships. the half breadth plan, draw a perpendicular to the wing tranfom in the likeer plan. Alfo draw perpendiculars from the points where the cant line in the half-breadth plan interfects the level line below the wing tranfom, and alfo the water lines to the correfponding lines in the fheer plan; then a curve defcribed through thefe points will be the reprefentation of the foremof fa-thion-piece in the fheer plan. In the fame manner thie middle and after fafhion-pieces may be defcribed; obferving to let the middle one run up, no higher than the under part of the deck tranfom, and the after to the under fide of the fourth tranform under the deck. The tranfoms may now be drawn with ink, as their lengths - are limited by the fafhion-pieces.

Neither the head nor the forelide of the fternpoft are yet defcribed; take, therefore, from the dimenfions, the breadth of the poft on the keel, and fet it off on the upper edge of the keel from the aft fide of poft. The head of the poft muft next be determined, which muft juft be high enough to admit of the helm-poft tranfom and the tiller coming between it and the upper deck beam; the height therefore that is neceffary will be one foot nine inches above the wing tranfom. Now draw a level line at that height, upon which fet off the breadth of the fternpoft at that place, taken from the dimenfions, and a line drawn from thence to the point fet off on the keel will be the forefide of the fternpoft; obferving, however, not to draw the line through the tranfoms, as it will only appear between them. The inner poft may be drawn, by fetting off its thicknefs forward from the fternpeft, and drawing a ftraight line as before, continuing it no higher than the under fide of the wing tranfom.

The cant-timbers in the after body being defcribed, rogether with the parts dependent on them, thofe in the fore body may be next formed; in order to which, the foremoft and aftermoft cant timbers mult be firft deter. mined, and alfo the cant of the foremoft ones. The foremoft cant-timber will extend fo far forward as to be named \(\mathcal{E}^{\circ}\); the cant on the middle line may be one foot four inches afore fquare timber \(W\), and on the main half breath line one foot nine inches afore timber \(Y\); in which fituation the line may be drawn for the cant ; the aftermoft may be timber Q . The cant timbers may now be defcribed in the fame manner as thofe in the after body, namely, by fpacing them equally between the cant timber \(\mathcal{E}\) and the fquare timber \(P\), both on the main half breadth and middle lines, and draw. ing ftraight lines between the correfponding points, obferving to let them run out to the top-timber half"breadth line, where it comes without the main half breadth line.

The hawfe pieces muit next be laid down in the half breadth plan; the fides of which mult look fore and aft with the thip upon account of the round of the bow. Take the fiding of the apron, which may be about four inches more than the item, and fet off half of it from the middle -line, -drawing a line from the main half breadth to the feremolt cant timber, which will reprefent the loremolt edge of the knight-head; then from that fet off the fiding of the knight-head, which may
be ene foot four inches, and draw the aft fide of it. Applicatiay The hawfe pieces may then be drawn, which are foufof the fore in number, by fetting off their fidings, namely, one foot going Rulo fix inches parallel from the knight-head and from : each to truetion of other; and ftraight lines being drawn from the main half.breadth line to the foremoft cant timber will repre. fent them.

The hawfe holes fhould be defcribed in fuch a man. ner as to wound the liawfe pieces as little as poffible : they may therefore be placed fo that the joint of the hawfe pieces fhall be in the centre of the holes, whence they will only cut half the hawfe pieces. Take the dimenfions of the hawfe holes, which is one foot fix inches, and fet off the foremoft one, or that next the middle line, on the joint between the firlt and fecond hawfe piece ; then fet off the other on the joint between the third and fourth hawfe piece; and fmall lines being drawn acrofs the main half breadth at their refpective places will reprefent the hawfe boles in the half.breadth plan.

The hawle holes fhould next be reprefented in the theer plan. In this clafs of fhips they are always pla. ced irn the middle between the cheeks; therefore fet off their diameter, namely, one foot fix inches, between the cheeks, and draw lines parallel to the cheeks for their upper and lower part. Then to determine their fituation agreeable to the half-breadth plan, which is the fore and aft way, draw perpendiculars from their interfections with the main half-breadth line to the lines drawn between the cheeks, and their true fitua. tions, the fore and aft way, will be obtained; and, by defcribing them round or circular, according to the points fet off, they will be rep.efented as they appear in the fheer plan.

The apron may be drawn in the fheer plan, fetting off its bignefs from the ftem, and letting it come fo low that the fcarf may be about two feet higher than the furemolt end of the fore foot ; by which it will give fhip to the fcarfs of the ftem. It may run up to the head of the ftem.
The cutting down fhouldnext be drawn. Take therefore from the tables of dimenfions the different heights there expreffed, and fet them off from the upper edge of the keel on the correfponding timbers-in the fheer plan: then a curve defcribed through the points fet off, from the ianer poft aft to the apron forward, will be the cutting down. Next fet off from the cutting down the thicknefs of the timber Atrake, which is \(8 \frac{1}{3}\) inches, and a curve defcribed parallel to the former will repre. fent the timber ftrake, from which the depth of the hold is always meafured.

The kelfon is drawn, by taking its depth from the dimentions, and fetting it off above the cutting down line; and a curve defcribed parallel to the cutting down will reprefent the kelfon.

The cutting down line being defcribed, the knee of the dead wood abaft timber 27 , being the after flour timber, may then be reprefented. Set off the fiding of the floor ubaft it, and erect a perpendicular in the fheer plan, which will terminate the foremoft end of the dead wood: then the fore and aft arm of the knee ruay be half the length of the whole dead wood, and the up and down arm may reach to the under part of the lower tranfom ; and the whole knee may be placed in fuch a manner that the upper piece of the dead
wood

\section*{Book I.}

Application wood fhall bolt over it, and be of as much fubftance as of the fore- the knee itfelf: therefore the knee muft confequently oong Rules be placed its whole thicknefs below the cutting down truction of line reprefenting the upper part of the dead wood.

The fheer draught, the body, and half-breadth plans are now finifhed, from whence the fhip may be laid down in the mould loft, and alfo the whole frame erect. ed. As, however, the ufe of the diagonal lines in the body plan has not been fufficiently explained, it is therefore thought proper to fubjoin the following illu45 Atration of them.
Nature and The diagonal lines in the body plan are mentioned tife of dia- in the tables of dimenfions merely for the purpofe of forming the body therefrom; but after the body is formed, they are of very principal ufe, as at their ftations the ribbands and harpins which keep the body of the fhip together while in her frames are all defcribed, and the heads of the different timbers in the frame like. wife determined.

The lowermoft diagonal, or \(n^{\circ} 1\). which is named the lower firmark, at which place the bevellings arc taken for the hollow of the floors; its fituation is gene. rally in the middle between the keel and the floor firmark.

Second diagonal is placed in the midhips, about 18 inches below the floor head, and is the ftation where the floor ribiand is placed in midhips, and likewife the floor harpin forward; there is alfo a bevelling taken at this diagonal all the way fore and aft, from which it is termed the floor firmark.

Third diagonal, terminates the length of the floors, and is therefore called the floor bead. There are likewife bevellings taken at this diagonal as far forward and aft as the floor extends. 'The placing of this diagonal is of the utmof confequence to the frength of the Jhip, it being fo near to that part of the bulge which takes the ground, and of confequence is always liable to the greateft ftrain ; it thould therefore be placed as much above the bearing of the body in midfhips as could be conveniently allowed by converfion of the timber; but aforc and abaft it is not of fo much confequence.

Fourth diagonal is placed in the middle between the floor head and the fifth diagonal, at which place a ribband and harpin areftationed for the fecurity of the firlt or lower futtock, from whence it is named the fir \(\rho\) futtock firmark. There are alfo bevellings taken at this diagonal all afore and aft, which being part of the body where the timbers moft vary, occafions them to be the greateft bevellings in the whole body.

Fifth diagonal terminates the heads of the firlt futtocks, and is therefore called the firfl futtock bead. It Should be placed at a convenient diftance above the floor head, in order to give a fufficient fcarf to the lower part of the fecond futtocks. There arc likewife bevellings for the timbers taken at this diagonal, all fore and aft.

Sixth diaronal fhould be placed in the middle beiween the firlt futtock head and the feventh diagonal; at which place the ribband and harpin are ftationed for the fupporr of the fecond futtocks. Bevellings are taken at this diagonal all fore and aft. It is named the fecond futtock firmurk.

Seventh diagonal terminates the fecond futtock theads from the fore to the aftcrmoft floors, and afore and abaft them it terminates the double futtock heads

Vow. XVII. Part II.

\section*{\(I \quad \mathrm{I} \quad \mathrm{N} G\).}
in the fore and aft cant bodies. It thould be placed in Application midfhips, as much above the firlt futtock head as the of the ferefirft futtock is above the floor head: by which it gives going Rules the fame fcarf to the lower part of the third futtock ftruction of as the firft futtock does to the fecond. 'Ihere are be-Ships. vellings taken all fore and aft at this diagonal. It is named the fecond futtock head.

Eighth diagonal is the ftation for the ribband and harpin which fupports the third futtocks, and is therefore placed between the fecond futtock head and ninth diagonal. It is alfo a bevelling place, and is named the third futtock firmark.

Ninth and laft diagonal is placed the fame diftance above the fecond futtock head as that is above the firft, and terminates all the heads of the third futtocks which are in the frames, as they come between the ports; but fuch as are between the frames, and come under the lower deck ports, muft run up to the under part of the ports, as no fhort timbers fhould by any mcans be admitted under the ports, which require the greateft pofs fible ftrength. This diagonal is likewife a bevelling place for the heads of the third futtocks, and is there. fore called the third futtock bead.

The fourth futtock heads are terminated by the un. der part of the upper deck ports all fore and aft, and a ribband is placed fore and aft at the height of the upper breadth line, another between the lower and upper deck ports, and one at the top-timber line ; which, with the ribbands and harpins before-mentioned, keep the whole body of the fhip together, and likewife in its proper form and flape.

It muft be obferved, that the diagonal lines laid dowe in the dimenfions will not correfpond to what has been faid above upon diagonals, as they were drawn difcretionally upon the body for the purpofe of giving the true dimenfions of it. Therefore, when the body is drawn in fair, the firft diagonals (which fhould only be in pencil) are to be rubbed out, and the proper diagonals drawn with red ink, ftrictly adhering to what has been faid above.
Sect. III. Of the Inboard Works of the Ship defcribed
in thopreceding Seciion.
Draughts of the outboard works being now conftructed, in which every part is defcribed that is neceffary to enable the artift to put the fhip in her frames, we muft now procced to form another draught of the cavity of the fhip or inboard works, which mult be fo contrived that every thing within the fhip may be arranged in the moft commodious manner and to the beft advantage.

It is ufual to draw the inbeard works in the fheer- Stip-Buildo draught; but as this generally occafions much confu-er's Repofio fion, it is therefore the beft and eafieft method to ap-tory. propriate a draught to this particular purpofe.

Take from the fheer draught the ftem, ftern-poft, counter timbers, and keel, and defcribe them on another paper; draw in alfo the cutting down, kelfon, apron, tranfoms, fafhion-pieces, and decks, and the upper line of the fheer all fore and aft, alfo the timbers and ports.

The beams come firt under confideration, and thould be fo difpofed as to come one under and one between each port, or as near as can be to anfwer other works of the flip; but where it happens that a beam cannot poffibly be placed under the port, then a beam arm

3 E
fhould

Application thould be introduced to make good the deficiency. of the foic- Every beam, and alfo the beam arms, fhould be kneed going Rules
to the Cun- at each end with one lodging and one hanging knce; fruction of and in thofe parts of the flip which require the knees Ships. to be very acute, fuch as the after beams of the gundeck, and in fome Chips, whofe bodies are very fharp, the foremolt beams of the gun-deck, there fhould be knees of iron. Care fhould be taken always to let the upper fide of the knees be below the furface of the beams in large fhips one inch and a half, and in fmall fhips an inch, by which means the air will have a free paffage between the knees and under part of the deck.

In the converfion of the beams the fide next the lodging knee fhould be left as broad at the end of the heam as ean poffibly be allowed by the timber, the heam retaining its proper fcantling at the end of the lodging knee : by fo doing the lodging knees will be more without a fquare, which confequently makes them the more eafy to be provided.

In hips where the beams can be got in one piece, they flould be fo difpofed as to have every other one with the butt end the fame way ; for this reafon, that the butts will decay before the tops. In large fhips the beams are made in two or three pieces, and are therefore allowed to be ftronger than thofe that are in one piece. The beams in two pieces may have the fcarf one-third of the length, and thofe in three pieces fhould have the middle piece half the length of the whole beam. The cuftomary way of putting them together is to table them; and the length of the tablings fhould be one-half more than the depth of the beam. It is very common to divide the tablings in the middle of the beam, and that part which is taken out at the upper fide to be left at the lower fide, and then kerfey or flannel is put into the farf: but in this cafe the water is liable to lie in the fcarf, and muft be the means of rotting the beams. If, however, the beams were tabled together in dovetails, and taken through from fide to fide, putting tar only between them, which hardens the wood; then the water occafioned by the leaking of the decks would have a free paffage, and the beam would dry again; and this method would not be found inferior in point of ftrength to the other. The length of the fore and aft arm of the lodging knee fhould extend to the fide of the hanging knee next to it ; but there is no neceffity for that arm to be longer than the other. In faftening the knees, care fhould be taken to let one bolt pafs exactly through the middle of the throat, one foot fix inches from each end, and the reft divided equally between; obferving always to have the holes bored fquare from the knee. The bolts for the thwarthip arms of both hanging and lodging knees may go through the arms of each knee, and drive every one the other way.
In order to draw the beams in the draught, take the moulding of the lower deck beams, and fet it off below the line reprefenting the deck at the fide, and draw a line in pencil parallel thereto, which will reprefent the under fide of the beams. In like manner reprefent the under fide of the beams for the upper deck, quarter deck, forecaftle, and roundhoufe. Then take the fiding of the lower deck beams, and place one under and one between each port, all fore and aft, drawing them in pencil. Determine the dimenfions of the well fore
and aft, which is ten feet, and fet it off abaft the beam Appy icai under the eighthl port, placing the beam under the ninth of the fo port at that diftance : thofe two beams may then be 登ine Ra drawn in ink, and will terninate the extent of the well thruetion the fore and aft way ; and as a beam cannot go acrofs shij s. the fhip at that place upon account of its being the well and matt room, there muft therefore be a beam arm between thefe two beams.

The main hatchway fhould then be determined, letting the beam that forms the fore part of the well form the aft part of it, and the beam under the next part may form the fore fide of it, which beam may allo be now drawn in ink: there fhould alfo be another beam arm introduced in the wake of the main hatchway.

The fore hatchway may be next determined; the fore fide of which thould range well up and down with the after end of the forecaftle, and it may be fore and aft about four-fevenths of the main hatchway. At the forefide of the fore hatchway there muft be a ladderway down to the orlop, which may be as much fore and aft as the beams will allow. The rett of the beams afore the fore hatchway may remain as firft placed, there being nothing in the way to alter the fhip. Then determine on the after hatchway, the forefide of which comes to the aft fide of the mainmaft room.

There fhould alfo be a hatchway, the forefide of which may be formed by the aft fide of the beam under the twelfth port; which is for the conveniency of the fpirit and fifh rooms: and there fhould be a ladderway abaft it to lead down to the cockpit. There may be alfo another hatchway, the forefide of it to be formed by the aft fide of the beam under the eleventh port. The fize of the ladder and hatchways muft be governed by the-beams, as when there is a good thift of beams they fhould not be altered for ladder and hatchways, unlefs it is the three principal hatchways, which muft always be of a proper fize, according to the fize of the fhip.

The after capftan mult be placed between the two hatcliways laft defcribed, and the beams abaft may ftand as they are already fhifted, oblerving only the mizenmaft. I'here fhould be a fmall fcuttle placed afore the lecond beam from aft, for the convenience of the bread room : it muft be on one of the middle lines, as there is a carling at the middle under the four or five after beams to receive the pillars for the fupport thereof.

The bits may be placed, letting the forefide of the after ones come againft the aft fide of the beam abaft the third port, and the forefide of the foremoft ones againft the next beam but one forward; then at the forefide of each bit there fhould be drawn a fmall fcuttle for the conveniency of handing up the powder from the magazine. The breaft hook thould alfo be dtawn, which may be three feet the moulding away, and fided nine-tenths of the beams of the lower deck.

The gun-deck, beams, knees, \&c. being defcribed; in which, as well as all the decks having ports, the fame precautions are to be ufed as in the gun-deck ; and obferving to keep the beams upon one deck as nearly as poffible over the beams of the other, for the conveniency of pillaring, as they will then fupport each other.

The hatchways are to be placed exactly over, thofe

\section*{Book I.} 5 H I P-B U application on the lower deck, each over each; and therefore, of the fore-where there is a beam arm in the lower deck there oing Rule muft alfo be one above it in the upper deck, and the o the Con- fame in the middle deck in three-deck fhips. It comhips. monly happens in fhips of the line that there cannot be a whole beam between the deck breaft hook and the beam that fupports the ftep of the bowfprit, becaufe the bowfprit paffes through that place: in this cafe, there muft be a beam arm placed, letting the end come equally between the beam and the breaft hook: but in flips that the bowfprit will allow of a whole beam, then the ports and the reft of the beams muft be confulted in order to fpace it; and when it fo happens that the foremaft comes in the wake of a port, then a beam arm muft be neceffarily introduced.

Having placed the beams according to the difpofition of the other beams below, the ladder-ways fhould be contrived : there fhould be one next abaft the fore hatchway, which is a fingle ladder-way ; and one next afore the main hatch, which is a double ladder-way; the ladders ftanding the fore and aft way. There fhould alfo be another next abaft the after hatch, and one over the cockpit correfponding with that on the lower deck.

The capftans are next to be confidered; the after one is already placed on the lower deck, the barrel of which muft pafs through the upper deck to receive the whelps and drumhead there, it being a double captan. In fhips having three decks, the upper part of each capftan is in the middle deck; but in fhips with one deck there is only this one capftan, the upper part of which is placed on the quarter deck. The foremoft capftan fhould be placed in the molt convenient fpot, to admit of its being lowered down to the orlop out of the way of the long boat: it may therefore be placed between the main and fore hatchways; the beam under the fixth port of the lower deck may form the aft fide of its room, and the beams on each fide of it fhould be placed exactly over or under the beams on the other decks, and they fhould be at a diftance from each other fufficient to let the drumheads pafs between them. The centre of the capftan fhould then be placed in the middle between the beams which compofe its room; and the partners fhould be fitted in fuch a manner as to Shift occalionally when wanted, which is by letting them be in two pieces fitted together. The partners on ithe lower deck, wherein the capptan fteps, muft be fupported by a pillar on the orlop deck, the lower part of which may be fitted in an oak chock; fo that when the pillar is taken away, and the capftan lowered down, that chock ferves as a ftep for the capitan. Thofe two beams on the orlop, by having the pillar and chock upon them, have therefore the whole weight of the capitan preffing downwards: for the fupport of them, there thould be a carling placed underneath the fore and aft way, with three pillars, one under each beam, and one between; all of them being ttept in the kelfon, by which the orlop deck will be well fupported in the wake of the capttan, and the other decks will feel no ftrain from it.

The fire hearth is next to be difpofed; which is placed differently according to the fize of the fhip. In three-deckers it is found moft convenient to place it on the middle deck; whence there is much more room under the forecaftle than there would have been had it

\section*{I L D I N G.}
been placed there, In all two-deck fhips it is placed Application under the forecaftle, becaufe on the deck underneath of the forethe bits are in the way. It is alfo under the forecafle geing Rules in one-aeck fhips, though confined between the bits: Arue on in this cafe it fhould be kept as near as poffible to the ships. after bits, that there may be more room between it and the foremof bits to makc a good galley.

The pofitions of the main-topfail-fheet bits are next to be determined; the foremoft of which muft be fo placed as to let its forefide come againft the alt fide of the beam abaft the main hatchway, and to pafs down to the lower deck, and there ftep in the beams : admitting it to be a ftraight piece, it would come at, the aft fide of the lower deck beam the fame as it does at the upper deck beam, in confequence of thofe two beams ranging well up and down with each other : it muft therefore have a caft under the upper deck beam, by which the lower part may be brought forward fufficient to fop in the lower deck beam. The aftermoft murt be placed againit the forefide of the beam abaft the maft, and ftep on the beam below ; but there is no neceffity to provide a crooked piece as before, for the beam of the upper deck may be moved a little farther aft, till it admit of the bit ftopping on the lower deckbeam, unlefs the beam comes under a port, as in that cafe it muft not by any means be moved. The crofs pieces to the bits fhould be on the forefide, and in height from the upper deck about one-third of the height between it and the quarter deck. With regard to the heads of the bits, the length of the finip's wafte fhould be confidered; and if there is length enough from the forecaftle to the foremoft bits to admit of the fpare geer being ftowed thereon without reaching farther aft, the quarter deck may then run fo far forward that the head of the foremoft bits fhall tenon in the furemolt beam; this gives the mainmaft another deck, and admits of the quarter deck being all that the longer: but if there is not the room before mentioned, then the quarter deck muft run no further forward than the after bits, which will then tenon in the foremolt beam ; and the foremoft bits muft have a crofs piece let on their heads, which is termed a bor \(\int\) e, and will be for the purpofe of receiving the ends of the fpare geer.

The length of the quarter deck being now determined, the beams are then to be placed. For this pur pofe the feveral contrivances in the quarter deck muft be previoufly confulted. It is neceffary to obferve, that there are neither carlings nor lodges, the carlings of the hatches excepted, in the quarter deck, round-houfe, and forecaftle; as they would weaken inftead of ftrengthening the beams, which thould be as fmall as the fize of the fhip will permit, in order that the upper works may be as light as poffible. Hence, as there are to be neither carlings nor lodges, the deck will require a greater number of beams, and a good round up, as on the contrary the deck would be apt to bend with its own weight. The moft approved rule is therefore to have double the number of beams in the quarter deck as there are in a fpace of the fame length in the upper deck.

Then proceed to fhift the beams to the beft advantage, confulting the latchways, ladder-ways, mafts, bits, wheel, \&cc. With refpect to the ladder-ways on the quarter decks of all fhips, there fhould be one near the fore part of the great cabin for the officers, and an-
othe!

Application other near the foremoft end of the quarter deck, conof the fore- fifting of double ladders for the conveyance of the men Roing Rules. 10 from the other decks in cafes of emergency; and fruction of likewife one on each fide of the fore part of the quarter deck from the gangway: and in every thip of the line all the beams from the foremof ladder-way to the after one fhould be open with gratings, both for the admifition of air, and for the greater expedition of conveying different articles in the time of action.

Two fcuttles are to be difipofed one on each fide of the mainmaft, if it happens to come through the quarter deck, for the top tackles to pafs through, to hook to the eye bolts drove in the upper deck for that purpofe.

The fteering wheel fhould be placed under the forepart of the roundhoufe, and the two beams of the quarrer deck, which come under it, fhould be placed conformable to the two uprights, fo that they may tenon in them. The quarter deck beams fhould be kneed at each end with one hanging and one lodging knee; which adds greatly to the ftrength of the fide. The hanging knees which come in the great cabin may be of iron; their vertical arms to be two-thirds of the length of that of wood, and to reach the fpirketing. It fhould be obferved, that the beam abatt, which comes under the fcreen bulkhead, fhould round aft agreeable to the round of the bulkhead, for the fupport of the fame.
The forecaftle beams fhould be placed according as the works of the deck will admit. The hatchways are therefore to be confidered frrt. There fhould be one for the funnel of the fire hearth to pafs through, and one for the copper to admit of vent for the fleam; and alfo one or two over the galley as the forecafte will admit of. The fore-topfail-heet bits fhould be fo difpofed as to come one pair on the fore and one on the aft fide of the maft, to let into the fide of the forecaftle beams, and ftep on the upper deck beams below : there fhould alfo be a ladder-way at the fore part of the foreeaftle for the conveniency of the fore part of the fhip.

The beams may now be placed agreeable thereto, their number being four more than there are in a fpace in the upper deck equal in length to the forecaftle ; and where there happens to be a wide opening between the beams, as in the cafe of a liatchway, maft room, \&c. then half a beam of fir may be introduced to make good the deficiency. The foremof beam fhould be of a breadth fufficient to take the aft fide of the inboard arms of the catheads, as they are fecured upon this beam by being bolted thereto. Every beam of the forecafle fhould be kneed at each end with one hanging and one lodging knee: the vertical arms of the hanging knces fhould reach the fpirketing, and the knees well bolted and carefully clenched.

Proceed to the roundhoufe; the fame things being obferved with refpect to the beams as in the quarter deck : for as the roundhoufe beams are fided very fmall, it hence follows that they muft be near to each other. Let therefore the number of beams on the roundhoufe be four more than in the fame length of the quarter deck; every other beam being of fir for lightnefs, and every oak beam may be kneed at each end with one hanging and one lodging knee; the hanging knees abaft may be of iron, their vertical arms to be in length two

\section*{I L D I N G.}
thirds of thofe of wood. The roundhoufe fhould al- Applicati ways have a great round up, both for ftrength and con- of the for veniency. There mult be on the roundhoufe a fmall going Rul pair of knee-bits on each fide of the mizenmatt, turned titruction round and fcarfed over each other, and bolted through Ships.
the maft carlings. There muit alfo be a companion on the roundhoufe placed over the middle of the coach, in order to give light thereto.

With regard to placing the roundhoufe beams, the uprights of the fteering wheel and the mizennalt are to be obferved; as when the beams which interfere with thofe parts are properly faced, the reft may be difpofed of at diferetion, or at an equal diftance from cach other, and letting the beam over the fcreen bulkhead have a proper round aft, agreeable to the quarter deck beam underneath.

The upper parts of the inboard works being now defcribed, proceed next to the lower parts, or to thofe which come below the lower deck. Draw in the orlop, by taking the heights afore, at midihips, and abaft, between that and the gun-deck, from the dimentions, and a curve defcribed through thefe points will repre: fent the upper part of the-deck. Set off the thicknefs of the plank below, and the under fide of the plank will be reprefented. As this deck does not run quite forward and aft as the other decks, the length of it mult be therefore determined; for this purpole let the after beam be placed at a fufficient diftance from aft to admit of the bread rooms being of a proper fize for the fhip, which will be under that beam of the gun deck that comes at the fecond part from aft. The after beam being drawn in, proceed to fpace the other beams, placing them exaclly under thofe of the gun-deck; ąud that which comes under the foremoft beam of the gun. deck may terminate the fore part of the orlop. Draw the limber ftrake, by fetting off its thicknefs above the cutting down line, and a line drawn parallel thereto will reprefent the limber ftrake. That part of the orlop which is over the after magazine, fpirit room, and fifl room, and alfo that which is over the fore magazine, is laid with thicker planks than the reft of the deck; which is for the better fecurity of thofe places, the planks being laid over the beams; but in the midfhips, from the fore part of the firit room to the aft part of the fore magazine, the beams are laid level with the furface of the deck, and the planks are rabbeted in from one beam to the other.

In order to reprefent the orlop as juft defcribed, the dimenfions of the different apartments above mentioned mult be determined : Let the aft fide of the after beam be the aft fide of the after magazine, and from thence draw the bulkhead down to the limber ftrake; and theforefide of the third beam may be the forefide of the after magazine, drawing that bulkhead likewife, whicls. will alio form the aft fide of the filh room ; the forefide. of the fifl room may be drawn from the aft fide of the fifth beam, which will alfo reprefent the aft fide of the fpirit room; then the forefide of the firit room may: be drawn from the forefide of the fixth beam. Hence from the forefide of the fixth beam quite aft the deck. will be reprefented by the two lines already drawn, and the upper fide of the beams will be reprefented by the. lower line.

Proceed next to the forepart of the orlop, letting the
fore-
forefice of the after bits be the aft part of the foremoft magazine, drawing the bulkhead thereof, which will come to the aft fide of the fixth beam ; therefore, from the fixth beam to the foremoft end of the orlop, the plank and beams will be reprefented juft in the fame manner as before nentioned for the after part of the orlop: then the midfhip part of the deck will be reprefented by letting the upper line be the upper fide of the plank, and likewife the upper fide of the beams; and the lower line will reprefent the lower edge of the plank, only drawing it from beam to beam, and obferving not to let it pafs through them.

The hatchways, \&c. may now be reprefented on the orlop, letting the main, fore, and after hatchway, be exactly under thofe of the gun-deck: there mult be one over the fifh room, and one over the fpirit room. There muft be two fcuttles over the after magazine for the palfage to the magazine and light room. There fhould alfo be one afore the fourth beam from forward for the paflage to the fore magazine, and one abaft the fecond beam for the paflage to the light room.

The bulkheads for the fore and after parts of the well may be drawn from the lower deck beams to the orlop, and from thence to the limber ftrake in the hold. The fhot lockers may alfo be reprefented, having one afore and one abaft the well : there fhould allo be one abaft the foremoft magazine, the ends of which may be formed by the after bits. The fteps of the mafts may be drawn in by continuing their centres down to the limber frake; and likewife two crutches abaft the inizen ftep divided equally between that and the after part of the cutting down: the breaft hooks may alfo be drawn letting them be five in number below the lower deck hook, and all equally divided between that and the fore ftep. Hence every part of the inboard is decribed as far as neceffary.

\section*{Chap. V. Of the Method of Whole-moulding.}

Having now finifhed the methods of laying down the feveral plans of a fhip, any farther addition on this fubject might appear unneceflary. We cannot, however, with propriety, omit to defcribe the method called whole-moulding, ufed by the ancients, and which ftill continues in ufe among thofe unacquainted with the more proper methods already explained. This method will be illuttrated by laying down the feveral plans of a long-boat ; the length of the keel being 29 feet, and breadth moulded nine feet.

Draw the ftraight line PO (fig. 37.) equal to 29 feet, the extreme length of the boat, and alfo to reprefent the upper edge of the keel. Let (由) be the ftation of the midfhip frame. From the points \(P, \oplus\), and \(O\), draw the lines PT, \(\oplus \mathrm{M}\), and OS, perpendicular to PO. Make \(\rightarrow \mathrm{M}, \mathrm{N}\), equal to the upper and lower heights of breadth refpectively at the main frame, PT the height of breadth at the tranfom, and OS the height at the ftem. Defcribe the curve TMS to reprefent the fheer or extreme height of the fide, which in a thip would be called the upper beight of breadth line, or up. per edge of the wale. Through the point \(N\) draw a curve parallel to TMS, to reprefent the breadth of the nyper ftrake of a boat, or lower edge of the wale if in

1 L D I N G.
a fhip. The dotted line I'NS may alfo be drawn to Nethod reprefent the lower height of breadth.

Set off the rake of the port from P to \(p\), and draw the line \(p t\) to reprefent the aft fide of the port ; then of Wholemoulding. Tt will reprefent the rourd up of the tranfom. Set off the breadth of the port from \(p\) to \(r\), and from 'I' to \(s\), and draw the line \(r\) s to reprefent the forefide of the port, which may either be a curve or a ftraight line at pleafure. Set up the height of the tuck from \(p\) to \(k_{0}\) Let \(k \mathrm{X}\) be the thicknefs of the tranfom, and draw theline ZX to reprefent the forefide of the tranfom.

There is given the point \(S\), the height of the theer on the forefide of the ftem; now that fide of the ftem is to be formed either by fweeps or fome other contrivance. Set off the breadth of the ftem, and form the aft fide of it.

Set up the dead-rifing from \(\oint\) to \(d\), and form the rifing line \(r\) is. Draw the line KL parallel to PO to reprefent the lower edge of the keel, and another to reprefent the thicknefs of the plank or the rabbet. The rabbet on the poft and ftem may alfo be reprefented; and the ftations of the timbers affigned, as \(\otimes,(1), 1,2\). \(3,4,5,6,7,8,9\); and \(\oplus,(A), A, B, C, D, E, F\). \(\mathrm{G}, \mathrm{H}\); and the fheer plan will be completed.

The half-breadth plan is to be formed next; for this. purpofe the perpendiculars TP, \(9,8, \& c\). muft be produced. Upon \(M \oplus\) produced fet off the half breadth from the line KL to \(R\) (fig. 38.) ; fet off alfo the half breadth at the tranfom from K to \(b\), and defcribe. the extreme half breadth line 6 RX, making the forepart of the curve agreeable to the propofed round of the tranfom.

We may next proceed to form the timbers in the body plan. Let AB (fig. 39.) be the breadth moulded at \(\oplus\). Erect the perpendicular CD in the middle of the line \(A B\); draw the line \(m n\) diftant therefrom the half thicknefs of the poft, and \(x y\) the half thicknefs of the ftern. Then take off the feveral portions of the perpendiculars \(\oplus, 1,2, \& c\). intercepted between the upper edge of the keel and the rifing line in the fheer plan, and fet them up from \(C\) upon: the line \(C D\); through thefe points draw lines parallel to AC; take off alfo the feveral lower heights of breadth at \(\oplus \in, 1,2, \& c\). from the fheer plan; and fet them up from C upon the middle line in the body plan; and draw lines parallel to AC through thefe points: Then take off the feveral half breadths correfponding to each from the floor plan; and fet them off on their proper half-breadth lines from the middle line in the body plan.

Conftruct the midfhip frame by Problem V. the formof which will in fome meafure determine the form of the reft. For if a mould be made on any fide of the middle line to fit the curve part of it, and the rifing. line, or that marked bend mould (6g. 40.), and laid in fuch a manner that the lower part it, which is ftraight, may be fet upon the feveral rifing lines, and the upper part juft touch the point of the half breadth in thebreadth line eorrefponding to that rifing upon which the mould is placed, a surve may then be drawn by the mould to the rifing line. In this manner we may proceed fo far as the rifing line is parallel to the lower. height of the breadth line. Then a hollow mould mutt be made, the usper end of which is left Atraight, as: thate

Meth d of Whole. moulding.
that marked bollow mould (fig, 40.). This is applied in fuch a manner, that fome part of the hollow may touch the fide of the keel, and the ftraight part touch the back of the curve before defcribed by the bend mould: and, berinning abaft, the ftraight part will al--wavs come lower on every timber, till we come to the midfhip timber, when it comes to the fide of the keel. Having thus formed the timbers, fo far as the whole mouldings will ferve, the timbers abaft them are next 'formed. Their half breadths are determined by the fleer and floor plans, which are the only fixed points through which the curves of thefe timbers muft pafs. 'Some form thele after timbers before the whole is moulded, and then make the hollow mould, which will :be ftraighter than the hollow of either of thefe timbers. It is indifferent which are firft formed, or what methods are ufed; for after the timbers. are all formed, though 'every timber may appear very fair when confidered by itfelf, it is uncertain what the form of the fide will be. 'In order to find which, we mult form feveral ribband and water lines; and if thefe do not make fair curves, they mutt be rectified, and the timbers formed from thefe ribband and water lines. In ufing the hollow mould, when it is applied to the curve of each timber, if the ftraight part is produced to the middle line, we thall have as many points of interfection as there are timbers; and if the heights above the bafe be transferred to the correfponding timbers in the fheer plan, a curve paffing through thefe points is what is called a rifing frait. This may be formed by fixing a point for the aftermoft timber that is whole nooulded, and transferring that height to the Theer plan. The curve muft pafs through this point, and fall in with the rifing line fomewhere abaft dead flat; and if the feveral heights of this line be transferred from the fheer to the middle line in the body plan, thefe points will regulate what is called the bauling dozun of the hollow mould.

The timbers in the after body being all formed, thofe in the fore body are formed in the fame manner, by transferring the feveral heights of the rifing and breadth lines from the fheer to the body plan; the half breadths correfponding to each height mult alfo be transferred from the floor to the body plan. The farne hollow mould will ferve both for the fore and after body; and the level lines, by which the water lines to prove the after body were formed, may be produced into the fore body, and by them, the water lines to prove the fore body, may be defcribed.

Another method of proving the body is by ribband lines, which are formed by fections of planes inclined to the theer plan, and interfecting the body plan diagonally, as before obferved, of which there may be as niany as may be judged neceffary. As this has been already explained, we fhall therefore lay down only one, reprefented in the body plan by the lines marked dia. Thefe are drawn in fuch a manner as to be perpendicular to as many timbers as conveniiently may be. After they are drawn in the body plan, the feveral portions of the diagonal intercepted between the middle line and each timber mutt be trwisferred to the floor plan. Thus, fix one foot of the compaffes in the point where the diagonal interfects the middle line in the body plan ; extend the other foot to the point where the diagonal inserfects the timber; for example, timber 9: Set off the same extent upon the perpendicular reprefenting the plane

\section*{I L D I N G.}
of timber 9 from the point where it interfecto the line Meth KL on the floor plan: in like manner proceed with all the other timbers both in the fore and after body; and thefe fhall have the points thro' which the curve mult pafs. If this fhould not prove a fair curve, it mult be altered, obferving to conform to the points as nearly as the nature of the curve will admit : fo it may be carried within one point, and without another, according as we find the timbers will allow. For after all the ribband lines are formed, the timbers muft, if needful, be altered by the ribband lines: this is only the reverfe of forming the ribband lines; for taking the portions of the feveral perpendiculars intercepted between the line \(\not \mathrm{K} \mathrm{L}\) and the curve of the ribband line in the floor plan, and fetting them off upon the diagonal from the point where it interfects the middle line, we thall have the points in the diagonal through which the curves of the timbers mult pals. Thus the diftance between the line KL and the ribband at timber 3 on the floor plan, when transferred to the body plan, will extend on the diagonal from the middle line to the point where the curve of timber 3 interfects that diagonal. The like may be faid of all the other timbers; and if feveral ribband lines be formed, they may be fo contrived that their diagonals in the body plan fhall be at fuch diftances, that a point for every timber be* ing given in each diagonal, will be fufficient to determine the form of all the timbers.

In ftationing the timbers upon the keel for a boat, there mult be room for two futtocks in the fpace before or abaft \(\otimes\); for which reafon, the diftance between thefe two timbers will be as much more than that be\(t\) ween the other as the timber is broad. Here it is between \(\oplus\) and (A); which contains the diftances between \(\Theta\) and ( 1 ), and the breadth of the timber befides.

The timbers being now formed, and proved by rib. band and water lines, proceed then to form the tranfom, fafhion-pieces, \&c. by Problem VI.

This method of whole-moulding will not anfwer for the long timbers afore and abaft. They are generally canted in the fame manner as thofe for a fhip. In or der to render this method more complete, we fhall here defcribe the manner of moulding the timbers after they are laid down in the mould loft, by a rifing fquare bend, and hollow mould.

It was fhown before how to form the timbers by the bend and hollow moulds on the draught. The fame method muft be ufed in the loft ; but the moulds mult be made to their proper fcantlings in real feet and inches. Now when they are fet, as before directed, for moulding each timber, let the middle line in the body plan be drawn acrofs the bend mould, and draw a line acrofs the hollow mould at the point where it touches the upper edge of the keel ; and let them be marked with the proper name of the timber, as in fig. 40 . The graduations of the bend mould will therefore be exactly the fame as the narrowing of the breadth. Thus; the diftance between \(\otimes\) and 7 on the bend mould is equal to the difference between the half breadth of timber 7 and that of \(\oplus\). The height of the head of each timber is likewife marked on the bend mould, and alfo the floor and breadth firmarks. The floor firmark is in that point where a ftraight edged batten touches the back of the bend mould, the batter being fo placed
as to touch the lower edre of the keel at the fame time. 'The feveral rifings of the floor and heights of the cutting down line are marked on the rifing fquare, and the half breadth of the keel fet off from the fide of \(i t\).

The moulds being thus prepared, we fhall apply them to mould timber 7. 'The timber being firt properly fided to its breadth, lay the bend mould upon it, fo as may beft anfwer the round according to the grain of the wood; then lay the rifing fquare to the bottom of the berd mould, fo that the line drawn acrofs the bend mould at timber 7 may coincide with the line reprefenting the middle of the keel upon the rifing fquare; and draw a line upon the timber by the fide of the fquare, or let the line be fcored or cut by a tool made for that purpofe, called a rafeing knife (E); this line fo rafed will be the fide of the keel. Then the fquare mult be moved till the fide of it comes to 7 on the bend mould, and another line muft be rafed in by the fide of it to reprefent the middle of the keel. 'The other fide of the keel muft likewife be rafed after the fame manner, and the point 7 on the rifing fquare be marked on each fide of the keel, and a line rafed acrofs at thefe points to reprefent the upper edge of the keel. From this line the height of the cutting down line at 7 muft be fet up, and then the rifing fquare may be taken away, and the timber may be rafed by the bend mould, both infide and outfide, from the head to the floor firmark ; or it may be carried lower if neceffary. After the firmarks and head of the timbers are marked, the bend mould may likewife be taken away, and thenthe hollow mould applied to the back of the fweep in fuch a manner that the point 7 upon it may interfect the upper fide of the keel, before fet off by the rifing fquare; and when in this pofition the timber may be rafed by it, which will complete the outfide of the timbers. The infide of the timbers may likewife be formed by the hollow mould. The fcantling at the keel is given by the cutting down before fer off. The mould muft be fo placed as to touch the fweep of the infide of the timber formed before by the bend mould, and pals through the cutting down point.

The ufe of the firmarks is to find the true places of the futtocks; for as they are cut off three or four inches fhort of the keel, they mult be fo placed that the futtock and floor firmarks may be compared and coincide. Notwithftanding which, if the timbers are not very carefully trimmed, the head of the futtock may be either within or without its proper half breadth; to prevent which a half breadth ftaff is made ufe of.

The half breadth ftaff may be one inch fquare, and of any convenient length. Upon one fide of it are fet off from one end the feveral half breadths of all the timbers in the after body, and thofe of the fore body upon the oppofite fide. On the other two fides are fet off the feveral heights of the fheer, the after body on one fide, and the fore body on its oppofite. Two fides of the ftaff are marked balf breadths, and the other two fides beights of the Seer.

The ftaff being thus prepared, and the floor-timbers

\section*{I L D I N G.}
faftened on the kecl, and levelled acrofs, the futrocks muft next be faftened to the floor timbers; but they muft be fet firft to their proper half breadth and height. The half breadth ftaff, witl the affiltance of the ramline \(\delta\), ferves to fet them to the half breadth : for as \(\S\) See next the keel of a boat is generally perpendicular to the ho. Chapter. rizon, therefore the line at which the plummet is fufpended, and which is moveable on the ram line, will be perpendicular to the keel. Whence we may by it fet the timbers perpendicular to the keel, and then fet them to their proper half breadths by the flaff: and when the two firmarks coincide, the futtock will be at its proper height, and may be nailed to the floor timbers, and alfo to the breadth ribhand, which may be fet to the height of the fieer by a level laid acrefs, taking the height of the fheer by the ftaif from the upper fide of the keel; by which means we fhall difoover if the ribband is exactly the height of the fheer; and if not, the true height may be fet of by à pair of compaffes from the level, and marked on the timbers.

\section*{Chap. VI. Of the Practice of Ship-building.}

The elevation, projection, and half-breadth plans, of a propofed fhip being laid down on paper, we murt next proceed to lay down thefe feveral plans on the mould loft of the real dimenfions of the fhip, propofed to be built, and from which moulds for each feparate part are to be made. The method of laying down thefe plans, from what has been already faid, will, it is prefumed, be no very difficult tafk. to accomplifh, as it is no more than enlarging the dimenfions of the original drauehts; and with refpect to the moulds, they are very eafily formed agreeable to the figure of the feveral ? parts of the fhip laid down in the mould loft.
Blocks of wood are now to be prepared upon which : the keel is to be laid. Thefe blocks are to be placed at nearly equal diftances, as of five or fix feet, and in fuch a manner that their upper furfaces may be exactly in the fame plane, and their middle in the fame ftraight line. This laft is eafily done by means of a line Atretch. ed a little more than the propofed length of the keel ; and the upper planes of thefe blocks may be verified by a long and ftraight rule; and the utmoft care and precantion mult be taken to have thefe blocks properly bedded. Each block may be about fix or eight inches longer than the keel is in thicknefs; their breadth from 12 to 14 inches, and their depth from a foot to a foot and half.
The dimenfions of the keel are to be taken from the mould loft, and the keel is to be prepared accordingly. As, however, it is feldom poffible to procure a piece of wood of fufficient length for a keel, efpecially if for a large fhip, it is, therefore, for the moft part neceflary to compofe it of feveral pieces, and theie pieces are to be fcarfed together, and fecurely bolted, fo as to make one entire piece. It muft, however, be obferved, that. the pieces which compofe the keel ought to be of fuchlengths, that a fcarf may not be oppofite to the ftep of any of the mafts. Rabbets are to be formed on each. fide of the keel to receive the edge of the planks next :
(E) The term rafeing is ufed when any line is drawn by fuch an inftrument inftead of a pencil. .

Practice of ShipI huilding.
to it, or garboard Atrake, and the keel is to be laid on the blocks ( F ).
The ftem, and the pof, and the feveral tranfoms belonging to it, are to be prepared from the moulds, and rabbeted in like manner as the keel, to receive the ends of the plank. The tranfoms are to be bolted to the pof at their middle, each at its refpective height, taken from the elevation in the mould loft, and the extremities of the tranfoms are to be firmly connected with the fafhion-pieces. Both ftem and poft are then to be erected, each at its refpective extremity of the keel. The ftenons at the heel of each being let into mortifes prepared to receive them, and being fet to their proper rakes or angles with the keel, are to be fupported by props or fhores. Pieces of wood called dead wood are to be laid upon and fixed to the upper fide of the keel towards the fore and aft parts of it ; the deepnefs of the dead wood increafing with its diftance from the middle, agreeable to the propofed form of the cutting down line.

A line is to be fretched from the middle of the head -of the ftem to that of the poft, called the ram line, upon which is a moveable line with a plummet affixed to it. The midhaip and other frames are to be erected upon the keel at their proper ftations. The extremities of each frame are fet at equal diftances from the vertical longitudinal fection of the fhip, by moving the frame in its own plane until the plumb-line coincides with a mark at the middle between the arms of each frame; and although the keel is inclined to the horizon, yet the frames may alfo be fet perpendicular to the keel by means of the plumb-line. The fhores which are fupporting the frames are now to be fecurely fixed, that the pofition of the frames may not be altered. The ribbands are now to be nailed to the frames at their proper places, the more effectually to fecure them; and the intermediate vacancies between the frames filled up with filling timbers. For a perfpective view of a flip framed, fee Plate CCCCLIV. fig. 2.

The frames being now fationed, proceed next to fix on the planks, of which the wales are the principal, being much thicker and fronger than the reft, as is reprefented in the midfhip frame, Plate CCCXIV. The harpins, which may be confidered as a continuation of the wales at their fore ends, are fixed acrofs the hawfe pieces, and furround the fore part of the fhip. The planks that inclofe the fhip's fides are then brought about the timbers; and the clamps, which are of equal thicknefs with the wales, fixed oppofite to the wales within the fhip. Thefe are ufed to fupport the ends of the beams, and accordingly fretch from one end of the fhip to the other. The thick fuff or ftrong planks of the bottom within board are then placed oppofite to the feveral fcarfs of the timbers, to reinforce them throughout the fhip's length. The planks employed to line the fhip, called the ceiling or foot-zwaling, is next fixed in the intervals between the thick ftuff of the hold. The beams are afterwards laid acrofs the fhip to fupport the decks, and are connected to the fide by lodging and

\section*{I L D I N G.}
hanging knees : the former of which are exhibited at \(F\), Plate CLVI. See alfo the article Deck; and the hanging-knees, together with the breadth, thicknefs, and pofition of the keel, floor timbers, futtocks, toptimbers, wales, clamps, thick ftuff, planks within and without, beams, decks, \&c. are feen in the midfhip frame, Plate CCCXIV. and in that article thefe feveral parts have already been explained.

The cable-bits beiner next erected, the carlings and ledges, reprefented in Plate CLVI. are difpofed between the beams to ftrengthen the deck. The water-ways are then laid on the ends of the beams throughout the fhip's length, and the fpirketing fixed clofe above them.The upper deck is then planked, and the fring placed under the gunnel, or plan/beer, in the wait. The difpofition of thofe latter pieces on the timbers, viz. the wa-ter-ways, fpirketing, upper deck, ftring, and gunnel, are alfo reprefented in the midhip frame, Plate CCCIV.

Then proceed next to plank the quarter deck and forecafle, and to fix the partners of the mafts and capfterns with the coamings of the hatches. The breaflbooks are then bolted acrofs the ftem and bow withinboard, the ftep of the foremaft placed on the kelfon, and the riclers, exhibited in the Midship Frame, fayed to the infide of the timbers, to reinforce the fides in different parts of the ship's length. The pointers, if any, are afterwards fixed acrofs the hold diagonally to fupport the beams; and the crotches ftationed in the af. ter hold to unite the half timbers. The leps of the mainmaft and capfterns are next placed; the planks of the lower decks and orlop laid; the navel-boods fayed to the hawfe holes; and the knees of the bead, or cutwater, connected to the ftern. The figure of the head is then erected, and the trail-board and cheeks fixed on the fide of the knee.
The taffarel and quarter-pieces, which terminate the Ship abaft, the former above and the latter on each fide, are then difpofed, and the ftern and quarter galleries framed and fupported by their brackets. The pumps, with their well, are next fixed in the hold; the limber boards laid on cach fide of the kelfon, and the garbourd frake fixed on the fhip's bottom next to the heel without.

The hull being thus fabricated, proceed to feparate the apartments by bulkheads or partitions, to frame the port-lids, to fix the catheads and chefs-trees ; to form the hatchways and fcuttles, and fit them with proper covers or gratings. Next fix the ladders at the different hatchways, and build the manger on the lower deck, to carry off the water that runs in at the hawfeholes when the fhip rides at anchor in a fea. The breat-room and magazines are there lined; and the gunnel, rails, and gangways fixed on the upper part of the fhip. The cleats, kevels, and ranges, by which the ropes are faftened, are afterwards bolted or nailed to the fides in different places.

The rudder, being fitted with its irons, is next hung to the ftern-poft, and the tiller or bar, by which it is managed, let into a mortife at its upper end. The
fcuppers,
(F) In fhips of war, which are a long while in building, it has been found that the kecl is often apt to rot before they are finifhed. Upon this account, therefore, fome builders have begun with the floor timbers, and added the keel afterwards.

\section*{pok I.}

\section*{S H I P-B U}
fcuppers, or leaden tubes, that carry the water off from the decks, are then placed in holes cut through the fhip's fides; and the flandards reprefented in the Midship Frame, Plate CCCXIV. bolted to the beams and fides above the decks to which they belong. The poop lanthorns are laft fixed upon their cranes over the itern, and the bilge-ways or cradles placed under the bottom to conduct the flip feadily into the water whilf launching.
As the various pieces which have been mentioned above are explained at large in their proper places, it is therefore fuperfluous to enter into a more particular defcription of them here.
Chap. VII. Of Improvements in the Mafs and Rudder.
Since the article Mast was printed, an account of a method for reftoring matts of fhips when wounded, or otherwife injured, in an eafy, cheap, and expeditious manner, by Captain Edward Pakenlam of the royal navy, has been publifhed in the tenth volume of the Tranfactions of the Society for the Encouragement of Arts, \&cc. Captain Pakenham introduces his invention with the following obfervations :
" Among the various accidents which hips are liable to at fea, none call more for the attention and exertion of the officer than the fpeedy refitting of the mafts; and having obferved, in the courfe of lait war, the very great deftruction made among the lower mafts of our hhips from the enemy's mode of fighting, as well as the very great expence and delay in refitting a fleet after an action, particularly acrofs the Atlantic-a very fimple expedient has fuggefted itfelf to ine as a refource in part ; which appears fo very fpeedy and fecure, that the capacity of the meaneft failor will at once conceive it. I therefore think it my duty to ftate my ideas of the advantages likely to refult from it ; and I fhall feel myfelf exceedingly happy fhould they in anywife contribute to remedy the evil.
" My plan, therefore, is, to have the heels of all lower matts fo formed as to become the heads: but it is not the intention of the above plan to have the fmalleft alteration made in the heels of the prefent lower mafts; for as all line-of-battle fhips mafts are nine inches in diameter larger at the heel than at the head, it will follow, that by letting in the treffel-trees to their proper depth, the maft will form its own cheeks or hounds; and I flatter myfelf the following advantages will refult from the above alteration.

Firt, I muft beg to obferve, that all line-of-battle fhips bury one-third of their lower mafts, particularly three-deckers; it therefore follows, that if the wounds are in the upper third, by turning the maft fo as to make the heel the head, it will be as good as new ; for, in eight actions I was prefent in laft war, I made the following obfervations:
"That in the faid actions fifty-eight lower mafts were wounded, and obliged to be fhifted, thirty-two of which had their wounds in the upper third, and of courfe the fhips detained until new matts were made. And when it is confidered that a lower maft for a 90 or 74 ftands government in a fum not lefs, I am informed, than 20001 . to 23001 . the advantages acrofs the Atlsntic refulting from the aforefaid plan will be particularly obvious; not to mention the probability of there being no fit fpars in the country, which was the cafe in

Vol. XVII. Part II.

\section*{I L D I N G.}
the inflances of the Ifis and Princefs Royal ; and as Improve. I was one of the lieutenants of the Tfis at that time, ments in I am more particular in the circumfance of that the Mafts hip. The Thicular in the circuminan of that and beve both her lower mats wounded der. above the cathar pins in her action with the C - \(-\underbrace{-}\) far, a French 74; and as there were no fpars at New York, the Ifis was detained five weeks at that place.Now, if her mafts had been fitted on the plan I have propofed, I am confident the would have been ready for fea in 48 hours; and as a further proof, I beg leave to add, that the whole fleet, on the glorious 12 th of April, had not the leaft accident of any confequence except what befel their lower mafts, which detained them between eight and ten weeks at Jamaica.
" The delay of a fhip while a new maft is making, and probably the fleet being detained for want of that fhip, which frequently occurred in the courfe of laft war, the taking of hipwrights from other work, with a variety of inconveniences not neceffary to mention here, muft be obvious to every officer that has made the fmalleft obfervations on fea actions.
" You will further obferve, that this fubftitute is formed on the molt fimple principle, fitted to the meaneft capacity, and calculated to benefit all fhips, from a firt-rate down to the fmalleft merchantman, in cafes of an aceident by fhot, a fpring, a rottennefs, particularly as thefe accidents generally happen in the upper third of the maft and above the cheeks.
"It might probably be objected, that a difficulty and fome danger might arife from the wounded part of the maft being below ; but this will at once be obviated, when it is remembered, that as the wounded part is below the wedges, it may with eafe be both fifhed, cafed, and fecured, to any fize or degree you pleafe, with the addition of its being wedged on each deck."
Fig. 41. reprefents a maft of a firft-rate in its proper ftate, the figures reprefenting its thicknefs at the different divifions.
Fig. 42. the fame maft inverted, the heel forming the head, and the treffel-trees let into their proper depth, the additional thicknefs of the maft forming its own cheeks.

Fig. 43. the propofed maft, the figures reprefenting the thicknefs of the malt in the propofed alterations; \(a\), the heel made fquare ; \(b\), the letting in of the treffeltrees; \(c\), the third proportion of thicknefs continued up to where the fourth is in the prefent maft, or at leaft fome little diftance above the lower part of the cheeks, which is always looked upon as the weakelt part of the maft ; and by its being fo proportioned, the matt, when turned, will be nearly as ftrong in the partners as before.

As the expence of a maft is much greater than is generally imagined, it is therefore thought proper to fubjoin the following ftatement of the feveral articles ufed in making a 74 gun fhip's mainmaft.
Fifhes for a fpindle, 21 inches, 2 nails of Value. two mafts,

Principles of Naval Arcbitec. ture, P. 50.

In order to leffen the enormous expence of mafts, a propofal was made fome years ago to conftruct them hollow ; and the author having premifed feveral experiments which he had made, proceeds as follows:
" Galileo taught us, that the refiftance or ftrength of a hollow cylinder is to that of a full cylinder, containing the fame quantity of matter, as the total diameter of the hollow one is to the diameter of the full one; and thefe experiments fhow us, that the Atrength or refiftance of two or more pieces of wood, faftened together at each end, and connected by a pillar, pillars, or framing, increafes, at leaft to a certain degreee, cateris paribus, as the diftance between them and number of pillars, provided the force is applied in the line or direcvion of the pillars.
"It is furprifing that this difcovery of Galileo has not been made fubfervient to more ufeful purpofes. It is particularly applicable to the conftruction of mafts, as not requiring that the hollow cylinder thould be made of one folid piece of wood ( \(G\) ).
"However, the foregoing experiments teach us, that the fame advantages may be obtained by other forms befides that of a cylinder; and that perhaps not only in a fuperior degree, but likewife with greater facility of execution; as by adopting a fquare figure, but more particularly by conftructing them of feparate pieces of wood, placed at proper diftances from each other, in the following or any other manner that may be found moft convenient. Tig. 44, 45, and 46, exhibit each the tranfverfe fection of a maft, in which the fmall circles reprefent the trees or upright pieces of wood, and

I L D I N G.
the lines the beams or framing of wood, which are em-Improvs ployed at proper places and at proper diftances from mentsi it \(\mathrm{Ma}^{2}\) each other, for connecting them together. Perhaps fo- and Ru lid frames of wood, placed at proper diftances from each der
other, and filling up the whole dotted fpace, would anfwer better; in which event, the maft could be frongly hooped with iron at thofe places, and the upright trees formed fquare, or of any other cơnvenient form.
"It will be evident to thofe acquainted with this fubject, that fuch mafts would be greatly ftronger than common ones containing the fame quantity of materials. It is likewife evident that they would be lefs apt to fpring, as being fupported on a more extended bafe, and affording many conveniences for being better fecured; and that they might be conifructed of fuch wood as at preferit would be deemed altogether improper for mafts: a circumftance of importance to Britain at all times, but more particularly now, when there is fuch difficulty in procuring wood proper for the kind of mafts in commen ufe."

An improvement in the rudder has lately taken place \(A_{n} \mathrm{mim}_{\text {- }}\) in feveral fhips, particularly in fome of thofe in the fer- proveme vice of the Eaft India company. It will, however, be in the ru neceffary previoully to defcribe the ufual form of the rudder, in order to fhow the advantages it poffeffes when conftructed agreeable to the improved method.
\(\mathrm{N}^{\circ}\) I. (fig. 47) reprefents the rudder according to \({ }^{\text {Paperr }}\) O the common method of conftruction; in which AB is \({ }_{c}^{\text {Naval }} \mathrm{A}\) the axis of rotation. It is hence evident that a fpace parte 1 . confiderably greater than the tranfverfe fection of the rudder at the counter mult be left in the counter for the rudder to revolve in. Thus, let CAB ( \(\mathrm{n}^{\mathrm{b}} 2\).) be the fection of the rudder at the counter ; then there muft be a fpace fimilar to CDE in the counter, in order that the rudder may be moveable as required. Hence, to prevent the water from walhing up the rudder cafe, a rudder coat, that is, a picce of tarred canvas, is nailed in fuch a manner to the rudder and counter as to co ver the intermediate fpace: but the canvas being continually wafhed by the fea, foon becomes brittle, and unable to yield to the various turns of the rudder without breaking; in which cafe the flip is of courfe left pervious to the waves, even of three or four feet high; in faict, there are few men bred to the fea who have not been witneffes to the bad effects of fuch a fpace being left fo ill guarded againft the ftroke of the waves; and many fhips have, with great probability, been fuppofed to founder at fea from the quantity of water flipped between the rudder and couriter.
It was to semedy this defect that the alteration abore alluded to took place; which confifts in making the upper part AFG (fig. \(\cdot 48, \mathrm{n}^{\circ}\) i.) of the rudder \(A B D\) cylindrical, and giving that part at the fame time a caft forward, fo that the axis of rotation may by that means be the line \(A D\), paffing as ufual from \(E\) to \(D\), through the centres of the braces which attach the ruds: der to the ftern-poft, and from E.to.A through the
(G) The ftrength of thefe cylinders would be ftill further augmented by having folid pieces of wood placed within them at proper diftances, and fecurely faftened to them, in the fame manner, and on the fame principles, that nature has furnifhed reeds'with joints; and for anfwering, in fome'refpects, the fame purpofe as the pillars in the experimeits illuded to.
d-wa- axis the cylinder AFG, in order that the tranfverfe fecLine, tion KH ( \(\left.\mathrm{n}^{\circ} 2.\right)\) at the counter may be a circle revolving upon its. centre; in which cafe the face of halt an inch is more than fufficient. between the rudder and the counter, and confequently the neceflity of a rudder coat entirely done away. But as it was forefeen, that if the rudder by any accident was unhipped, this alteration might endanger the tearing away of the counter, the hole is made much larger than the tranfverfe fection of the cylindric part of the rudder, and the fpace between filled up with pieces of wood fo fitted to the counter as to be capable of withtanding the. fhock of the fea, but to be eafily carried away with the. rudder, leaving the counter, under fuch circumftances, in as fafe a ftate as it would be agreeable in the prefent form of making rudders in the navy.

\section*{Chap. VIII. Upon the Pofition of the Load water Line, and the Capacity of a Ship.}

The weight of the quantity of water difplaced by the bottom of a flip is equal to the weight of the Thip with its rigging, provifions, and every thing on board. If therefore the exact weight of the thip when ready for fea be calculated, and alfo the number of cubic feet in the fhip's bottom below the load-water line, and hence the weight of the water fhe difplaces; it will be known if the load-water line is properly placed in the draught.
The pofition of the fhip in the draught may be either on an even keel, or to draw moft water abaft ; but an even keel is judged to be the beft pofition in point of velocity, when the fip is conftructed fuitable thereto, that is, when her natural pofition is fuch. For when a flip is conftructed to fwin by the ftern, and when brought down to her load-water made to fwim on an even keel (as is the cale with moft thips that are thus built), her velncity is by that means greatly retarded, and alfo her ftrength greatly diminifhed : for the forepart being brought down lower than it fhould be, and the middle of the fhip maintaining its proper depth in the water, the after part is by that means. lifted, and the fhip is then upon an even keel : but in confequence of her being out of her natural pofition, the after part is always preffing downwards with a confiderable ftrain, which will continue till the fhip's fheer is entirely broke, and in time would fall into its natural pofition again: for which reafon we fee fo many fhips with broken backs, that is, with their fheers altered in fuch a manner that the fheer rounds,up, and the higheft part is in the midfhips.

Such are the difadvantages arifing from not paying a due attention to thofe points in the conftruction of a draught ; therefore, when the load-water line is found to be fo fituated at a proper height on the draught; according to the weight given for fuch a fhip, and alfo drawn parallel to the keel, as fuppefing that to be the beft failing trim, the next thing is to examine whether the body is conftructed fuitable thereto, in order to avoid the above-mentioned ill confequences.

In the firf place, therefore, we mult divide the fhip equally in two lengthwife between the fore and after perpendiculars; and the exact number of cubic feet in the whole bottom beneath the load-water line being

I I. D I N G。
41
known, we mult find whether the number of cubic Leadiwzfeet in each part fo divided are the fame; and if they ter Line ship are found to be equal, the bndy of the thip inay then Capacity. be faid to be contruited in all refpeas fuitable to her fwimming on an even keel, let the fhape of the body be whatever it will; and which will be found to be her natural pofition at the load-water line. But if either of the parts fhould contain a greater number of cubic feet than the other, that part which contains the greateft will fwim the molt out of the water, and canfes quently the other will fwim deepef, fuppofing the flip in her natural pofition for that conftruction. In order, therefore, to render the flifp fuitably conitrusted to the load-water line in the draught, which is parallel to the keel, the number of cubic feet in the lefs. part muft be fubtracted from the number contained in the greater part, and that part of the body is to be filled out till it has increafed half the difference of their quantities, and the other part is to be drawn. in as much.: hence the two parts will be equal, that is, each will contain the fame number of cubic feet, and the fhip's body will be conftructed in a manner fuitable to her fwimning on an even keel.

If it is propofed that the thip laid down on the draught thall not fwim on an even keel, but draw morewater abaft than afore, then the fore and after parts of the fhip's body below the load-water line are to be compared; and if thefe parts are unequal, that part which is. lealt is to be filled out by half the difference, and the other part drawn in as much as before.

It will be neceffary, in the firft place, to calculate the weight of a hhip ready equipped for fea, from the knowledge of the weight of every feparate thing in her and belonging to her, as the exact weight of all the timber, iron, lead, mafts, fails, rirging, and in fhort all the materials, men, provifions, and every thing elfe on board of her, from which we fhall be able afterwards to judge of the truth of the calculation, and whether the load-water line in the draught be placed: agreeable thereto. This is indeed a very laborious tafk, upon account of the feveral pieces of timber, \&c. being of fo many different figures, and the fpecific gravity of fome of the timber entering the conftruction not being precifely determined.

In order to afcertain the weight of the hull, the timber is the firlt thing which comes under confideration: the number of cubic feet of timber contained in: the whole fabric mult be found; which we fall be able to do by help of the draught and the principal dimenfions and fcantlings; obferving to diftinguifh the different kinds of timber from each other, as they differ confiderably in weight ; then the number of cubic feet contained in the different forts of timber being reduced into pounds, and added, will be the weight of the tim. ber. In like manner proceed to find the weight of the iron, lead, paint, \&c. and the true weight of the whole will be found.

In reducing quantity to weight, it may be oblerved jee Fydroc that a cubic foot of oak is equal to 66 pounds, and the festics. fpecific gravity of the other materials are as fullow:
\begin{tabular}{lrll}

\hline
\end{tabular}

Agreeable to the above eftimate, we find that the eighty gun fhip, with every thing on board and fit for fea, when brought down to the load water line, weighs \(8,182,463\) pounds, or nearly 3653 tons. It may now be known if the load water line in the draught be pro. perly placed, by reducing the immerfed part of the bo. dy into cubic feet. For if the eighty gun fhip, when brought down to the load water line, weighs 3653 tons, the quantity of water difplaced muft alfo be 3653 tons : now a cubic foot of falt water being fuppofed to weigh 74 pounds, if therefore 8182463 be divided by 74 , the quotient is 110573 , the number of cubical feet which the muft difplace agreeable to her weight.

It is now neceffary to find the number of cubic feet contained in the fhip's bottom below the load water line by calculation. If the bottom was a regular folid, this might be very eafily done; but as it is otherwife, we muft be fatisfied with the following method by approximation, firft given by M. Bouguer.

Take the lengths of every other of the lines that re-method 5 prefent the frames in the horizontal plane upon the up-calculatin per water line; then find the fum of thefe together, the conte: with half the foremoft and aftermott frames. Now mul of the bot tiply that fum by the diftance between the frames, and tom of a the product is the area of the water line contained between the foremoft and aftermoft frames: then find the area of that part abaft the after frame, which forms a trapezium, and allo the poft and rudder; find alfo the area of that part afore the forematt frame, and alfo of the ftem and gripe; then thefe areas being added to that firft found, and the fum doubled, will be the area of the furface of the whole water line. The reafon of this rule will be obvious to thofe acquainted with the firt principles of mathematics.

The areas of the other water line may be found in the fame manner: then the fum of all thefe areas, except that of the uppermoft and lowermoft, of which only one half of each muft be taken, being multiplied by the diftance between the water lines (thefe lines in the plane of elevation being equidifant from each other), and the product will be the folid content of the fpace contained between the lower and load water lines.

Add the area of the lower water line to the area of the upper fide of the keel ; multiply half that fum by the diftance between them, the product will be the folid content of that part between the lower water line and upper edge of the keel, fuppofing them parallel to each other. But if the lower water line is not parallel to the keel, the above half fum is to be multiplied by the diftance between them at the middle of the fhip.

The folid contents of the keel muft be next found, by multiplying its length by its depth, and that product by the breadth. Then the fum of thefe folid contents will be the number of cubic feet contained in the immerfed part of the fhip's bottom, or that part below the load water line.

Determination of the number of Cubic Feet contained in the Bottom of the Eighty Gun Ship. See Plates CCCCLX. and CCCCLXI.

The fore body is divided into five, and the after body into ten, equal parts in the horizontal plane; befides the parts contained between the foremolt timber and the ftem, and the aftermolt timber and the poft. The plane of elevation is alfo divided into five equal parts by water lines drawn parallel to the keel. Thefe water lines are alfo defcribed upon the horizontal plane.

It is to be obferved that there mult be five inches added to each line that reprefents a frame in the horizontal plane for the thicknefs of the plank, that being nearly a mean between the thicknefs of the plank next the water and that on the lower part of the bottom.

Weight of a cubic foot of falt water
\[
11057310
\]

Weight of the whole fhip with every thing on board \(\quad-\quad \$ 182463.8 \mathrm{lbs}\).

As the weight of the fhip, with every thing on board, found by this calculation, is equal to that found by eftimate; it hence appears that the water line is properly placed in the draught. It now only remains to find whether the body is conftucted fuitably thereto, that is, whether the flip will be in her natural pofition when brought down to that line. For this purpole a perpendicular mult be erected 27 feet \(\frac{1}{4}\) inch. abaft dead flat, which will be the middle between the two perpendiculars and the place where the centre of gravity fhould fall, that the fhip may fwim on an even keel. The folidity of that part of the bottom contained between the faid perpendicular and dead flat is then to be calculated, which will be found to be 25846 feet 7 inches.
Solidity of the bottom afore dead flat 36523 f. 4 in , ——between the middle and dead flat \(25846 \quad 7\)

Solid content of the fore part of the bot-
\begin{tabular}{l} 
tom \\

\hline
\end{tabular}

Hence the after part of the Thip's bottom is too lean by 7083 cubic feet, and the fore part as much too full. The after part muft therefore be flled out until it has seceived an addition of 7083 feet, and the fore part muft be drawn in till it has loft the fame quantity, and the bottom will them be conftrutted fuitable to the fhip's fwimming on an even keel:

\section*{Chap. IX. Of the Tonnage of a Ship.}

This is a queftion of equal importance and difficul. Proper mee ty. By the tonnage of a fhip is meant the weight of thod of calevery thing that can with fafety and expediency be ta culating tonnag keu on board that hip for the purpo!e of conveyance: of a fhip. it is alfo called the \(\wp i p\) 's burtben; and it is totally different from the weight of the whole as fhe floats in the water. It is perbaps beft expreffed by calling it the weight of the sargo. It is of importance, becaufe it is by this that the merchant or freighter judges of the fitnefs

Tonnage of of the fhip for his purpofe. By this government judge a ship. of the fhips requifite for tranfport fervice, and by this are all revenue charges on the thip computed. It is no lefs difficult to anfwer this queition by any general rule which thall be very exact, becaufe it depends not only on the cubical dimenfions of the thip's bottom, but alfo on the fcantling of her whole frame, and in fhort on the weight of every thing which properly makes part of a fhip ready to receive on board her cargo. The weight of timber is variable; the fcantling of the frame is no lefs fo. We muft therefore be contented svith an average value which is not vety remote from the truth; and this average is to be obtained, not by any mathematical difcuffion, but by obfervation of the burthen or cargo actually received, in a great variety of cafes. But fome fort of rule of calculation muft be made out. This is and muft be done by perfons not mathematicians. We may therefore expect to find it incapable of being reduced to any principle, and that every builder will have a different rule. Accordingly the rules given for this purpofe are in general very whimfical, meafures being ufed and combined in a way that feems quite unconnected with ftercometry or the meafurement of folids. The rules for calculation are even affected by the interefts of the two parties oppofitely concerned in the refult. The calculation for the tonnage by which the cuftoms are to be exacted by government are quite different from the rule by which the tonnage of a tranfport hired by government is computed ; and the fame fhip hired as a tranfport will be computed near one half bigger than when paying importation duties.
Yet the whole of this might be made a very fimple bufinefs and very exact. When the hip is launched, let her light-water line be marked, and this with the cubical contents of the immerfed part be noted down, and be engroffed in the deed by which the property of the fhip is conveyed from hand to hand. The weight of her mafts, fails, rigging, and fea-ftores, is moft cafily obtained; and every builder can compute the cubical contents of the body when immerfed to the load water line. The difference of thefe is unqueftionably the burthen of the flip.

It is evident from what has been already faid in the laft chapter, that if the number of cubic feet of water which the fhip difplaces when light, or, which is the fame, the number of cubic feet below the light water line, found by the preceding method of calculation, be fubtracted from the number of cubic feet contained in the bottom below the load water line, and the remainder reduced to tons by multiplying by 74, the number of pounds in a cubic foot of fea water, and divided by 2240 , the number of pounds in a ton, the quotient will be the tonnage.

But as this method is very troublefome, the following rule for this purpofe is that which is ufed in the king's and merchant's fervice.

Let fall a perpendicular from the forefide of the ftem at the height of the hawfe holes ( H ), and another per. pendicular from the back of the main poft at the height

\section*{I L D I N G.}
of the wing tranfom. From the length between thefe two Tan perpendiculars deduct three-fifths of the extreme breadth (1), and alfo as many times \(2 \frac{1}{2}\) inches as there are feet in the height of the wing tranfom above the upper edge of the keel ; the remainder is the length of the keel for tonnage. Now multiply this length by the extreme breadth, and the product by half the extreme breadth, and this laft product divided by 94 is the tonnage ré. quired.

Or, multiply the length of the keel for tonnage by the fquare of the extreme breadth, and the product divided by 188 will give the tonnage.

\section*{1. For Men of War.}

Take the length of the gun-deck from the rabbet of the ftem to the rabbet of the ftern-polt. \(\frac{23}{2} \frac{3}{4}\) of this is to be affumed as the length for tonnage, \(=\mathrm{L}\).

Take the extreme breadth from outfide to outfide of the plank; add this to the length, and take \(\frac{1}{2} \frac{1}{3}\) of the fum; call this the depth for tonnage, \(=\mathrm{D}\).
Set up this height from the limber ftrake, and at that height take a breadth allo from outtide to outfide of plank in the timber when the extreme breadth is found, and another breadth in the middle between that and the limber ftrake; add together the extreme breadth and thefe two breadths, and take \(\frac{7}{3}\) of the fum for the breadth for tonnage \(=\mathrm{D}\).
Multiply L, D, and B together, and divide by 49. The quotient is the burthen in tons.

The following proof may be given of the accuracy of this rule. Column 1. is the tonnage or burthen by the king's meafurement ; col. 2 . is the tonnage by this rule ; and, col. 3 . is the weight actually received on board thefe fhips at Blackftakes:

\section*{2. For Ships of Burthen.}

Take the length of the lower deck from the rabbet of the fem to the rabbet of the ftern-polt; then \(\frac{3}{3} \frac{1}{2}\) of this is the length for tonnage, \(=\mathrm{L}\).

Add the length of the lower deck to the extreme breadth from outfide to outfide of plank; and take \(\frac{3}{55}\) of the fum for the depth for tonnage,\(=\mathrm{D}\).

Set up that depth from the limber ftrake, and at this height take a breadth from outfide to outfide. Take another at \(\frac{2}{3}\) of this height, and another at \(\frac{\frac{1}{3}}{}\) of the height. Add the extreme breadth and thefe three breadths, and take the \(4^{\text {th }}\) of the fum for the breadth for tonnage, \(=\mathrm{B}\).

Multiply L, D, and B, and divide by \(36 \frac{2}{3}\). The quotient is the burthen in tons.

Chap. X. Of the Scale of Solidity.
By this fcale the quantity of water difplaced by the bottom of the fhip, for which it is conftructed, anfwering to 2 given draught of water is eafily obtained; and
allo the additional weight necefary to bring her down to the load water line.

In order to conitruct this fcale for a given fhip, it is neceffary to calculate the quantity of water difplaced by the keel, and by that part of the bottom below each water line in the draught. Since the areas of the feveral water lines are already computed for the eighty gun thip laid down in Plates CCCCLX. and CCCCLXI. the contents of thefe parts may hence be eafily found for that fhip, and are as follow.

Conftruct any convenient fcale of equal parts to reprefent tons, as fcale \(n^{*}\). and another to reprefent feet, as \(n^{\circ} 2\).

Draw the line AB (fig. 36) limited at A, but pro. Cccci duced indefinitely towards \(B\). Make AC equal to the depth of the keel, 2 feet 3 inches from fcale \(\mathrm{n}^{\circ} \mathbf{2}\), and Conftr through C draw a line parallel to AB , which will re-fiale of prefent the upper edge of the keel ; upon which fet off lidity \(f\) \(\mathrm{C} c\) equal to 21 tons 185.5 lbs , taken from fale \(\mathrm{n}^{\circ} \mathrm{I}\), the m Again, make \(A D\) equal to the diftance between the of eigh lower edge of the keel and the fifth water line, namely, 6 feet 4 inches, and a line drawn through \(D\) parallel to AB will be the reprefentation of the lower water line; and make D 6 equal to 305 tons 848 lbs , the correfponding tonnage. In like manner draw the other water lines, and lay off the correfponding tonnages accordingly: then through the points A, \(c, b, e, f\), \(g\), \(b\), draw the curve Acbefg \(b\). Through \(b\) draw \(b \mathrm{~B}\) perpendicular to AB , and it will be the greateft limit of the quantity of water expreffed in tons difplaced by the bottom of the Mip, or that when the is brought down to the load water line. And fince the Thip difplaces 1788 tons at her light water mark, take therefore that quantity from the fcale \(\mathrm{n}^{\circ} 1\), which being laid upon \(A B\) from \(A\) to. K, and KL drawn perpendicular to \(A B\), will be the reprefentation of the light water line for tonnage. Hence the fcale will becompleted.

\section*{ok II.}

\section*{S H I P-B U}

Let it now be required to find the number of cubic feet difplaced when the draught of water is 17 feet, and the number of additional tons neceffary to bring her down to the load water mark.
Take the given draught of water 17 feet from the fcale \(n^{\circ} 2\), which laid from it will reach to I ; through which draw the line IMN parallel to \(A B\), and interfecting the curve in AC ; then the diftance IM applied to the fcale \(n^{\circ} \mathrm{x}\). will meafure about 2248 tons, the difplacement anfwerable to that draught of water; and MN applied to the fame fcale will meafure about 1405 tons, the additional weight neceffary to bring her down to the load water nark. Alfo the neareft diftance between M and the line KL will meafure about 460 tons, the weight already on board.

It will conduce very much to facilitate this operation to divide KB into a fcale of tons taken fromi the fcale \(n^{\circ} \mathrm{I}\), beginning at B , and alfo \(b \mathrm{~L}\), beginuing at \(b\). Then when the draught of water is taken from the fcale \(n^{\circ} 2\), and laid from it to \(I\), as in the former example, and IMN drawn parallel to \(A B\), and interfeeting the curve in \(M\). Now throngh \(M\) draw a line perpendicular to \(A B\), and it will meet \(K B\) in a point reprefenting the number of tons aboard, and alfo \(b \mathrm{~L}\) in a point denoting the additional weight neceffary to load her.

Again, if the weight on board be given, the correfponding draught of water is obtained as follows.

Find the given number of tons in the fale KB , through which draw a line perpendicular to \(A B\); then through the point of interfection of this line with the curve draw another line parallel to AB. Now the diftance between \(A\) and the point where the parallel interfected AH being applied to the fcale \(\mathrm{n}^{\circ} 2\), will give the draught of water required.
Any other cafe to which this fcale may be applied will be obvious.

Book II. Containing the Properties of Ships, \&c.

\section*{Сhap. I. Of the Equilibrium of Ships.}

Since the preffure of fluids is equal ia every direction, the bottom of a fhip is therefore acted upon by the fluid in which it is immerfed; which preffure, for any given portion of furface, is equal to the product of that portion by the depth and denifity of the fluid : or it is equal to the weight of a column of the fluid whofe bafe is the given furtace, and the altitude equal to the diftance between the furface of the flaid and the centre of gravity of the furface preffed. Hence a floating body is in equilibrio between two forces, namely, its gravity and the vertical preffure of the fluid ; the horizontal preffure being deftroyed.

Let ABC (fig. 49.) be any body immerfed in v. a fluid whofe line of floatation is GH : hence the preffure of the fluid is exerted on every portion of the furface of the immerfed part AFCH . Let EF , CD be any two fmall portions contained between the lines \(\mathrm{ED}, \mathrm{FC}\), parallel to each other, and to the line of foatation GH : then the preffure exerted upon EF is exprefled by EF \(\times\) IK, IK being the depth of EF

\section*{I I D I N G.}
or CD ; the denfity of the fluid being fuppofed equal to r . In like manuer the preffure upon CD is equal to \(\mathrm{CD} \times I \mathrm{~K}\). Now fince the preffure is in a direction perpendicular to the furface, draw therefore the line EL perpendicular to EF, and DM perpendicular to DC, and make each equal to the depth IK, below the furface. Now the effort or preflure of the fluid upon EF will be expreffed by EF \(\times E L\), and that upon CD by \(\mathrm{CD} \times \mathrm{DM}\). Complete the parallelograms ON, QS, and the preffure in the direction EL is refolved into EN, EO, the firt in a horizontal, and the fecond in a vertical direction. In like manner, the preffure in the direction DM is refolved into the preffures DS, DQ. Hence the joint effect of the preffures in the horizontal and vertical directions, namely, EF \(\times\) EN , and \(\mathrm{EF} \times \mathrm{EO}\), will be equal to \(\mathrm{EF} \times \mathrm{EL}:\) For the fame reafon, \(\mathrm{CD} \times \mathrm{DP}+\mathrm{CD} \times \mathrm{DQ}=\mathrm{CD} \times \mathrm{DM}\). But the parts of the preffures in a horizontal direction \(\mathrm{EF} \times \mathrm{EN}\), and \(\mathrm{CD} \times \mathrm{DP}\), are equal. For, becaufe of the fimilar triangles ENL, ERF, and DPM, DSC, we have \(\frac{E L}{E N}=\frac{E F}{F R}\) and \(\frac{D M}{D P}=\frac{D C}{C S}\) : Hence \(D M\) \(\times \mathrm{CS}=\mathrm{DP} \times \mathrm{DC}\), and EL \(\times \mathrm{FR}=\mathrm{EN} \times \mathrm{EF}\). Now fince \(\mathrm{E} L=\mathrm{DM}\), and \(\mathrm{FR}=\mathrm{CS}\), therefore \(\mathrm{EL} \times \mathrm{FR}\) \(=\mathrm{DM} \times \mathrm{CS}=\mathrm{DP} \times \mathrm{DC}=\mathrm{EN} \times \mathrm{EF}\). Hence, fluce \(\mathrm{EF} \times \mathrm{EN}=\mathrm{DP} \times \mathrm{CD}\), the effects of the preffures in a horizontal direction are therefore equal and contrary, and confequently deftroy each other.

The preffure in a vertical direction is reprefented by \(\mathrm{EO} \times \mathrm{EF}, \mathrm{DO} \times \mathrm{DC}, \& \mathrm{c}\). which, becaufe of the fimilar triangles EOL, ERF, ind DLM, DSC, become \(E L \times E R, D M \times D S, \& c\). or \(I K \times E R, I K \times D S\), \&c. By applying the fame reafoning to every other portion of the furface of the immerfed part of the body, it is hence evident that the fum of the vertical preffures is equal to the fum of the correfponding difplaced columns of the fluid.

Hence a floating body is preffed upwards by a force The weigire equal to the weight of the quantity of water difplaced; of a fhip and fince there is an equilibrium between this force and equal to the the weight of the body, therefore the weight of a float- quan of the of ing body is equal to the weight of the difplaced fluid water dif(к). Hence alfo the centre of gravity of the body placed. and the centre of gravity of the difplaced fluid are in and the the fame vertical, otherwife the body would not be at And the reft. on gravity of
Chap. II. Upon the Efforts of the Water to bend a the fanie Vefel.
WGEN it is faid that the preffure of the water upon Theorie the immerfed part of a veffel counterbalances is weight, complettes it is fuppofed that the different parts of the veffel are fo Euccr, clofely connected together, that the forces which act eranflated upon its furface are not capable of producing any by.Watfon. change. For we may eafily conceive, if the connection of the parts were not fufficiently ftrong, the veffel would run the rifk either of being broken in pieces, or of fuffering fome alteration in its figure.

The veffel is in a fituation fimilar to that of a rod \(A B\) (fig. 50 .), which being acted upon by the forces \(\mathrm{A} a, \mathrm{C} c, \mathrm{D} d, \mathrm{~B} b\), may be maintained in equilibrio, 3 G 2 proo
(k) Upon this principle the weight and tonnage of the 80 gun thip laid down was calculated.

\section*{420} \(S \mathrm{H}\) I P-B U

Efforts of th: Water to beid a
Vrifel

P'ate
CCuclev
provided it has a fufficient degree of ftiffnefs : but as foon as it begins to give way, it is evident it muft bend in a convex manner, fince its middle would obey the forces \(\mathrm{C} c\) and \(\mathrm{D} d\), while its extremities would be ac. tually drawn downwards by the forces \(\mathrm{A} a\) and \(\mathrm{B} b\).

The veffel is generally found in fuch a fituation; and fince fimilar efforts continually act whilft the veffel is immerfed in the water, it happens but too often that the keel experiences the bad effect of a ftrain. It is therefore very important to inquire into the true caufe of this accident.

For this purpofe, let us conccive the veffel to be divided into two parto by a tranfverfe fection through the vertical axis of the vefd, in which both the centre of gravity G (fig. 51.) of the whole veffel and that of the immerfed part are fituated: fo that one of them will reprefent the head part, and the other that of the ftern, each of which will be confidered feparately. Let \(g \mathrm{l}=\) the centre of gravity of the entire weight of the firlt, and o that of the immerfed part corresponding. In like manner, let \(\gamma\) be the centre of gravity of the whole after part, and \(w\) that of its iminediate portion.

Now it is plain, that the head will be act.cd upon by the two forces \(g m\) and \(o n\), of which the firlt will prefs it down, and the latter pufh it up. In the fame manner, the ftern will be preffed down by the force \(\gamma \mu\), and pufhed up by the force \(\omega v\). But thefe four forces will maintain themfelves in equilibrium, as well as the total forces reunited in the points \(G\) and \(O\), which are equivalent to them; but whilf neither the forces before nor thofe behind fall in the fame direction, the veffel will evidently fuftain efforts tending to bend the keel upwards, if the two points \(0 \omega\) are nearer the middle than the two other forces \(g m\) and \(\gamma \mu\). A contrary effect would happen if the points \(\circ\) and \(\omega\) were more diftant from the middle than the points \(g\) and \(\gamma\).

But the firft of thefe two caufes ufually takes place almoft in all veffels, fince they have a greater breadth towards the middle, and become more and more narrow tovards the extremities; whilit the weight of the veffel is in proportion much more confiderable towards the extremities than at the middlc. From whence we fee, that the greater this difference becomes, the more allo will the veffel be fubject to the forces which tend to bend its keel upwards. It is therefore from thence that we muft judge how much ftrength it is neceffary to give to this part of the veffel, in order to avoid fuch a confequence.

If other circumftances would permit either to load the veffel more in the middle, or to give to the part immerfed a greater capacity towards the head and ftern, fuch an effect would no longer be apprehended. But the deftination of moft veffels is entirely oppolite to fuch an arrangement: by which means we are obliged to ftrengthen the keel as much as may be neceffary, in order to avoid fuch a difafter.

We fhall conclude this chapter with the following practical obfervations on the hogging and fagging of thips by Mr Hutchinfon of Liverpool:
"When fhips with long floors happen to be laid a-
PraEical
Scamunßisp, p. 13.
dry upon mud or fand, which makes a folid refiftance againft the long ftraight floors amidfhips, in comparifon with the two fharpends, the entrance and run meet with little fupport, but are prefed down.lower than the
flat of the floor, and in proportion hogs the thip amidfhips; which is too well known from experience to occafion many total loffes, or do fo much damage by hogging them, as to require a valt deal of trouble and expence to fave and repair them, fo as to get the hors taken out and brought to their proper fheer again : and to do this the more effectually, the owners have often been induced to go to the expence of lengthening them; and by the common method, in proportion as they add to the burden of thefe fhips, by lengthening their too long ftraight floors in their main bodies amidhips, fo much do they add to their general weaknefs to bear hardfhips either on the ground or afloat ; for the feanto ling of their old timber and plank is not propurtionable to bear the additional burden that is added to them.
" But defects of this kind are beft proved from real and inconteftable facts in common practice. At the very time I was witing upon this fubject, I was called upon for my advice by the commander of one of thofe ftrong, long, ftraight floored hips, who was in much trouble and diftraction of mind for the damage his fhip had taken by the pilot laying her on a hard, gentle floping fand, at the outfide of our docks at Liverpool, where it is common for fhips that will take the ground to lie for a tide, when it proves too late to get into our wet docks. After recommending a proper fhip carpenter, I went to the fhip, which lay with only a fmall keel, yet was greatly hogged, and the butts of her upper works ftrained greatly on the lee. fide ; and the feams of her bottom, at the lower futtock heads, vaftly opened on the weather fide: all which ftrained parts were agreed upon not to be caulked, but filled with tallow, putty, or clay, \&c. with raw bullocks hides, or canvas nailed with battons on her bottom, which prevented her finking with the flow of the tide, without hindering the preffure of water from righting and clofing the feams again as fhe floated, fo as to enable them to keep her free with pumping. This veffel, like many other inftances of fhips of this conftruction that I have known, was faved and repaired at a. very great expence in our dry repairing docks. And. that their bottoms not only hog upivards, but fag (or curve) downwards, to dangerous and fatal degrees, according to the ftrain or preffure that prevails upon them, will be proved from the following facts:
"It has been long known from experience, that when fhips load deep with very heavy cargoes or materials that are flowed too low, it makes them fo very labourfome at fea, when the waves run high, as to roll away their mafts; and after that misfortune caufes them to labour and roll the more, fo as to endanger their working and ftraining themfelves to pieces: to prevent. which, it has been long a common practice to leave a great part of their fore and after holds empty, and to. ftow them as high as poffible in the main body at mid. fhips, which caufes the bottoms of thefe long ftraight floored fhips to fag downwards; in proportion as the. weight of the cargo ftowed there exceeds, the preffure of the water upwards, fo much fo as to make them dangeroully and fatally leaky.
"I have known many initances of thofe ftrong fhips of 500 or 600 tons burdens built with long ffraight floors, on the eaft coaft of England, for the coal and timber trade, come loaded with timber from the Baltic
fts of to Liverpool, where they commonly load deep with Water rock falt, which is too heavy to fill their holds, fo that
for the above reafons they fowed it high amidfhips, and left large empty fpaces in their fore and after holds, which caufed their long ftraight floors to fag downwards, fo much as to make their hold Atunchions amidfhips, at the main hatchway, fettle from the beams three or four inches, and their mainmalts fettle fo much as to oblige them to fet up the main rigging when roiling hard at fea, to prevent the mafts being rolled away; and they were rendered foleaky as to be obliged to return to Livérpool to get their leaks ftopped at great expence. And in order to fave the time and expence in difcharging them, endeavours were made to find out and Atop their leaks, by laying them afhore dry on a level fand ; but withont effect: for though their bottoms were thus fagged down by their cargoes when afloat, yet when they came a-dry upon the fand, fome of their bottoms hogged upwards fo much as to raife their mainmafts and pumps fo high as to tear their coats from their decks; fo that they have been obliged to difcharge their cargoes, and give them a repair in the repaining dock, and in come to double their bottums, to enable them to carry their cargoes with fafety, ftowed in this manner. From this caufe I have known one of thefe ftrong fhips to founder.
"A mong the many inftances of fhips that have been diftreffed by carrying cargoes of lead, one failed from hence bound to Marfelles, which was foon obliged to put back again in great diftrels, having had four feet water in the hold, by the commander's account, owing to the fhip's bottom fagging down to fuch a degree as made the hold ftaunchions fettle fix inches from the lower deck beams amidfhips; yet it is conmmen with thefe long ftraight floored fhips, when thefe heavy cargoes are difcharged that makes their bottom fag down, then to hog upwards: fo that when they are put into a dry repairing dock, with empty holds, upon fta aight blocks, they commonly either fplit the blocks clofe fore and aft, or damage their keels there, by the whole weight of the finip lying upon them, when none lies upon the blocks under the flat of their floors amidfhips, that being hoggred upwards; which was the cafe of this flip's bottom; theugh fagged downwards fix inches by her cargo, it was now found hogged fo much that her keel did not touch the blocks amidhips, which occafioned fo much damage to the after part of the keel, as to oblige them to repair it; which is commonly the cafe with thefe mips, and therefore deferving particular notice."

In order to prevent thele defects in Mips, "they fhould all be built with their floors or bottoms lengthwife, to form an arch with the projecting part downwards, which will naturally not only contribute greatly to prevent their taking damage by their bottoms hogging and ftraining upwards, either aground or afloat, as has been mentioned, but will, among other advantages, be a help to their failing, fteering, flaying, and waring."

\section*{Chap. III. Of the Stalility of Ships.}

When a veffel receives an impulfe or preffure in a horizontal direction, fo as to be inclined in a fmall degree, the veffel will then either regain its former potition as the preffure is taken off, and is in this cafe
faid to be poffeffed of fability ; or it will continue in its inclined fate ; or, lafty, the inclination will increafe until the veffel is overturned. With regard to the firtt cafe, it is evident that a fufficient degree of fability is neceffary in order to fuftain the efforts of the wxind; but neither of the other two cafes mull be permitted to have place in vefels.

Let CED (fig. 52.) be the fection of a fhip paffing through its centre of gravity, and perpendicular to the theer and floor plans; which let be in equilibrium in a fluid; \(A B\) being the water line, \(G\) the centre of gravity of the whole body, and \(g\) that of the immerfed part AEB. Let the body receive now a very fmall inclination, fo that \(a \mathrm{E} b\) becomes the immerfed part, and \(\gamma\) its centre of gravity. From \(\gamma\) draw \(\gamma \mathrm{M}\) perpendicular to \(a b\), and meeting \(g \mathrm{G}\), produced, if neceflary, in \(M\). If, then, the point \(M\) thus found is higher than \(G\) the centre of gravity of the whole body, the body will, in this cale, return to its former pofition, the preffure being taken off. If the point M coin, cides with \(G\), the veffel will remain in its inclined ffate; but if \(M\) be below \(G\), the inclination of the veffel will continually increafe until it is entirely overfet.

The point of interfection \(M\) is called the metacenter, and is the limit of the altitude of the centre of gravity of the whole veffel. Whence it is evident, from what has already been faid; that the ftability of the veffel increafes with the altitude of the metacenter above the centre of gravity: But when the metacenter coincides with the centre of gravity, the vefiel has no tendency whatever to move out of the fituation into which it may be put. Thus, if the veffel be inclined either to the right or left fide, it will remain in that pofition until a new force is impreffed upon it : in this cafe, therefore, the veffel would not be able to carry fail, and is hence unfit for the purpofes of navigation. If the metacenter is below the common centre of gravity, the veffel will inftantly overfet.

As the determination of the metacenter is of the utmoft importance in the conftruction of fhips, it is therefore thought neceffary to illuftrate this fubject more particularly.

Let \(A E B\) (fig. 52 .) be a fection of a thip perpendicular to the keel, and allo to the plane of elevation, and paffing through the centre of gravity of the fhip, and alfo through the centre of gravity of the immerfed: part, which let be \(\delta\).

Now let the fhip be fuppofed to receive a very fmall. inclination, fo that the line of floatation is \(a, b\), and \(y\) the centre of gravity of the immerfed part \(a E b\). From \(\gamma\) draw \(\gamma \mathrm{M}\) perpendicular to \(a b\), and interfecting GM in: M , the metacenter, as before. Hence the preffure of the water will be in the direction \(\gamma \mathrm{M}\).

In order to determine the point M , the metacenter, the pofition of \(\gamma\) with refpect to the lines \(A B\) and \(g G\), muft be previoufly afcertained. For this purpofe, let the thip be fuppofed to be divided into a great number of fections by planes perpendicular to the keel, and pasallel to each other, and to that formerly drawn, thefe planes being fuppofed equidiltant. Let AEB (fig. 53.) be one of thefe fections, \(g\) the centre of gravity of the immerfed part before inclination, and \(\gamma\) the centre of gravity of the immerfed part when the fhip is in its inclined fate \(;\) the diftance \(g \gamma\) between the two centres

Stablity of of gravity in each fection is to be found. Let \(A B\) be
\(\qquad\)

Bexout:s
Mecbaniqu
ant. 263.
the line of floatation of the fhip when in an upright ftate, and \(a b\) the water line when inclined. Then, be caufe the weight of the fhip remains the fame, the quantity of water difplaced will alfo be the fame in both cafes, and therefore \(\mathrm{AEB}=a \mathrm{E} b\), each fuftaining the fame part of the whole weight of the fhip. From each of thele take the part AE \(h\), which is common to both, and the remairders \(\mathrm{AO} a, \mathrm{BO} b\) will be equal ; and which, hecaufe the inclination is fuppofed very fmall, may be confidered as rectilineal triangles, and the point \(O\) the middle of \(A B\).
Now, let H, I, K, be the centres of gravity of the spaces \(\mathrm{AO} a, \mathrm{AE} b\), and \(\mathrm{BO} b\), refpectively. From thefe points drav the lines \(\mathrm{H} b, \mathrm{I} i\), and \(\mathrm{K} k\), perpendicular to \(A B\), and let IL be drawn perpendicular to EO. Now to afcertain the diftance \(\gamma q\) of the centre of gravity \(\gamma\) of the part \(a \mathrm{E} b\) from the line AB , the momentum of \(a \mathrm{E} b\) with refpect to this line muft be put equal to the difference of the momentums of the parts \(\mathrm{AE} b\), AO \(a\), which are upon different fides of \(\mathrm{AB}+\). Hence \(a \mathrm{E} b \times r q\), or \(\mathrm{AEB} \times r q=\mathrm{AE} b\) \(\times \mathrm{I} i-\mathrm{AO} a \times \mathrm{H} b\). But fince \(g\) is the common centre. of gravity of the two parts \(\mathrm{AE} b, \mathrm{BO} b\), we have therefore \(\mathrm{AEB} \times{ }_{g} \mathrm{O}=\mathrm{AE} b \times \mathrm{I} i+\mathrm{BO} b \times \mathrm{K} k\). Hence by expunging the term \(A E b \times I i\) from each of thefe equations, and comparing them, we obtain AEB \(\times 2 q=\Lambda \mathrm{EB} \times g \mathrm{O}-\mathrm{BO} b \times \mathrm{K} k-\mathrm{AO} a \times \mathrm{H} b\) 。

Now, fince the triangles \(\mathrm{AO} a, \mathrm{BO} b\), are fuppofed infinitely fmall, their momentums or products, by the infnitely little lines \(\mathrm{H} b, \mathrm{~K} k\), will alfo be infinitely fnall with refpect to \(\mathrm{AEB} \times g \mathrm{O}\); which therefore being rejected, the former equation becomes \(\mathrm{AEB} \times \gamma q\) \(=\mathrm{AEB} \times g \mathrm{O}\), and hence \(\gamma q=g \mathrm{O}\). Whence the centres of gravity \(2, g\), being at equal diltances below AB , the infinitely little line \(\gamma g\) is therefore perpendicular to EO. For the fame reafon \(g \nu\), fig. \(5^{2}\). may be confidered as an arch of a circle whofe centre is M .

To determine the value of \(g \gamma\), the momentum of \(a \mathrm{E} b\) with refpect to EO muft be taken, for the fame reafon as before, and put equal to the momentums of the two parts \(\mathrm{AO} a, \operatorname{AE} b\); and we flall then have \(a \mathrm{E} b \times g \gamma\), or \(\mathrm{AEB} \times g^{2}=\mathrm{AEB} \times \mathrm{IL}+\mathrm{AO} a\) \(\times \mathrm{O}\). But fince \(g\) is the common centre of gravity of the two fpaces AE \(b, \mathrm{BO} b\), we fhall have \(\mathrm{AE} b \times\) \(\mathrm{IL}-\mathrm{BO} b \times \mathrm{O} k=\mathrm{O}\), or \(\mathrm{AE} b \times \mathrm{LL}=\mathrm{BO} b \times\) \(\mathrm{O} k\). Hence \(\mathrm{AEB} \times g_{\gamma}=\mathrm{BO} b \times \mathrm{O} k+\mathrm{AO} a \times \mathrm{O} b\) \(={ }_{2} \mathrm{BO} b \times \mathrm{O} k\); becaufe the two triangles \(\mathrm{AO} a\), \(\mathrm{BO} b\) are equal, and that the diftances \(\mathrm{O} k, \mathrm{O} b\), are alfo evidently equal.
Let \(x\) be the thicknefs of the fection reprefented by \(A B C\). Then the momentum of this fection will be \({ }_{2} \mathrm{BO} b \times x \times \mathrm{O}\), which equation will alfo ferve for each particular fection.

Now let \(\int\) reprefent the fum of the mornentums of all the fections. Hence \(f\), AEB \(\times x \times g \gamma=f, 2\). BO \(b \times x \times \mathrm{O} k\). Now the firft member being the fum of the momentums of each fection, in proportion to a plare paffing through the keel, ought therefore to be equal to the fum of all the fections, or to the volume of the immerfed part of the bottom multiplied by the diftance \(g \gamma\). Hence \(V\) reprefenting the volume, we fhall have \(\mathrm{V} \times \mathrm{g} \gamma=\int, 2 \mathrm{BO} 6 \times \infty \mathrm{O} k\).

In order to determine the value of the fecond member of this equation, it may be remarked, that when the

\section*{I L-D I N G.}

Thip is inclined, the original plane of fioatation CBPQ (fig. 54.) becomes \(\mathrm{C} b p \mathrm{Q}\). Now the triangles NI \(n\), BO b, being the fame as thofe in figures 42 . and 53. ; and as each of there triang!es tave one angle equal, they may, upon account of their infinite finallnefs, be confidered as. fimilar ; and hence BOB:NI \(n:\left.\overline{\mathrm{OB}}\right|^{1}\) \(: \overline{\left.\mathrm{F}\right|^{2}}\); whence \(\mathrm{BO} b=\frac{\left.\overline{\mathrm{OB}}\right|^{2}}{\overline{\mid N_{1}^{2}}} \times \mathrm{NI} n\). Moreover, we have (fig. 53.) \(\mathrm{O} k=\frac{2}{3} \mathrm{O}^{12}\), for the points K and \(k\). may be confidered as equiditant from the point \(O\) : whence \(\mathrm{BO} b \times \mathrm{O} k=\frac{\left.\frac{2}{3} \mathrm{OB} \right\rvert\,}{\overline{|N|^{2}}} \times \mathrm{NI} n\).
 equation the value of \(g \gamma\) is obtained.

To find the altitude \(g \mathrm{M}\) (fig. 55.) of the metacenter above the centre of gravity of the immerfed part of the bottom, let the alc NS be defreribed from the centre I with the radius IN; then NI \(n=\frac{\mathrm{IN} \times \mathrm{NS}}{2}\). Now fince the two ftraight lines \(\gamma \mathrm{M}, g \mathrm{M}\) are perpendicular to an and AN refpeelively, the angles M and NI \(n\) are therefore equal : and the infinitely little portion \(g \gamma\), which is perpendicular to \(g \mathrm{M}\), may be confidered as an arch deferibed fiom the centre M. Hence the two fectors NIS, \(g \mathrm{M}_{\gamma}\) are finilar ; and therefore \(g \mathrm{M}: g_{\gamma}:=\) IN : NS. Hence \(N S=\frac{1 N \times g \gamma}{g M}\); and confequently. NI \(n=\frac{\left.\overline{\mathrm{IN}}\right|^{2} \times g_{\gamma}}{g_{\mathrm{M}}}\). Now this being fubftituted in the former equation, and reduced, we have \(\mathrm{V} \times g_{\gamma}=\delta\) \(\frac{\frac{2}{2} \overline{O B}{ }^{3} \times x \times g \gamma}{g} \bar{M}\). But fince \(g M\) and \(g y\) are the fame, whatcver fection may be under confideration, the equation may therefore bs expreffed thus, \(\mathrm{V} \times g_{\gamma}=\) \(\frac{\frac{2}{3} g^{\gamma}}{\frac{3}{\mathrm{M}}} \cdot \delta, \overline{\mathrm{OB}}^{3} \times x\). Hence \(g \mathrm{M}=\frac{\frac{2}{\int} \int \frac{\overline{Q B}^{3}}{} \times x}{\overline{\mathrm{~V}}}\). Let \(y=\mathrm{OB}\), and the equation becomes \(g \mathrm{M}=\) \(\frac{\frac{2}{3} \int, y^{3} x}{\mathrm{~V}}\). Whence to have the altitude of the metacenter above the centre of gravity of the immerfed part of the bottom, the length of the fection at the waterline muff be divided by lines perpendicular to the middle line of this fection into a great number of equal parts. fo that the portion of the curve contained between any two adjacent perpendiculars may be confidered as a ftraight line. Then the fum of the cubes of the half perpendiculars or ordinates is to be multiplied by the diftance bet ween the perpendiculars, and two thirds of the product is to be divided by the volume of the immerled part of the bottom of the flip.

It is hence evident, that while the feetor at the water line is the fame, and the volume of the immerfed part of the bottom remains alio the fame, the atritude of the metacenter will remain the fame, whatever may be the figure of the bottom.

\section*{Chap. IV. Of the Centre of Gravity of the immerfed Part of the Bottom of a Jhip.}

The centre of gravity* of a fhip, fuppofed homo-* See geneous, and in an upright poiftion in the water, is in a \({ }^{\text {ccamic }}\)
e of vertical fection pafing through the keel, and dividing the fhip into two equal and fimilar parts, at a certain diftance from the ftern, and altitude above the heel.

In order to determine the centre of gravity of the immerfed part of a thip's bottom, we mult begin with deternining the centre of gravity of a fection of the hip parallel to the keel, as ANIDFPB (fig. 56.), bounded by the paralle lines \(\mathrm{AB}, \mathrm{DF}\), and by the equal and fi milar curves AND, BPF.

If the equation of this curve were known, its centre of gravity would be eafily found: but as this is not the cafe, let therefore the line CE be drawn through the middle \(\mathrm{C}, \mathrm{E}\), of the lines \(\mathrm{AB}, \mathrm{DF}\), and let this line CE be divided into fo great a number of equal parts by the perpendiculars \(T H, K M, \& c\). that the arches of the curves contained between the extremities of any two adjacent perpendiculars may be confidered as ftraight lines. The momentums of the trapeziums DTHF, TKMH, \&c. relative to the point E, are then to be found, and the fum of thefe momentums is to be divided by the fum of the trapeziums, that is, by the furface ANIDFPB.

The diftance of the centre of gravity of the trapezium THFD from the point \(E\) is \(=\frac{1}{\frac{1}{1}} \frac{\mathrm{IE} \times(\mathrm{DF}+\mathrm{THH})}{\mathrm{DF+TH} \ddagger}\) , For the fame reafon, and becaufe of the equality of the lines IE, IL, the diftance of the centre of gravity of the trapezium TKMH from the fame point E will be \(\frac{\frac{1}{3} \mathrm{IE} \times(\mathrm{TH}+2 \mathrm{KM})}{\mathrm{TH}+\mathrm{KM}}+\mathrm{IE}\), or \(=\frac{\frac{1}{2} \mathrm{IE} \times(4 \mathrm{TH}+5 \mathrm{KM})}{\mathrm{TH}+\mathrm{KM}}\). In like manner, the diftance of the centre of gravity of the trapezium NKMP from the point E will be \(\frac{\frac{1}{i} \mathrm{IE} \times(\mathrm{KM}+2 \mathrm{NP})}{\mathrm{KM}+\mathrm{NP}}+2 \mathrm{IE}\), or \(\frac{1 \mathrm{IE} \times(7 \mathrm{KM}+8 \mathrm{NP})}{\mathrm{KM}+\mathrm{NP}}\), \&c.

Now, if each diftance be multiplied by the furface of the correfponding trapezium, that is, by the product of half the fum of the two oppofite fides of the trapezium into the common altitude IE, we fhall have the momentumsof thefe trapeziums, namely, \(\frac{\frac{\pi}{6}}{\overline{\mathrm{IE}}}{ }^{2} \times(\mathrm{BF}+2 \mathrm{TH})\), \(\left.\frac{1}{6} \overline{\mathrm{IE}}\right|^{2} \times(4 \Gamma \mathrm{H}+5 \mathrm{KM}) \frac{1}{6} \overline{\mathrm{TE}} \times(7 \mathrm{KM}+8 \mathrm{NP})\), \&c. Hence the fum of thefe momentums will be \(\frac{3}{6}\) \(\overline{\left.\mathrm{I} E\right|^{2}} \times(\mathrm{DF}+6 \mathrm{TH}+12 \mathrm{KM}+18 \mathrm{NP}+24 \mathrm{QS}+14\) AB ). Whence it may be remarked, that if the line CE be divided into a great number of equal parts, the factor or coefficient of the laft term, which is here 14, will be \(=2+3(n-2)\) or \(3 n-4, n\) being the number of perpendiculars. Thus the general expreffion of the fum of the momenturns is reduced to \(\left.\overline{\mathrm{IE}}\right|^{2} \times\left(\frac{1}{6} \mathrm{DF}\right.\) i\(\mathrm{TH}+2 \mathrm{KM}+{ }_{3} \mathrm{NP}+4 \mathrm{QS}+, 8 \mathrm{cc} .-+\frac{3 n-4}{6}\) \(\times A B\) ).

The area of the figure \(A N D F P B\) is equal to \(\mathrm{IE} \times\left(\frac{1}{2} \mathrm{DF}+\mathrm{TH}+\mathrm{KM}+\mathrm{NP}+, \& c . \ldots+\frac{\pi}{2}\right.\) \(A B)\); hence the diftance EG of the centre of gravity G from one of the extreme ordinates DF is equal to \(\mathrm{IE} \times\left(\frac{1}{6} \mathrm{DF}+\mathrm{TH}+2 \mathrm{KM}+3 \mathrm{NP}+, \& \mathrm{c} \cdot+\frac{3^{n-4}}{6} \times \mathrm{AB}\right)\) : centre of gravity \(G\) from one of the extreme ordinates DF. To the fixth of the firft ordinate add the fixth of the laft ordinate multiplied by three times the num-
ber of ordinates mimus four ; then the fecond ordinate, twice the third, three times the fourth, \&c. the fum will be a firt term. Then to half the fum of the extreme ordinates add all the intermediate ones, and thefum will be a fecond term. Now the firlt terin divided by the fecond, and the quotient multiplied by the interval between two adjacent perpendiculars, will be the dittance fought.
Thus, let there be feven perpendiculars, whofe values are \(18,23,28,30,30,21,0\), feet refpectively, and the common interval between thefe perpendiculars. 20 feet. Now the fixth of the firlt term 18 is 3 ; and as the laft term is \(c\), there tore to 3 add 23 , twice 28 . or 56 , thrice 30 or 90 , four times 30 or 120 , five times 21 or 105 ; and the fum is 397 . Then to the half of \(18+0\), or 9 , add the intermediate ordinates, and thefum will be 141. Now \(\frac{397 \times 20}{1+1}\), or \(\frac{7940}{141},=59\) feet 4 incles nearly, the difance of the centre of gravity
from the firt ordiuate. from the firlt ordiuate.

Now, when the centre of gravity of any fection is. determined, it is eafy from thence to find the centre of gravity of the folid, and confequently that of the bot-
tom of a flip. tom of a fhip.
The next ttep is to find the height of the centre of gravity of the bottom above the kecl. For this pur-the centrepofe the bottom mult be inagined to be divided into of gravity fections by planes parallel to the keel or water-line, keel. (figs. 5.7, 58.) Then the folidity of each portion contained between two parallel planes will be equal to half the fum of the two oppofed furfaces multiplied ly the diffance between them; and its centre ot gravity will be at the fame altitude as that of the trapezium abc \(d_{\text {s }}\). (fit. 58.), which is. in the vertical fection paffing through the keel. It is hence obvious, that the fame rule as before is to be applied to find the altitude of the centre of gravity, with this difference only, that the word perpendicular or ordirate is to be changed into fection. Hence the rule is, to the fixth part of the loweft fection add the product of the fixth part of the uppermolt fection by three times the number of fections. minus four; the fecond fection in afcending twice the third, three times the fourth, \&c. the fum will be: a firft term. To half the fum of upper and lower fections add the intermediate ones, the fum will be a fecond term. Divide the firlt term. by the fecond, and; the quotient multiplied by the diftance between the fections will give the altitude of the centre of gravity
above the keel. above the keel.

With regard to the centre of gravity of a fhip, whether it is confidered as loaded or light, the operation becomes more difficult. The momentum of every different part of the fhip and cargo muft be found feparately with refpect to a horizontal and alfo a vertical plane. Now the fums of thefe two monentums being. divided by the weight of the fhip, will give the altitude of the centre of gravity, and its diflance from the vertical plane; and as this centre is in a. vertical plane paffing through the axis of the keel, its place is therefore determined. In the calculation of the nomentums, it mutt be obferved to multiply the weight, and not the magnitude of each piece, by the diftance of its centre of gravity.
A more eafy method of finding the centre of gravity of a fhip is by a mechanical operation, as follows: Conftruct

Centre i,f Cravity.

Gravity.
69 A mechanical method for afiertaining the centre of gravity of a Mhip.
a block of as tight wood as poffible, exactly fimilar to the parts of the propofed draught or hip, by a fale of about one-fourth of an inch to a foot. The block is then to be fufpended by a filk-thread or very fine line, placed in different fituations until it is found to be in a ftate of equilibrium, and the centre of gravity will be pointed out. The block may be proved by faftening the line which fufperids it to any point in the line joining the middles of the ftem and poit, and weights are to be fufpended from the extremities of this middle line at the ftem and poft. If, then, the block be properly conftructed, a plane paffing through the line of fufpenfion, and the other two lines, will alfo pafs through the keel, ftem, and poft. Now, the block being fufpended in this manner from any point in the middle line, a line is to be drawn on the block parallel to the line of fufpenfion, fo that the plane paffing through thefe two lines may be perpendicular to the vertical plane of the thip in the direction of the keel. The line by which the block is fufpended is then to be removed to fome

\section*{I L D I N G.}
other convenient point in the middle line ; and another line is to be drawn on the block parallel to the line fufpending it, as before. Then the point of interlection. of this line with the former will give, the pofition of the centre of gravity on the block, which may now be laid down in the draught.
Chap. V. Application of the preceding Rules to the Determination of the Centre of Gravity and the Height of the Metacenter above the Centre of Gravity of a Ship of 74 Guns.
In fig. 59. are laid down the feveral fections in a horizontal direction, by planes parallel to the keel, and at equal diftances from each other, each diftance being 10 feet oinches 4 parts.
I. Determination of the Centre of Gravity of the upper Ho. rizontal Seaion.
To find the diftance of the centre of gravity of the plane \(8 \mathrm{~g} \circ \mathrm{G}\) from the firft ordinate 8 g .

37.

\section*{Sum}

Then \(\frac{26182.1242}{374 \cdot 2756}=69.95\), the diftance of the centre of gravity of the whole fection from the aft fide of the poft.

\section*{VIII. Determination of the Centre of Gravity of the eighth Plane.}

This plane is equal in length to the feventh horizontal plane, and its breadth is equal to that of the keel. The diftance between the feventh and eighth planes is three feet, but which is here taken equal to 2 feet \(1 \delta^{\frac{3}{2}}\) inches.
Diftance between the aft fide of the polt and the firft ordinate
Fourteen intervals between the fifteen ordi-
nates, each interval being 10.03 feet
Diftance of the laft ordinate from the fore foot
\[
13.5
\]
\[
140.42
\]
2.2

Hence the length of the eighth plane is Which multiplied by the breadth
1. 33
208.

The diftance of its centre of gravity from the aft fide of the peft, being equal to half its length, is
78.06

The centres of gravity of thefe eight : planes being found, the diftance of the centre of gravity of the bottom of the fhip from the aft fide of the poft, and allo its altitude, may from thence be caflly determined.
From the principles already explained, the diftance of the centre of gravity of the bottom from the aft fide of the poft, is equal to the fum of the momentums of an infinite number of horizontal planes, divided by the fum of thefe planes, or, which is the fame, by the folidity of the bottom. As, however, we have no more than eight planes, we muft therefore conceive their momentums as the ordinates of a curve, whofe diftances may be the fame as that of the horizontal planes. Now the fum of thefe ordinates minus half the fum of the extreme ordinates being multiplied by their diftance, gives the furface of the curve ; of which any ordinate whatever reprefents the momenturn of the horizontal plane at the fame altitude as thefe ordinates ; and the whole furface will reprcfent the fum of the momentums of all the horizontal planes.
Hor.Planes. Fact. Products. Momentums. FaCt. Products.
\[
\begin{array}{rlr|rll}
5974.16 & 0 \frac{1}{2} & 2987.08 & 503037.73 & 0 \frac{7}{2} & 251518.86 \\
5592.27 & 1 & 55.92 .27 & 473560.21 & 1 & 47356021 \\
4939.27 & 1 & 4939.27 & 422084.77 & 1 & 422084.77 \\
4169.50 & 1 & 4169.50 & 357735.21 & 1 & 357735.21 \\
3365.42 & 1 & 3355.42 & 288729.20 & 1 & 288729.20 \\
2366.46 & 1 & 2366.46 & 199022.48 & 1 & 199022.48 \\
3.4 .27 & 1 & 374.27 & 21682.12 & 1 & 21682.12 \\
208.00 & 0 \frac{1}{2} & 104.00 & 16236.48 & 0 \frac{1}{2} & 8118.24 \\
& & - & 23898.27 & & \\
& & & & & 2022451.09
\end{array}
\]

Now \(\frac{2022451.09}{23898.27}=84.63\), the diftance of the
of centre of gravity of the bottom of the fhip from the aft fide of the poft.

The height of the centre of gravity of the bottom above the lower edre of the keel may ke determined by the fame principles. Thus,

To one fixth of the lowermoft horizontal fection add the product of one fixth of the uppermoft fection by, three times the number of fections minus four the fecond fection in afcending, twice the third, three tiines the fourth, \&c. ; and to half the fum of the extreme planes add all the intermediate ones.. Now the firtt of thefe furns, multiplied by the diftance between the planes or fections, and divided by the fecond fum, gives the altitade of the centre of gravity of the bottom of the Ihip above the lower edge of the keel as required.
\begin{tabular}{|c|c|c|c|c|}
\hline \multirow[t]{2}{*}{Hor. Planes. 208.00} & \multirow[t]{2}{*}{1 ft Fact. \(0 \%\).} & \multicolumn{3}{|l|}{Ift Producis, 21 Fact. 2 d Producta.} \\
\hline & & 34.67 & \(0 \frac{1}{5}\) & 104.00 \\
\hline \(374.27^{\text {* }}\) & 1 & 374.27 & 1 & 374.27 \\
\hline 2366.46 & 2 - & 4732.92 & 1 & 2366.46 \\
\hline 3365.42 & 3 & 10096.26 & I & 3365.42 \\

\hline 493.9.27 & 5 & 24696.35 & I & 4939.27 \\
\hline 5592.27 & & 33553.62 & 1 & 5592.27 \\
\hline \multicolumn{5}{|l|}{\(5974 \cdot 16((3 \times 8)-4) \times \frac{8}{8}\)} \\
\hline & & 110079.96 & & 23888.27 \\
\hline
\end{tabular}

Now \(\frac{110079.96}{23898.27} \times 2.95=13.588\), the height of the centre of gravity of the bottom of the fhip above the lower edge of the keel.

We have now found the diftance of the centre of gravity of the bottom of the fhip from the aft fide of the poft, and its altitude above the lower edge of the keel. Hence the fhip being fuppofed in an upright pofition, this centre of gravity will neceffarily be in the vertical longitudinal fection which divides the thip into two equal and fimilar parts; the polition of this centre is therefore determined.

It now remains to find the height of the metacenter above the centre of gravity; the expreffion for this al.
titude, as found in Chap. III. is \(\frac{\frac{2}{3} \int y^{3} x}{V}\); which we fhall he now apply to determine the metacenter of the fhip of of 74 guns, whofe centre of gravity we have already found.

\section*{A P PENDIX.}

WHEN a fhip is built, fhe muft be fitted with mafts, yards, fails, ropes, and blocks, or, in other words, the mult be rigyed before fhe can go to fea. To complete this article, it may therefore be thought neceffary to treat of the art of rigging veffels; but we have elfewhere (fee Mast-Rigging, Rope-Making, and SAIL) fhown how the feveral parts of a fhip's rigying are made; and the art of putting them properly together, fo as to make the fhip beft anfwer the purpofe for which fhe is intended, depends upon a juft knowledge of the impulfe and refflance of fluids, and of the theory and practice of feamanhip. (See Resistance of Fluids and Seamanship). Nothing, therefore, of the fubject is left to us kere, except we were to ftate in few words the progreffive method of rigging fhips ; but there is no one undeviating mode which is purfued, as the nature of the operation is fuch that all the parts of it may be advancing at the fane time. We fhall therefore take our leave of Biots and flip-building with a few general obfervations on fail-making, which were omitted under the article SAll, referring our readers for farther information to the very elegant work lately publifhed, in

Appendix. two volumes 4 to, on the Elements and Pralice of Rigging and Seaman乃bip.

Sails are made of canvas, of different textures, and are extended on or between the ,matts, to receive the wind that forces the veffel througl the water. They are quadrilateral or triangular, as has been elfewhere deferibed, and are cut out of the canvas cloth by cloth. The width is governed by the length .of the yard, gaff, boom, or flay; the deptb by the height of the maft. In the valuable work to which we have juft referred, the following directions are given for cutting fails, "The width and depth being given, find the number of cloths the width requires, allowing for feams, tabling on the leeches, and flack cloth; and, in the depth, allow for tabling on the head and foot. For fails cut fquare on the head and foot, with gores only on the leeches, as forme topfails, \&c. the cloths on the head, between the leeches, are cut fquare to the depth; and the gores on the leeches are found by dividing the depth of the fail by the number of cloths gored, which gives the length of each gore. The gore is fet down from a fquare with the oppofite felvage; and the canvas being cut diagonally, the longet gored fide of one cloth makes the fhortef fide of the next ; confequently, the firft gore being known, the reft are cut by it. In the leeclies of topfails cut hollow, the upper gores are longer thar the lower ones ; and in fails cut with a roach leech, the lower gores are longer than the upper ones. This muft be regulated by judgment, and care taken that the whole of the gores do not exceed the depth of the leech. Or, by drawing on paper the gored fide of the fail, and delineating the breadth of every cloth by a convenient fcale of equal parts of an inch to a foot, the length of every gore may be found with precifion. Sails, gored with a fiweep on the head or the foot, or on both, have the depth of their gores marked on the felvage, from the fquare of the given depth on each cloth, and are cut as above; the longeft felvage of one ferving to meafure the fhortef felvage of the next, beginning with the firft gored cloth next the middle in fome fails, and the firt cloth next the maft leech in others. For thofe gores that are irregular no ftrít rule can be given; they can only be determined by the judgement of the fail-maker, or by a drawing.

\section*{Elements} and P'ractice quarters of a yard hollow in the foot; but, in the merof Bigging chant fervice, top and topgallant fails are cut with more and Sa- or lefs hollow in the foot. Flying jibs are cut with a manjbip, vol.i. p. gr. roach-curve on the flay, and a three-inch gore in each cloth, fhortening from the tack to the clue. Lower fudding-fails are cut with fquare leeches, and topmaft and topgallant-maft fudding fails with goring leeches.
"The length of reef and middle bands is governed by the width of the fail at their refpective places; the leechlinings, buntline-cloths, top-linings, matt-cloths, and cor-nier-pieces, are cut agreeably to the depth of the fail ; each cloth and every article fhould be properly marked with charcoal, to prevent confufion or miftake. Sails that have bonnets are cut out the whole depth of the fail and bonnet included, allowing enough fer the tablings on the foot of the fail and head and foot of the

I L D I N G.
honnet. The bonnet is cut off after the fail is fewed Apy together. If a drabler is required, it is allowed for in the cutting out the fame as the bonnet."

When the cloth is thus properly cut, the different pieces are to be joined together in the form of a fail ; and for doing this properly we have the following directions in the work already quoted. "Sails have a double flat feam, and fhould be fewed with the befl Eng-lifh-made twine of three threads, fpun 360 fathoms to the pound, and have from one hundred and eight to one hundred and fixteen flitches in every yard in length. The twine for large fails, in the royal navy, is waxed by hand, with genuine bees-wax, mixed with one-fixth part of clear turpentine; and, for fmall fails, in a mixture made with bees wax, 4 lb ; hogs lard 5 lb ; and clear turpentine Ilb . In the merchant fervice, the twine is dipped in \(\operatorname{tar}(\mathrm{L})\), foftened with a proper proportion of oil.
"It is the erroneous practice of fome failmakers not to few the fedms any farther than where the edge is creafed down for the tabling; but all fails fhould be fewed quite home to the end, and, when finifhed, fhould be well rubbed down with a rubber. In the merchant fervice feams are fometimes made broader at the foot than at the head, being flroriger. Broad feams are not allowed to be made on courfes, in the royal navy, but goring leeches are adopted in lieu of them. Boommainfails and the fails of floops generally have the feams broader at the foot than at the head. The feams of courfes and topfails are fluck or ftitched up, in the middle of the feams, along the whole length, with double feaming-twine; and have from 68 to 72 ftitches in a yard. In the merchant fervice it is common to ftick the feams with two rows of fitches, when the fail is half worn, as they will then laft till the fail is worn out.
"The breadth of the feams of courfes, topfails, and other fails, in the royal navy, to be as follow, viz. courfes and topfails, for 50 gun hhips and upwards, one inch and a half, and, for 44 gun fhips and under, one inch and a quarter, at head and foot; all other fails, one inch at head and foot.
"The tablings of all fails are to be of a proportion. able breadth to the fize of the fail, and fewed at the edge, with 68 to 72 flitches in a yard. Thofe for the heads of main and fore courfes to be four to fix inches wide ; for fprit courfes and mizens, drivers, and other boom fails, 3 to 4 inches wide; for topfails, 3 inches to 4 inches and 2 half; topgallant. and frit topfails, 3 inches; royal fails, 2 inches and a half; jib and other ftayfails, 3 inches to 4 inches and a half, on the flay or hoift ; and for fudding fails, 3 inches to 4 inches on the head. Tablings on the foot and leeches of main and fore courfes to be 3 inches to 5 inches broad; fprit courfe and topfails, 3 inches; topgallant and fprit topfails, 2 inches and a half; royals, 2 inches; fore leeches of mizen, driver, and other boomfails, 3 inches and a half to 4 inches; after leech, 3 inches; and on the foot 2 or 3 inches. Tablings on the after leech of jibs and other flayfails to be from 2 to 3 inches broad; and, on the foot, 2 to 2 inches and a half: on fudding fail leeches one inch and a half to two inches and a half; and on the foot, from one to two inches.
" Main
(L) The dipping of the twine in tar, we are perfuaded, is a very bad practice, for the reafon affigned in Rope= Maкing. See that article, \(\mathrm{n}^{\circ}{ }^{\circ} 2\).

\section*{S HI PB U}
"Main and fore courses are lined on the leeches, from clue to earing, with one cloth feamed on and tuck or ftitched in the middle, and have a middle band half way between the lower reef band and the foot, alfo four buntline cloths, at equal diftances between the leeches, the upper end of which are carried under the middle band, that the lower fide of the band may be tabled up. on or fewed over the end of the buntline pieces. They have likewife two reef bands; each in breadth one third of the breadth of the canvas; the upper one is one fixth of the depth of the fail from the head, and the lower band is at the fame diftance from the upper one; the ends go four inches under the leech linings, which are famed over the reef bands. All linings are feamed on, and are fuck with 68 to 72 fitches in a yard.
" Main, fore, and mizen, topfails have leech linings, mat and top linings, buntline cloths, middle bands and reef bands. The leech linings are made of one breadth of cloth, fo cut and fewed as to be half a cloth broad at the head, and a cloth and a half broad at the foot; the piece cut out being half the breadth of the cloth at one end, and tapering to a point at the othere. The middle bands are put on half way between the lower reef and foot, the buntline cloths join the top-linings, and the buntline cloths and top-linings are carried up to the lower fide of the middle band, which is tabled on them. The malt lining is of two cloths, and extends from the foot of the fail to the lower reef, to receive the beat or chafe of the mat. The middle band is made of one breadth of canvas, of the fame number as the top-lining. It is firft folded and rubbed down, to make a creafe at one third of the breadth; then tabled on the felvage, and fuck along the creafe ; then turned down, and tabled and fuck through both the double and fingle parts, with 68 to 72 flitches in a yard. It is the opinion of many, that middle bands should not be put on until the fail is half worn.
" Main and fore topfails have three and fometimes four reef bands from leech to leech, over the leach linings; the upper one is one eighth of the depth of the fail from the head, and they are the fame diftance afunder in the royal navy, but more in the merchant fervice. The reef bands are each of half a breadth of canvas put on double ; the firtt;fide is fuck twice, and the lat turned over, fo that the reef holes may be worked upon the double part of the band, which is alfo stuck with 68 to 72 fitches in a yard.
"The top-lining of top arils is of canvas \(n^{\circ} 6\) or 7 . The other linings of this, and all the linings of other fails, fhould be of the fame quality as the fails to which they belong.
"Top .linings and mat cloths are put on the aft fine, and all ocher linings on the fore fides, of fails. Mizens are lined with one breadth of cloth from the clue five yards up the leech, and have a reef band fewed on, in the fame manner as on other fails, at one fifth the depth of the fail from the foot; they have alfo a nock-piece and a peek-piece, one cut out of the other, fo that each contains one yard. Mize topsails of 50 gun hips and upwards have three reefs, the upper one is one eighth of the depth of the fail from the head, and the reefs are at the fame diftance afunder. Dizen topsails of hips of 44 guns and under have two recfs one feventh part of the depth of the fail afunder, the upper one being at the fame diftance from the head. Main and main top

Vow XVII. Part II.
ftudding fails have each one reef, at one eighth of the Appendix. depth of the fail from the head. Reef bands fhould not be put on until the fail is rewed up, a contrary practice being very erroneous. Lower ftayfails, fore top and main top ftayfails, and flying jibs, have clue-pieces two yards long. Square tack ftayfails have half a breadth of cloth at the fore part, with a clue-piece containing two yards, and a peek-piece, containing one yard.
"Sails have two holes in each cloth, at the heads and reefs of courfes, topfails, and other fquare fails; one hole in every yard in the flay of flying jibs, and one in every three quarters of a yard in the flays of fquare tack and other ftayfails. There are made by an inftrument called a pegging awl, or a ftabber, and are fenced round by ftitching the edge to a fall grommet, made with log or other line ; when finifhed, they should be well stretched or rounded up by a pricker or a marline-fpike. Reef and head holes of large fails have grommets of twelve-thread line, worked round with 18 to 21 fitch. es; faller fails have grommets of nine-thread line, with 16 to 18 flitches, or as many as Shall cover the line, and faller holes in proportion. The holes for marling the clues of fails and the top-brims of topsails have grommets of log-line, and fhould have from 9 to 1 If titches; twelve holes are worked in each cloth. Main courfes have marring holes from the clue to the lower bow line cringle up the leech, and from the clue to the firlt buntline cringle on the foot. Fore courfes have marling holes one eighth of the depth of the fail up the leech, and from the clue to the frt buntline cringle at the foot. Main and fore topfails have marling holes three feet each way from the clue and at the top-brims. Spritfails, mizen topfails, lower ftayfails, main and fore top ftayfails, and jibs, have marring holes two feet each way from the clues. All other fails are fewed home to the clues. Marling holes of courfes are at three fourths of the depth of the tabling at the clues from the rope, and thole of ropfails are at half the depth of the tablings at the clues and top brim from the rope."

The rope, which is Sewed on the edges of fails to prevent their rending, and which is called bolt-rope, Should be well made of fine yarn, faun from the belt Riga rhine hemp well topt, and fewer on with good Englifh-made twine of three threads, fun 200 fathom to the pound ; the twine in the royal navy is dipped in a compofition made with bees-wax, 4 lbs; hoys lard 5 lbs ; and clear turpentine one pound; and in the merchant fervice, in tar foftened with oil. They fhould be ftoved in a flove by the heat of a flue, and not in a baker's oven or a fave tub; and tarred in the bet Stockholm tar. The flexibility of them fhould be always confidered, in taking in the flack, which mud reft on the judgment of the failmaker.
" Bolt-ropes of courfes, top fails, and all other fails, should be neatly fewed on through every buntline of the rope; and, to avoid stretching, the rope mut be kept tightly twitted while fewing on, and care taken that neither too much nor too little flack is taken in ; they are to be crofs-fitched at the leeches every twelve inches in length; at every fam, and in the middle of every cloth at the foot, with three crofs-fitches: four crofs-ftitches fhould be taken at all beginnings and fartenings off; the frt fitch given twice, and the lat three times. Small fails have two crofs flitches at every fear, and three at every fattening off.

\section*{S H I P-B U}
"On main and fore courfes two iuches flack cloth fhould be allowed in the head and foot, and one inch and a half in the leeches, in every yard in length. Topfails are allowed 3 inches flack in every cloth in the foot, one inch and a half in every. yard in the leech, and two inches in every cloth left open in the top-brim. Mizen courfes . have two incles flack in every yard in the foremoft leech, but none in the after leech or foot. Spritfail courfes have no flack cloth. Jibs have four inches flack in every yard in the flay, one irch in every cloth in the foot, and none in the leech. Stay Fails have three inches flack in every yard in the flay, one inch in

\section*{I L D I N G.}
every cloth in the foot, but none in the leech. Topgallant fails have two inches flack in every cloth in the foot, and one inch in every yard in the leech. Studding fails have an inch and a half flack in every yard in gosing leeches, but no flack in fquare leeches, and one inch in every cloth in the head and foot."
Thefe directions for failmaking, we truft may be ufeful. They are indeed very general, but the limits prefcribed us will not permit of a more minute detail. 'The failmaker will find every infruction that he can want in the Elements of Rigying and Seamanßip, a work whick we thersfore recommend to his attention.

\section*{S H I}

Ship.
\(S_{\text {HIP's }}\) Form Gauge, an inftrument recommended by Mr Hutchinfon as fit to afcertain any alteration in the bottom of a fhip, by its hogging or fagging; and alfo to regulate the ftowage of a fhip.
"All fhips (fays he) of any confequence are built with ftaunchions fixed from the kelfon to the middle of all the lower-deck beams fore and aft, in order to fupport them in their exact, regular height, as well as the whole frame of the fhip in the regular form in which fhe was built upon the ftocks; yet notwithftanding thefe ftaunchions, it is proved from experience that our fhips bottoms, hitherto, by the preffure of water, and improper ftowage, have generally been hogged upwards, or fagged downwards, and moft about the midfhip frame or main body of the fhip, which is commonly about the fore part of the main hatchway ; which naturally makes it the beft place at which to fix the fhip's form gauge, where either the hogging or fagging of her bottom may be obferved and feen fooneft and beft, to regulate the fowage of heavy materials to the greateft advantage, fo as to keep her bottom nearly in the fame form in which the was built.
"The gauge I recommead is nothing more than a narrow plate of iron divided into inches and quarters like the flide of a carpenter's rule. Let this be fixed to the after fide of the ftaunchion now mentioned, with its upper end projecting two or three inches above the flaunchion; a groove being cut out for it in the after fide of the lower-deck beam, and a mark being made (when the fhip is on the ftocks) at the part of the beam which correfponds to the o on che gauge. When the fhip alters in her fhape, the gauge will nide up and down in this groove, and the quantity of hogging or fagging will be pointed out on the gauge by the mark on the beam. The ftowage may then be fo managed as to bring this mark to coincide again with the 0 , or to approach it as near as wie fee neceffary."

SHIP-Money, was an impofition charged upon the ports, towns, cities, boroughs, and counties of this realm, in the reign of king Charles I. by writs, commonly called /bip-writs, under the great feal of England, in the years 1635 and 1636 , for the providing and furnifhing of certain fhips for the king's fervice, \&c. which was declared to be contrary to the laws and ftatutes of this realm, the petition of right and liberty of the fubject, by ftat. 17 Car. I. c. 14. See Blackfone's Commentaries, vol. iv. p. 30.
SHIp-Shape, according to the fafhion of a fhip, or in the manner of an expert failor; as, ' The maft is not rigged thip fhape; Trim your fails hip-fhape.

\section*{S H I}

Stowing and Trimming of SHIPS, the method of difpofing of the cargo in a proper and judicious manner in the hold of a fhip.

A fhip's failing, fteering, faying, and wearing, and being lively and comparatively eafy at fea in a ftorm, depends greatly on the cargo, ballaft, or other materials, being properly ftowed, according to their weight and bulk, and the proportional dimenfions of the built of the fhip, which may be made too crank or too ftiff to pafs on the ocean with fafety. Thefe things render this branch of knowledge of fuch confequence, that rules for it ought to be endeavoured after, if but to prevent, as much as poffible, the danger of a fhip overfetting at fea, or being fo labourfome as to roll away her mafts, \&c. by being improperly ftowed, which is often the cafe.

When a fhip is new, it is prudent to confult the builder, who may be fuppofed beft acquainted with a fhip of his own planning, and moft likely to judge what her properties will be, to advife how the cargo or materials, according to the nature of them, ought to be difpofed of to advantage, fo as to put her in the beft failing trim; and at every favourable opportunity afterwards it will be proper to endeavour to find out her beft trim by experiment.

Ships muft differ in their form and proportional dimenfions; and to make them anfwer their different purpofes, they will require different management in the ftowage, which ought not to be left to mere chance, or done at randem, as goods or materials happen to come to hand, which is too often the caufe that fuch improper ftowage makes fhips unfit for fea: therefore the ftowage fhould be confidered, planned, and contrived, according to the built and properties of the hip, which if they are not known fhould be inquired after. If the is narrow and high-built in proportion, fo that the will not fhift herfelf without a great weight in the hold, it is a certain fign fuch a fhip will require a great part of heavy goods, ballaft, or materials, laid low in the hold, to make her ftiff enough to bear fufficient fail without being in danger of overfetting. But if a fhip be built broad and low in proportion, fo that fhe is ftiff and will fupport herfelf without any weight in the hold, fuch a fhip will require heavy goods, ballaft, or materials, ftowed higher up, to prevent her from being too ftiff and labourfome at fea, fo as to endanger her mafts being rolled away, and the hull worked loofe and made leaky.

In order to help a fhip's failing, that fhe fhould be lively and eafy in her pitching and afcending motions,

\section*{S H I [ 435 ] S H I}
it thould be contrived by the ftowage, that the principal and weightiett part of the cargo or materials flould lie as near the main body of the fhip, and as far from the extreme ends, fore and aft, as things will admit of. For it fhould be confidered, that the roomy part of our fhips lengthwife forms a fweep or curve near four times as long as they are broad ; therefore thofe roomy parts at and above the water's edge, which are made by a full harping and a broad tranfom to fupport the fhip fteady and keep her from plunging into the fea, and allo by the entrance and run of the fhip having little or no bearing body under for the preffure of the water to fupport them, of courfe fhould not be ftowed with heavy goods or materials, but all the neceffary vacancies, broken ftowage, or light goods, fhould be at thefe extreme ends fore and aft ; and in proportion as they are kept lighter by the flowage, the fhip will be more lively to fall and rife eafy in great feas; and this will contribute greatly to her working and failing, and to prevent her from ftraining and hogging ; for which reafon it is a wrong practice to leave fuch a large vacancy in the main hatchway, as is ufual, to coil and work the cables, which ought to be in the fore or after hatchway, that the principal weight may be more eafily ftowed in the main body of the fhip, above the flattelt and loweft floorings, where the preffure of the water acts the more to fupport it.
Macbine for meafuring a SHIP's Way. We have already defrribed a variety of machines or inftruments which have beea propofed for this purpofe under the article Log. In this place, therefore, we fhall confine ourfelves to the machine invented by Francis Hopkinfon, Efq; Judge of the Admiralty in Pennfylvania. After having fhown the fallacies to which the common log , and alfo that particular kind of inftrument invented by M. Saumarez, are liable, he proceeds to defcribe his own machine as follows:
This machine, in its moft fimple form, is reprefented
circular palate of brafs rivetted to the lower extremity of the rod. E an horizontal arm connected at orte end with the top of the \(\operatorname{rod} A B\) by a moveable joint \(F\), and at the other end with the bottom of the index H, by a like moveable joint \(G\). \(H\) is the index turning on its centre \(I\), and travelling over the graduated arch K ; and L is a ftrong fpring, bearing againft the rod \(A B\), and conftantly counteracting the preffure upon the palate \(D\). The \(\operatorname{rod} A B\) frould be applied clofe to the cut-water or ftem, and fhould be of fuch a length that the palate \(D\) may be no higher above the keel than is neceffary to fecure it from injury when the veffel is arground, or fails in fhoal water. As the bow of the Chip curves inward towards the keel M , the palate D will be thrown to a diftance from the bottom of the veffel, although the perpendicular rod to which it is annexed lies clofe to the bow above; and therefore the palate will be more fairly acted upon. The arm E fhould enter the bow fomewhere near the hawfe hole, and lead to any convenient place in the forecaftle, where a fmooth board or plate may be fixed, having the index \(H\), and graduated arch \(K\), upon it.

It is evident from the figure, that as the fhip is urged forward by the wind, the palate \(D\) will be preff. ed upon by the refifting medium, with a greater or lefs
force, according to the progreffive motion of the fhip; and this will operate upon the levers fo to immediately affect the index, making the leaft increafe or diminution of the flip's way vilible on the graduated arch; the fpring L always counteracting the preffure unon the palate, and bringing back the index, on any relaxation of the force impreffed.

This machine is advantageoufly placed at the bow of the fhip, where the current firt begins, and acts fairly upon the palate, in preference to the ftern, where the tumultuous clofing of the waters caufes a wake, vifible to a great diftance. The palate \(D\) is funk nearly as low as the keel, that it may not be influenced by the heaping up of the water and the dafhing of the waves at and near the water line. The arch K is to afcertain how many knots or miles fhe would rum in one hour at her then rate of failing. But the graduations on this arch muft be unequal ; becaufe the refiftance of the fpring \(L\) will increafe as it becomes more bent, fo that the index will travel over a greater fpace from one to five miles than from five to twelve. Laflly, the palate, rod, fpring, and all the metallic parts of the inftrument, fhould be covered with a ftrong varnifh, to prevent rult from the corrofive quality of the falt water and fea air.
'This machine may be confiderably improved as follows: Let the rod or fpear \(A B\) (fig. 5.) be a round rod of iron or fteel, and inftead of moving on the fulcrum or joint, as at C , let it pafs through and turn freely in a focket, to which focket the moveable joint muft be annexed, as reprefented in fig. 6: The rod muft have a fhoulder to bear on the upper edge of the focket, to prevent its llipping quite down. The rod mutt alfo pafs through a like focket at F, fig. 5. The joint of the lower focket muft be fixed to the bow ot the fhip, and the upper joint or focket muft be connected with the horizontal arm E. On the top of the up. permoft focket let there be a fmall circular plate, bearing the 32 points of the mariner's compals; and let the top of the rod \(A B\) come through the centre of this plate, fo as to carry a fmall index upon it, as is reprefented in fig. 7. This fmall index muft be fixed to the top of the rod on a fquare, fo that by turning the index round the plate, the rod may alfo turn in the fockets, and of courfe carry the palate D round with it; the little index always pointing in a direction with the face of the palate. The fmall compafs plate fhould not be faftened to the top of the focket; but only fitted tightly on, that it may be moveable at pleafure. Suppofe then the intended port to bear S. W. from the place of departure, the palate muft be turned on the foc ket till the fouth-weft point thereon looks directly to the fhip's bow ; fo that the fouth-weft and north-eaf line on the compals plate may be precifely parallel with the thip's keel, and in this pofition the plate mult remain during the whole voyage. Suppofe, then, the fhip to be failing in the direct courfe of her intended voyage, with her bowfprit pointing fouth-weft. Let the little index be brought to the fouch-weit point on the compafs plate, and the palate D will neceffarily prefent its broad face toward the port of deftination ; and this it muft always be made to do, be the fhip's courfe what it may. If, on account of unfavourable winds, the fhip is obliged to deviate from her intended courfe, the little index mult be moved fo many points from the fouth-weft

\section*{SH I [ 436 ] S H I}
sithp. line of the compafs plate as the compafs in the binnaele fhall fhow that die deviates from her true courfe; fo that in whatever direction the fhip flall fail, the palate D will always look full to the fouth-weff point of the horizon, or towards the port of detination, and confequently will prefent only an oblique furface to the refifting mectium, more or lefs oblicque as the fhip deviates more or lefs foom the true courfe of her voyage. As, therefore, the refiftance of the water will operate lef's upon the palate in an oblique than in a direct pofition, in exact proportion to its obliquity, the index H will not fhow how many knots the veffiel runs is her then courfe, but will indicate how many fhe gains in the diret line of her intended voyage - Thus, in fig. g. if the Bhip's courfe lies in the direction of the line \(A B\), but fhe can fail by the wind no nearer than \(A C\); fuppofe, then, her progreflive motion fuch as to perform \(A C\) equal to five knots or miles in an hom, yet the index II will only point to four knots on the graduated arch, becaure fhe gains no more thian at that rate on the true line of her voyage, viz. from \(A\) to B. Thus will the difference between her real motion and that pointed out by the index be always in proportion to her deviation from her intended port, until fhe fails in a line at right angles therewith, as \(A D\); in which cafe the palate would prefent only a thin fharp edge to the refifting medium, the preffure of which fhould not be fufficient to overcome the friction of the machine and the bearing of the fpring L . So that at whatever rate the fhip may fail on that line, yet the index will not be affected, fhowing that fhe gains nothing on her true courfe. In this cafe, and alfo when the veffel is not under way, the action of the fpring I. fhonld caufe the index to point at \(O\), as reprefented by the dotted lines in fig. 5. and 8.

As the truth of this influment muft depend on the equal preffure of the refifting medium upon the palate D, according to the fhip's velocity, and the proportionable action of the fpring \(L\), there fhould be a pin or fcrew at the joints \(C\) and \(F\), fo that the rod may be readily uufhipped and taken in, in order to clean the palate from any foulnefs it may contract, which would greatly increafe its operation on the index H , and thereby render the graduated arch falfe and uncertain.

Futther, the fpring I. may be expofed too much to injury from the falt water, if fixed on the outfide of the ship's bow. To remedy this, it may be brought under cover, by confructing the machine as reprefented by fig. 8. where AB is the rod, C the fulcrum or centre of its inotion, \(D\) the palate, \(E\) the horizontal arm leading through a fmall hole into the forecafle ; M is a ftrong chain faftened at one end to the arm E, and at the other to a rim or barrel on the wheel \(G\), which by means of its teeth gives motion to the femicircle I and index \(H\). The fpring \(L\) is fpiral, and enclofed in a box or barrel, like the main fpring of a watch. A fmall chain is fixed to, and paffing round the barrel, is faftened by the other end to the fuzee W. This fuzee is connected by its teeth with the wheel G, and counteracts the motion of the palate D. N, N, are the two fockets through which the rod \(A B\) paffes, and in which it is turned round by means of the little index R. S is the fmall compafs plate, moveable on the top of the upper focket N . The plate S hath an upright rim round its edge, cut into teeth or notches, fo that when she index \(R\) is a litule raifed up, in order to bring it
round to any intended point, it may fall into one of thefe notches, and be detained there ; otherwife the preffure of the water will force the palate \(D\) from its oblique pofition, and turn the rod and index round to the direction in which the fhip fhall be then failing:Should it be apprehended that the palate \(D\), being placed fo far forward, may affect the fhip's Iteerage, or obftruct her rate of failing, it fhould be confidered that a very fmall plate will be fufficient to work the machine, as one of three or four inches in diameter would pro bably be fufficient, and yet not large enough to have any feufible effect on the helm or fhip's way.
The greateft difficulty, perhaps, will be in graduating the arch K , (if the machine is contructed as in fig. 5.) ; the unequal divifions of which can only be af. certained by actual experiment on board of each thip refpectively, inafmuch as the accuracy of thele graduations will depend on three circumftances, viz. the poff. tion of the fulcrum \(C\) with refpect to the lenşth of the rod, the fize of the palate D , and the frength or bearing of the fpring L. When thefe graduations, however, are once afcertained for the machine on board of any one veffel, they will not want any future alte. rations, provided the palate D be kept clean, and the fpring \(L\) retains its elafticity.

But the unequal divifions of the graduated arch will be unneceffary, if the machine is conttructed as in fig. 8.; for as the chain goes round the barrel \(L\), and then winds through the fpiral channel of the fuzee \(W\), the force of the main fpring muft operate equally, or nearly fos in all pofitions of the index, and confequently the divifions of the arch K may in fuch cafe be equal.

After all, it is not expected that a fhip's. longitude can be determined to a mathematical certainty by this inftrument. The irregular motions and impulfes to which a fhip is continually expofed, make fuch an accuracy unattainable perhaps by any maclinery: But if it flould be found, as we flatter ourfelves it will on fair experiment, that it anfwers the purpofe much better than the common log, it may be confidered as an acquio fition to the art of navigation.

It fhould be obferved, that in afcertaining a fhip's longitudc by a time-picce, this great inconvenience occurs, that a fmall and trifling miltake in the time makes a very great and dangerous error in the diftance ruin : Whereas the errors of this machine will operate no farther than their real amount; which can never be great or dangerous, if corrected by the ufual obfervations made by mariners for correcting the common log.

A like machine, made in its limple form (as at fig. 5.), fo conftructed as to fhip and unfhip, might occafionally. be applied alongfide about midhips, in order to afcertain the leeway; which, if rightly fhown, will give the Thip's precife longitude. As to fea currents, this and all other machines hitherto invented muft be fubject to their influence; and proper allowances muft be made according to the Akill and knowledge of the navigam tor.

Lafly, fome difcretion will be neceffary in taking ob* fervations from the machine to be entered on the log = book: that is, the moft favourable and equitable moment fhould be chofen for the obfervation; not whilft the thip is rapidly defcending the declivity of a wave, or is fuddenly checked by a ftroke of the fea, or is in the very act of plunging. In all cafes, periods may be found in which a thip proceeds with a true average velocity \({ }^{\circ}\)

\section*{S H O \([437\} \quad\) G H O}
velocity ; to difeever whieh, a litule experienee and at = tention will lead the fillful mariner ( \(A\) ).
Shirauz. See Schiras.
SHIRE, is a Saxon word fignifying a divifion ; but a county, comitatus, of the fame import, is plainly derived from coines, " the count of the Franks;" that is, the earl or alderman (as the Saxons called him) of the fhire, to whom the government of it was entrufted. This he efually exercifed by his deputy, till called in Latin vice-comes, and in Englifh the foeriff, lluriceve, or /bire reeve, fignilying the "officer of the fhire ;" upon whom, in procels of time, the civil adminiffration of it totally devolved. In fome counties there is an intermediate divifion between the fhire and the hundred; as lathes in Kent and rapes in Suffex, each of them containing about three or four hundreds apicce. Thefe had formerly their lathe-reeves and rape-rceves, acting in fubordination to the fhire-reeve. Where a county is divided into three of thefe intermediate jurifdictions, they are called trithings, which were anciently governed by a trithing recve. Thefe trichings fill fubfift in the large county of York, where, by an eafy corruption, they are denominated ridings; the north, the eaft, and the welt riding.

SHIRL, or Cockle, in mineralogy. See Cockle.
SHIRT, a loofe garment, commonly of linen, worn next the body.--Some doubt the propriety of changing the linen when a perfon is fick. Clean linen promotes perfpiration; and it may be renewed as often as the patient pleafes, whether the diforder be of the acite or the chronical kind. Except during a crifis in fevers, whilft the patient is in a fweat, a change of linen, if well dried and warmed, may be daily ufed.

Shirts were not worn by Jews, Greeks, or Romans, but their place was fupplied by thin tunica of wool. The want of linen among the ancients made frequent wahhings and ablutions neceffary.

SHiver. See Schistus and Shale.
SHIVERS, in the fea language, names given to the little rollers, or round wheels of pulleys.

SHOAD, among miners, denotes a train of metalline ftones, ferving to direct them in the difcovery of mines.

Shoad-Stones, a term ufed by the miners of Cornwall and other parts of this kingdom, to exprefs fuch loofe maffes of fone as are ufually found about the entrances into mines, fometimes running in a ftraight courle from the load or vein of ore to the furface of the earth.
Thefe are ftones of the common kinds, appearing to have been pieces broken from the ftrata or larger maffes; but they ufually contain mundic, or marcalitic matter, and more or lefs of the ore to be found in the mine. They appear to have been at fome time rolled about in water, their corners being broken off, and their furface fmoothed and rounded.

The antimony mines in Cornwall are always eafily difcovered by the fhoad-fones, thefe ufually lying up to
the furface, or very nearly fos and the matter of the fone being a white fpar, or debafed cryftal, in which the native colour of the ore, which is a mining bluith black, eafily dilcovers itfelf in ftreaks and threads.

Shoad-ftones are of to many kinds, and of fuch van rious appearances, that it is not eafy to defcribe or know them: but the miners, to whom they are of greateft ufe in the tracing or fearching after new mines, diftinguifh them from other ftones by their weight; for if very ponderous, though they look ever fo much like common ftones, there is great reafon to fufpect that they contain fome metal. Another mark of them is their being fpongry and porous; this is a fign of efpecial ufe in the tin countries; for the tin fhoad-fones are often fo porous and fpongy, that they refemble large bodies thoroughly calcined. There are many other appearances of tin hoads, the very hardeft and firmeft ftones often containing this metal.

When the miners, in tracing a fhoad up hill, meet with fuch odd fones and earths that they know not well what to make of them, they have recourle to vanning, that is, they calcine and poweer the fone, clay, or whatever elfe is fuppofed to contain the metal ; and then wafling it in an inftrument, prepared for that purpofe, and called a vanning Jhovel, they find the earthy matter wafhed away, and of the remainder, the ftony or gravelly matter lies behind, and the metalline matter at the point of the fhovel. If the perfon who performs this operation has any judgment, he eafily difcovers not only what the metal is that is contained in the fhoad, but alfo will make a very probable guefs at what quantity the mine is likely to yield of it in proportion to the ore.
SHOAL, in the fea-language, denotes a place where the water is fhallow ; and likewife a great quantity of fifhes, fuch as a /boal of herrings.
SHOCK, in electricity. The effect of the explofion of a charged body, that is, the difcharge of its electricity on any other body, is called the electric Joock.
SHOE, a covering for the foot, ufually of leather.
Shoes, among the Jews, were made of leather, line1, rufh, or wood; thofe of foldiers were fometimes of brafs or iron. They were tied with thongs which paffed under the foles of the feet. To put off their fhoes was an aet of veneration; it was alio a fign of mourning and humiliation : to bear ore's fhoes, or to untie the latchets of them, was confidered as the meaneff fervice.
Among the Greeks fhoes of various kinds were ufed. Sandals were worn by women of ditinction. The Lacedemonians wore red fhoes. The Grecian fhoes generally reached to the middle of the leg. The Romans ufed two kinds of fhoes; the calceus, which covered the whole foot fomewhat like our fhoes, and was tied above with latchets or ftrings ; and the folea or fipper, which covered only the fole of the foot, and was faftened with leathern thongs. The calceus was always worn
along
(A) An ingenious mechanic would probably conftruct this machine to better advantage in many refpects. The author only meant to fuggeft the principle ; experiment alone can point out the beft method of applying it. He is fenfible of at leaft of one deficiency, viz. that the little index R, fig. 4. will not be ftrong enough to retairs the palate D in an oblique pofition when the fhip is failing by the wind; more efpecially as the compats plate S , in whofe notched rim the index \(R\) is to fall, is not fixed to, but only fitted tight on the focket N. Many means, however, might be contrived to remedy this inconveniense.

\section*{S H O}
along with the toga when a perfon went abroad: nlippers were put on during a journey and at feafts, but it was reckoned effeminate to appear in public with them. Black fhoes were worn by the citizens of ordinary rank, and white ones by the women. Red fhoes were fometimes worn by the ladies, and purple ones by the coxcombs of the other fex. Red fhoes were put on by the chief magiftrates of Rome on days of ceremony and triumphs. The fhoes of fenators, patricians, and their children, had a crefcent upon them which ferved for a buckle ; thefe were called calcei lunati. Slaves wore no fhoes; hence they were called cretati from their dufty feet. Phocion alfo and Cato Uticenfis went without thoes. The toes of the Roman fhoes were turned up in the point ; hence they were called calcei rofitati, repandi, \&c.

In the 9 th and 10 th centuries the greateft princes of Europe wore wooden fhoes, or the upper part of leather and the fole of wood. In the reign of William Rufus, a great beau, Robert, furnamed the borned, ufed fhoes with long fharp points, ftuffed with tow, and twifted like a ram's horn. It is faid the clergy, being highly offended, declaimed againtt the long-pointed thoes with great vehemence. The points, however, continued to increafe till, in the reign of Richard II. they were of fo enormous a length that they were tied to the knees with chains fometimes of gold, fometimes of filver. The upper parts of thefe fhoes in Chaucer's time were cut in imitation of a church window. The long-pointed fhoes were called crackowes, and continued in fathion for three centuries in fpite of the bulls of popes, the decrees of councils, and the declamations of the clergy. At length the parliament of Ensland interpoled by an act A. D. 1463 , prohibiting the ufe of fhoes or boots with pikes exceeding two inches in length, and prohibiting all thoemakers from making thoes or boots with longer pikes under fevere penalties. But even this was not fufficient: it was neceffary to denounce the dreadful fentence of excommunication againft all who wore thoes or boots with points longer than two inches. The prefent fafhion of Shoes was introduced in 1633 , but the buckle was not ufed till 10 бо.

In Norway they ufe fhoes of a particular conftruction, confifting of two pieces, and without heels; in which the upper leather fits clofe to the foot, the fole being joined to it by many plaits or folds.

The fhoes or flippers of the Japanefe, as we are informed by Profeffor Thunberg, are made of rice-ftraw woven, but fometimes for people of diftinction of fine nips of ratan. The fhoe confifts of a fole, without upper leather or hind-piece ; forwards it is croffed by a ftrap, of the thicknefs of one's finger, which is lined with linen; from the tip of the fhoe to the ftrap a cyliudrical Itring is carried, which paffes between the great and fecond toe, and keeps the fhoe faft on the foot. As thete fhoes have no hind-piece, they make a noife, when people walk in them like flippers. When the Japanefe travel, their fhoes are furnifhed with three Atrings made of twifted fraw, with which they are tied to the legs and feet, to prevent them from falling off. Some people carry one or more pairs of fhoes with them on their journeys, in order to put on new, when the old ones are worn out. When it rains, or the roads are very dirty, thefe fhoes are foon wetted through, and one
continually fees a great number of worn out fhoes lying on the roads, efpecially near the brooks, where travellers have changed their floes after wafhing their feet. Inftead of thefe, in rainy or dirty weather they wear high wooden clogs, which underneath are hollowed out in the middle, and at top have a band acrofs like a ftirrup, and a ftring for the great toe; fo that they can walk without foiling their feet. Some of them have their, ftraw fhoes faftened to thefe wooden clogs. The Japanefe never enter their houfes with their fhoes on : but leave them in the entry, or place them on the bench near the door, and thus are always barefooted in their houfes, fo as not to dirty their neat mats. During the time that the Dutch live at Japan, when they are fometimes under an obligation of prying vifits at the houfes of the Japanefe, their own rooms at the factory being likewife covered with mats of this kind, they wear, in. ftead of the ufual fhoes, red, green, or black nlippers, which on entering the houfe they pull off: however, they have ftockings on, and fhoes made of cotton ftuff with buckles in them, which fhoes are made at Japan, and can be wafhed whenever they are dirty. Some have them of black fattin, in order to avoid wafhing them.

SHoE of an Anchor, a fmall block of wood, convex on the back, and having a fmall hole, fufficient to contain the point of the anchor fluke, on the forefide. It is ufed to prevent the anchor from tearing or wounding the planks on the thip's bow, when afcending or defcending ; for which purpofe the fhoe flides up and down along the bow between the fluke of the anchor and the planks, as being preffed clofe to the latter by the weight of the former.

To SHOE an Anchor, is to cover the flukes with a broad triangular piece of plank, whole area or fuperficies is much larger than that of the flukes. It is intended to give the anchor a ftronger and furer hold of the bottom in very foft and vozy ground.

\section*{Hor/e-Shoz. Sce Farriery, Sect. 47.}

SHOOTING, in the military art. See Artillery, Gunnery, and Projectiles.

Shooting, in fportfmanfhip, the killing of game by Shootir the gun, with or without the help of dogs.
Under this article we fhall lay down all the rules thip. which are neceffary to be obferved in order to render one accomplifhed and fuccefsful in the art of fhooting.

The firft thing which the fportfman ought to attend Directic to is the choice of his fowling-piece. Conveniency re-for choo quires that the barrel be as light as poffible, at the fame time it ouglit to poffefs that degree of ftrength which will make it not liable to burft. Experience has proved, that a thin and light barrel, which is of equal thicknefs in every part of its circumference, is much lefs liable to burft than one which is confiderably thicker and heavier, but which, from being badly filed or bored, is of unequal ftrength in different places.

It is alfo of importance to determine of what length the barrel ought to be, in order to acquire that range which the fportfman has occafion for. On this fubject we have received the following information from an experienced fportfman. We lave, at different times, compared barrels of all the intermediate lengths between 28 and 40 inches, and of nearly the fame caliber, that is to fay, from 22 to 26 ; and thefe trials were

\section*{S H O \(\quad[439] \quad \mathrm{S}\) H O}
ing. made both by firing the pieces from the fhoulder, and from a firm block, at an equal diffance, and with equal weights of the fame powder and of the fame fhot.

To avoid every poffibility of error, the quires of paper at which we fired were fixed againft planks inthead of being placed againft the wall. From thefe trials frequently repeated, we found that the fhot pierced an equal number of fheets, whether it was fired from a barrel of \(28,3=32,34,36,3^{8}\), or 40 , inches in length. Nay more, we have compared two barrels of the fame caliber, but one of them 33 , and the other 66 inches long, by repeatedly firing them in the fame manner as the others, at different diftances, from 45 to 100 paces, and the refults have always becn the fame, i. e. the barrel of 33 incles drove its fhot through as many fheets of paper as that of 66 did . The conclufion from all this is, that the difference of 10 inches in the length of the barrel, which feems to be more than is ever infifted upon among fportfmen, produces no fenfible difference in the range of the piece ; and therefore, that every one may pleare himfelf in the length of his barrel, without either detriment or advantage to the range.

It may appear as an objection to this, that a duckgun which is five or fix feet long kills at a greater diftance than a fowling-piece ; but this is not owing to its len th, but to its greater weipht and thicknefs, which give it fuch additional ftrength, that the thot may be increafed, and the charge of powder doubled, trebled, and even quadrupled. But a barrel of five or fix feet length would be very inconvenient for fowling. Thofe who confult the appearance of the piece, lightnefs, and the eafe with which it is managed, will find that a barrel from 32 to 38 inches will anfwer bef.
The next thing to be confidered is, of what dimenfions the caliber or bore of a fowling-piece ought to be. This matter has been fubjected to experiment, and it has been found, that a barrel of 22 or 24 , which is the largeft caliber ufually employed in fewling-pieces, throws its fhot as clofely as one of the fmalleft caliber, viz. of 30 or 32 (A).
of the As to the length and form of the fock, it may be laid down as a principle, that a long ftock is preferable to a fhort one, and at the fame time rather more bent than ufual ; for a long flock fits firmer to the fhoulder than a fhort one, and particularly fo when the fhooter is accuftomed to piace his left hand, which principally fupports the piece, near to the entrance of the ramrod into the fock.

It is certain, however, that the fock may be fo formed as to be better fuited to one man than another. For a tall, long-armed man, the flock of a gun fhould be longer than for one of a lefs ftature and fhorter arm. That a ftraight ftock is proper for him who has high fhoulders and a fhort neck; for, if it be much bent, it would be very difficult for him, efpecially in the quick motion required in fhooting at a flying or running object, to place the butt of the gun-ftock firmly to the fhoulder, the upper part alone would in general be fix. ed; which would not only raife the muzzle, and confequently fhoot high, but make the recoil much more fenfibly felt, than if the whole end of the fock were
firmly placed on his foulder. Befides, fuppofing the shooting. Mooter to bring the butt home to his fhoulder, he would -r fcarcely be able to level his piece at the object. On the contrary, a man with low fhoulders, and a long neck, requires a flock much bent; for if it is ftwaight, he will, in the act of lowering his head to that place of the flock at which his cheek fhould reft in taking aim, feel a conftraint whicl he never experiences, when by the effect of the proper degree of bent, the flock lends him fome affiftance, and, as it were, meets his aim half way.

Having now defcribed the fowling-piece which has been found to anfwer beft, it will next be proper to give fome inftructions for the choice of gunpowder, hhot, and wadding.
The various kinds of gunpowder are well known; Bef qunbut, in the opinion of fome experienced fportfmen, powder. Hervey's battle-powder is the bett. Thofe who wilh to examine the ftrength of powder, may determine it by drying fome of it very well, and then trying how many theets of paper it will drive the fhot through, at the diftance of 10 or 12 yards. In this trial we fhould be careful to employ the fame fized fhot in each experiment, the quantity both of the fhot and the powder bein regulated by exact weight ; otherwife we cannot, even in this experiment, arrive to any certainty in comparing the ftrength of different powders, or of the fame powder at different times.

Powder ought to be kept very dry, for every degree To be kept of moifture injures it; and if confiderable, the faltpetre dry. is diffolved, and the intimate combination of the feveral ingredients is entirely deftroyed. It is obferved, that after firing with damp powder the piece becomes very foul, which feems to arife from the diminution of the activity of the fire in the explofion. Flafks of copper or tin are much better for keeping powder in than thofe made of leather, or than fmall cafks. Their necks ought to be fmall and well ftopped with cork.

The patent milled /hot is now very generally ufed, and size of 8 is reckoned fuperior to any other. The fize of the fhot. fhot muft vary according to the particuliar fpecies of game which is the object of the fportfman's purfuit, as well as be adapted to the feafon. In the firft month of partridge fhooting, \(\mathrm{N}^{0} \mathrm{I}\). is moft proper; for fince at this time the birds fpring near at hand, and we feldom fire at more than the diftance of 40 paces, if the fhooter takes his aim but tolerably well, it is almoft impoffible for a bird at this diftance to efcape in the circle which the fhot forms.

As hares fit clofer, and are thinly, covered with fur at this feafon, they may eafily be killed with this fhot at 30 or 35 paces. No I. is equally proper for fhooting fnipes or quails. About the beginning of October, when the partridges are ftronger, \(\mathrm{N}^{\mathrm{N}} 3\). is the mof proper fhot to be ufed. Many fportfmen ufe no other during the whole feafon. The directions which have now been given refer only to the patent fhot.

We fhall now fubjoin a table, which will fhow at one view the number of pellets compofing an ounce weight of.each fort of fhot, the patent and the common, beginning with the fmalleff fize.

Patent
(A) In fpeaking of the fize of the caliber, we mean by 22 or 24 , that fo many balls exaclly fiting it weigh juft one pound; and every caliber is marked in the fame way.

\section*{Shooting.}

9 For a fowling-piece of a common caliber, which is Pf powder from 24 to 30 balls to the pound weight, a dram and and fhot in a quarter, or at moft a dram and a half, of good powthe charge. der'; and an ounce, or an ounce and a quarter of fhot, is fufficient. But when fhot of a larger fize is ufed, fuch as \(\mathrm{N}^{\circ}\) 5. the charge of fhot may be increafed onefourth, for the purpofe of counterbalancing in fome degree what the fize of the fhot lofes in the number of pellets, and alfo to enable it to garnifh the more. For this purpofe the fportfman will find a meafure marked with the proper gauges very convenient to lim. An inftrument of this nature has been made by an ingenious artift of London, E.gg, of the Haymarket.

A confequence of overloading with thot, is the powder has not fufficient ftrength to throw it to its proper ditance; for if the object fired at be diftant, one-half of the pellets compofing the charge, by their too great quantity and weight, will ftrike againt each other, and fall by the way; and thofe which reach the mark will have fmall force, and will produce but little or no ef. fect.

The ufe of the wadding is to carry the fhot in a body to a certain diftance from the muzzle of the piece. It ought to be of foft and pliable materials. The beft kind of wadding, in the opinion of an experienced fowler, is a piece of an old hat ; but this cannot be obrained in fufficient quantity. Next to it nothing is better than foft brown paper, which combines fupplenefs with confiftence, moulds itfelf to the barrel, and never falls to the ground within 12 or 5 paces from the muzzle of the piece. Tow anfwers very well, and cork has been extolled for poffeffing the peculiar virtue of increafing the range and clofenefs of the fhot.
The wadding ought to be quite clofe in the barrel, but not rammed too hard ; for if it be rammed too clofe, or be of a rigid fubifance, the piece will recoil, and the fhot will fpread too much. On the other hand, if the wadding be very loofe, or is compofed of too foft materials, fuch as wool or cotton, the difcharge will not poffefs proper force.
In loading a piece, the powder ought to be fightly rammed down by only preffing the ramrod two or three times on the wadding, and not by drawing up the ramrod and then returning it into the barrel with a jerk of

\section*{440 ]}

\section*{S H O}
the arm feveral times. For when the powder is vio- Shoot lently comprefled, fome of the grains muft be bruifed, \(\sim\) which will prevent the explofion from being quick, and will fpread the fhot too wide. In pourin the powder into the barrel, the meafure ought to be held fo as that the powder may fall moft readily to the bottom. I hat no grains may adhere to the fides of the barrel, the butt-end of the piece may be ftruck agai. it the ground. The fhot ought never to be rammed down with force: it is fufficient to frike the butt-end of the gun againft the ground as before. Then the wadding is to be put down gently. A fportfman ought never to carry his gun under his arm with the muzzle inclined downwards, for this practice loofens the wadding and charge too much.

Inmediately after the piece is fired it ought to be re- Dircctii loaded; for while the barrel is ftill warm, there is no for load danger of any moitture lodging in it to hinder the pow- and firis der from falling to the bottom. As it is found that the coldnefs of the barrel, and perhaps the moifture condenfed in it, diminifhes the force of the powder in the firt fhot ; it is proper to fire off a little powder before the picce is loaded. Some prime before loading, but this is not proper unlefs the touch.hole be very large. After every difcharge the touch-hole ought to be pricked, or a fmall feather may be inferted to clear away any humidity or foulnefs that has been contracted.

The fportfman having loaded his piece, muft next prepare to fire. For this purpofe he ought to place his hand near the entrance of the ramrod, and at the fame time grafp the barrel firmly. The muzzle fhould be a little elevated, for it is more ufual to fhoot low than high. This direction ought particularly to be attended to when the object is a little diftant; becaufe fhot as well as ball only moves a certain diftance point blank, when it begins to defcribe the curve of the parabola.

Practice foon teaches the fportfman the proper di- Diftanic fance at which he flould fhoot. The diftance at which which he ought infallibly to kill any kind of game with pa- fport(m) tent fhot, \(\mathrm{N}^{\circ} 3\). provided the aim be well taken, is from ourhit. 25 to 35 paces for the footed, and from 40 to 45 paces for the winged, game. Beyond this diftance even to 50 or 55 paces, both partridges and hares are fometimes killed ; but in general the hares are only fightly wounded, and carry away the fhot ; and the partridges at that diftance prefent fo fmall a furface, that they frequently efcape untouched between the fpaces of the circle. Yet it does not follow that a partridse may not be killed with \(\mathrm{N}^{\circ} 3\) patent fhot at \(6 \cup\) and even 70 paces diftance, but then thefe fhots are very rare.

In fhooting at a bird flying, or a hare running acrofs, How tu it is neceffary to take aim before the object in propor-aim is t tion to its ditance at the time of firing. If a partridge akenflies acrofs at the diftance of 30 or 35 paces, it will be fufficient to aim at the head, or at molt but a fimall fpace before it. If it be 50,60 , or 70 paces diftant, it is then requifite to aim at leaft half a foot before the head. The fame practice ought to be obferved in fhooting at a hare, rabbit, or fox, when running in a crofs direction; at the fame time making due allowance for
(в) The reader will obferve, that the patent fhot has no \(N^{\circ} 6\). the \(\times\) being fubftituted in its place, and that the numbers do not follow each other in the order of progreffion: the reafon of this we cannot affign.

\section*{S H O}

\section*{[ 441 ] S H O}
gor the diftance and fwiftnefs of the pace. Another thing to be attended to is, that the fhooter ought not involuntarily to ftop the motion of the arms at the moment of pulling the trigger ; for the inftant the hand ftops in order to iire, however inconfiderable the time be, the bird gets beyond the line of aim, and the fhot will mifs it. A fportfman ought therefore to accuftom his hand while he is taking aim to follow the object. When a hare runs in a ftraight line from the fhooter, he thould take his aim between the ears, otherwife he will run the hazard either of miffing, or at leaft not of killing dead, or as it is fometimes called clean.

A fowling-piece fhould not be fired more than 20 or 25 times without being wafhed; a barrel when foul neither fhoots fo ready, nor carries the fhot fo far as when clean. The flint, pan, and hammer, fhould be well wiped after each hot; this contributes greatly to make the piece go off quick, but then it fhould be done with fuch expedition, that the barrel may be reloaded whilft warm, for the reafons we have before advanced. The flint fhould be frequently changed, without waiting until it miffes fire, before a new one is put in. Fifteen or eighteen fhots, therefore, fhould only be fired with the fame flint ; the expence is too trifling to be regarded, and by changing it thus often much vexation will be prevented.

A gun alfo fhould never be fired with the prime of the preceding day ; it may happen that an old priming will fometimes go off well, but it will more frequently contract moitture and fuze in the firing ; then the object will moft probably be miffed, and that becaufe the piece was not frefh primed.

For the information of the young fportfman we 's fhall add a few more general direetions. In warm weather he ought to feek for game in plains and open grounds, and in cold weather he may fearch little hills expofed to the fun, along hedges among heath, in ftubbles, and in paftures where there is much furze and fern. The morning is the beft time of the day, before the dew is exhaled, and before the game has been difturbed. The colour of the thooters drefs ought to be the fame with that of the fields and trees; in fummer it ought to be green, in winter a dark grey. He ought to hunt as much as poffible with the wind, not only to prevent the game from perceiving the approach of him and his dog, but alfo to enable the dog to fcent the game at a greater diftance.

He fhould never be difcouraged from hunting and ranging the fame ground over and over again, efpecially in places covered with heath, brambles, high grafs, or young coppice wood. A hare or rabbit will frequently fuffer him to pafs feveral times within a few yards of its form without getting up. He fhould be ftill more patient when he has marked partridges into fuch places, for it often happens, that after the birds have been fprung many times, they lie fo dead that they will fuffer him almoft to tread upon them before they will rife. Pheafants, quails, and woodcocks do the fame.

He ought to look carefully about him, never palfing a bufh or tuft of grafs without examination; but he ought never to ftrike them with the muzzle of his gun for it will loofen his wadding. He who patiently beats and sanges his ground over again, without being difVol. XVII. Part II.
couraged, will always kill the greatef quantity of Shouting. game ; and if he is fhooting in company, he will find game where others liave paffed without difcovering any.

When he has fired he fhould call in his dog, that he may not have the mortification to fee game rife which he cannot fhoot. When he has killed a bird, inftead of being anxious about picking it up, he ought to fol. low the reft of the covey with liis eye till he fee them fettle.

Three fpecies of dogs are capable of receiving the Dogs fit proper inftruction, and of being trained. Thefe are for fyort. the fmooth pointer, the fpaniel, and the rough pointer. The laft is a dog with long curled lair, and feems to be a mixed breed of the water.dog and the fpaniel. The fmooth pointer is active and lively enough in his range, but in general is proper only for an open country.
'The greateft part of thefe dogs are afraid of water, brambles, and thickets; but the fpanitl and the rough pointer are eafily taught to take the water, even in cold weather, and to range the woods and rough places as well as the plain. Greater dependence may therefore be had on thefe two laft fpecies of dogs than on the fmooth pointer.
The education of a pointer may commence when he Directions is only five or fix months old. The ouly lefons which for training he can be taught at this time are to fetch and carry any \({ }^{\text {a pointer, }}\) thing when defired; to come in when he runs far off, and to go behind when he returns; ufing, in the one cafe, the words bere, come in, and in the other back or bebind. It is alfo neceffary at this period to accuftom him to be tied up in the kennel or ftable; but he ought not at firft to be tied too long. He fhould be let loofe in the morning, and faftened again in the evening. When a dog is not early accuitomed to be chained, he difturbs every perfon in the neighbourhood by howling. It is alfo of importance that the perfon who is to train him fhould give him his food.

When the dog has attained the age of 10 or 12 months, he may be.carried into the field to be regularly trained. At firft he may be allowed to follow his own inclination, and to run after every animal he fees. His indifcriminating eagernefs will foon abate, and he will purfue only partridges and hares. He will foon become tired of following partridges in vain, and will content himfelf after kaving flufhed them to follow them with his eyes. It will be more difficult to prevent him from following hares.

All young dogs are apt to rake; that is, to hunt with their nofes clofe to the ground, to follow birds rather by the track than by the wind. But partridges lie much better to dogs that wind them, than to thofe that follow them by the track. 'The dog that winds the fcent approaches the birds by degrees and without difturbing them; but they are inmediately alarmed when they fee a dog tracing their footfeps. When you perceive that your dog is committing this fault, call to him in an angry tone bold up: he will then grow unealy and agitated, going firlt to the one fide and then to the other, until the wind brings him the feent of the birds. After finding the game four or five times in this way, he will take the , wind of himfelf, and hunt with his nofe high. If it be difficult to correct this fault, it will be neceffary to put the puzzle peg upon him. This is of very fimple conftruction, confifting

Shoting. only of a piece of oak or deal inch board, one foot in length, and an inch and a half in breadth, tapering a little to one end ; at the broader end are two holes rimning longitudinally, throu rh which the collar of the dog is put, and the whole is buckled romed his neck; the piece of wood being projected bcyond his nofe, is then faftened with a piece of leather thong to his under jaw. By this means the peg advancing feven or eight inches beyond his fnout, the dog is prevented from putting lis nofe to the ground and raking.

As foon as the young doy know's his game you mult bring him under complete fubjection. If he is tractable, this will be cafy; but if he is ftubborn, it will be neceffary to ufe the trafb cord, which is a rope or cord of 20 or 25 fathoms in length faftened to his collar. If he refufe to come back when called upon, you mult check him fmartly with the cord, which will often bring him upon his haunches. But be fure you never call to him except when you are within rcach of the cord. After repeatiug this feveral times he will not fail to come back when called; he ought then to be carefed, and a bit of bread fhould be given him. He ought now conftantly to be tied up, and never unchained, except when you give him his food, and even then only when he has done fomething to deferve it.

The next ftep will be to throw down a piece of bread on the ground, at the fame moment taking hold of the dog by the collar, calling out to lim, "take heed,-foftly." After liaving held him in this manner for fome fpace of time, fay to him, "feize-lay hold." If he is impatient to lay hold of the piece of bread before the fignal is given, correct hiun gently with a fmall whip. Repeat this leffon until he "takes heed" well, and no longer requiles to be held fait to prevent him from laying hold of the bread. When he is well accuftomed to this manége, turn the bread with a ftick, holding it in the manner you do a fowling-piece, and having done fo, cry feize. Never fuffer thic dog to eat either in the honfe or field without having firit made him take heed in this manner.
'Then, in order to apply this leffon to the game, fry fmall pieces of bread in hoors lard, with the dung of partridge; take thefe in a linen bag into the fields, ftubbles, ploughed grounds, and paltures, and there put the pieces in feveral different places, marking the fpots with little cleft pickets of wood, which will be rendered more diftinguifhable by putting pieces of card in the nicks. This being done, caft off the dog and conduct him to thefe places, always hunting in the wind. After he has caught the fceut of the bread, if he approaches 100 near, and feems eager to fall upon it, cry to him in a menacing tone, "take heed," and if he does not ftop immediately, correct him with the whip. He will foon comprehend what is required of him, and will ftand.
At the next leffon, take yourgun charged only with powder, walk gently round the piece of bread once or twice, and fire inftead of crying feize. The next time of practifing this leffon, walk round the bread four or five times, but in a greater circle than before, and continue to do this, until the dog is conquered of his impatience, and will ftand without moving until the fignal is given lim. When he keeps his point well, and ftands fteady in this leffon, you may carry him to the birds; if he runs in upon them, or barks when they foring up, you mult cor-
reet him ; and if he continues to do fo, you muft return Sho to the fried bread; but this is ieldom neceffary.

When the dog has learned by this ufe of the bread to take heed, he may be carried to the fields with the tranh cord dragging on the ground. When he fprings birds for the firt time, if he runs after them or barks, check him by calling out to him, take beed. If he point properly, carefs him; but you ought never to hunt withont the cord until he point famich.

If the dor ruus after fheep, and it be difficult to cure and him, couple him with a ram, and then whip the dog as vent long as you can follow him. His cries will at firt alarm the ram; he will run with all his fpeed, and drag the dog along with him ; but he will at length take courage, turn upon the dog, and butt him feverely with his horns. When you think the dog is fufficiently chaftifed, mutie him: he whever run at fheep aqain.

Having now given a few general inftructions concerning the beft method of training pointers, we fhall fubjoin a few obfervations refpecting the moft common fpecies of game, the partridge, pheafant, groufe, woodcock, fnipe, and wild duck.

Partridges pair in the fpring, and lay their eggs (ge- ohr nerally from 15 to 25) during May and part of June.tion The young begin to fly about the end of June, and their cern plumage is complete it the begiming of Octoher. 'the pa male has a confpicuous horfefhoe upon his breatt, an obtufe fpur on the liinder part of the leg, which diftinguifhes him from the female. He is allo rather larger.

When a fportfinan is fhooting in a country where the birds are thin, and he no longer choofes to range the field for the bare chance of meeting with them, the following method will fhow him where to find them on another day. In the evening, from fun-fet to nightfall, he fhould polt himfelf in a field, at the foot of a tree or a bufh, and there wait until the partridge begin to call or jnck, which they always do at that time; not only for the purpofe of drawing together when feparated, but alfo when the birds compoling the covey are not difperfed. After callug in this manner for fome little fpace of time, the partridges will take to flight; then, if he mark the place where they alight, he imay be affured they will lie there the whole night, unlefs difturbed. Let him return to the fame polt the next mopuing by break of day, and there watch a while; being careful to keep his dog in a ftring, if he is not under perfect command.

As foon as the dawn begins to peep, the partridges will begin to call, and foon afterwards will perform the fame manœuvre as on the preceding evening; that is, after having called a whilc, they will take their flight, and will moft commonly fettle at a little diftance: There in a few minutes they will call again, and fome. times take a fecond flight, but that will be to no great diffance. Then as foon as the fun is rifen, and the fportiman can fee to fhoot, he may caft off his dog and purfue them.

The pheafant is of the fize of a common dunghill 8 cock, and lays its egers generally in the woods, the number of which is 10 or 12

Pheafants are accounted ftupid birds; for when they are furprifed they will frequently fquat down like a rabbit, fuppofing themflves to be in fafety as foon as their
ing. heads are concealed ; and in this way they will fometimes fuffer themfelves to be killed with a fick. 'They love low and moift places, and haunt the edges of thofe pools which are found in woods, as well as the high grafs of marthes that are near at hand; and above all, places where there are clumps of alders.

Groufe, or muir-game, are found in Wales, in the northern counties of England, and in great abuldance in Scotland. They chiefly inhabit thofe mountains and muirs which are covered with heath, and feldom defcend to the low grounds. They fly in companies of four or five braces, and love to frequent moffy places, particularly in the middle of the day or when the weather is warm. In purfuing this game, when the pointer fets, and the fportfman perceives the birds running with their heads erect, he mult run after them as faft as he can, in the hope that he may get near cnough to fhoot when they rife upon the wing; for he may be pretty certain they will not lie well that day. As thefe birds are apt to grow foon putrid, they ought to be drawn carefully the inftant they are fhot and fluffed with any heath, and if the feathers happen to be wetted they mutt be wiped dry.
The woodrock is a bird of paffage; it commonly arrives about the end of October, and remains until the middle of March. Woodcocks are fattelt in December and January, but from the end of Feloruary they are lean. At their arrival they drop anywhere, but afterwards take up their refidence in copfes of nine or ten years growth. They feldom, however, fay in one place longer than 12 or 15 days. During the day they remain in thofe parts of the woods where there are void fpaces or glades, picking up earth-worms and grubs from the fallen leaves. In the evening they go to drink and wath their bills at pools and fprings, after which they repair to the open fields and meadows for the night. It is remarkable, that when a woodcock fprings from a wood to go into the open conntry, he always endeavours to find fome glade or opening, which he follows to the boundaries of the wood. At his return he purfues the fame path a good way, and then turns to the right or left oppofite to fome glade, in order to drop into a thick part of the wood, where he may be fheltered from the wind. He may therefore be watched with advantage in thefe narrow paffes and little alleys on the edges of woods which lead to a peol or fpring, or he may be watched in the dufk of the evening near the pools which he frequents.

The fripe is a bird of paffage as well as the woodcock. This bird is fearcely worth fhooting till the froft commences. In the month of ivovember they begin to grow fat. Snipes, like woodcocks, frequent fprings, bogs, and marfhy places, and generally fly againit the wind. The flant and crofs fhots are rather difficult, as the birds are finall and fly very quickly. The fportfinan ought to look for them in the direction of the wind ; becaufe then they will fly towards him, and prefent a faires mark.
'I'he wild duck is alfo a bird of paffage, and arrives here in great flocks from the northern countries in the beginning of winter. Still, however, a great many remain in our marthes and fens during the whole year, and breed.

The wild duck differs little in plumage from the tame duck, but is eafily diftinguifhed by its fize, which is lefs; by the neck, which is more nender; by the foot,
which is fmaller ; by the mails, which are more black; Shooting and above all, by the web of the foot, which is much finer and fofter to the touch.

In the fummer feafon, when it is known that a team of young ducks are in a particular piece of water, and jult beginning to fly, the fportiman is fure to find them early in the morning dabbling at the edges of the pool, and amongtt the long grafs, and then he may get very near to them: it is ufual alio to find them in thofe places at noon.

In the beginning of autumn almoft every pool is frequented by teams of wild ducks, which remain thete during the day; concealed in the rufhes. If thefe pools are of fmall extent, two fhooters, by going one on each fide, making a noife and throwing ftones into the rufhes, will make them fly up; and they will in this way frequently get fhots, efpecially it the pool is not broad, and contracts at one end. But the fureft and moft fuccefsful way, is to launch a fmall boat or trow on the pool, and to traverfe the rufhes by the openings which are found; at the fame time making as little noife as poffible. In this manner the ducks will fuffer the fportfmen to come finfficiently near them to fhont flying; and it often happens that the ducks, after havin r, flown up, only make a circuit, return in a little time, and again alight upon the pool. Then the fportfmen endeavour a fecond time to come near them. If feveral fhooters are in company, they thould divide, two fhould go in the boat, whilit the others fpread themfelves about the edge of the pool, in order to fhoot the ducks in their flight. In pools which will not admit a trow, water-fpaniels are abfolutely neceffary for this fport.

In winter they may be found on the margins of little pools; and when pools and rivers are frozen up, they mult be watched for in places where there are fprings and waters which do not freeze. The fport is then much more certain, becaufe the ducks are confined to thefe places in order to procure aquatic herbs, which are almott their only food at this period.

SHOP-lifters, are thofe that fteal roods privately out of fhops; which, being to the value of 5 s . though no perfon be in the fhop, is felony without the benetic of clergy by the 10 and is W. III: c. 23.

SHORE, a place wathed by the fea, or by fome large river.

Count Marfigli divides the fea-fhore into three portions: the firlt of which is that track of Land which the fea juft reaches in ftorms and high tides, but which it never covers; the fecond part of the fhore is that which is covered in high tides and florms, but is dry at other times; and the third is the defeent from this, which is always covered with water.

The firft part is only a continuation of the continent, and fuffers no alteration from the neighbourhond of the fea, except that it is rendered fit for the growth of fome plants, and wholly unfit for that of others, by the faline iteams and impregnations : and it is fearce to be conceived by any, but thofe who have obferved it, how far on land the effects of the fea reach, fo as to make the eartl proper for plants which will not grow without this influence; there being feveral plants frequently found on high hills and dry places, at three, four, and more miles trom the fea, which yet would not grow unlefs in the neighbourhood of it, ner will ever be found elfowhere.

\section*{S H O}

Ithe fecond part or portion of the fhore is much more affected by the fea than the former, being frequently wafhed and beaten by it. Its productions are rendered falt by the water, and it is covered with fand, or with the fragments of fhells in form of fand, and in fome places with a tartarous matter depofited from the water; the colour of this whole extent of ground is ufually dufky and dull, efpecially where there are rocks and ftones, and thefe covered with a flimy matter.

The third part of the fhore is more affected by the fea than either of the others; and is covered with an uniform cruft of the true nature of the bottom of the fea, except that plants and animals have their refidence in it, and the decayed parts of thefe alter it a little.

SHORE (Jane), the celebrated concubine of the licentious king Edxard IV. was the wife of Mr Matthew Shore, a goldfmith in Lombard ftreet, London. Kings are feldom unfuccefsful in their amorous purfuits; therefore there was nothing wonderful in Mrs Shore's removing from Lombard-ftreet to fhine at court as the royal favourite. Hiftorians reprefent her as extremely bcautiful, remarkably cheerful, and of moft uncommon generofity. 'The king, it is faid, was no lefs captivated with her temper than with her perfon: fhe never made ufe of her influence over him to the prejudice of any perfon ; and if ever fhe importuned him, it was in favour of the unfortunate. After the death of Edward, fhe attached herfelf to the lord Halings; and when Richard III. cut off that nobleman as an obftacle to his ambitious fchemes, Jane Shore was arrefted as an accomplice, on the ridiculous accufation of witcheraft. This, however, terminated only in a public penance; excepting that Richard rifled her of all her little property: but whatcver feverity might have been exercifed towards her, it appears that fhe was alive, though fufficiently wretched, under the reign of Henry VIII. when Sir Thomas More faw lier poor, old, and fhrivelled, without the leaft trace of her former beauty. Mr Rowe, in his tragedy of Jane Shore, has adopted the popular fory related in the old hiftorical ballad, of her perifhing by hunger in a ditch where Shoreditch now ftands. Ilut Stow affures us that ftreet was fo named before her time.

SHORL. See Schorl.
SHORLING and Morling, are words to diftinguifh fells of fheep; Joorling being the fells after the fleeces are fhorn off the fheep's back; and morling, the fells flead off after they die or are killed. In fome parts of England they underftand by a Borling, a fheep whofe face is fhorn off; and by a morling, a fheep that dies.

SHORT (James), an eminent optician, was born in Edinburgh on the ioth of June, O. S. in the year 1710. At ten years of age, having loft his father and mother, and being left in a ftate of indigence, he was received into Heriot's Hofpital, (fee Edinburgh Public Buildings, \(n^{\circ}\) 16.), where he foon difplayed his mechanical genius in conftructing, for himfelf, little chefts, book. cafes, and other conveniences, with fuch tools as fell in his way. At the age of twelve he was removed from the Hofpital to the High School, where he fhowed a confiderable tafte for claffical literature, and generally kept at the head of his forms. In the year \(\mathbf{1} 726\) he was entered into the univerfity, where he paffed through
the ufual courfe of education, and took his matter's degree with great applaufe.

By his friends he was intended for the church ; but after attending a courfe of theological lectures, his mind revolted from a profeffion which he thought little fuited to his talents ; and he devoted his whole time to mathematical and mechanical purfuits. He had been fortunate enough to have the celebrated M‘Laurin for his preceptor ; who having foon difcovered the bent of his genius, and made a proper eftimate of the extent of his capacity; encouraged him to profecute thofe ftudies is which nature had qualified him to make the greateft figure. Under the eye of that eminent mafter, he began in 1732 to conftruct Gregorian telefcopes; and, as the profeffor obferved in a letter to Dr Jurin, "by taking care of the figure of his fpecula, he was enabled to give them larger apertures, and to carry them to greater perfection, than had ever been done before him." See Optics, \({ }^{9} 97\). )

In the year \({ }^{1} 73^{6} \mathrm{Mr}\) Short was called to London, at the defire of Queen Caroline, to give inftructions in mathematics to William duke of Cumberland; and immediately on his appointment to that very honourable office he was elected a fellow of the royal fociety, and patronifed by the earls of Morton and Macclesfield. In the year 1739 he accompanied the former of thofe noble lords to the Orkney Ifles, where he was employed in adjufting the geography of that part of Scotland: and happy it was for him that he was fo employed, as he might otherwife have been involved in a fcuffle which took place between the retainers of Sir James Stewart of Barra and the attendants of the earl, in which fome of the latter were dangeroully wounded.

Mr Short having returned to London, and finally eftablifhed himfelf there in the line of his profeffion, was in 1743 employed by lord 'Thomas Spencer to make for him a reflector of twelve feet focus, for which he received 600 guineas. He made feveral other telefcopes of the fame focal diftance with greater improvements and higher magnifiers; and in 1752 finifhed one for the king of Spain, for which, with its whole apparatus, he received I 2001 . This was the nobleft inftrument of the kind that had then been conftructed, and perhaps it has never yet been furpaffed except by the aftonifhing reflectors of Herfchel. See Telescope.

Mr Short was wont to vifit the place of his nativity once every two or three years during his refidence irs London, and in 1766 he vifited it for the laft time. On the 15 th of June 1768 he died, after a very fhort ill. nefs, at Newington Butts, near London, of a mortification in his bowels, and was buried on the 22 d of the fame month, having completed, within a few days, his fifty-eighth year. He lett a fortune of about 20,0001 . of which 15,0001 . was bequeathed to two nephews, and the reft in legacies to his friends. In gratitude for the fteady patronege of the earl of Morton, he left to his daughter the Lady Mary Douglas, afterwards countefs of \(A\) boyne, roocl. and the reverfion of his fortune, thould his nephews die without iffue; but this rever. fionary legacy the lady, at the defire of her father, generoufly relinquifhed by a deed in favour of Mr Short's brother Mr 'Thonas Short and his children. Mr Short's eminence as an artit is univerfally known, and we have often heard him fooken of by thofe who had

\section*{S H O \(\left[\begin{array}{lll}445 & 7 & \mathrm{~S}\end{array} \mathrm{H}\right.\) O}
known him from his youth, as a man of virtue and of very amiable manners.

\section*{Short-fiand Writing. See Stenògraphy.}

Short-jointed, in the manege. A horfe is faid to be fhort-jointed that has a fhort paftern ; when this joint, or the paftern is too fhort, the horle is fubject to have his fore lcgs from the knee to the cornet all in a ftraight line. Commonly your fhort-jointed horfes do not ma. nege fo well as the long.jointed; but out of the manege the fhort-jointed are the beft for travel or fatigue.

SHORT-Sightednefs, a certain defect in vifion, by which objects cannot be diftinctly feen unlefs they are very near the eye. See Optics, \(\mathrm{n}^{\circ}{ }^{155}\).

SHORTFORD, q. d. fore-clofe, an ancient cuftom in the city of Exeter, when the lord of the fee cannot be anfwered rent due to him out of his tenement, and no diftrefs can be levied for the fame. The lord is then to come to the tenement, and there take a fone, or fome other dead thing off the tenement, and bring it before the mayor and bailiff, and thus he muft do feven quarter days fucceffively; and if on the feventh quarterday the lord is not fatisfied of his rent and arrears, then the tenement fhall be adjudged to the lord to hold the fame a year and a day; and forthwith proclamation is to be made in the court, that if any man claims any title to the faid tenement, he muft appear within the year and day next following, and fatisfy the lord of the faid rent and arrears: but if no appearance be made, and the rent not paid, the lord comes again to the court, and prays that, according to the cuftom, the faid tenement be adjudged to him in his demefne as of fee, which is done accordingly, fo that the lord hath from thenceforth the faid tenement, with the appurtenances to him and his heirs.

SHOT, a denomination given to all forts of balls for fire-arms; thofe for cannon being of iron, and thofe for guns, pifols, \&c. of lead. See Shоoting.

Cafe SHOT formerly confifted of all kinds of old iron, nails, mufket-balls, ftones, \&c. ufed as above.

Shot of a Cable, on Thip-board, is the fplicing of two cables together, that a fhip may ride fafe in dcep waters and in greatt roads; for a thip will ride eafier by one fhot of a cable, than by three fhort cables out ahead.

Grape Shor. See Grape-Shot.
Patent milled SHot is thus made: Sheets of lad, whofe thicknefs correfponds with the fize of the fhot required, are cut into fmall pieces, or cubes, of the form of a tie. A great quantity of thefe little cubes are put into a large hollow iron cylinder, which is mounted horizontally and turned by a winch; when by their friction againft one another and againft the fides of the cylinder, they are rendered perfectly round and very fmooth. I'he other patent fhot is caft in moules, in the fame way as bullets are.
\(S_{\text {Hot-Flaggon, a fort of flaggon fomewhat bigger than }}\) ordinary, which in fome counties, particularly Derbyfhire, it is the cuftom for the hoft to ferve his gueftsin, after they have drank above a fhilling.

Small \(S_{H O T}\), or that uifd for fowling, fhould be well fized, and of a moderate bignefs : for fhould it be too grcat, then it flies thin, and fcatters too much; or if too fmall, then it hath not weight and ftrength to penetrate far, and the bird is apt to fly away with it. In crder, therefore, to have it fuitable to the occafion, it
not being always to be had in every place fit for the purs pofe, we fhall fet down the true method of making all forts and fizes under the name of mould-ßot. Its principal good properties are to be round and folid.
'rake any quantity of lead you think fit, and melt it down in an iron veffel; and as it melts keep it ftirring. with an iron ladle, Akimming off all impurities whatfoever that may arife at the top: when it begins to look of a greenifh colour, frew on it as much auripigmentum or yellow orpiment, finely powdered, as will lie on a fhilling, to every 12 or 14 pound of lead; then flirring them together, the orpiment will flame.

The ladle fhould have a notch on one fide of the brim, for more eafily pouring out the lead ; the ladle mutt remain in the melted lead, that its leat may be the fame with that of the lead, to prevent inconveniences which otherwife might happen by its being either too hot or too cold : then, to try your lead, drop a little of it into water, and if the drops prove round, then the lead is of a proper heat ; if otherwifc, and the fhot have tails, then add more orpiment to increafe the heat, till it be found fufficient.

Then take a plate of copper, about the bignefs of a trencher, which muft be made with a hollownefs in the middle, about three inches compafs, within which murt be bored about 40 holes according to the fize of the fhot which you intend to caft: the hollow bottom fhould be thin ; but the thicker the brim, the better it will retain the heat. Place this plate on a frame of iron, over a tub or veffel of water, about four inches from the water, and fpread burning coals on the plate, to keep the lcad melted upon it : then take fome lead and pour it. gently on the coals on the plate, and it will make its way through the holes into the water, and form itfelf into fhot; do thus till all your lead be run through. the holes of the plate, taking care, by keeping your coals alive, that the lead do not cool, and fo ftop up the holes.

While you are cafting in this manner, another perfonwith another ladle may catcl fome of the fhot, placing. the ladle four ar five inches underncath the plate in the water, by which means you will fee if they are defeco tive, and rectify them.

Your chief care is to keep the lead in a juft degree of heat, that it be not fo cold as to fop up the holes in your plate, nor fo loot as to caufe the fhot to crack ? to remedy the heat, you muft refrain working till it isof a proper coolnefs; and to remedy the coolnefs of your lead and plate, you muft blow your fire ; obferving, that the cooler your lead is, the larger will be your fhot ; as: the hotter it is, the fmaller they will be.

After you have done cafting, take them out of the water, and dry them over the fire with a gentle heat \({ }_{\text {, }}\) ftirring them continually that they do not melt; when dry, you are to feparate the great fhot from the fmall, by the help of a fieve made for that purpofe, according. to their feveral fizes. But thofe who would have very large fhot, make the lead trickle with a ftick out of the. ladle into the watcr, without the plate.

If it fop on the plate, and yet the plate be not too cool, give but the plate a little knock; and it will runs again; care mult be had that none of your implements be greafy, oily, or the like; and when the flot, being feparated, are found too large or too fmall for your pur.

\section*{S H O \(\quad[446] \quad\) S H R} pole, or otherwife imperfect, they will ferve afgain at the next operation.
The fizes of common fhot for fowling are from \(\mathrm{N}^{0}\) I to 6 , and fmaller, which is called muftard feed, or duft thot; but \(\mathrm{N}^{\circ} 5\) is fmall enough for any flooting what foever. The \(\mathrm{N}^{2}\) I may be ufed for wild geefe; the \(\mathrm{N}^{\circ} 2\) for ducks, widgeons, and other water-fowl; the \(\mathrm{N}^{\circ} 3\) for pheafants, partridges after the firft month, and all the fenfowl; the \(\mathrm{N}^{\circ} 4\) for partridges, woodeocks, \&c. ; and the \(\mathrm{N}^{\circ} 5\) for fnipes and all the fmaller birds.

Tin-Caje SHot, in artillery, is formed by putting a great quantity of fmall iron fhot into a cylindrical tin-box called a cannifter, that juft fits the bore of the gun. Leaden bullets are fometimes ufed in the fame manner ; and it muft be obferved, that whatever number or fizes of the fhots are ufed, they mult weigh with their cafes nearly as much as the fhot of the piece.

SHOVEL (Sir Claudefly), was born about the year 1650 of parents rather in the lower rank of life. He was put apprentice to a fhoemaker; but difliking this profeffion, he abandoned it a few years after, and went to fea. He was at firft a cabin boy with Sir Chriftopher Mynns, but applying to the ftudy of navigation with indefatigable induftry, his fkill as a feaman foon raifed him above that ftation.

The corfairs of 'Tripoli having committed great outrages on the Englifh in the Mediterranean, Sir John Narborough was fent in 1674 to reduce them to reafon. As he had reccived orders to try the effects of nerociation before he proceeded to hoftilities, he fent Mr Shovel, who was at that time a lieutenant in his flet, to demand fatisfaction. The Dey treated him with a great deal of difrefpect, and fent him back without an anfwer. Sir John difpatched him a fecond time, with orders to remark particularly the fituation of things on fhore. The behaviour of the Dey was worfe than ever. Upon Mr Shovel's return, he informed Sir John that it would be poffible, notwithftanding their fortifications, to burn all the fhips in the harbour. The boats were accordingly manned, and the command of them given to Lieut. Shovel, who feized the guardfhip, and burnt fonr others, withont lofing a man. This action fo terrified the Tripolins, that they fued for peace. Sir John Narborough gave fo favourable an account of this exploit, that Mr Shovel was foon after made captain of the Sapphire, a fifth rate fhip.

In the battle of Bantry-Bay, after the revolution, he commanded the Edgar, and, for his gallant behaviour in that action, was foon after knighted by king William. Next year he was employed in tranfporting an army in. to Ireland; a fervice which he performed with fo much diligence and dexterity, that the king raifed him to the rank of rear-admiral of the blue, and delivered his commiffion with his own hands. Soon after he was made rear admiral of the red, and fhared the glory of the victory at La Hogue. In 1694, he bombarded Dunkirk. In 1703, he commanded the grand fleet in the Mediterranean, and did every thing in his power to affift the Proteftants who were in arms in the Cevennes.

Soon after the battle off Malaga, he was prefented by prince George to Queen Anne, who received him gracioully, and next year employed him as commander in chief.

In 1705 he commanded the fleet, together with the carls of Peterborough and Monmouth, which was fent
into the Mediterranean; and it was owing to him chiefly that Barcelona was taken. Alter an menfuccefsful attempt upon Toulon, he failed for Gibralt: \(\cdot\), and from thence homeward with a part of the fleet. On the 22 d of October, at night, his fhio, with three others, was caft away on the rocks of Scilly. All on board perifhed. His body was found by fome fifhermen on the ifland of Scilly, who ftripped it of a valuable ring, and afterwards buried it. Mr Paxton, the purfer of the Arundel, hearing of this, found out the fellows, and obliged them to difcover where they had buried the body. He carried it on board his own fhip to Portfmouth, from whence it was conveyed to London, and interred with great folemnity in Weftminfter Abbey. A monument was afterwards erected to his memory by the direction of the Queen. He married the widow of his patron, Sir John Narborough, by whom le lelt two daughters, co-heireffes.

SHOVELER, in ornithology, a fpecies of ANAs.
SHOULDER-blade, a bone of the fhoulder, of a triangular fignre, covering the hind part of the ribs, called by anatomifts the fiapula and omoplata. See Anaтому.

SHOUT, clamour, in antiquity, was frequently ufed on ecclefialtical, civil, and military occafions, as a fign of approbation, and fometimes of indignation.Thus as Cicero, in an affembly of the people, was expofing the arrogance of I.. Antony, who had had the impudence to canfe himfelf to he infcribed the patron of the Romans, the people on hearing this raifed a fhout to fhow their indignation. In the ancient military difcipline, floouts were ufed, I. Upon occafion of the general's making a fpeech or harangue to the army from his tribunal. This they did in token of their approving what had been propofed. 2.: Before an engagement, in order to encourage and fpirit their own men, and fill the enemy with dread. This is a practice of great antiquity; befides which, it wants not the authority of reafon to fupport it; for as mankind are endowed with two fenfes, hearing and feeing, by which fear is raifed in the mind, it may be proper to make ufe of the ear as well as the eye for that purpofe. Shouts were alfo raifed in the ancient theatre, when what was acted pleafed the fpectators. It was ufual for thofe prefent at the burning of the dead to raife a great fout, and call the dead perfon by his name before they fet fire to the pile.

SHOWER, in meteorology, a cloud condenied into Rain.

SHREWMOUSE. See Sorex.
SHREWSBURY, the capital of Shropfhire in England. This town, the metropolis of the county, grew up out of the rnins of Uriconium, anciently a city, now a village called Wroxeter, about four miles from it. The Saxons called it Scrobbes Berig, from the fhrubs that grew about it ; and from thence the prefent name of Shrewufloury is fuppofed to have been formed. It is pleafantly fituated upon a hill near the Severn, over which there are two handfome bridges. It was a place of note in the Saxon times; after which it was granted by William the Conqueror, together with the title of earl and moft of the county, to Roger de Montgomery, who built a cafle upon the north fide of it, where the Severn, that encompaffes it on all other fides, leaves an opening. His fon Robert built allo a wall acrofs this neck of land, when he revolted
from

\section*{S H R}
[ 4.47 ]

\section*{S H R}
wible from Henry I. We learn from doomfday-book, that at that time, when a widow of this town married, the paid 20 fhillings to the king, and a virgin ro. The above.mentioned Roger founded alio, and endowed here, a Bencdictine monaflery and a collegiate church. When old are came upon him, he quitted the world, and fpent the re?t of his days as a monk in the abbey, and when he died was interred in its church. From the hiftory of this church and monaftery, it appears, that ecclefiaftical benefices about that time were hereditary. The abbey became fo rich afterwards, that the abbot was mitred, and fat in parliament. Befides this abbey, in after times there were three others, viz. a Francifcan, Dominican, and Auguftin, and likewife two collegiate churches ; one dedicated to St Chad and the other to St Mary. In the contef between the emprefs Maud and Stephen, this town, and its governor Willian Fitz-Allan, fided with the emprefs. In Henry III.'s time, a part of it was burnt down by the Welch ; and in Richard II.'s reign a parliament was held in it. At a place called Battlefelell, near this town, Henry Percy the younger, furnamed Hotfpur, was killed in an engagement with Henry IV. againt whom he had rebelled. The king afterwards built a chapel upon the fpot, and endowed it for the fupport of two priefts to pray for the fouls of the fain. Two of Edw. IV.'s fons were born here ; namely, Richard, duke of York, whom Perkin Warbeck afterwards perfonated, and who was murdered in the Tower; and Gcorge Plantagenet, who died before his brothers. Here firlt broke out the fweating-ficknefs, which carried off great numbers fo fuddenly, that thofe who were feized with it cither died or recovered in the fpace of 24 hours. In the beginning of the civil wars, king Charles I. came hither, and formed an arny, with which he marched towards London ; but was met by the parliament's forces at Edgehill. He continued here from the 2oth of Sep. tember to the 12 th of October, during which time he was joined by prince Rupert, and many of the gentry and nobility of thefe parts. This towa anciently gave title of earl to the Montgomeries, and afterwards to the ' \(\Gamma\) albots, by whom it is fill retained. Here is a free grammar-fchool, with three maiters, and feveral uhhers, well endowed by Edward VI. and queen Elizabeth, and not inferior to many colleges in the univerfitics. It has a good library and chapel, and there are feveral fcholarlhips appropriated to it in the univerfity of Cambridge. Here are alfo feveral hofpitals, alms-hinfes, and charity-fchools. This town is one of the moft flourithing in England, having two great weekly markets for corn, cattle, and provifions ; and another for. Welch cottons and flanuels, of which great quantities are fold. A great trade is carried on with the Welch, who bring their commoditics hither, as to the common mart of both nations. The town is large and well-built, and the fituation extremely pleafant. 'There is a very beautiful walk called the quarry, between the town walls and the Severn, delightfully fhaded with rows of lime-trees, fo that it is not inferior to the Mall in St James's Park. The town is alfo noted for its gallantry and politeneefs, being full of gentry, for whom there are always balls and affemblies once a-week all the year round. Here is a fine houfe and gardens, which belonged to the carl of Bradford; and in the neighbourhood, at Wroxeter, the Roman highway; called Watling ftrect,
may be feen for feveral miles, where Roman coins are frequently found. In Shrewfoury are 12 incorporated trading companies; and the corporation has a power to try even capital caufes of itfel!, except high treafon. It is faid that thigh-bones of deal men have been found here a yard long, and teeth three inches round and three long.

SHRIKE. See Lanies.
SHRIMP, in ichthyology. Sce Cancer, \(n^{\circ} 5\) and 6.
SHRINE, in ecclefiaftical hitory, a cafe or box to hold the relica of fone faint.

SHROPSHIRE, a county of England, bounded on the fouth by Worceiterfhire, Herefordfhire, and Radnorlhire ; on the north, by Chefhire ; on the ealt, by Staffordthire; on the wefl, by Montgomeryfhire and Denbighthire, in Wales. Its length is between 49 and 50 miles, its breadth about 38 , and its circumference about 210 . It is an inland county, containing 890,000 acres, 113,680 inhabitants, and 15 hundreds, in which are 170 parifhes, and 15 market towns. It makes a part of three bifhoprics, viz. Hereford, Coventry and Litchfield, and St Afaph. Some part of it lies on the north, and fome on the fouth fide of the Severn. Befides the Severn, it is alfo watered by the TTemd or Tefidiauc, as it is called in Welch, which flows from the mourtains of Radnorfhire; and by the 'I'ern, which has its rife and name from one of thofe pools called tearnes, in Staffordnire. All thefe abound with fifh, efpecially trouts, pikes, lampreys, graylings, carp, and cels. The air, efpecially upon the hills, with which the county abounds, is very wholefome. There is as great a diverfity of foil as in moft other counties. On the hills, where it is poor, is very good pafture for fheep; and in the low grounds, where it is very rich, along the Severn in particular, there is plenty of grafs for hay and black cattle, with all forts of corn. No county is better provided with fuel than this, having in it many inexhaultible pits of coal, and alfo mines of lead and iron. Over molt of the coal-pits in this county lies a ftratum or layer of blackifh porous reck, of which, by grinding and boiling, they make pitch and tar, which are rather better than the common fort for caulking fhips, as they do not crack, but always continue clofe and fmooth. Quarries of lime-ftone, and iron-ftone are common enough in the county, and the foil in many places is a reddifh clay. As it lies. upon the bo:ders of Wales, it was anciently full of cattles and walled towns. On the fide next that country there was an almoft continued line of caftles, to guard the county againft the inroads and depredations of the Welch. The borders here, as thofe between England: and Scotland, were called marches, and there were cer-* tain noblemen intitled barones marchix, marchiones de marchia Wallia, " lords of the marches, or marquiffes of the marches of Wales," who were veltec with a Cort of palatine juriddiction, held courts of juftice to determine controverfies, and enjoyed many privileges and immunities, the better to enable and encourage them to protect: the county againft the incurfions of the Welch, and tomaintain order amongt the borderers; but they often: abufed their power, and were the greateft of tyrants.

As to the ecclefiaftical government of the county the far greater part, namely, all that belongs to the bifoprics of Herefors, and of Litchfield and Coventry,

\section*{S H R [ \(44^{8}\) ] S H U}

Shrove is under the jurifdiction and vifitation of the archdeacon 1 Shrub. of Shrewfoury or \$alop, and is divided irto feveral deanries.

The Oxford circuit includes in it this county, which fends 12 members to parliament, viz. two for the fhire, and two for each of the following towns, Shrewfbury,' Ludlow, Wenlock, and Bifhop's Caftle.

SHROVE-TuEsday, is the Tuefday after Quinquagefima Sunday, or the day immediately preceding the firft of Lent ; being fo called from the Saxon word Sbrive, which fignifies " to confefs." Hence ShroveTuefday fignifies Confeffion-Tuefday ; on which day all the people in every parifh throughout England (during the Romifh times) were obliged to confefs their fins, one by one, to their own parifh-priefts, in their own parifh churches ; and, that this might be done the more regularly, the preat bell in every parifh was rung at ten o'clock (or perhaps fooner), that it might be heard by all, and that they might attend, according to the cuf. tom then in ufe. And though the Romifh religion has now given way to the Proteftant religion, the cuftom of ringing the great bell in our ancient parifh-churches, at leaft in fome of them, fill remains, and obtains in and about London the name of Pancake bell ; perhaps, becaufe after the confeffion it was cuftomary for the feveral perfons to dine on pancakes or fritters. Moft churches, indeed, have rejected that cuftom of ringing the bell on Shrove-Tuefday ; but the ufage of dining on pancakes or fritters, and fuch like provifion, ftill continues.

SHROUDS ( \(f\) crud Sax.), a range of large ropes extending from the mat-heads to the right and left fide of the hip, to fupport the mafts, and enable them to carry fail, \&c.

The fhrouds as well as the fails are denominated from the mafts to which they belong. Thus they are the main, fore, and mizen . fhrouds; the main-top-maft, fore-top-maft, or mizen-top-maft fhrouds ; and the main-top-gallant, fore-top-gallant, or mizen-top-gallant fhrouds. The number of fhrouds by which a mat is fuftained, as well as the fize of rope of which they are formed, is always in proportion to the fize of the maft and the weight of the fail it is intended to carry.

Bowfprit fhrouds are thofe which fupport the bowfprit. Bumkin fhrouds are thofe which fupport the bumkins. Futtock fhrouds are fhrouds which connect the efforts of the topmaft fhrouds to the lower fhrouds. Bentinck-fhrouds are additional fhrouds to fupport the matts in heavy gales. Preventer fhrouds are fimilar to bentinck-hhrouds, and are ufed in bad weather to eafe the lower rigging. See Mast and Sail.

SHRUB, frutex, a little, low, dwarf tree, or a woody vegetable, of a fize lef8 than a tree; and which, inftead of one fingle ftem, frequently from the fame root puts forth feveral fets or ftems. See Plant and Tree. Such are privet, phillyrea, holly, box, honeyfuckle, \&c. Shrubs and trees put forth in autumn a kind of buttons, or gems, in the axis of the leaves; thefe buttons are as fo many little ova, which, coming \&o expand by the warmth of the following fpring, open into leaves and flowers. By this, together with the height, fome diftinguifh fhrubs from fuffrutices, or under fhrubs, which are low bufhes, that do not put forth pny of thefe buttons, as fage, thyme, \&c.

The two hardieft Chrubs we are poffeffed of are the ivy and box ; thefe ftand the feverity of our fharpeft winters unhurt, while other fhrubs perifh, and trees have their folid bodies fplit and torn to pieces. In the hard winter of the year 1683 , thefe two fhrubs fuffered no injury any where; though the yews and hollies, which are generally fuppofed very hardy, were that winter in fome places killed, and in others ftripped of their leaves, and damaged in their bark. Furze-bufhes were found to be fomewhat hardier than thefe, but they fometimes perifhed, at leaft down to the root. The broom feemed to occupy the next ftep of hardinefs beyond thefe. This lived where the others died, and where even this died, the juniper fhrubs were fometimes found unhurt. This laft is the only fhrub that approach. es to the hardinefs of the box and ivy, but even it does not quite come up to them; for while they fuffer nothing in whatever manner they are expoded, the juniper, though it bears cold well under the fhelter of other trees, yet cannot bear the viciffitudes of heat and cold ; infomuch that fome juniper fhrubs were found half dead and half vigorous; that fide which faced the mid-day fun having perifhed by the fucceffive thawings and freezings of its fap; while that which was not ex pofed to the viciffitudes of heat had born the cold perfectly well. Such fhrubs as are not hardy enough to defy the winter, but appear half dead in the fpring, may often be recovered by Mr Evelyn's method of beat ing their branches with a flender hazel-wand, to ftrike off the withered leaves and buds, and give a free paffage to the air to the internal parts. Where this fails, the method is to cut them down to the quick, and if no part of the trunk appears in a growing condition, they muft be taken off down to the level of the ground. Philofuphical Tranfactions, no 165 .

SHUCKFORD (Samuel), curate of Shelthon in Norfolk, prebendary of Canterbury, and chaplain in ordinary to the king, was a learned Englifhman. His manners were thofe of a philofopher, uncorrupted by the manners of the world. He wrote a hiftory of the world, facred and profane, to ferve as an introduction to Prideaux, in 3 vols 8 vo. It is heavily written, but difplays a great deal of erudition. His death, which happened in 1756, prevented him from carrying it down to the year 747 before Chrift, where Prideaux begins. He wrote alfo a treatife on the Creation and Fall of Man, to ferve as a fupplement to the preface to his hiftory.

SHU'TLE, in the manufactures, an inftrument ufed by the weavers, which guides the thread it contains, either of woollen, filk, flax, or other matter, fo as to make it form the woofs of ftuffs, cloths, linens, ribbands, \&c. by throwing the fhuttle alternately from left to right, and from right to left, acrofs between the threads of the warp, which are ftretcled out lengthwife' on the loom.

In the middle of the fhuttle is a kind of cavity, called the cye or chamber of the fhuttle; wherein is inclofed the fpoul, which is a part of the thread deftined for the woof; and this is wound on a little tube of paper, ruth, or other matter.

The ribband-weaver's thuttle is very Eifferent from that of moft other weavers, though it ferves for the fame purpofe : it is of box, fix or feven inches long, one broad, and as much deep; fhod with iron at both
ends, which terminate in points, and are a little crooked, the one towards the right, and the other fowards the left, reprefenting the figure of an es horizontally placed. See Weaving.

SIALOGOGUES, medicines which promote the falivary difcharge.

SIAM Proper, by fome called Upper, (to diftinguifh it from the Lozver Siam, under which are often included Laos, Cambodia, and Malacca); is bounded on the north by the kingdoms of Pegu and Laos; on-the eaft by Cambodia and Cochin-China; on the fouth by Ma. lacca and the bay of Siam; and on the weft by the occan. But as the opinions of geographers are extremely various concerning the fituation and extent of moft of the inland countries of Afia and Africa, neither the extent nor boundarics of Siam are yet accurately known. By fome it is fuppofed to extend 550 miles in length, and 250 miles in breadth ; in tome places it is not above 50 miles broad.

The winds blow here from the fouth upon the coaft of Siam, in Marcl, A pril, and May ; in April the rains begin, in May and June they fall almoft without ceafing. In July, Augult, and September, the winds blow from the weft, and the rains continuing, the rivers overflow their banks nine or ten miles on each fide, and for more than 150 miles up the ftream. At this time, and more particularly-in July, the tides are fo ftrong as to come up the river Menan as far as the city of Siam, which is fituated 60 miles from its mouth; and fometimes as far as Louvo, which is 50 miles higher. 'The winds blow from the weft and north in October, when the rain ceafes. In November and December the winds blow dry from the north, and the waters being in a few days reduced to their ancient channels, the tides become fo infenfible, that the water is frefh at the mouth of the river. At Siam there is never more than one flood and one ebb in the face o! 24 hours. In January the wind blows from the eaft, and in February from the eaft and fouth. When the wind is at eaft, the current fets to the weft; and, on the contrary, when the wind is at weft, the currents run to the eaftward.

As this country is fituated near the tropic, it muft neceffarily be very hot; but yet, as in other places nearly of the fame latitude, when the fun is vertical and fhines with a moft intenfe heat, the inhabitants are fo fkreened by the clouds, and the air is fo refrefhed by a deluge of rain that overflows the plains which the people chiefly inhabit, that the heat is very fupportable. The cooleft wind blows in December and January.

The vegetable produce of this country is chiefly rice and wheat, befides tropical and a few European fruits. The Siamefe prepare, the land for tillage as foon as the earth is fufficiently moittened by the floods. They plant their rice before the waters rife to any confiderable height, and, as they rife flowly, the rice keeps pace with them, and the ear is always above the water. They reap their corn when the water retires, and fometimes go in boats to cut it while the waters are upon the ground. They alfo fow rice in feveral parts of the kingdom that are not overflowed, and this is thought better tafted, and will keep longer, than the other; but they are forced to fupply thefe fields conftantly with water, while the rice is growing, from batins and ponds that lie about them.

Vol. XVII. Part II.

\section*{449 ] \\ S I A}

They have no European fruits except oranges, le-
|Sizn. mons, citrons, and pomegranates. They have bananas, Indian figs, jaques, durions, mangoes, mangoftańs, tamarinds, ananas, and cocoa-nuts; they have alfo abundance of pepper and fugar.canes. The mountains are covered with trees which make good mafts. The vegetable of greateft ufe in the country is the bamboo, which grows chiefly in marihy foils, and is often found of a prodigious fize. Cotton trees are found in great numbers; and others that yield capoc, a very fine cotton wool, but fo fhort as to be unfit for fimning, though it anfwers very well for ftuffing mattreffes and pillows.

There is no country where elephants abound more Animals. than in Siam, or where they are held in greater veneration. They have a few horfes, fleep, and goats, befides oxen and buffaloes; but they have no good animal food except the flefh of hogs, their beef and mutton being of a very indifferent quality.

The Siamefe are of fmall ftature, but well propor- Defcription tioned ; their complexions are fwarthy : the faces of of the inhaw both the men and women are broad, and their fore- bitants. heads, fuddenly contracting, terminate in a point, as well as their chins. They have fmall black eyes, hollow jaws, large mouths, and thick pale lips. Their teeth are dyed black, their nofes are fhort and round at the end, and they have large ears, which they think very beautiful. Their hair is thick and lank, and both fexes cut it fo fhort that it reaches no lower than their ears; the women make it ftand up on their foreheads; and the men thave their beards.

People of diftinction wear a piece of calico tied about their loins, that reaches down to their knees.The men bring ' up this cloth between their legs, and tuck it into their girdles, which gives it the appearance of a pair of breeches. They have alfo a mullin fhirt without a collar, with wide neeves, no wriftbands, and the bofom open. In winter they wear a piece of ftuff or painted linen over their fhoulders, like a mantle, and wind it about their arms.

The king of Siam is diftinguifhed by wearing a veft of brocaded fatin, with fraight fleeves that reach down to the wrift, under fuch a hint as we have juft defcribed, and it is unlawful for any fubject to wear this drefs unlefs he receives it from the king. They wear fippers with piked toes turned up, but no ftockings. The king fonactimes prefents a military veft to the generals; this is buttoned before, and reaches to the knees; but the fleeves are wide, and come no lower than the elbows. All the retinue of the king, either in war or in hunting, are clothed in red. The king wears a cap in the form of a fugar-loaf, encompaffed by a coronet or circle of precious ftones, and thofe of his officers have a circle of gold, filver, or of vermilion gilt, to diftingnifh their quality; and thefe caps are faftened with a ftay under the chin ; they are only worn when they are in the king's prefence, or when they prefide in courts of juftice, and on other extracrdinary occations. They have alfo hats for travelling ; but, in general, few people cover their heads notwithtanding the fcorching heat of the fun.

The women alfo wrap a cloth about their middle, which hangs down to the calf of their legs. They cover their breafts with another cloth, the ends of which hang over their fhoulders. But they have no garment 3 L

\section*{S I A}
correfponding to a fift, nor any covering for their heads but their hair. The conmon people are almolt naked, and wear neither fhoes nor flippers. The women wear as many rings on the three laft fingers of each hand as they can keep on, and bracelets upon their writs and ancles, with pendants in their ears fhaped like a pear.

For an inferior to ftand before a fuperior is deemed infolent; and therefore flaves and people of inferior rank fit upon their heels, with their heads a little inclined, and their joined hands lifted up to their fore. heads. In paffing by a fuperior they bend their bodics, joining their hands, and lifting them toward their heads in proportion to the refpect they would how. When an inferior pays a vint, he enters the room ftooping, profteates himfelf, and then remains npon his knees, fitting upon his heels without fpeaking a word till he is addreffed by the peifon whom he vilits; for he that is of the higheft quality mult always fpeak firft. If a perfon of rank vifits an inferior, he walks upright, and the mafter of the houfe receives him at the door, and waits on him fo far when he goes away, but never farther.

The higheft part of the houfe is efteemed the moft honourable, and no perfon cares to lodge under another's feet. The Siamefe indeed have but one ftory, but the ronms rife gradually, and the innermont, which are the higheft, are always the moft honourable. When the Siamefe ambaffador came to the French court, fome of his retinue were lodged in a floor over the ambaffador's head ; but they no fooner knew it, than they were flruck with the greateft confternation, and ran down tearing their hair at the thoughts of being guilry of what they confidered as fo unpardonable a crime.

The Siamefe never permit fuch familiaxities as are practiled by gentlemen in Europe. Eafinefs of accels, and affability to inferiors, is in that part of the world thought a fign of weaknefs, and yet they take no notice of fome things which would be looked upon as ill breeding amorig us; fuch as belching in company, which no man endeavours to prevent, or fo much as holds his hand before his mouth. They have an extraordinary refpect for the head, and it is the greateft affront to ftroke or touch that of another perfon; nay, their cap mult not be ufed with too much familiarity; for when a fervant carries it, it is put on a ftick and held above his head; and when the mafter ftands fill the ftick is fet down, it having a foot to ftand upon. They alfo fhow their refpect by lifting their hands to the head; and therefore, when they receive a letter from any one for whom they have a great refpect, they immediately hold it up to their heads, and fometimes lay it upon their beads.
Genius and 'I hey are efteemed an ingenious people, and though difp-fitiors rather indolent than active in difpofition, they are not addicted to the voluptnous vices which often accompany a fate of eafe, being remarkably chafte and temperate, and even holding drurkennefs in abhorrence. They are, however, accounted infolent towards their inferiors, and equally obfequious to thofe above them; the latter of. which qualities appears to be particularly inculcated from their earlieft youtb. In general, their behaviour is extremely modeft, and they are averfe to loquacity. Like the Chinefe, they avoid fpeaking in
the firt perfon ; and when they aderefs a lasy, it is al ways with fome refpectful epithet, infinuating -perfoual accomplifhments.

No man in this country learns any particular trade, but has a general knowledge of all that are commonly practifed, and every one works fix months for the kings by iotation; at which time, if he Mould be found perfectly irnorant of the bulinefs he is fet about, he is dommed to fuffer the baftinado. 'The confequence of this burdenfome fervice is, that no man endeavours to excel in his bufinefs, left he flould be obliged to prasife it as long as he lives for the benefit of the crown.

The government of this country is extremely op- Gover \({ }^{9}\) preffive, the king being not only fovereign but proprie- meut. tor of all the lands, and chief merchant likewife; by which means lie monopolizes almolt the whole traffic, to the great prejudice of his fubjects. Whe crown is faid to be hereditary, but it is often transferred by revolutions, on account of the exorbitant abule of power in thofe who exercife the royal office. In his palace, the king is attended by women, who not only prepare his food, and wait on him at table, but even perform the part of valets, and put on all his clothes, except his cap, which is confidered as too facred to be touched by any hand but his own. He thows himfelf to the people only twice a-year, when he diftributes his alms to the talapoins or priefts; and on thofe occafions he always appears in an elevated fituation, or mounted on the back of an elephant. When he takes the diverfion of hunting, he is as ufual attended by his women on foot, preceded by a guard of 200 men , who drive all the people from the roads through which they are to pafs; and when the king ftops, all his attendants fall upon their faces on the ground.

All their proceedings in law are committed to wri- Forms ting, and none is fuffered to exhibit a charge againft proce another, without giving fecurity to profecute it, and anfwer the damages if he does not prove the fact againft the perfon accufed. When a perfon intends to profecnte another, he draws up a petition, in which he fets forth his complaint, and prefents it to the nai, or lead of the band to which he belongs, who tranimits it to the governor; and if the complaint appears frivolous, the profecutor, according to the laws of the country, fhould be punifhed; but the magiltrates generally ert. courage profecutions on account of the perquifites they bring to their office.

Every thing being prepared for hearing, the parties are feveral days called into court, and perfuaded to agree; but this appears to be only a matter of form. At length the governor appoints a day for all parties to attend ; and being come into court, the clerk reads the procefs and opinion of his affociates, and then the governor examines upon what reafons their opinions are founded; which being explained to him, he proceeds to pafs judgment.

When fufficient proofs are wanting, they have re- Trial courfe to an ordeal trial, like that of our Saxon ance- deal. ftors :. both the plaintiff and the defendant walk upon burning coals, and he that efcapes unhurt is adjudged to be in the right: fometimes the proof is made by putting their hands in boiling oil ; and in both thefe trials, by fome peculiar management, one or the other is faid to remain. unhurt. 'l'hey have alio a proof by water,

\section*{S I A [ 451}
gree of north latitude ; and the latter rmming throurh Laos and Cambodia, difcharges itfelf into the Indian ocean in the gth degree of north latitude.

The capital of the country is Siam, called by the natives Siyothoya, fituated in the 101 ft degree of eaf longitude, and in the 14 th degree of north latitude, being almoft encompaffed by the branches of the river Menan. It is about 10 miles in cirqumfereace within the walls, but not a fixth part of the ground is occtupied by buildings. In the vacant fpaces there are neare 350 parodas or temples, round which are feattered the convents of the priefts and their burying-places. The ftreets of the city are fpacious, and fome have canals running through them, over which is a great number of bridges. The houfes fland on pillars of the bamboo cane, and are built of the fame naterials; the communication betweeni different families, during the winter feafon, being carried on as in other tropical countries by means of boats. The grounds belonging to the feveral tenements are feparated by a pallifado, within which the cattle are houfed in barns, erected likewife apon pillars, to preferve them from the annual inundation.

SIBBALDIA, in botany: A genus of plants belonging to the clafs of pentandria, and to the order of pentagymia; and in the natural fyttem arranged under the \(35^{\text {th }}\) order, Senticofe. The calyx is divided into ten fegments. The petals are five, and are inferted into the caly \(x_{\text {. }}\). The ftyles are attaohed to the fide of the germens. The feeds are five. There are three fpecies belonging to this genus, the procumbens, ereafa, and altaica. The procumbens, or reclining fibbaldia, is a native of North Britain, having never been difcovered in the fouthern parts of the ifland. It grows on Ben-Lomond and Ben-Mor, within a mile of the fummit. It is diftinguifhed by a procumbent or trailing ftem; by three leaves growing on the top of a fmall footitalk, which are trifid at the extremity, and fomewhat hairy. The flowers are yellow, and bloffom in July or Auguft.

SIBENICO, or Sebenico, the name of a city and province of Dalmatia. T'he provituce of Sibenico runs along the fea for more than 30 miles; reaches in fome places above 20 miles within land, and comprehend's above 70 illands. The city of Sibenico is fituated near the mouth of the river Clierca, in the Gulf of Venice, 35 miles north of Spalatto, and 25 fouth-eaft of Zara. E. Long. \(16^{\circ} 46^{\prime}\), N. Lat. \(44^{\circ} 17^{\prime}\). It belongs to the Venetians. It is defended on one fide by a caftie, which held out againft repeated attacks of the Turks, and towards the fea by a fort.

SIBERIA, a large country, comprehending the Boundaries moft northerly parts of the Ruffian empire in Alia. It and estento is bounded on the eaft by the eaftern ocean; on the fouth by Great Tartary ; on the weft by Ruffia ; and on the north by the Frozen Ocean. It is about 2.000 miles in length from eaft to weft, and 750 miles in breadth from north to fouth.

At- what time this country was firf inhabited, or Conquerea by whom it was peopled, we are entirely ignerant; by the but wisings have been fourd in it when it was difeover- Ruflians. ed, which fhows that it muft have been early known to a civilized peoplet. 'The Ruffians, from whom we have \({ }^{\dagger}\) Bell's received our knowledge, knew nothing of it before the Travelso middle of the 16 th century. In the reign of John Bafilowitz I. indeed, an incurfion had been made into Siberia,

\section*{S I B} and fome Tartar tribes fubdued: but thefe conquelts were \(\mathrm{n} \cap \mathrm{t}\) permanent ; and we hear of no further communication between Ruffia and Siberia till-the time of John Bafilowitz II. It was opened again at that time by means of one Anika Strogonoff, a Ruffian merchant who had eftablifhed fome falt-works at a town in the government of Archangel. This man carried on a trade with the inhabitants of the north-welt parts of Siberia, who brought every year to the town abovementioned large quantities of the fineft furs. TKus he acquired a very confiderable fortune in a fhort time; when at laft the czar, perceiving the advantages which would accrue to his fubjects from having a regular intercourfe with Siberia, determined to enlarge the communication which was already opened. With this view he fent into Siberia a body of troops, which crofled the Yugorian mountains, that form part of the northeaftern boundary of Europe. They feem, however, not to have paffed the Irtifh, or to have penetrated farther than the weftern branch of the river Oby. Some Tartar tribes were laid under contribution, and a chief named \(Y_{\text {ediger }}\) confented to pay an annual tribute of 1000 fables. But this produced no lafting advantage to Ruffia; for, foon after, Yediger was defeated and taken prifoner by Kutchum Khan, a defcendant of the great Jenghiz Khan : and thus the allegiance of this country to Ruffia was diffolved.

For fome time we hear of no further attempts made by the Ruffians on Siberia; but in 1577 the foundation of a permanent conqueft was laid by one, Yermac Temofeeff, a Coffack of the Don. This man was at firft the head of a party of banditti who infefted the Ruffians in the province of Cafan; but being defeated by the troops of the czar, he retired with 6000 of his followers into the interior parts of that province. Continuing his courfe ftill eaftward, he came to Orel, the moft eafterly of all the Ruffian fettlements. Here he took up his winter-quarters: but his reflefs genius did not fuffer him to contirue for any length of time in a fate of inactivity; and from the intelligence he procured concerning the fituation of the ueighbouring Tartars of Siberia, he turned his arms towards that quarter.

Siberia was at that time partly divided among a number of feparate princes, and partly inhabited by the various tribes of independent Tartars. Of the - former Kutchum Khan was the moft powerful fovereign. His dominions confifted of that tract of coun. fian conqueft.
try which now forms the fouth-weftern part of the province of Tobollk; and ftretched from the banks of the Irtifh and Oby to thofe of the 'l'obol and Tura. His principal refidence was at Sibir, a fmall fortrefs upon the river Irtifh, not far from the prefent town of Tobolfk, and of which fome ruins are ftill to be feen. After a courfe of unremitted fatigue, and a feries of victories which almoft exceed belief, but of which we have not room to give the detail, our intrepid adventurer difpoffeffed this prince of his dominions, and feated himfelf on the throne of Sibir. The number of his followers, however, being greatly reduced, and perceiving he could not depend on the affection of his new fubjects, he had recourfe to the czar of Mufcovy, and made a tender of his new acquifitions to that monarch, upon condition of receiving immediate and effectual fupport. This propofal was received with the greateft fatisfaction by the czar; who granted him a pardon for all former offences, and fent him the required fuccours. Yermac, however, being foon after drowned is an unfuccelsful excurfion, the Ruffians began to lofe their footing in the country. But fref reinforcements being feafonably fent, they not only recovered their ground, but pufhed their conquelts far and wide; wherever they appeared, the Tartars were either reduced or exterminated. New towns were built, and colonies were planted on all fides. Before a century had well elapfed, all that vaft tract of country now called Siberia, which ftretches from the confines of Europe to the Eaftern Ocean, and from the Frozen Sea to the prefent frontiers of China, was annexed to the Ruffian dominions.

The air of Siberia is, in general, extremely piercing, clio the cold there-being more fevere than in any other part of the Ruffian dominions. The Siberian rivers are frozen very early, and it is late in the fpring before the ice is thawed (A). If the corn does not ripen in Augrult, there is little hope of a harveft in this country ; and in the province of Jenifeifk it is fometimes covered with fnow before the peafants can reap it. To defend the inhabitants againft this extreme feverity of the climate, Providence feems more liberally to have dealt out to them wood for fuel and furs for clothing. As the win ter's day in the north parts of Siberia laft but a few hours, and the forms and flakes of fnow darken the air fo much, that the inhabitants, even at noon, cannot fee to do any thing without artificial lights, they neep away the greateft part of that feafon.

Thefe

\section*{S I B}

Thefe fevere winters are rapidly fucceeded by fummers, in which the heat is fo intenfe that the Tungufians, who live in the province of Jakutfk, go almoft naked. Here is fcarcely any night during that feafon ; and towards the Frozen Ocean the fun appears continually above the horizon. The vegetables and fruits of the earth are here extremely quick in their growth.
The whole track of land beyond the 60th degree of north latitude is a barren wafte; for the north part of Siberia yields neither corn nor fruits; though barley is known frequently to come to perfection in Jakutk.For this reafon, the inhabitants of the northern parts are obliged to live on fifh and flefh, but the Ruffians are fupplied with corn from the fouthern parts of Siberia, where the foil is furprifingly fertile. 'The countries be-' yond the lake of Baikal, efpecially towards the eaft, as far as the river Argun, are remarkably fruitful and pleafant ; but fuch is the indolence of the inhabitants, that feveral fine tracts of land, which would make ample returns to the peafant for cultivating them, lie neglected. The paftures are excellent in this country, which abounds in fine horned cattle, horfes, goats, \&c. on which the Tartars chiefly depend for fubfiltence. How-
ever, there are feveral fteppes, or barren waftes, and un- 'Siberiz. improvable tracts in thefe parts; and not a finglc fruit tree is to be feen. There is great variety of vegetables, and in feveral places, particularly near Krafnaia Sloboda, the ground is in a manner overrun with afparagus of an extraordinary height and delicious flavour. The bulbs of the Turkifh bundes, and other forts of lilies, are múch ufed by the Tartars inftead of bread. This want of fruit and corn is richly compenfated by the great quantities of wild and tame bealts, and fowls, and the infinite variety of fine fifh which the country affords (в.)

In that part of Siberia which lies near the Ice Sea, as well as in feveral other places, are woods of pine, larch, and other trees ; befides which, a confidcrable quantity of wood is thrown afhore by the waves of the Ice Sea; but whence it comes is not yet afcertained.

Befides the wild fowl with which Siberia abounds, Wild \({ }^{6}\) there is a prodigious number of quadrupeds, fome of beafto which are eatable, and others valuable for their fkins or furs.

The animals moft valued for their flins are the black fox
fome diftance from the rivcr Argun, for which purpofe they thawed the earth by degrees, and dug fome fathoms till they had penetrated a fathom and half below the level of the river, but found no fpring. Hence perhaps we may venture to affert, that befides the great elevation of the earth in thefe countries, there is another caufe, perhaps latent in the earth itfelf, of this extraordinary cold, naturally fuggefted to us by confidering the cavity of an old filver mine at Argun, which being exhaufted of its ore, now ferves the inhabitants in fummer time for a cellar to keep their provifions: this place is fo extremely cold as to preferve flefh meats from putrefaction in the hotteft fummers, and to fink the mercury in de Lifle's thermometer to 146 and 147. The author travelling from Nerfchoi towards Argun, to vifit the works of the filver mines in that place, Auguft 1735, came to the river Orkija, near Solonifchaia, on July the ift, from whence he arrived a little before dark at the village of Seventua, diftant from the river 27 leagues. In this journey he and his fellow travellers for more than four leagues felt it vafly cold ; foon after they came into a warm air, which continued fome leagues; after which the cold returned; and thus are travellers fubjected to perpetual viciffitudes of warmth and cold. But it is obferved, in general, that the eaftern parts are colder than the weftern, though fituated in the fame latitude; for as in thore eaftern regions fome tracts of land are much colder than the leit, their effects muft be felt by the neighbouring parts. And this conjecture is favoured by the thermometrical obfervations made with M. de L'Ine's inftrument. in all parts of Siberia, in which the mercury was depreffed to the 226 th. degree, even in thofe parts that lie very much towards the fouth, as in the territory of Selinga, which faid degree anfwers in Fahrenheit's thermometer to about 55.5 below 0 , but the fame thermometer fometimes indicated a much greater cold. At the fort: of Kiringa, on Feb. 10. 1738, at 8 in the morning, the mercury ftood at 240, which anfwers ncarly to 72 below 0 in Fahrenheit's. On the 23 d of the fame month it was a degree lower. At the fame place, December 13. at three in the afternoon, it ftood at 254 in De Life's thermometer, and very near 90 in Fahrenheit's ; on December 29. at four in the afternoon, at 263 ; on November 27 . at noon, at 270 ; January. 9. at 275, which feveral depreffions anfwer in Fahrenheit's to \(99.44,107.73\), and 113.65 ; on January 5 . at 5 in the morning \({ }_{2}\) at 262, an hour after at 281 , but at eight o'clock it returned to 250 , and there remained till 6 in the afternoon \({ }_{9}\), and then rofe by degrees till an hour before midnight, when it ftood at 202. So that the greatef depreffion of the mercury anfwers in Fahrenheit's thermometer to 120.76 degrees below 0 , which is indeed very furprifing, and what no body ever imagined before. While this cold lafted at Jenifea, the fparrows and magpies fell to the ground, ftruck dead, as it were, with the. froft, but revived if they were foon brought into a warm room. The author was told alfo that numbers of wild beafts were.found in the woods dead and ftiff with the froft, and feveral travellers had their blood and juices quite frozen in their veffels. The air itfelf at that time was fo difmalg. that you would think it changed to ice, as it was a thick fog, which was. not diffipable by any exhalations; as in the fpring and autumn, and the author could fcarce fland three minutes in the porch of his houfe for the cold-
(в) The oak, though frequent in Ruffia, it is faid, is not to be found through this.vaft region nearer than the banks of the Argun and Amur, in the dominions of China. The white poplar, the afpen, the black poplar \({ }_{2}\), the common fallow, and feveral fpecies of the willow, are very common. The Norway and filver fir form great forefts; but the former does not grow beyond the 6oth degree of north latitude, and the latter not beyond5.8 degrees. To this dreary region of Siberia, Europe is indebted for that excellent fpecies of oats called: Avena. Sibirica, and our gardens are enlivened with the gay and brilliant flowers brought from the fame: country.

\section*{S I B}
fox, the fable, the hyma, the ermine, the fquirrel the beaver, and the lynx. The fin of a real black fox is more efteemed than even that of a fable. In the country near the Frozen Ocean are alfo blue and white foxes. The fineit fables come from Nerthink and Jakutfl, the inhabitants of which places catch them in the mountains of Stannowoi Krebet. The tributary nations were formerly obliged to pay their taxes in the fkins of foxes and fables only. But now the fkins of fquirrels, bears, rein-deer, \&c. and fometimes money, are received by way of tribute; and this not only from thofe who live near the Lena, but alfo in the governments of Ilinfk, Irkutzk, Selenginfk, and Nertfhinfi: When the Tartars firft became tributary to Ruffia, they brought their furs indifcriminately as they caught them, and among them were often fables of extraordinary value ; and formerly, if any trader brought with him an iror kettle, they gave him in exchange for it as many fables as it would hold. But they are now better acquainted with their value. They fell their fables to fmugglers at a very high price, and pay only a ruble inftead of a fkin to the revenue officers, who now reeeive more ready money than fables, by way of tribute. The fubjects plead the fcarcity of furs, and indeed not without fome appearance of truth.

Siberia has itill other and more valuable treafures than thofe we have yet mentioned. The filver mines of Ar gun are extremely rich; the filver they produce yield fome gold, and both of thefe are found among the cop. per ore of Koliwan. This courtry is alfo patticularly rich in copper and iron ore. The former lies even upon the furface of the earth ; and confiderable mines of it are foumd in the mountains of Pietow, Koliwan, PloIkau, Wofkerefenfik, Kufwi, Alepaik, and feveral others, and in the government of Krafnoiarfk (c). Iron is ttill more plentiful in all thefe places, and very good; but that of Kamenfki is reckoned the beft. Several hunndred thoufand puds of thefe metals are annually exported from the fmelting houfes, which belong partly to the crown, and partly to private perfons. Moft of them lie in the government of Catharimenburg. The Tartars alfo extract a great quantity of iron from the ore.

The topazes of Siberia have a fine luftre, and in open fandy places, near the river Argun, as well as on the banks of other rivers and lakes, are found fingle fmall pieces of agate. Here are alfo cornelians and green jafper with red veins. The Iatter is chiefly met with in the deferts of Gobifkoi.

The famous marienglas, or lapis fpecularis, great quantities of which are dug up in Siberia, is by fome called Mufcovy or Ruffian glafs; and by others, though with lefs propriety, ifinglafs. It is a particular fpecieg of tranfparent ftone, lying in ftrata like fo many fheets of paper. The matrix, or ftone in which it is found, iop partly a light yellow quartz, or mareaffia, and partly a brown indurated fluid; and this ftore contams in it all the fpecits of the marienglas. Fo render the marienglas fit for ufe, it is fplit with a thin two.edged

\section*{S I B}
knife; but care is taken that the lamina be not too thin. It is ufed for windows and lanterns all over Siberia, and indeed in every part of the Ruffian empire, and looks very beantiful ; its luftre and clearnefs furpaffing that of the fineft glafs, to which it is particularly preferable for windows and lanterns of fhips, as it will ftand the explofion of cannon. It is found in the greateft plenty near the river Witim.

Siberia affords magnets of an exrraordinary fize, and Mag even whole mountains of loadfone. Pit-coat is alfo dug up in the northern parts of this country. The kamennoe inaflo, a yellowifh kind of alum, unctious and fmooth to the touch, like tophus, is found in the mountains of Krafnoiarfk, Ural, Altaifh, Jenifea, Baikal, Bargufik, Lena, and feveral others in Siberia.

In this country are not only a great number of frefl \({ }^{5}\) water lakes, but likewife feveral whofe waters are falt ; and thefe reciprocally change their nature, the falt fometimes becoming frefh, and the frefh changing into faline. Some lakes wilo dry up, and others appear where none were ever feen before. The falt lake of Yamufha, in the province of 'tobolik, is the moft remarkable of all, for it contains a falt as white as fnow, confilting entirely of cubic cryftals. One finds alfo in Siberia faline fprings, falt water brooks, and a hill of falt.

Siberia affords many other things which deferve notice. That uffefl root called rhubarb grows in vaft quantities near the city of Seleginf. The curious mamuth's bones and horns, as they are called, which are found alongr the banks of the Oby, Jenefei, Lena, and Irtifh, are unqueftionably the teeth and bones of elephants. But whether thefe elephants teeth and bones were conveyed to thefe northern regions by the general deluge, or by any other inundation, and were by degrees covered with earth, is a point which might lead us into long and very fruitlefs difquifitions ; we thall therefore only obferve, that fuch bones have likewife been found in Ruffia, and even in feveral parts of Germany. A kind of bones of a till larger fize than thefe have allo been dug up in siberia, and feem to have beh longed to an animal of the ox kind. The horn of the whale called narobal has been found in the earth near the rivers Indigirka and Anadir ; and the teeth of another fpecies of whales, called Wolrofs, about Anadirfkoi. The latter are larger than the common fort, which are brought from Greenland, Archangel, and Kola.

The chain of Siberian mountains reaches from that Mout of Werchoturie towards the fouth as far as the neighbourhood of the city of Orienburg, in a continued ridye, under the name of the Uralian mountains; but from thence it alters its direction weftward. Thefe mountains are a kind of boundary between Ruffia Proper and Siberia. Another chain of hills divides Siberia from the country of the Calmucks and Mongalians. Thefe mountains, between the rivers: Irtih and Oby, are called the Attaic or Golden Mountains, which name they afterwards lofe, particularly between the river Jem nefei and the Baikal lake, where they are called the Sayanian mountains.
(c) The copper mines of Koliwan, from which gold and fiver are extracted, employ above 4c,000 people. The filver mines of Nertfhinft, beyond lake Baikal, employ above 14,000. The whele revenue ariinig frona thefe mines, according to Mr Coxe, is not lefs than L. \(679,182,138\).

\section*{}
pia, The inhabitants of Siberia confif of the Aborigines or ancient inhabitants, the Tartars, and Rufiaus.

Some of thefe nations have no other religion but that of nature ; others are Pagans or Mahometans, and fome of them have been converted to Chritlian:\(\pm y\), or rather only baptifed by the Ruffian mifionasies.

SIBTHORPIA, in botany: A genas of plants belonging to the clafs of didynamia, and to the order of angiofpermia; and in the natural fyftem claffed with thofe the order of which is doubtful. The calys is fpreading, and divided into five parts, almolt to the bafe. The corolla is divided into five parts in the fame manncr, which are rounded, equal, fpreading, and of the length of the calyx. The flamina grow in pairs at a diftance from each other. The capfule is compreffed, orbicular, bilocular, the partition being tranfverfe. There are two fpecies, the curopea and evolvulacea. The europea, or baftard money-wort, is a native of South Britain. The fterns of it are flender, and creeping. The leaves are fmall, round, and notched. The flowers grow uuder the wings of the leaves, are fmall, and of a pale red colour. It bloffoms from July to September, and is found in Cornwall on the banks of rivulets.

SIBYLS, in pasan anticquity, certain women faid to have been endowed with a prophetic fpirit, and to have delivered oracles, fhowing the fates and revolutioms of kingdoms. Their number is unknown. Plato fpeaks of one, others of two, Pliny of three, RElian of four, and Varro of ten ; an opimon which is univerfally adopted by the learned. Thefe ten Sibyls generally refided in the following places, Perfia, Libya, Delphi, Cumze in Italy, Erythrea, Samos, Cumæ in Eolia, Marpeffa on the Hellefpont, Aucyra in Phrygia, and Tiburtis. "I'he moll celebrated of the Sibyls is that of Cumre in Italy, whom fome have called by the different rames of Amalthæa, Demiphile, Herophile, Daphue, Manto. Phemonoe, and Deiphobe. It is faid, that Apollo became enamoured of her, and that to make her senfible of his puffion he offered to give her whatever fhe fhould afk. The Sibyl demanced to live as many years as the had grains of fand in her hand, but unfortunately forgot to alk for the enjoyment of the health, vigour, and bloom, of which the was then in poffeffion. The god granted her requeft, but fhe refited to gra. tify the paffion of her lover. - though he offered lier per:petual yonth and beauty. Some time after fhe became old and decrepit, her form decayed, melancholy palenees and haggard looks fncceeded to bloom and cheerfulnefs. She had already lived about 700 years when Eneas came to Italy, and, as forne have imagined, fle had three centuries more to live before ber years were as numerous as the grains of fand which fhe had in her hand. She Gave Eneas iuftructions how to find his father in the infernal regions, and even conducted him to the entrance of hell. It was ufval for the Sibyl to write her prophecies on leaves, which fhe placed at the entrance of her cave; and it required particular care in fuch as confulted her to take up thete leaves before they were difperfed by the wind, as their meaning then became incomprehemfible. According to the moft authentic hif torians of the Roman republic, one of the Sibyls came to the palace of Tarquin the Second, with nine volumes, which fhe offered to fell for a very high price. The monarch difregarded her, and the immediately difappeared,
and foon after returned, when the had burned tircee of the volumes. She affus the fame price for the remaining fix books; and when Tarquin refufed to buy them, The burned three more, and fill perifted in demanding the fame fum of money for the three that were left. I' his extraordiary behaviour aftonifhed Tarquin; he bowint the books, and the Sibyl initantly vanifeed, and never aiter appeared to the world. Thefe books were prefenved with great care by the mourch, and called the Sibylline verles. A college of priefts was appointed to have the care of them; and fuch reverence did the Romans entertain for thefe prophetic books, that they were confulted with the greateft folemnity, and only when the fate feemed to be in danger. When the capitol was bunt in the troubles of Sylla, the Sibylline verfes which were depofited there perifhed in the con: flagration; and to repair the lofs which the republicfeemed to have futtained, commiffoners were immediately fent to different parts of Greece to collect whatever verfes could be found of the infpired writings of the Sibyls. The fate of thefe Sibylline verfes which were collected after the conflagration of the capitol is unknown. 'There are now many Sibylline verfes extant. but they are reckoned univerfally fpurions; and it is evident that they were compoled in the lecond century by fome of the followers of Chriftianity, who wifhed to convince the heathens of their error, by affilting the caufe of truth with the arms of pions artifice.

SICERA, a name given to any inebriating liquor by the Heileniftic Jews. St Chryfoftom, Theodoret, and Thecphilus of Antiocts, who were Syrians, and who therefore ought to know the fignification and nature of "ficera," affiure us, that is properly fignifies palm-wine Pliny acknowledges, that the tvine of the palm tree was very well known through all the eait, and that it was marle by taking a buftel of the dates of the palin-tree, and throwing them into three gallons of water ; then fqueezing out the juice, it would intoxicate like wine. The wine of the palm tree is white: when it is drunk new, it bas the tafe of the cocoa, and is fwect as honey. When it is kept loager, it grows Atront, and intoxicater, After long keeping, it becomes winegar.
SICHLIAN, in mutic, denotes a kiud of gay fprighty air, or dance, probably invented in sicily, fomewhat of the nature of an Englifh jig; ufually marked with the characters \(\frac{6}{8}\), or \(\frac{12}{8}\). It conlifts of two Arains; the firft. of four, and the fecond of eight, bars or meafures.

SICILY, is a latge ifland in the Mediterrancan Sea, Brundaried adjoining to the fouthern extremity of Italy, and ex-and extent tends from latitued \(36^{\circ} 25^{\prime}\) to latituce \(38^{\circ} 25^{\prime}\), and from longitude \(12^{\circ} 50^{\prime}\) to longitude \(16^{\circ} 5^{\prime}\) eaft from London. Itz greatelt length 210 miles, breadth 133 , circumference 6 c ; its form triangular, the three angles being the promontories of Pelorum, Pachynum, and Lilybrum, or as they are now called the Faro, Capo Paffaro, and Capo Boco. It is divided from Italy by the ftraits of Meflina, reaching trom the Tower of Faro, which is the molt northerly part of the ifland, to the Cafo dell' Armi, or the Cape of Arms, the mott fouthern part of Calabria. Thefe ftraits, by the Latins. called Fretum Sicuhum, by the Italians Il Fare di Meffina, and by us the Fare of Mefsina, are between 12 and 15 miles over in the broadeft places, and in the narroweft about a mile and an half; infomuch that when

Meffina was taken by the Carthaginians, many of the inhabitants are faid to have faved themfelves by fwimming to the oppofite coafts of Italy. Hence has arifen an opinion that the ifland of Sicily was originally join. ed to the continent, but afterwards feparated by an earthquake or fome other natural caufe. This feparation, however, is reckoned by the moft judicious among the ancients to be fabulous; and they content themfelves with fpeaking of it as a thing faid to have happened.
Wiftory dro Anciently this ifland was called Sicania, Sicilia, and rinj, the fa- Trinacria or Triquetra; the two former it had from the bulous ages. Sicani and Siculi, who peopled a confiderable part of the country ; the two latter from its triangular figure.

Its firft inhabitants, according to the moft refpectable ancient authors, were the Cyclopes and Læftrigones, who are faid to have fettled in the countries adjoining to Mount Etna; but of their origin we know nothing, except what is relăted by the poets. After them came the Sicani, who called themfelves the original inhabitants of the country; but feveral ancient hiftorians inform us that they came from a country in Spain watered by the river Siconus. Diodorus, however, is of opinion, that the Sicani were the moft ancient inlabitants of this inand. He tells us that they were in poffeffion of the whole, and applied themfelves to cultivate and improve the ground in the neighbourhood of Etna, which was the moit fruitful part of the ifland: they built feveral fmall towns and villages on the hills to fecure themfelves againft thieves and robbers; and were governed, not by one prince, but each city and diftrict by its own king. Thus they lived till Etna began to throw out flames, and forced them to retire to the weftern parts of the ifland, which they continued to inhabit in the time of Thucydides. Some Trojans, after the deftuction of their city, landed in the ifland, fettled among the Sicani, and built the cities of Eryx and Egefta, uniting themfelves with them, and taking the geHeral name of Elymi or Elymæi. "They were afterwards joined by fome Phocenfes, who fettled here on their return from the fiege of Troy.

After the Sicani had for many ages enjoyed an undifturbed poffeflion of the whole of Sicily, or fuch parts of it as they chofe to inhabit, they were vifited by the Siculi, who were the ancient inhabitants of Aufonia properly fo called; but being driven out from thence by the Opici, they took refuge in the ifland of Sicily. Not being contented with the narrow bounds allowed them by the Sicani, they began to:encroach upon their neighbours; upon which a war enfuing, the Sicani were utterly defeated, and confined to a corner of the inland, the name of which was now changed from Sicania into that of Sicilia.

About 300 years after the arrival of the Siculi, the ifland firt began to be known to the Greeks, who eftablifhed various colonies, and built many cities in different parts of the ifland; and it is only from the time of their arrival that we have any hiltory of the inand. The firt of the Greeks that came, into Sicily were the Chalcidians of Euboea, under the conduct of Thucles, who built Naxus, and a famous altar of Apollo, which, as Thucydides tells us, was fill ftanding in his time without the city. The year after, which was, accordjne to Dionyfurs Halicarnaffenfis, the third of the ryth Olympiad, Archias the Corinthian, one of the Hera-
clidx, laid the foundations of Syracufe. Seven years after, a new colony of Chalcidians founded Leontini and Catana, after having driven out the Siculi, who inhabited that tract. About the fame time Lamis, with a colony from Megara, a city of Achaia, fettled on the river Pantacius, at a place called Trotilum, where his adventurers lived fome time in common with the Chalcidians of Leontini; but, being driven from thence by the Leontines, he built the city of Thapfus, where he died. Upon his death, the colony left Thapfus; and under the conduct of Hyblon king of the Siculi, found. ed Megara Hyblæa, where they refided 245 years, till they were driven out by Gelon tyrant of Syracufe. During their abode at Megara, they fent one Pamilus, who was come from Megara in Achaia, their original city, to build Selinus. This city was founded about 100 years after the foundation of Megara. Antiphemus and Entimus, the former a Rhodian, the other a Cre\(\tan\), led each a colony of their countrymen, and jointly built the city of Gela on a river of the fame name, eftablifhing in their new fettlement the Doric cuftoms, about 45 years after the founding of Syracufe. The inhabitants of Gela founded Agrigentum 108 years after their arrival in Sicily, and introduced the fame cuftoms there. A few years after, Zancle was built by the pirates of Cumæ in Italy ; but chiefly peopled by the Chalcidians, Samians, and Ionians, who chofe rather to feek new fettlements than live under the Perfian yoke. Some time after, Anaxales, tyrant of Rhegium, drove out the ancient proprietors; and, dividing his lands amongtt his followers, called the city Mefana or Mefene, which was the name of his native city in Peloponnefus. The city of Himera was founded by the Zancleans under the direction of Eucleides, Simus, and Sacon; but peopled by the Chalcidians and fome Syracufan exiles, who had been driven out by the contrary faction.

The Syracufians built Acræ, Chafmenæ, and Camarina; the firft 70 years, the fecond 90 , and the third 135, after the foundation of their own city. This is the account which Thucydides, a moft judicious and exact writer, gives us of the various nations, whether Greeks or Barbarians, who fettled in Sicily. Strabo counts among the ancient inhabitants of Sicily the Morpetes, who being driven out of Italy by the Oenotrians, fettled in that part of the inand where the ancient city of Morgantium ftood. The Campani, who affumed the name of Mamertini, that is; invincible. warriors, and the Carthaginians, who fettled very early in Sicily, ought likewife to be counted among the ancient inhabitants of the ifland.

Before this period the hiitory of Sicily is blended with fables like the early hiftory of almoft every other country. After the fettlement of the Greeks in the ifland, its various revolutions have been traced from their feveral fources by many writers ; but by none with greater accuracy than Mr Siwinburne. From his account of his 'Travels in the Two Sicilies, we have therefore taken the following concife hiftory of this kingdom, which will at once gratify fuch of our readers as intereft themfelves in the fate of a generous people who long ftruggled in vain for freedom; and at the fame tinie afford them a fpecimen of the entertainment they may receive from the very elegant work of the author.
"Ari-

\section*{S I C [ 457\(]\) S I C}
"Arittocracy prevailed at firt in the Greek fettlements, but foon made way for tyranny ; which in its turn was expelled by democracy. One of the earlieft deftroyers of common liberty was Phalaris of Agrigen.tum, who reigned 600 years before Chrift : his example was contagious; a legion of tyrants fprang up, and not a commonwealth in the ifland efcaped the lafh of an ufurper. Syracule was molt oppreffed and torn to pieces by diffenfion; as its wealth and preponderance in the general fcale held out a greater temptation than other cities to the ambition of wicked men. It requires the combined teftimony of hiftorians to enforce our belief of its wonderful profperity, and the no lefs extraordinary tyranny of fome of its fovereigns. Thefe Grecian colonies attained to fuch excellence in arts and fciences as entboldened them frequently to vie with the learned and ingenious in the mother country; nay, often enabled them to bear away the palm of victory: there needs no ftronger proof of their literary merits than a bare recital of the names of Archimedes, Theocritus, Gorgias, and Charondas.
" But the Sicilian Greeks were not deftined to enjoy the fweets of their fituation without moleftation. Very foon after their arrival, the inhabitants of the neighbouring coaft of Africa began to afpire to a thare of Sicily. Carthage fent large bodies of forces at different times to eftablifh their power in the inland, and about 500 years before the Chriftan era had made themfelves mafters of all the weftern parts of it. The Siculi retained poffeffion of the midland country, and the fouthern and eaftern coafts were inhabited by the Greeks.
"A bout that time Gelo was chofen prince of Syracufe on account of his virtues, which grew ftill more confpicuous after his exaltation: had the example he fet been followed by his fucceffors, the advantages of freedom would never have been knowr or wifhed for by the Syracufans. The Carthaginians found in him a vigorous opponent to their project of enflaving Sicily, a project invariably purfued but never accomplifhed.
"Hiero fucceeded his brother Gelo, and, contrary to the ufual progreffion, began his reign by a difplay of bad qualities. Senfible of his error, and improved by experience, he afterwards adopted more equitable meafures. At his death the Syracufans threw off the yoke, and for fixty years revelled in all the joys of freedom. Their peace was, however, difturbed by the Athenians and the Carthaginians. The latter plundered Agrigentum, and threatened ruin to the relt of the Grecian flates; but a treaty of peace averted that form. 'The Athenians, under pretence of fupporting their allies the people of Segefta, but in reality from a thirft of dominion, invefted Syracufe with a formidable land and naval armament under the command of Nicias; in confequence of a rafh indigefted plan, ill conducted attacks, and inadequate fupplies, their whole hoft was cut to pieces or led away into captivity.
" Syracufe had fcarce time to breathe after her victory ere inteftine wars broke out, and raifed Dionyfius to fupreme command. A varice, defpotifm, and cruelty, marked every day of his reign ; but his military enterprifes were crowned with conftant fuccefs. He died in peace, and bequenthed a powerful fovereignty to a fon of his name tainted with the fame and worfe vices, but not endowed with equal capacity and martial abilio

Ios. XVII. Part II.
ty; in fuch hands the rod of tyraniny ceafed to be formidable, and the tyrant was driven out of Sicily by the

Sicily. patriotic party ; but matters were not fufficiently fetthed for popular government, and Dionyfius refumed the fceptre for a while, till 'I'moleon forced lim into perpetual exile."

Liberty feemed now to be eftallifhed on a permanent Agathocles bafis; but in Syracufe fuch profpects always proved il-the tyrant. lufory. Agathocles, a tyrant more inhuman than any preceding ufurper, feized the throne, and deluged the country with blood. He was involved in a perilous conteft with the Carthaginians, who obtained many advantages over him, drove his troops from port to port, and at laft blocked up his capital. In this defperate fituation, when all foreign helps were precluded, and hardly a refource remained at home, the genius of Agathocles compaffed his deliverance by a plan that was imitated among the ancients by Hannibal, and among the moderns by the famous Cortes. He embarked with the flower of his army ; forced his way through innumerable obftacles; landed in Africa; and, having burnt his fleet; routed the Carthaginians in a pitched battle, and laid their territory wafte. Carthage feemed to be on the brink of ruin, and that hour might have mark. ed her downfal had the Sicilian hoft been compofed of patriotic foldiers, and not of ungovernable affaffins; dif. cord pervaded the victorious camp, murder and riot enfued; and the tyrant, after beholding his children and friends butchered before his fàce, efcaped to Sicily, to meet a death as tragical as his crimes deferved.

Anarchy now raged throughout the inland, and eve- Pyriturs ry faction was reduced to the neceffity of calling in the king of affiftance of foreign powers; among whom Pyrrhus king \(\begin{gathered}\text { Epirus dea } \\ \text { ceives the }\end{gathered}\) of Epirus took the lead, and reduced all parties to fome ceives the degree of order and obedience. But ambition foon prompted him to invade thofe rights which he came to defend; he caft off the mank, and made Sicily feel under his fway as heavy a hand as that of its former oppreffors; but the Sicilians foon affumed courage and ftrength enough to drive him out of the inaud.

About this period the Mamertini, whom Mr Swin.The \({ }^{10} \mathrm{Ma}_{\mathrm{a}}\) burne indignantly ftyles a crew of mifcreants, furprifed niertini furMeffina, and, after a general maffacre of the citizens; na, and are eftablifhed a republican form of government. Their com- affifted by monwealth became fo troublefome a neighbour to the the RoGreeks, that Hiero II. who had been raifed to the mans; chief command at Syracufe in confideration of his fuperior wifdom and warlike talents, found himfelf neceffitated to form a learue with Carthage, in order to deftroy this neft of villains. In their diftrefs the Mamertini implored the affiftance of Rome, though the fenate had recently punifhed with exemplary feverity one of their own legions for a fimilar outrage committed at Rhegium. 'The virtue of the Romans gave way to the temptation, and the defire of extending their empire be. yond the limits of Italy, caft a veil over every odious circumftance attending this alliance. A Roman army croffed the Faro, relieved Meffina, defeated the Carthaginians, and humbled Hiero into an ally of the republic.

Thus began the firtt Punic war, which was carried which on for many years in Sicily with various fuccefs. Thegives rife to genius of Hamilcar Barcas fupported the African caufe \({ }^{\text {the firft }}\) under numberlefs difappointments, and the repeated Punic war. overthrows of his colleagues; at laft, finding his exer-

3 M
tions

\section*{S I C [ 45}
tions ineffectual, he adviied the Carthaginian rulers to purcliafe peacc at the price of Sicily. Such a treaty was not likely to be obferved loneer than want of ftrength fhould curb the animolity of the vanquifhed party: when their vigour was recruited, Hannibal fon of Hamilcar ealily perfuaded them to refume the conteft, and for 16 years waged war in the heart of the Roman territories. Meanıhile Hiero conducted himfelf with fo much prudence, that he retained the friendfhip of both parties, and preferved his portion of Sicily in perfect tranquillity. He died in extreme old ase, beloved and retpected both at home and abroad.

His gran fon Hieronymus, forfaking this happy line of politics, and contracting an alliance with Carthage, fell an early victim to the troubles which his own folly had excited. Once more, and for the laft time, the Syracufans found themfelves in poffeffion of their independence: but the times were no longer fuited to fuch a fy f tem; diffenfions gained head, and diftracted the public councils. Carthage could not fupport them, or prevent Marcellus from undertaking the fiege of Syracufe, immortalized by the mechanical efforts of Archimedes, and the immenfity of the plunder. See Syracuse.

The Sicilians after this relinquifhed all martial ideas, and during a long feries of generations turned their attention folely to the arts of peace and the labours of agrriculture. Their pofition in the centre of the Roman empire preferved them beth from civil and foreign foes, except in two inftances of a fervile war. The rapacity of their governors was a more conftant and infupportable evil. In this ftate of apathy and opulence Sicily remained down to the \(\eta\) th century of our era, when the Saracens began to difturb its tranquillity. The barbarous nations of the nerth had before invaded and ravaged its coafts, but had not long kept poffcffion. The Saracens were more fortunate. In 827 they availed themftlves of quarrels among the Sicilians to fubdue the country. Palermo was chefen for their capital, and the ftandard of Mahomet triumphed about 200 years. In 1038 George Maniaces was fent by the Greck emperor with a great army to attack Sicily. He made good his landing, and pufhed his conquefts with vigour : his fuccefs arofe from the valour of fome Norman troops, which were at that time unemployed and ready to fell their fervices to the beft bidder. Maniaces repaid them with ingratitude ; and by his abfurd conduct gave the Muffulmen time to breathe, and the Normans a pretext and opportunity of invading the Imperial dominions in Italy? Robert and Roger of Hauteville afterwards conquered Sicily on their own account, not as mercenaries; for having fubftantially fettled their power on the continent, they turned their arms againft this ifland in obedience to the dictates of zeal and ambition. After ten years ftruggle, the Saracens yielded up the rich prize, and Robert ceded it to his brother Roger, who affumed the title of Great Earl of Sicily, ruled the flate with wifdom, and ranks defervedly among the greateft characters in hiftory. He raifed himfelf from the humble fation of a poor younger fon of a private gentleman, to the exalted dignity of a powerful monarch, by the fole force of his own genius and courage; he governed a nation of ftrangers with vigour and juftice, and trarfimitted his poffeffions undifputed to his pofterity. Such an affemblage of great qualities is well intitled to our admiration.

\section*{458 ]}

He was fucceeded by his fon Simon, whofe reign was fhort, and inade way for a fecond fon called Roger. In 1127 this prince joined to his Sicilian poffeffions the whole inheritance of Robert Guifcard (fee Naples, tom \(\mathrm{n}^{\circ} 23\).), and affumed the regal fyle. The greateft of dif part of his reign was taken up in quelling revolts in Ita- rent ly, but Sicily enjuyed profound peace. In \(115+\mathrm{his}^{\text {n }}\) fon William afcended the throne, and paffed his lifc in war and con'ufion. William II. fucceeded his father, and died without iffue. Tancred, though bafely born, was elected his fuccefor, and after him his fon William III. who was vanquifhed by Henry of Swabia. During the troubles that agitated the reign of his fon the emperor Frederic, peace appears to have been the lot of Sicily. A fhort lived fedition, and a revolt of the Saracens, are the only commotions of which we read. For greater fecurity, the Saracens were removed to Puglia 400 years after the conqueft of Sicily by thcir anceftors. Under Conrad and Manfred Sicily remained quiet ; and from that time the hiftory of Sicily is related under the article Napies, \(\mathrm{n}^{\circ}{ }^{\circ} 26\), scc.

At the death of Charles II. of \$pain, his fpoils be- Is at came an object of furious contention; and at the peacecon of Utrecht, Sicily was ceded to Victor duke of Savoy, by than who, not many years after, was forced by the emperor Charles VI. to relinquifh that fine inand, and take Sardinia as an equivalent. But as the Spaniards lad no concern in thefe bargains, they made a fudden attempt to recover Sicily, in which they failed through the vigilance of the Englifh admiral Byng. He deftroyed their fleet in 1718, and compelled them to drop their fcheme for a time. In 1734 the Spanifh court refumed their defign with fuccefs. The infant Don Carlos drove the Germans out, and was crowned king of the two Sicilies at Palermo. When he paffed into Spain to take poffeffion of that crown, he transferred the Sicilian diadem to his fon Ferdinand III. of Sicily and IV. of Naples, and it has ever fince remained in the poffeffion of the fame family.

Sicily is feparated, as we have already obferved, from A Italy by a narrow Itrait called the Faro of Mef/ina. 'This the ftrait is fkill remarkable for the rapidity of its currents \({ }^{\circ}\) and the irregular ebbing and flowing of the fea, which fometimes rufhes in with fuch violence as to endanger fhips riding at anchor. Anciently it was much more remarkable for Scylla and Charybdis, the one a rock, and the other a whirlpool, between which it was vely dargerous to fteer, and concerning which fo many fables have been related by the ancients. Scylla is a rock on the Italian fide, oppofite to Cape Pylores, which runs out into the fea on the Sicilian fide. Mr Brydone informs us, that the navigation of the ftraits is not even yet performed without danger. He informs us, that the noife of the current which fets through the ftraits may be heard for feveral miles, like the roaring of fome large impetuous river confined between narrow banks. In many places the water rofe into whirlpools and eddies, which are dangerous to fhipping. 'The current fet exactly for the rock of Scylla, and would certainly have carried any thing thrown into it againft that point. Our author, however, is by no means of opinion that the ftrait is fo dangerous as the ancients have reprefented it ; though he thinks that the ftrait is now probably much wider than formerly, which may have diminifhed the danger. See Scylla. There are many fmall rocks,

\section*{S I C [ 459,] S I C}
which fhow their heads near the bafe of the large ones. Thefe are probably the dogs defcribed by the ancient poets as howling round Scylla. The rock is near 200 feet high, and has a kind of caftle or fort built on its fummit with a town called Scylla or Sciglio, containing 300 or 400 inhabitants on its fouth fide, which gives the title of prince to a Calabrefe family.

Charybdis is now fo much diminifhed, that it feems almoft reduced to nothing in comparifon of what it was, though even yet it is not to be paffed without danger. See Charybdis.

In the ftraits, Mr Brydone informs us, a moft furprifing phenomenon is to be obferved. In the heat of fummer, after the fea and air have been much agitated, there appears in the heavens over the itraits a great va. riety of fingular forms, fome at reft and others moving with great velocity. 'Thefe forms, in proportion as the light increafes, feem to become more aerial, till at laft, fome time before fun-rife, they totally difappear. The Sicilians reprefent this as the moft beautiful fight in nature. Leonti, one of their beft and lateft writers, fays, that the heavens appear crowded with a variety of objects, fuch as palaces, woods, gardens, \&c. befides the figures of men and other animals that appear in motion among them. Some treatifes have been written concerning this phenomenon; but nothing fatisfactory has been delivered concerning its caufe.

Though Sicily lies in a warm climate, the air is healthful, being refrefhed with fea-breezes on every fide. It has at all times been remarkably fertile; but the era of its greateft profperity was from the fiege of Syracufe by the Athenians to the Carthaginian conqueits. Then and long after it fupplied with grain in years of fcarcity all the countries upon the Mediterranean except Egypt and the coafts of Afia, and Rome and Carthage continually. Even now, under all the impediments of fuperftition and bad goverument, its productions are, in quantity and quality, the beft in Europe. Of the vegetable are grain, wines, oil, fruits, tobacco, mulberry trees for the filkworm, cotton, medicinal roots, and fugar canes. The laft of thefe flourifh near Avola and Merilli. They are of an inferior quality to thofe of the Weft Indies, but their fugar is fweeter than any other. The animal production is fimilar to that of Italy, but the horned cattle are a fmaller breed. The coalts abound with fifh, particularly with tunney and anchovies; the export of which forms a very lucrative branch of commerce. 'There are mines of filver, copper, and lead, but none are worked. Near Palma are beds of the beft fulphur : at the mouth of the river Giaretta is found a yellow amber, preferable to that of the Baltic ; and in every part of the ifland quarries of marbles, that have furnimed materials for all the noble edifices of Sicily. The moft beautiful are in the neighbourhood of Palermo, particularly the yellow, and thode that refemble the verde antique, porphyry, and lapis lazuli. The population of the ifland amounts to \(1,300,000\) fouls; not as much again as the fingle city of Syracufe formerly contained. the rivers are navigable, having but a fhort courfe, and defcending precipitately from the mountains. The chief are the Cantera, the Jarretta, and the Salfo; of which, the two former run from welt to eaft, and the third from north to fouth.

Of the mountains in this ifland the moft noted is Mount Etna, now called Monte Gibello, or Mongibello, a volcano whofe eruptions have often proved fatal to the neighbouring country. Sce Etna.

Were the Sicilians a cultivated people, among whom Confituthofe arts were encouraged which not only promotetion and go. the wealth and comfort of a nation, but alfo exercife the vernment., nobler faculties and extend the views of mankind, the Munter's circumfances of their government are fuch, that it Memoirs remight gradually be improved into a free conflitution : lative to but to this, the ignorance, fuperftition, and poverty, of Sisiles and the people feem to be invincible obftacles. The monarchical power in Sicily is far from being abfolute ; and the parliament claims a fhare of public authority independently of the will of the king, deduced from a compact made between Roger and the Norman barons after the expulfion of the Saracens, This claim is denied by the king, who wifhes the nobles to confider their privileges as derived folely from his favour. Hence the government is in a fituation which greatly refembles that of our own and the other kingdoms of Europe in the feudal times ; there are continual jealoufies and oppofitions between the king and the barons, of which an enlightened people might eafily take advantage, and obtain that fhare in the conftitution which might fecure them from future oppreffion. In thefe difputes, the king has the advantage at leaft of power if not of right; and feveral works, in which the claims of the Sicilian barons have been afferted, were publicly burned a few years ago.

As the fovereign holds his court at Naples', Sicily is governed by a viceroy, who is appointed only for three years, though at the end of that term his commiffion is fometimes renewed. He lives in great flate, and, as the reprefentative of the king, his power is very confiderable. He prefides in all the courts and departments of 'government, and is commander in chief of all the forces: he calls or diffolves the parliament when he pleafes; and by him all orders, laws, and fentences, muft be figned : but his office is far from being defirable, as it generally renders him the object either of the jealoufy of the court of Naples, or of the hatred of the Sicilians.
The parliament confifts of the nobles, the bifhops, and abbots, and the reprefentatives of 43 cities, which are immediately fubject to the crown. Thofe cities which are fubject to any of the nobles fend no members to the parliament ; in thele the king has not much authority, and derives little advantage from them. According to the laws, the parliament ought to be affembled at the end of every three years : but the government pays little attention to this rule. The common people are in general very much attached to the nobles, and are inclined to take their part in all their differences with the court : but the magiftrates and principal inhabitants of the cities which belong to thefe feudal lords; wifh to get rid of their authority, and imagine that they fhould be lefs oppreffed, if immediately fubject to the king: thefe inclinations are not difagreeable to the court, and are encouraged by moft of the law. yers, who are of great fervice to government in contefting the privileges of the nobles. Many of thefe privileges are now abridged; and the power of the barons, with refpect to the adminiftration of juftice in their domains, was very properly limited by the viceroy Ca-

\section*{S I C [ 460 \(] \quad\) S I D}
raccioli, in the year 178.5 . The government of this nobleman was very beneficial to Sicily, as he, in a great meafure, cleared the ifland of the banditti that ufed to infeft it, and made feveral excellent regulations for the eftablifhment of focial order and perfonal lecurity. He deferves the thanks of every well-wifher to mankind for Maving abolifhed the court of inquifition, which had been eftablifhed in this country by Ferdinand the Catholic, and made dependent on the authority of the grand inquifitor of Spain. Its laft auto da fe was held in the year 1724, when two perfons were burned. At length Charles III. rendered it independent of the Spanifh inquifitor, and abridged its power, by forbidding in to make ufe of the torture, and to inflict public punifh. ments. The Marchefe Squillace, and his fucceffor the Marchefe 'Tanucci, were both enemies to the hierarcliy; and, during their viceroyalties, took care to appoint fenfible and liberal men to the office of inquifitor : the laft: of whom was Ventimiglia, a man of a molt humane and amiable character, who heartily wifhed for the abolition of this diabolical court, and readily contributed toward it. While he held the office of inquilitor, he always endeavoured to procure the acquittal of the acculed; and when he could fuceed no other way, would pretend foine informality in the trial. The total annihilation of this inftrument of the worft of tyranny was referved for Caraccioli. A prieft being accufed to the inquifition, was dragged out of his houfe and thrown into the dungeon. He was condemned; but, on account of informality, and a violation of jultice in the trial, he appealed to the viceroy, who appointed a committee of jurifts to examine the procefs. The inquifitor refufed to acknowledge the authority of this commiffinn ; pretending that to expofe the fecrets of the holy office, and to fubmit its decifions to the examination of lay judges, would be fo inconfiftent with lis duty, that he would fee the inquifition abolifhed rather than confent to it. Caraccioli took him at his word, and procured a royal mandate by which the holy office was at once annihilated. He affembled all the nobility, judges, and bifhops, on the \(27^{\text {th }}\) of March 1782 , in the palace of the inquifition, and commanded the king's order to be read ; after which he took poffeffion of the archives, and caufed all the prifons to be fet open : in thefe were at that time only two prifoners, who had been condemned to perpetual confinement for witchcraft. The papers relating to the finances were preferved; but all the reft were publicly burned. The poffeffions of the holy office were affigned to the ufe of churches and charitable inftitutions: but the officers then belonging to it retained their falaries during their lives. The palace itfelf is converted into a cultomhoufe, and the place where heretics were formerly roafted alive for the honour of the Catholic faith, is now changed into a public garden. The cognizance of offences againft orthodoxy is committed to the bifhops: but they cannot cite any one to appear before them without permiffion from the viceroy; neither can they confine any perfon to a folitary prifon, nor deny him the privilege of writing to his friends, and converfing freely with his advocate. 'The nobility are fo numerous in this ifland, that Labat fays it is paved with noblemen. The general affembly of parliament is compofed of 66 archbifhops, bifhops, abbots, and priors, which form the Bracchio ecclefiaftico.

Fifty-eight princes, 27 dukes, 37 marquiffes, 27 counts, S I vifcount, and 79 barons, form the militaire; and the demaniale confifts of 43 reprefentatives of free towns. Out of each braechio four deputies are chofen to conduct public bufinefs. But the viceroy, the prince of Butera, and the protor of Palermo, are always the three firft. \(N . B\). There are many titled perfons that have no feat in the affembly, viz: 62 princes, 55 dukes, 87 marquiffes, I count, and 282 other feudatories. There are three archbifhoprics and feven bifhoprics; and the ifland, ever fince it was conquered by the Saracens, has been divided into three parts or valleys; namely, the Val di Demone, Val di Noto, and Val di Mazzara.

SICINNIUS (Dentatus), a tribune of the people, lived a little after the expulfion of the kings from Rome. He was in 120 battles and flkirmifhes, befides fingle combats, in all of which he came off conqueror. He ferved under nine generals, all of whom triumphed by his means. In thefe battles he received 45 wounds in the fore-part of his body, and not one in his back. The fenate made him great prefents, and he was honoured with the name of the Roman Achilles.

SICYOS, in botany: A genus of plants belonging to the clafs of monocia, and to the order of fyngenelia; and in the natural fyftem arranged under the 34 th order, Cucurbitacea. The male flowers have their calyx quinquedentated, their corolla quinquepartite, and there are three filaments. The female flowers have their calyx and corolla fimilar ; but their ftyle is trifid, and their drupa monofpermous. There are three fpecies, the angulata, laciniata, and garcini, which are all foreign plants.

SIDA, Kellow or Indian Mallow, in botany: A genus of plants belonging to the clafs of monadclphia, and to the order of polyandria; and in the natural fyftem ranging under the 37 th order, Columniferce. The calyx is fimple and angulated; the ftyle is divided into many parts ; there are feveral capfules, each containing one feed. There are 27 fpecies. I. The Spinofa; 2. Anguftifolia; 3. Alba; 4. Rhombifolia; 5. Alnifolia ; 6. Ciliaris; 7. Retufa; 8. Triquetra; 9. Jamaicenfis; 10. Carpinifolia; rı. Vifcofa; 12. Cordifolia; 13. Umbellatæ; 14. Paniculata; 15. Atrofanguinea; 16. Periplocifolia; 17. Ureus ; 18. Arborea; 19. Occidentalis; 20. Americana; 21. A butilon ; 22. Mau. ritiana; 23. Affatica; 24. Indica; 25. Crifpa; 26. Criftata; 27. Ternata. The firf 18 fpecies have 15 capfules; the reft are multicapfular. They are all natives of warm climates; and moit of them are found in the Eaft or Weft Indies.

The Chinefe make cords of the fida abutilon. This plant loves water, and may be advantageoully planted in marfhes and ditches, where nothing elfe will grow. From experiments made by the Abbé Cavanilles, a Spaniard, which are inferted in the Mem. de l'Acad. Royale, it appears that the plants fucceed beft when fown in May, and they arrive at perfection in three months and a half. The maceration of the fmaller ftalks is finifhed in about 15 days; of the larger in a month. The ftrength and goodnefs of the thread appeared to be in proportion to the perfection of the vegetation, and to the diftance the plant was kept at from other plants. The fibres lie in ftrata, of which there are fometimes fix : they are not quite fraight, but preferve an undula. ting direction, fo as to form a network in their natu-

\section*{S I D}
mal pofitions. Their fmell refembles that of hemp; the fibres are whiter, but more dry and harfh than thofe of hemp. The harfhnefs is owing to a greenifh gluten which connects the fibres; and the white colour muft always be obtained at the expence of having this kind of thread lefs fupple ; when of its natural hue, it is very foft and flexible. This defcription belongs chiefly to the fida ; but it will alfo apply to the malva crifpa, Peruviana, and Mauritiana. 'I he malva crifpa gave, however, the greateft quantity of fibres, and its gluten was moft copious. 'Ihe fibres of the fida abutilon, and the malva crifpa, are the lonseft and the Arongeft ; thofe of the Peruviana and Mauritiana are the fhorteft and weakeft. The fibres of thofe plants which had loft their leaves are leis ftront, though of equal length with thofe which had preferved them.

SIDDEE, or Sedee: an Arabic title, by which the Abyffinians or Habafhys are always diftinguifhed in the courts of Hindoftan; where, being in great repute for firmnefs and fidelity, they are generally employed as commanders of forts or in pofts of great truft.

SIDEREAL year. See Astronomy-Index.
SIDERIA, in natural hiftory, the name of a genus of cryftals, ufed to exprefs thofe altered in their figure by particles of iron. Thefe are of a rhomboidal figure, and compofed only of fix planes. Of this genus there are four known fpecies. I. A colourlefs, pellucid, and thin one; found in confiderable quantities among the iron ores of the forelt of Dean in Gloucefterfhire, and in feveral other places. 2. A dull, thick, and brown one; not uncommon in the fame places with the former. And, 3. A black and very gloffy kind, a foffil of great beauty; found in the fame place with the others, as alfo in Leicefterfhire and Suffex.

SIDERITE, a fubftance difcovered by Mir Meyer, and by him fuppofed to be a new metal ; but Meffrs Bergman and Kirwan have difcovered that it is nothing elfe than a natural combination of the phofphoric acid with iron. Mr Klaproth of Berlin alfo came to the fame conclufion, without any communication with Mr Meyer. It is extremely difficult to feparate this acid from the metal ; however, he found the artificial compunnd of phofphoric acid and iron to" agree in its properties with the calx fideri alba obtained "by Bergman and Meyer from the cold-fhort iron extracted from the fwampy or marfhy ores. The difcovery of this fubflance, however, may be accounted an important affair in chemiftry, as we are thus furnifhed with an ir enfe quantity of phofphoric acid, which might be appled to ufeful purpofes if it could be feparated from the metal.

SIDERITIS, Ironwor t, in botany: A genus of plants belonging to the clafs of dic!ynamia, and to the order of gymnofpermia; and in the natural fyftem ranging under the 42 d order, Verticillata. The ftamina are within the tube of the corolla. There are two Atigmas, one of which is cylindrical and concave ; the other, which is lower, is membranous, fhorter, and fheathing the other. The fpecies are 13. 1. The Canarienfis, or Canary ironwort, which is a native of Madeira and the Canary iflands ; 2. The Candicans, which is alfo a native of Madeira; 3. The Syriaca, a native of the Levant; 4. I'he Perfoliata, a native of the Levant ; 5. The Montana, a native of Italy and Auftria; 6. The Elegans; 7. The Romana, a native of Italy'; 8. The Incana, a
native of Spain ; 9. The Hyffopifolia, a native of Italy Siderosy and the Pyrenees; 10. The Scordioides, a native of the fouth of France; 11. The Hirfuta, which is indigenous in the fouth of Europe ; 12. The Ciliata; 13. The Lanata.

SIDEROXYLON, IRon-wood, in botany : A ge. nus of plants belonging to the clafs of pentandria, and to the order of monogynia ; and in the natural fyftem ranging under the 43 d order, Dumofa. The corolla is cut into 10 parts, the laciniæ or fegments being incurvated alternately; the figma is fimple; the beriy contains five feeds.' There are ten fpecies: 1. Mite; 2. Inerme, fmooth iron-wood; 3. Melanophleum, laurelleaved iron-wood; 4. Fotidiffimum ; 5. Cymofumboth natives of the Cape of Good Hope ; 6. Sericeum, filky iron-wood, a native of New South Wales ; 7. Tenax, filvery-leaved iron-wood, a native of Carolina; 8. Lycioides, willow-leaved iron-wood, a native of North America; 9. Spinofum, thorny iron-wood or argan, a native of Morcceo; 10. Decandrum.

The wood of thefe trees being very clofe and folid, has given occafion for this name to be applied to them, it being fo heavy as to fink in water. As they are na. tives of warm countries, they cannot be preferved in this country unlefs they are placed, the two former in a warm ftove, the others in a green-houfe. They are propagated by feeds, when thefe can be procured from abroad.

SIDNEY (Sir Philip), was born, as is fuppofed, at Penfhurlt in Kent in the year 1554: His father was Sir Henry Sidney, an Irifh gentleman, and his mother Mary the eldeft daughter of John Dudley duke of Northumberland. He was fent when very young to Chrifto church college at Oxford, but left the univerfity at 17 to fet out on his travels. After viliting France, Germany, Hungary, and laly, he returned to England in 1575, and was next year fent by Qucen Elizabeth as her ambaffador to Randolph emperor of Germany. On his return he vifited Don John of Auftria, governor of the Netherlands, by whom he was received with great refpect. In 1579, when Queen Elizabeth feemed on the point of concluding her long projected marriage with the duke of Anjou, Sir Philip wrote her a letter, in which he diffuaded her from the match with unufual elegance of expreffion, as well as force of reafoning. About this time a quarrel with the earl of Oxford occafioned his withdrawing from court ; during which retirement he is fuppofed to have written his celebrated romance called Arcadia.

In 1585 , after the queen's treaty with the United States, he was made governor of Flufhing and mafter of the horfe. Here he diftinguifhed himfelf fo much both by his courage and conduct, that his reputation rofe to the higheft pitch. He was named, it is pretended, by the republic of Poland as one of the competitors for that crown, and might even have been elected had it not been for the interference of the queen. But his illuitrious career was foon terminated; for in 1586 he was wounded at the battle of Zutphen, and carried to Arnheim, where he foon after died. His body was brought to London, and buried in St Paul's cathedral. He is defcribed by the writers of that age as the moft perfect model of an accomplifhed gentleman that could be formed even by the wanton imagination of peetry or fiction. Virtuous conduct, polite converfation, heroic va.

\section*{S I D} lour, and elegant erudition, all concurred to render him the ornament and delight of the Englifh court: and as the credit which he enjoyed with the queen and the earl of Leicefter was wholly employed in the encouragement of genius and literature, his praifes have been tranfmitted with advantage to pofterity. No perfon was fo low as not to beconie an object of his humanity. Af. ter the battle of Zutphen, while he was lying on the field mangled with wounds, a bottle of water was brought him to relieve his thirft; but obferving a foldier near him in a like miferable condition, he faid, This man's neceffity is fill greater than mine; and refigned to him the bottle of water. Befides his Arcadia, he wrote feveral fmaller pieces both in profe and verfe, which have been publifhed.

Sidney (Algernon), was the fecond fon of Robert earl of Leicefter, and of Dorothy eldelt daushter of the earl of Northumberland. He was born about the year 1617. During the civil wars he took part againft the king, and diftinguifhed himfelf as a colonel in the army of the parliament. He was afterwards appointed one of king Charles's judges, but declined appearing in that court. During the ufurpation of Cromwel, Sidney, who was a violent republican, retired to the country, and fpent his time in writing thofe difcourfes on government which have been fo defervedly celebrated. \(A \mathrm{fter}\) the death of : the Protector, he again took part in the public tranfactions of his country, and was abroad on an embaffy to Denmark when king Charles was reftored. Upon this he retired to Hamburgh, and afterwards to Francfort, where he refided till 1677, when he returned to England and obtained from the king a pardon. It has been affirmed, but the ftory deferves no credit, that during his refidence abroad king Charles hired ruffians to affaffinate him. After his return he made repeated attempts to procure a feat in parliament, but all of them proved unfuccefsful. After the intention of the commons to feclude the duke of York from the throne had been defeated by the fudden diffolution of parliament, Sidney joined with eagernefs the councils of Ruffel, Effex, and Monmouth, who had refolved to oppofe the duke's fucceffion by force of arms. Fre-quent-meetings were held at London; while, at the fame time, a fet of fubordinate confpirators, who were not, however, admitted into their confidence, met and embraced the moft defperate refolutions. Keiling, one of thefe men, difcovered the whole confpiracy ; and Algernon Sidney, together with his noble affociates, was immedjately thrown into prifon, and ro art was left unattempted in order to involve them in the guilt of the meaner confpirators.

Howard, an abandoned nobleman, without a fingle fpark of virtue or honour, was the only witnefs againt Sidney ; but as the law required two, his difcourfes on government, found unpublifhed in his clofet, were conftrued into treafon, and declared equivalent to another witnefs. It was in vain for Sidney to plead that papers were no legal evidence; that it could not be proved they were written by him ; and that if they were, they contained nothing treafonable. The defence was over-ruled ; he was declared guilty, condemned, and executed! His attainder was reverfed in the firft year of king William.

He was a man of extraordinary courage ; fteady even to obitinacy; of a fincere but rough and boifterous
temper. Though he profeffed his belief in the Chri. ftian religion, he was an enemy to an eftablifhed church, and even, according to Burnet, to every kind of public worfhip. In his principles he was a zealous republican: government was always his favourite ftudy; and his effays on that fubject are a proof of the progrefs which he made.

SIDON (anc. reog.), a city of Phocnicia in Afia, famous in Scripture for its riches, arifing from the extenfive commerce carried on by its inhabitants. Heavy judgments were denounced againft the Sidonians on account of their wickednefs, which were accomplifhed in the time of Ochus king of Perfia : for that monarch having come againit them with an army on account of their rehellion, the city was betrayed by its king ; up. on which the wretched inhabitants were feized with defpair ; they fet fire to their houfes, and 40,000, with their wives and children, perifhed in the flames.

This city is now called Saide, and, according to Mr Bruce's account, not only its harbour is filled up with fand, but the pavement of the ancient city food \(7 \frac{1}{2}\) feet lower than the ground on which the prefent city ftands. Volney defcribes it as an ill-built dirty city. Its length along the fea-fhore is about 600 paces, and its breadth 150. At the north-weft fide of the town is the caftle, which is built in the fea itfelf, 80 paces from the main land, to which it is joined by arches. To the weft of this caftle is a fhoal is feet high above the fea, and about 200 paces long. The fpace between this fhoal and the caftle forms the road, but veffels are not fafe there in bad weather. The fhoal, which extends along the town, has a bafon inclofed by a decayed pier. This was the ancient port ; but it is fo choaked up by fand, that boats alone can enter its mouth near the caftle. Fakrel-din, emir of the Drufes, deftroyed all thefe little ports from Bairout to Acre, by finking boats and fones to prevent the Turkifh fhips from entering them. The bafon of Saide, if it were emptied, might contain 20 or 25 fmall veffels. On the fide of the fea, the town is abfolutely without any wall; and that which enclofes it on the land fide is no better than a prifonwall. 'The whole artillery does not exceed fix cannons, and thefe are without carriages and gunners. The garrifon fearcely amounts to 100 men. The water comes from the river A oula, through open canals, from which it is fetched by the women. Thefe canals ferve alfo to water the orchards of mulberry and lemon trees.

Sitle is a confiderable trading town, and is the chief emporium of Damafcus and the interior country. The French, who are the orly Europeans to be found there, have a conful, and five or fix commercial houfes. Their exports confift in filks, and particularly in raw and fpun cottons. The manufacture of this cotton is the principal art of the inhabitants, the number of whom may be eftimated at about 5000 . It is 45 miles weft from Damafcus. E. Long. 36. 5: N. Lat. 37.

SIDUS Genrgium, in aftronomy, a new primary planet, difcovered by Dr Herfchell in the year 1781. By moft foreign, and even by fome Britifh philofophers, it is known by the name of Herfchell, an honour which is due to the difcoverer. As the other planets are diAtinguifhed by marks or characters, the planet Herichell is diftinguifhed by an H , the initial letter of the difcoverer's name, and a crofs to fhow that it is a Chriftian planet. From many calculations of our beft altrono-

\section*{S 1 E}
mers and mathematicians, fays Dr Herfchell, I have collected the following particulars, as molt to be depended upon.
\begin{tabular}{|c|c|c|}

\hline Revolution & 83. & 64 fiderial years. \\
\hline
\end{tabular}

From my own ohfervations on this planet's apparent diameter, which I have found cannot well be lefs than \(4^{\prime \prime}\), nor indeed much greater, we infer, that its real diameter is to that of the earth as 4,454 to 1 ; and hence it appears to be of very confiderable bulk, and, except Saturn and Jupiter, by far the largeft of the remaining planets. Its light is of a bluifh-white colour, and in brilliancy between that of the Moon and of Venus. With a telefcope which magnifies about 300 times, it appears to have a very well defined vifible difk ; but with inftruments of a fmall power, it can hardly be diftinguifhed from a fixed flar of between the fixth and feventh magnitude: In a very fine clear night, when the moon is abfent, it may alfo be feen by the naked eye.

SIEGE, in the art of war, is to furround a fortified place with an army, and approach it by paffages made in the ground, fo as to be covered againft the fire of the place.

SIEGEN, a town of Germany in Wetteravia, with a caftle and the title of a principality, which it gives to a branch of the houfe of Naffaul. It is feated on a river of the fame name, in E. Long. 8. 5. N. Lat. 50.53.

SIENNA, a large, ancient, and celebrated city of rufcany in Italy; capital of the Siennefe, with an archbifhop's fee, a famous univerfity, and a citadel. It is about four miles in circumference, and furrounded with an old wall. The metropolitan church is much efteemed by travellers; and though it is a Cothic fructure, the architecture is admirable. It is built with black and white marble, and the pavement is of Mofaic work. The town is adorned with a great number of palaces, fountains, and fuperb churches, as alfo a magnificent hofpital. The great area is round, and the houfes about it are of the fame heisht, fupported by piazzas, under which people may walk in hot or rainy weather ; in the middle is a bafon, which can be filled with water at any time, to reprefent a fea.fight with fmall veffels. The Italian language is taught here with fuch purity, that a great many foreioners frequent it on that account. It is feated on three eminences, in a fertile foil, in E. Long. 11. 11. N. Lat. 43. 10.
SIENNESE, a duchy in Italy; bounded on the north by the Florentino, on the fouth by the Mediterranean fea and the duchy of Caftro, on the eatt by the Perugino and Orvietano, and on the weft by the Florentino and the Tufcan fea; being about 55 miles in length, and as much in breadth. The foil is pretty fertile, efpecially in mulberry trees, which feed a great number of filk-worms; and there are feveral mineral fprings. Sicuna is the capital town.

SIERRA leona, a large country on the weft coaft of Africa, which fome extend from the Grain Coalt
on the fouth ealt to Cape Verga or Vega on the north. welt, i. e. between \(7^{\circ}\) and \(10^{\circ} \mathrm{N}\). Lat. Others, how: ever, confine the country between Cape Verga and Cape Tagrin. There runs through it a great river of the fame name, of which the fource is unknown, but the mouth is in longitude 12.30. weit, lat. 8.5. north, and is nine miles wide. 'The climate and foil of this tract of country appear to be, on both fides of the river, among the beft in Africa, or at leaft the moft favourable to European conttitutions. The heat is much the fame as that of the Weft Indies; but on the higher grounds there is a cool fea breeze, and in the mountainous parts the air is very temperate. According to Lientenant Matthew, "Sierra Leona, if properly cleared and cultivated, would be equal in falubrity and fuperior in produce to any of the iflands in the Weft Indies ;" and others have affirmed, that " the air is better for a man's health than in many places of Europe.". Thefe advantages of climate induced the Englifh to eftablifh a factory at Sierra Leona; but they chofe not the moft healthful fituation. For the benefit of a fpring of good water they fixed their refidence in a low valley, which is often overfpread with mifts and noifone vapours, while the air is clear and ferene on the fummits of the hills, to which water from the well might be eafily carried.
The animal productions of this country are lions, from which it has its name; leopards, hyænas, mufk cats, and many kinds of weafels; the japanzee or chim. panzee, a fpecies of fimia, which has a fill more firiking refemblance to the human figure than even the ouran outang; porcupines, wild hogs, fouirrels, and antelopes. Befides thefe, which are natives of the country, oxen thrive in it, and even grow fat: affes too are employed in labour, and do not fuffer by the climate ; but fheep fuffer much from the heat, change their wool into hair, grow lean and increafe very little; white the hardy goat is here as prolific and large as in any other country. Of the birds which frequent the woods of Sierra Leona we can give no perfeet account. A rpecies of crane is mentioned as eafily tamed; comand poultry multiply falt ; ducks thrive well, but geefe and turkeys feem not to agree with the climate. Tur-
tles of all kinds are very common large forl kinds are very common, and fometimes of a species have been found ten alligators of a non-defeript lizards of fix different fpecies. Snakes in length, and moft innumerable, haunt the houfes in the nigh alfearch of poultry; and one was obferved whight in fured 18 feet, but was happily found not to beaous. Fifhes are in great variety both in the fea and inthe rivers. Befides the whale, the fhark, flinging ray, and porpoife, there are eels, horfe-mackarcl, tarpoons, cavillos, mullets, fnappers, yellow-tails, old-maids, tenpounders, and fome other fifhes; all of which, except the eels and ten-pounders, are efteemed fine eating. Oyfters are found in great abundance, and another fhellfifh, which the natives eat. Among the zoophites, none is more worthy of notice than the common fponge, which covers all the fandy beaches of the river, particularly on the Bullom fhere, and would fetch a highz price in Great Britain.
Of the numerous vegetable productions of Sierra Leona, our limits will permit us only to mention the following. Rice, which is the plant chiefly cultivated, as the natives fubfift almoft entirely upon it, grows both
in the high and low grounds. It profpers indeed bel in fwamps, though the grain is better in a drier foil. Next to rice the caffada confitutes the chief food of the inhabitants, and is cultivated with great care. The country likewife produces yams, various kinds of potatoes, eddoes, or the arum efculentum. Oil-palm, plantains, and bananas; papaw, guava, oranges and limes; pompions, melons, and cucumbers; pine-apples, pigeonpeas, which dreffed like Englifh peas are a good pulfe; maize or Indian corn ; millet, cocoa-nut trees; ockra; the tallow-tree; a great variety of tamarinds; different kinds of fig-trees and plums ; a kind of fruit refembling grapes, but more acid and acrid ; cherries refembling a fine nectarine in tafte; a fpecies of the bread fruit-tree; the crean fruit, fo called becaufe when wounded it yields a fine white juice refembling fugar or the beft milk, of which the natives are very fond ; the malaguetta pepper, or grains of paradife; a new fpeciés of nutmeg, but whether fo good as the common fort has not yet been afcertained; a new fpecies of the Peruvian bark, which it is hoped will prove as ufeful as the other ; and cola, a fruit highly efteemed by the natives for the fame virtnes with that bark; the ricinus, caffia, dyeItuffs, and gums, of great value ; cotton, tobacco, and fugar-canes, which, it is thought, would thrive exceed. ingly well under proper cultivation.
Confidering the ardour of the maritime nations of Europe for fettling colonies in diftant regions of the globe, it is fomewhat furprifing that a climate fo temperate and a foil fo productive as that of Sierra Leona did not long azo attract their rotice. But it was left to be colonized for a better purpofe than that which firft drew the natives of Europe to the Weft Indies and the American continent. Being thinly inhabited, Sierra Leona appeared to fome benevolent gentlemen in England a place where, without incommoding the natives, a fufficient quantity of ground might be bought on which to fettle a great number of free negroes, who in \({ }_{1} 786\) fwarmed in London in idlenefs and want. About 400 of thefe wretches, together with 60 whites, moltly women of bad character and in ill health, were accordingly fent out, at the charge of government, to Sierra Leona. Neceffity, it was hoped, would make them induftrious and orderly; and Captain Thomfon of the navy, who conducted them, obtained, for their ufe, a grant of land to his majefty from king Tom, the neighbouring chief, and afterwards from Naimbanna, the king of the country. 'I'he colony, however, foon went to ruin; but the land which they occupied being aboit 20 miles fquare, his majefty was enabled to grant by act of parliament to another colony founded on bet. ter principles and for aftill nobler purpofe.
The moft intelligent members of that fociety, which has laboured fo ftrenuonfly to procure an abolition of the flave-trade, juftly concluding that the natives of Gninea would reap very little benefit from the attain--ment of their object, unlefs they fhould be taught the principles of religion and the arts of civil life, which alone can render them really free, conceived the plan of a colony at Sierra Leona to be fettled for the truly generous purpofe of civilizing the Africans by maintaining with them a friendly iutercourfe, and a commerce in every thing but men. This plan could not be carried into effect but at a very great expence. Subfcriptions were therefore opcued-upon rational and equitable
terms, and a fum deemed fufficient was fpeedily raifed. \(A_{n}\) act of parliament was paffed in favour of the fubfcribers, by which they were incorporated by the deno. mination of the Sierra Leona Company ; and in purfuance of that act they held their firft meeting at London or the 19th of October 1791, when the following gentlemen wore chofen directors for that year.
" Henry Thornton, Efq; M. P. chairman - Philip Sanfom, Efq; deputy chairman-Sir Charles Middle. ton, Bart.-Sir George Young, Knt.-William Wilberforce, Efq; M. P.-Rev. Thomas Clarkfon, A. M. -Jofeph Hardcaftle, Efq; John Kington, Efq; Samuel Parker, Efq;-Granville Sharp, Efq;-William Sandford, Efq; - Vickeris Taylor, Efq;-GeorgeWolf,
Efq."

The directors having fated the natural advantages of Sierra Leona, and its prefent miferable condition, obferved, that they had not merely to eftablifh a com mercial factory, but that, to introduce civilization, cultivation, and a fafe trade, the company muft provide for the fecurity of the perfons and property of the colonifts. The directors therefore refolved, that three or four veffels fhould fail at once, with fuch a number of people as would be able to protect and affitt each other; with goods both for trade and for the fupply of the colony. Accordingly feveral veffels failed, having on board a council for the goverument of the colony and the management of the company's affairs; a number of artificers and other fervants of the company ; fome foldiers, and a very few Englifh fettlers. 'The directors were laudably cautious in the choice of colonifts. 'I'hey admitted into the fociety no white man of bad charace ter, or who was not a declared enemy to the flave-trade; and as the chief object of their enterprife was the civilization of the natives, it was with great propriety that they chofe more than three-fourths of their fettlers from the free negroes in Nova Scotia, who had borne arms for the Britifh government during the American war. The fuperintendant and conncil were particularly inftructed to fecure to all blacks and people of colour, at Sierra Leona, equal rights and equal treatment, in all refpects, with whites. They were to be tried by jury, as well as others; andithe council was defired to allot to the blacks employments fuited to their prefent abilities, and to afford them every opportunity of cultivating their talents. All practicable means of maintaining fubordination were directed to be ufed; and the council was efpecially inftructed to promote religion and morals, by fupporting public worflip and the due obfervance of the Sabbath, and by the inftruction of the people, and the education of children. But no peifon was to be prevented from performing or attending religious worfhip in whatever place, time, or manner, he might think fit, or from peaceably inculcating his own religious opinions. Orders were given in choofing the fcite of a town, to confider health as the firtt object; and the firt town was directed to be called Free-Town. Articles for building and cultivation were fent out, befides the cargoes for profecuting the company's commerce; and fchools for reading, writing, and accounts, were ordered to be fet up for the purpofe of inftructing the children of fuch natives as fhould be willing to put them under the company's carè.
The leading object of the company was to fubftitute, for that difgraceful traffic which has too long fubfifted,

\section*{S I E \(\quad\) 「. 4651 S I E}
a fair commerce with Africa, and all the bleffings which might be expected to attend it. Confiderable advantages appeared hereby likely to refulc to Great Britain, not only from our obtaining feveral commodities cheaper, but alfo from opening a market for Britifh manufactures, to the increafing demands of which it is difficult to affign a limit. From this connection, Africa was likely to derive the fill more important benefits of religion, morality, and civilization. To accomplifh thefe purpofes, it was neceflary for the company to poffefs a tract of land, as a repofitory for their goods, and which the Africans might cultivate in peace, fecure from the ravages of the flave.trade. It liad been afcertained, beyond a doubt, that the climate and foil of Africa were admirably fuited to the growth of fugar, fpices, coffee, cotton, indigo, rice, and every other fpecies of tropical produce. The company propofed to inftruet the natives to raife thefe articles, and to fet them the example; by a firited cultivation, on its own account. Directions were given to the company's commercial agent to pufh forward a trade, in a mode prefcribed, in the prefent produce of Africa. Meafures were taken for cultivating, on the company's account, the moft profitable tropical produce ; and in particular, a perfon of long experience in the Weft Indies was ordered to begin a fugar plantation. A mincralogit and botanift were likewife engaged to go out and explore the country for new articles of commerce.

Every thing being thus fettled upori the moft equitable and benevolent principles, the fhips failed with the Britilh colonifts, to whom, in March 1792, werc added II 3 I blacks from Nova Scotia. The native chiefs being reconciled to the plan, and made to underftand its beneficent tendency towards their people, the colony proceeded to build Free-Town, on a dry and rather elevated fpot on the fouth fede of the river. It occupied hetween 70 and 80 acres, its length being about one. third of a mile, and its breadth nearly thc fame; and it contained near \(40 \circ\) houfes, each laving one-twelfth of an acre annexed, on which a few vegetables were raifed. There were nine ftreets running from north-weft to foutheaft, and three crofs ftreets, all 80 feet wide, exccpt one of r 60 feet, in the middle of which werc all the public buildings. Thefe conlifted of a governor's houfe and offices; a large ftore-houfe; a large hofpital ; fix or eight other houfes, offices, and fhops, occupied by the company's fervants; and a church capable of containing 80 people. The colonits at firft fuffered much from the rainy feafon, egainft which it was not in their power to provide fufficient protection ; but at the end of it they iecovered in a great meafure their bealth and fpirits, an? proceeded with alacrity to execute the varions purpofes of their fettlement. To excite emulation in culture, the government gave premiums to thofe colonitts who raifed the greateft quantities of rice, yams, eddoes, cabbages, Indian corn, and cotton, refpectively. To limit the exceffies of the flavc-strade, and gain the favour of the neighbouring chiefs, the directors inftrused the governor and council to redeem any native from the reighbourhood, who flould be unjuftly fold either to or by a Britith fubject. The fervants of the company conducted then?elves with the utmoft propriety, being fober, moral, and exemplary ; and from the labours of the clergymen were derived fervices highly important in every point of view. Befure the end of two years Vol. XVII. Part II.
from the inflitution of the colony, order and indultry had begun to fhow their effects in an increaling profperity. The woods had been cut down to the difance of about three Englifh miles all round the town. By thefe means the climate had become healthier, and ficknels had diminifhed. The fame of the colony had fpread not ouly along the whole weftern coaft of Africa, but alfo to parts far diftant from the coalt ; embaffies had been received of the moft friendly nature from kings and princes feveral hundred miles diftant; and the native chiefs had begun to fend their children to the colony, with full confidence, to be taught reading, writing, and accounts, and to be brought up in the Chriltian religios. In a word, it was not without grounds that the directors looked forward to that joyful period when, by the influence of the company's meafures, the continent of Africa fhould be refcued from her prefent flate of darknefs and mifery, and exhibit a delightful fcene of light and knowiedsc, of civilization and order, of peaccful induftry and domeftic comfort. On their beneficent exertions they hoped with confidence for the bleffing of Providence ; they werc countenanced and fupported by the Britifh government; and upon the breaking out of the prefent war, the French Convention authorifed one of their agcuts to write to the directors, requefting a full account of the defign of the inftitution, and the names of the fhips employed in their fervice, and affuring them of the good wifhes of the French government to fo noble an undertaking. How completely that government fulfilled its promife is very generally known. Having vindicated the rights of man in Europe by the violation of every principle of truth and juftice, they dctermined by the fame means to give light and liberty to the Africans; and that they have fully carried their deternination into effect will be feer by the following extract of a letter from Mr Afzelius, thic company's botanift, dated Sierra Leona, 15 th November r 794 . "The Warfirams French have been here and have ruined us. They ar- Part 11. rived on the 28 th of September latt, early in the morn-p. 280 . ing, with a fleet confifting of one large fhip, two frigates, two armed brigs, and one cutter, tofether with two large armed merchant fhips, taken by them at the Ines de Lofs, an Englifh flave factory to the north of our colony, and which they have alfo deftroyed and burnt. So well had they concealed their nation, that we took them at firtt for Englifh. They had Englifhbuilt veffels, which were riggred in the Englith way. They fhowed the Englifh flag, and had their failors, at leaft thofe we faw on deck, dreffed like Englifh. In fhort, we did not perceive our miftake till we obferved them pointing their guns. We had not flrength fufficient to refilt, and therefore our governor gave orders, that as foon as they thould begin to fire, tlie Britith flag fhould be ftruck, and a flag of truce hoifted. Accordingly this was done, but ftill they continued firing, and did much damage; both within and without the town. They killed two people and wounded three or four. But, as we did not underttand the meaning of this proceeding, we afked them for an explanation ; and they anfwered us, that we fhould difplay the flag of liberty, as a proof of our fubmiffion. We affured them that it thould already have been done, if we had had any, which terminated the hoftilities from the fhips. In the mean time, moft of the inlabitants had fled from the the town, having taken with them as much of their

3 N property:

\section*{S I [ \(\quad\left[\begin{array}{lll}66\end{array}\right] \quad\) S I F}

Sierra.

\section*{Sich}
property as they conveniently could in fuch a hurry. I reit; deprived him of his trunks, his clothes, and his was with the governor, tegether with a number of 0 . thers ; but as fonn as I was certain they were enemies, I went towards my own houfe with a view to fave as much as poffible of my property and natural collections; but was received in fuch manner, that I could not venture to proceed. My honfe was fituated near the fhore, and unfortunately jult oppofite the frigate which fired. I faw the balls paffing through the houle, and heard them whizzing about my ears. I faw that I fhould lofe all iny property; but lite was dearer to me, and I haftened to the woods.
"In the afternoon the enemy landed, finding the town 2hnoft deftitute of people, but rich in provifions, clothing, and other itores. 'They began immediately to break open the houkes and to plunder. What they did not want, they deftroyed, burnt, or threw into the river. They killed all the cattle and animals they found in the fields or ftreets, yards, or elfewhere, not fparing even affes, doss, and eats. Thele proceedings they contimed the whole fucceeding week, till they had entirely ruined our beautiful and profpering colony; and when they found nothing more worth plundering, they fet fire to the public buildings and all the houfes belonging to the Europeans; and burnt, as they faid, by miftake nine or ten houfes of the colcnifts. In the mean time, they were not lefs active on the water. They fent three of their veffels to Bance ifland, an Englifh Gave factory hisher up the river, which they plundered and burnt, together with fome flave fhips lying there. 'they took befides abont 10 or 12 prizes, including the company's veffels. Moft of thefe they unloaded and burnt. They took along with them alfo two of our armed veffels, one of which was a large fhip, laden with provifons, and which had been long expected; but the unfortunately arrived a few days too foon, and was taken with her whole cargo. We expected at leaft to receive our private letters, but even this was refufed, and they were thrown overboard. At laft, after inficting on nes evely hardfhip we conld fuffer, only fparing our lives and the honfes of the colonits, they failed on the \(13^{\text {th }}\) of October laft, at noon, proceeding downwards to the Gold Coalt, and left us in the molt dread. ful fituation, withont proviions, medicines, clothes, houfcs, or furniture, \&xc. \&xc. and I fear much, that moft of us fhouid have perifhed, had not our friends in the neighbourhood, both natives and Europeans, who were fo happy as to efeape the enemy, been fo kind as to fend us what they could fpare. In the mear time, moft of us have either been, or ftill are, very fick, and many have died for want of proper food and medicine. The wort, however, is now paft. At leaft we are not in iny want of provifion, although of the coarfeft kind, but are dellitute of the moft necelfary articles and utenfils for the houfe, the table, and the kitchen."

It was thus that the Convention executed their purpole of fpreading light and liberty through the world. The Sierra Leona colony was eflablifhed for no other end than to abolifh the flave-trade, to enlighten the Africans, and to render them virtuous, rational, frec, and bappy; and thofe powerful patrons of the rights of man deftroyed that colony with many circumftances of the moft wanton cruelty. Though Mr Afzelius is a Swede, and ought therefore to have been protected by the laws of neutrality, they burnt his houfe with the
bed ; deftroyed the natural curiolities which he had collected at the hazard of his life; and carried away the inftruments by neans of which only he could collect more. It is with pleafure, however, that we learn from the proceedings of the general court held on the 25 th of February 1795, that the directors do not yet defpair of the colony; and 'that they have adopted the mot prudent meafures to avert all fuch calamities in fiture. That their benevolcut labours may be finally crowned with fuccefs is our earneft prayer, in which we thall, doubtlefs, be joined by every good Cliritian.

SIERRA morena, inountains of Andalufia in Spain.

SIEUR, a title of refpect among the French like that of mafler among us. It is much ufed by lawyers, as alfo by fuperiors in their letters to inferiors.

SIFANTO, or Siphanto, an itland of the Archipelago, to the weft of Paros, to the north-ent of Milo, and to the fouth-welk of Serphanto. The air is fo good here, that many of the inhabitants live to the age of 120 ; and their water, fruits, wild fowl, and poultry, are excellent, but more efpecially the grapes. It abounds with marble and granire, and is one of the moft fertile and beft cultivated of thefe iflands. The inliabitants employ themfelves in cultivating olive-trees and capers; and they have very good filk. 'Ihey trade in figs, onions, wax, honey, and fraw-hats; and may be about 8000 in all. E. Long. 25. 15. N. Lat. 37. 9.

SI-FANS, or TOU-FANs, a people inhabiting the country on the weft of China. Their country is only Grene a continued ridge of mountains, inclofed by the rivers \(D_{e}\) Hoang-ho on the north, Ya-long on the weft, and of Yang.tfe.kiang on the eaft, between the 30 th and 35 th degrees of north latitude.

The Si-fans are divided into two kinds of people: the one are called by the Chinelc Black Si-fans, the other Yellow ; Hames which are given them from the different colours of their tents. The black are the moft clownifh and wretched; they live in fmall bodies, and arc governed by petty chiefs, who all depend upon a greater.

The yellow Si-fans are fubject to families, the oldeft of which becomes a lama, and affumes the yellow drefs. Thefe lama princes, who command in their refpective diftricts, have-the power of trying caufes, and punifhing criminals ; but their government is by no means burdenfome; provided certain honours are paid them, and they receive punctually the dues of the god \(\mathrm{FO}_{3}\) which amount to very little, they moleft none of their fubjects. The greater part of the Si-fans live in tents; but fome of them have houfes built of carth, and even brick. Their habitations are not contiguous; they form at moft but fome fmall hamlets, confifting of five or fix families. 'They feed a great number of flocks, and are in no want of any of the neceffaries of life. The principal article of their trade is rhubarb; which their country produces in great abundance. 'I'heir horfes are fmall; but they are well fhaped, lively, and robuft.

Thefe people are of a proud and independent fpirit, and acknowledge with reluctance the fuperiority of the Chinefe government, to which they have been fubject. ed: when they are fummoned by the mandarins, they rarely appear; but the government, for political reafons,

\section*{S I G \(\left[\begin{array}{lll}467\end{array}\right] \quad\) S I G}

Itian winks at this contempt, and endeavours to keep thef intractable fubjects under by mildnefs and moderation : it would, befides, be difficult to employ rigorous means in order to reduce them to perfect obedience; their wild and fri huful mountains (the tops of which are always covered with fnow, even in the month of July) would afford them places of fhelter, from which they could never be driven by force.

The cuftoms of thefe mountaincers are totally different from thofe of the Chinefe. It is, for example, an act of great politenefs among them to prefent a white handkerchief of taffety or linen, when they accoft any perfon whom they are definons of honouring. All their religion confifts in their adoration of the god Fo, to whom they have a fingular attachment : their fuperftitious veneration extends even to his minifters, on whom they have confidered it as their duty to confer fupreme power and the government of the nation.

SIGAULTIAN operation, a method of delivery in cafes of difficult labour, firft praetifed by M. Sigault. It confifts in enlarging the dimenfions of the pelvis, in order to procure a fafe paffage to the child without infuring the mother. See Midwifery, chap. vii.

SIGESBECKIA, in botany: A genus of plants belonging to the clafs of fyngenefia, and to the order of polygamia fuperflua; and in the natural fyftem ranging under the 49 th order, Compofita. The receptacle is paleaccous; the pappus is wanting; the exterior calyx is pentaphyllous, proper, and fpreading; the radius is halved. There are three fpecies: I. T'he orientalis, which is a native of India and China. 2. The occidentalis, which is a native of Virginia. 3. The fofculofa, a niative of Peru.

SIGETH, a town of Lower Hungary, and capital of a county of the fame name. It is feated in a morafs, and has a triple wall, with ditches full of water ; and is defended by a citadel, being one of the ftrongeft places in Hungary. It now belongs to the houfe of Aur ftria, and was retaken from the Turks in 1669 , after it had been blocked up two years. In fome maps it is called Zigat. E. Long. 18. 58. N. Lat. 46. I7.

SIGHING, an effort of nature, by which the lungs are put into greater motion, and more dilated, fo that the blood pafles more freely, and in greater quantity, to the left auricle, and thence to the ventricle. Hence we learn, fays Dr Hales, how fighing increafes the force of the blood, and confequently proportionably cheers and relieves nature, when oppreffed by its too now motion, which is the cafe of thofe who are dejected and fad.

SIGH'I, or Vision. Sec Anatomy, ne 142. and Index fubjoined to Optics.

Imperffedion of Sighs with regard 10 Colours. Under the article Cozours, is given an inftance of a frange deficiency of lisht in fome people who could not diftinguifh between the different colours. In the Phil. Tranf. Vol. LXVIII. p. 611. we have an account of a gentleman who could not diftinguifh a claret colour from black. Thefe imperfections are totally unaceountable from any thing we yet know concerning the nature of this fenfe.

Secont Sight. See Second Sight.
SIGN, in general, the mark or character of fomeehing abient or invifible. See Character.

Among phyficians, the term lign denotes fome appearance in the luman body which ferves to indicate or
point out the condition of the patient with regard to health or difeafe.

Sign, in algebra. See Algebra, Part I.
\(\mathrm{SIGN}_{\mathrm{I}}\), in aftronomy, a conftellation containing a 12 th part of the zodiac. Sce Astronomy, \(n^{\circ} 318\).

Naval SIGNALS. When we read at our firefide the account of an engagement, or other interefling opcration of an army, our attention is generally fo much engaged by the refults, that we give but little to the movenents which led to them, and produced them, and we feldom form to ourfelves any diftinct notion of the conduet of the day. But a profeffional man, or one accultomed to reflection, and who is not fatisfied with the mere indulgence of eager curiofity, follows every regiment in its movements, endeavours to fee their connection and the influence which they have had on the fate of the day, and even to form to himfelf a general notion of the whole fcene of action at its different interefting periods. He looks with the eye of the general, and fees his orders fucceed or fail.

But few trouble themfelves farther about the narration. The movement is ordered; it is performed; and the fortune of the day is determined. Few think how all this is brought about; and when they are told that during the whole of the battle of Cuftrin, Frederic the Great was in the upper room of a country inn, from whence he could view the whole field, while his aids de camp, on horfeback, waited his orders in the yard below, they are ftruck with wonder, and can hardly conceive how it can be done : but, on reflection, they fee the poffibility of the thing. Their imagination accompanies the meffenger from the inn yard to the fcene of action; they hear the General's orders delivered, and they expect its execution.
But when we think for a moment on the fituation of the commander of a fleet, confined on board one fhip, and this fhip as much, or more clofely, engaged, than any other of the flect; and when we reflect that here are no meffengers ready to carry his orders to hips of the fquadron at the diftance of miles from him, and to deliver them with precifion and diftinctnefs, and that even if this were poffible by fending fmall fhips or boats, the vicifitudes of wind and weather may sender the communication fo tedious that the favourable moment may be irretrievably loft before the order can be conveyed. - When we think of all thefe circumftances, our thoughts are bewildered, and we are ready to imagine that a fea-battle is nothing but the uneonnected ftruggle of individual flips ; and that when the admiral has once " cried havoc, and let flip the dogs of war," he has done all that his fituation empowers him to do, and he mufl leave the fate of the day to the bravery and fkill of his captains and failors.

Yet it is in this fituation, apparently the moft unfa- signals a vourable, that the orders of the commander can bela'izuage conveyed, with a difpatch that is not attainable in the to the eye. operations of a land army. The feene of action is unincumbered, fo that the eye of the General can behold the whole without interruption. The movements which it is poffible to exccute are few, and they are precife. A few words are fufficient to order them, and then the mere fighting the flips muft always be left to their refpective cornmanders. This fimplicity in the duty to be performed has enabled us to frame a language fully adequate to the bufinefs in hand, by whieh a correfpondence can be kept up as far as the eye can fee. This is

\section*{5 I G [ 468 ] S I G}

Naval the language of signals, a language by writing, addrefSigralss, fed to the eye, and which he that runneth may read. As in common writing certain arbitrary marks are agreed on to exprefs certain founds ufed in fpeech, or rather, as in hieroglyphics certain arbitrary marks are agreed on to exprefs certain thoughts, or the fubjects of thefe thoughts; fo here certain exhibitions are made, which are agreed on to exprefs certain movements to be executed by the commander to whom they are addreffed, and all are enjoined to keep their eyes fixed on the fhip of the conductor of the fleet, that they may learn his will.

Ifed in
ancient times,

It is fcarcely poffible for any number of fhips to act in concert, without fome fuch mode of communication between the general and the commanders of private fhips. We bave no direct information of this circumflance in the naval tactics of the ancient nations, the Greeks and Romans ; yet the neceflity of the thing is fo apparent, that we cannot fuppofe it to have been mimitted by the mof ingenious and the moft cnltivated people who have appeared on the great theatre of the world; and we are perfuaded that Themiftocles, Conon, and other renowned fea commanders of Athens, had fignals by which they directed the movements of their fleets. We read, that when Egeus fent his fon Thefeus to Crete, it was agreed on, that if the fhip fhould bring the young prince back in fafety, a white flag fhould be difplayed. But thofe on board, in their joy for revifiting their country after their perilous voyage, forgot to hoift the concerted fignal. The anxious father was every day expecting the fhip which fhould bring back his darling fon, and liad gone to the fhore to look out for her. He faw her, but without the fignal agreed on. On which the old man threw himfelf into the fea. We find, too, in the hiftory of the Punic wars by Polybius, frequent allufions to fuch a mode of communication; and Ammianus Marcellinus fpeaks of the fpeculatores and vexillarii, who were on board the fhips in the Adriatic. The coins both of Greece and Rome exhibit both flags and ftreamers. In fhort, we cannot doubt of the ancients having practifed this hieroglyphical language. It is fomewhat furprifing that Lord Dudley, in his Arcano del Mare, in which he makes an oftentatious difplay of his knowledge of every thing conneeted with the fea fervice, makes no exprefs mention of this very effential piece of knowledge, although he muft, by his long refidence in Italy, have known the marine difcipline of the Venetians and Genoefe, the greateft maritime powers then in Europe.

In the naval occurrences of modern Europe, mention is frequently made of fignals. Indeed, as we have already obferved, it feems impoffible for a number of fhips to act in any kind of concert, without fome method of communication. Numberlefs fituations muft occur, when it would be impoffible to convey orders or information by meffengers from one fhip to another, and coaft and alarm fignals had long been practifed by every nation. The idea was, therefore, familiar. We find, in particular, that Queen Elizabeth, on occafion of the expedition to Cadiz, ordered her fecretaries to draw up inftructions, which were to be communicated to the admiral, the general, and the five counfellors of war, and by them to be copied and tranfmitted to the feveral Mips of the navy, not to be opened till they fhould arrive in a certain latitude. It was on this occafion, 'fays our hiftorian Guthrie), "that we meet
with the firfl regular fets of fignals and orders to the coms. manders of the Englifh fleet. But, till the movements of a fleet have attained fome fort of uniformity, regulated and connected by fome principles of propriety, and agreed on by perfons in the habit of directing a number of fhips, we may with confidence affirm that fignals would be nothing but a parcel of arbitrary marks, appropriated to particular picces of naval fervice, fuch as attacking the enemy, landing the foldiers, Ecc.; and that they would be confidered merely as referring to the final refult, but by no means pointing out the mode of exerution, or directing the movements which were neceffary for performing it.

It was James II. when duke of York, who firlt But firl confidered this practice as capable of being reduced in-formed in to a fyftem, and who faw the importance of fuch a to a fy ferm compolition. He, as well as the king his brother, had by Jamestl always fhowed a great predilection for the fea fervice; when duk and, when appointed admiral of England, he turned his whole attention to its inprovement. He had ftudied the art of war under Turenne, not as a paltime, but as a fcience, and was a favourite pupil of that moft accomplifhed general. Turenne one day pointed him out, faying, "Behold one who will be one of the firft princes and greatelt generals of Europe." When admiral of England, he endeavoured to introduce into the maritime fervice all thofe principles of concert and arrangement which made a number of individual regiments and fquadrons compofe a great army. When he commanded in the Dutch war, he found a fleet to be little better than a collection of hips, on board of each of which the commander and his thip's company did their beft to annoy the enemy, but with very little dependence on each other, or on the orders of the Gene. ral ; and in the different actions which the Englifh fleet. had with the Dutch, every thing was confufion as foon as the battle began. It is remarkable that the famous penfionary De Witt, who from a tarefman became a navigator and a great fea commander in a few weeks, made the fame reprefentation to the States General on his re* turn from his frit campaign.

In the memoirs of James II. written by himfelf, we have the following paffage: " 1665 . On the 15 th of March the duke of York went to Gunfleet, the general rendezvous of the fleet, and haftened their equipment. He ordered all the flag officers on board with him every morning, to agree on the order of battle and rank. In former battles, no order was kept, and this under the duke of York was the firlt in which fighting in a line and regular form of battle was obferved."

This mult be confidered as full authority for giving the duke of York the honour of the invention. For whatever faults may be laid to the charge of this unfortunate prisice, his word and honour ftands unimpeached. And we are anxious to vindicate his claim to it, becaufe our neighbonrs the French, as ufual, woud take the merit of this invention, and of the whole of naval tactics, to themfelves. True it is, that Colbert, the great and juftly celebrated minifter of Louis XIV. created a navy: for his ambitious and vain-glorious mafter, and gave it a conftitution which may be a model for other nation* to copy. By his encouragement, men of the greateft fcientific eminence were engaged to contribute to its improvement : and they gave us the firlt treatifes of naval evolutions. But it muft ever be remembered, that our accomplifhed, though mifguided fovereign, was then

Waval
refiding at the court of Louis; that he had formerly acted in concert with the French as a commander and flag officer, and was at this very time aiding them with lis knowledge of fea affairs. In the memorable day at La Hague, the gallant Ruffel, obferving one of Tourville's movements, exclaimed, "There! they have got Pepys \(\dagger\) among them." 'this aneccote we give on the anthority of a friend, who heard an old and refpectable officer (Admiral Clinton) fay, that he had it from a gentleman who was in the action, and heard the words fpoken ; and we truft that our readers will not be dif pleafed at having this matter of general opinion eftablifhed ou fome good grounds.

It was on this occafion, then, that the duke of York made the movements and evolutions of a fleet the object of his particular ftudy, reduced them to a fyitem, and compofed that "Syftem of Sailing and Fighting Inftructions," which has ever fince been confidered as the code of difcipline for the Britifh navy, and which has been adopted by our rivals and neighbours as the foundation of their naval tactics. It does great honour to its author, although its merit will not appear very eminent to a carelefs furveyor, on account of that very fimplicity which conftitutes its chief excellence. It is unqueftionably the refult of much fagacious reflection and painful combination of innumerable circumftances, all of which have their influence; and it is remarkable, that although fucceeding commanders have improved the fubject by feveral fubordinate additions, no change has to this day been made in its general principles or maxims of evolution.
Till fome fuch code be eftablifhed, it is evident that firnals can be nothing but arbitrary and unconnected hieroglyphics, to be learned by rote, and retained by me. mory, without any exercife of the judgment ; and the acquifition of this branch of nautical fkill muft be a more irkfome tafk than that of learning the Chinefe writing. But fuch a code being once fettled, the character in which it may be expreffed becomes a matter of rational difcuffion.

Accordingly, the failing and fighting inftructions of the duke of York were accompanied by a fet of fignals for directing the chief or moft frequent movements of the fleet. Thefe alfo were contrived with fo much judgment, and fuch attention to diftinctnefs, fimplicity, and propriety, that there has hardly been any change found neceffary; and they are fill retained in the Britifh navy as the ufual fignals in all cafes when we are not anxious to conceal our movements from an enemy.

Not withftanding this acknowledged merit of the duke of York's fignals, it muft be admitted that great improvements have been made on this fubject, corfidered as an art. The art military has, in the courfe of a century paft, become almoft an appropriate calling, and has therefore been made the peculiar ftudy of its profeffors. Our rivals the French were fooner, and more formally, placed in this fituation, and the miniters of Louis XIV. took infinite and moft judicious pains to make their military men fuperior to all others by their academical education. A more fcientific turu was given to their education, and the affiftance of fcientific men was liberally given them ; and all the nations of Europe muft acknowledge fome obligations to them for information on every thing connected with the art of war. They have attended very much to this fubject, bave greatly improved it, and have even introduced a
new principle into the art ; and by this means have reduced it to the molt fimple form of reference to the code of failing and fighting inftructions, by making the fignals immediately expreffive, not of orders, but of finple numbers. Thefe numbers being prefixed to the various articles of the code of inftructions, the officer who fees a fignal thrown out by the admiral reads the number, and reports it to his captain, perhaps without knowing to what it relates. Thus fimplicity and fecrecy, with an unlimited power of variation, are combined. We believe that M. de la Bourdonnais, a brave and intelligent officer, during the war 1758 , was the author of this ingenious thought.

We do not propofe to give a fyftem of Britifh fignals. This would evidently be improper. But we fall fhow our readers the practicability of this curious lan. guage, the extent to which it may be carried, and the methods which may be practifed in accomplifhing this purpofe. This may make it an object of attention to fcientific men, who can improve it ; and the young officer will not only be able to read the orders of the commander in chief, but will not be at a lofs, fhould circumftances place him in a fituation where he muft iffue orders to others.

Signals may be divided into,
I. Day Signals.
II. Night Signals; and,
III. Signals in a Fog.

They muft alfo be diftinguifhed into, 1. Signals of Evolution, addreffed to the whole Fleet, or to SQuadrons of the flet, or to Divisions of thefe fquadrons. 2. Signals of Migvements to be made by particular fhips; and, 3. Signals of Service, which may be either general or particular.

The great extent of a large fleet, the fmoke in time During an of battle, and the fituation of the commander in chief, engagewho is commonly in the midft of the greateft confufion ment the and hotteft fire, frequently makes it very difficult for the Admithe officers of diftant fhips to perceive his fignals with ral are rediftinctnefs, Frigates, therefore, are ftationed out of reated by the line, to windward or to leevard, whofe fole office it ifigates didis to obferve the admiral's fignals, and inftantly to repeat of the livethem. The eyes of all the fignal officers in the private thips of war are directed to the repeating frigates, as well as to the admiral ; and the officers of the repeating frigate, having no other duty, obferve the admiral incerfantly, and, being unembarraffed by the action, can dif. play the fignal with deliberation, lo that it may be very difinctly feen. Being minately acquainted with the fubftitutions which mult be made on board the admiral when his mafts and rigging are in diforder, his (perhaps imperfect) fignal is exhibited by the repeating frigate in its proper form, fo as to be eafily undertood. And to facilitate this communication, the commanders of the different fquadrons repeat the fignals of the commander in chief, and the commanders of divifion repeat the fignals of the commanders of their fquadron.

8
Every evolution fignal is preceded by a fignal of AD-Evolutione. vertisement and preparation, which is general, and fignals are frequently by a gun, to call attention; and when all the preceded fignals have been made which direct the different parts of adignal of that evolution, another fignal is made, which marks tifement, the clofe of the complex fignal, and divides it from others and accome. which may immediately follow it: and as the orders of panied withic the commander in chief may relate either to the mover fignah. ments of the whole flcet, thofe of a fingle divifion fignah.

\section*{S I G [ 470 ] S I G}

Naval thofe of certain private fhips, the Executive SigSignals.

9
Anfwered by the commander to whom they are addrefted. wal, which dictates the particular movement, is accompanied bya Directive Signal, by which thefe thips are pointed out, to which the order is addreffed.
The commander of the fhip to which any fignal is addreffed, is generally required to fignify by a fignal (which is general) that he has obferved it. And if he does not thoroughly underitand its meaning, he intimates this by another general fignal. And here it is to be obferved, that as foon as the figmal is anfwered by the fhips to which it is addreffed, it is ufual to haul it down, to avoid the confufion which might arife from others being hoifted in the fame placc. The order remains till executed, notwithftanding that the fignal is hauled down:

It may happen that the commander who throws out the fiynal for any piece of fervice, fees reafons for altering his plan. He intimates this by a general Annulling fignal, accompahying the fignal already oiven. This will frequently be more fimple than to make the fignals for the movements which would be required for re-eftablifhing the fhips in their former fituation.

All thefe things are of very eafy comprehenfion, and require little thought for their contrivance. But when we come to the particular evolutions and movements, and to combine thefe with the circumftances of fituastion in which the fleet may be at the time, it is evident, that much reficction is neceffary for framing a body of fignals which may be eafily exhibited, diftinctly perceived, and well underfood, with little rifk of being miftaken one for another. We fhall take notice of the circumftances which chiefly coniribute to give them thefe qualities as we proceed in defcribing their different claffes.
I. Of Day Signals.

These are made by means of the fhip's fails, or by colours of various kinds.

Thofe made with fails are but few in number, and are almoft neceffarily limited to the fituation of a fleet at anchor. Thus,
\begin{tabular}{|c|c|}
\hline The following Signals & ufually fignify, \\
\hline Main top-gallant ftayfail hoifted & Officers and men belonging to the fhip to come on board. \\
\hline Fore top-fail & To prepare for failing. \\
\hline Main top fail loofe & To unmoor. \\
\hline Main top-fail fheets hauled home & To weigh. \\
\hline Main top-fail heets clewed up, and the yard hoitted & Annul the former fignal, and the fhip to come to an anchor. \\
\hline Top-gallant fails loofe, and the fheets flying & Difcovering ftrange fails. \\
\hline Main top-gallant fail loofe and hoifted. Topfailyard down & Recal fhips in chafe. \\
\hline Mizen top fail hoifted, and the fheets clewed up & Moor. \\
\hline
\end{tabular}

Before we proceed to the defcription of the fignals by means of colours, fuch as flags, banners (or triangular flags), pendants or vanes, we muft take notice of the oftenfible diftinctions of the various divifions and
fubdivifions of a fleet, fo that we may underfand how the fame hignal may be addreffed to a Squadron, divifion, or fingle fhip or fhips. We fuppofe it known that a fleet of hips of war is diftributed into three grand divifions (which we fhall term 'quadrons), called the van, centre, and rear. I hefe denominations have not always a relation to the one being more advanced than the other, either towards the enemy, or in the direction of their courfe.

In a land army, the poftion of every part is concei-meaning ved from its reference to the enemy ; and the reader, of the ter conceiving himfelf as facing the enemy, eafily under-van, cent flands the terms van, centre, and rear, the right and left and rear, wing, \&cc. But the movements of a fea army having tha tile at a neceffary dependence on the wind, they cannot befea. comprehended unlefs expreffed in a lanzuage which keeps this circumftance continually in view. The fim: pleft and moft eafly conceived difpofition of a fleet, is that in which it is almoft indifpenfably obliged to form in order to engage an enemy. This is a ttraight line, each thip directly a-head of its neighbour, and clofe hauled. This is therefore called the line of battle. In this pofition, the two extremities of the fleet correfpond to the right and left wings of an army. Suppofe this line to be in the direction eaft and weft, the wind blowing from the north-north-weft, and therefore the fleet on the ftarboard tack ; the fhips heads are to the weft, and the weftermolt divifion is undoubtedly the van of the fleet, and the eaftermoft divifion is the rear. And it is in conformity to this arrangement and fituation that the list of the fleet is drawn up. But the fhips may be on the fame eaft and wefl line, clofe hauled, with their heads to the weft, but the wind blowing from the fouth-fouth-weft. They muft therefore be on the larboard tack. The fame fhips, and the fame divifion, are ftill, in fact, the van or the fleet. But fuppofe the fhips heads to be to the eaftward, and that they are clofe hauled, having the wind from the fouth-fouth eaft or the north-north-eaft, the fhips which were the real van on both tacks in the former fituation are now, in fact, the rear on both tacks; yet they retain the denomination of the van fquadron of this fleet, and are under the immediate direction of the officer of the fecond rank, while the other extremity is under the direction of the third officer. This fubordination therefore is rather an arrangement of rank and precedence than of evolution. It is, however, confidered as the natural order to which the general fignals muft be accommodated. For this reafon, the divifion which is denominated van in the lift of this fleet, is generully made to lead the fleet when in the line of battle on the ftarboard tack, and to form the quentbermoft column in the order of fuiling in columns; and, in general, it occupies that ftation from which it can moft eafly pafs into the place of the leading divifion on the ftarboard line of battle ahead. Although this is a technical nicety of language, and may frequently puzzle a landfman in reading an account of naval operations, the reflecting and intelligent reader will fee the propriety of retaining this mode of conceiving the fubordiuate arrangement of a fleet, and will comprehend the employment of the fignals which are neceffary for re-eftablifhing this arrangement, or directing the movements while another arrangement is retained.

This being underftood, it is eafy to contrive various methods

\section*{S I G}
methads of ditinguifhing every ffifp by the place which fhe occupies in the fleet, both with refpect to the whole line, with refpect to the particular fquadron, the particular divifion of that fquadron, and the particular place in that divifion. This may be done by a combination of the pofition and colour of the pendants and vanes of each fhip. 'Thus the colour of the pendants may indicate the fquadron, their pofition or maft on which they are hoifted may mark the divifion of that fquadron, and a diftinguifhing vane may mark the place of the private flip in her own divifion. The advantages attending this method are many. In a large fleet it would hardly be poffible for the commander in chief to find a fufficient variety of fingle fignals to mark the fhip to which an order is addreffed, by hoi?sing it along with the fignal appropriated to the intended movement. But by this contrivance one-third part of theefe fyynals of addrefs is fufficient. It alfo enables the commander in chief to order a general change of pofition by a fingle fignal, which othervife would require feveral. Thus, fuppofe that the fore, main, and mizen mafts, are appropriated (with the proper modifications) for exhibiting the fignals addreffed to the van, the centre, and the rear fquadrons of the fleet, and that a red, a white, and a blue flare, are chofen for the diftinguifhing flags of the officers commanding thefe fquadrons; then, if the commander in chief. fhall hoift a red flag at his mizen top-gallant maft head, it muft direct the van fquadron to take the pofition then occupied by the rear fquadron, the evolution neceffary for accomplifhings this end being fuppofed known by the commander of the fquadron, who will immediately make the neceffary fignals to the fquadron under his particular direction. In the fame manner, the ditinguifhing fignal for the leading fhip of a fquadron being hoifted along with the fignal of addrefs to the whole fleet, and the fignal for any particular fervice, will caufe the three or the nine leading fhips to execute that order, \&c. \&c.

All that has been faid hitherto may be confidered as fo many preparations for the real iffuing of orders by the commander in chief. The moft difficult part of the language remains, viz. to invent a number of fignals which fhall correfpond to that almoft infinite variety of movements and fervices which muft be performed.

Diftinctnefs, fimplicity, and propriety, are the three effential qualities of all firnals. A fignal mult be fome object eafily feen, ftrongly marked, fo that it may be readily undertood, with little rifk of its being miftaken for another. When made by flags, bauners, or pendants, they mult be of the fulleft colours, and ftiongeft contrafts. The thips are frequently at a very great diftance, fo that the intervening air occalions a great degradation of colour. They are feen between the eye and a very variable fiky; and in this fituation, efpecially in the morning or evening, or a dark day, it is not eafy to diftinguifh one full colour from another, all of them approaching to the appearance of a black. At the diftance of a very few miles hardly any full' colours can be diftinguifhed but a fcarlet and a blue. Red, blue, yellow, and white, are the colours which can be diftinguifhed at greater diftances than any others, and are therefore the only colours admitted as fignals. Even thefe are fometimes diftinguifhed with difficulty. A yellow is often confounded with a dirty white, and a
blue with a red. All other dark colours are found to tally unfit. But as thefc afford but a fmall variety, we mult combine them in one flag, by making it ftriped, fpotted, or chequered, taking care that the oppofition of colour may be as great as poffible, and that the pieces of which the flags are made up may not be too minute. Red mult never be ftriped nor fpotted with blue, and the ftripes, fpots, or chequers, fhould never be lefs than oue-third of the breadth of the flag. Plaie CCCCLXVI. is a lelection by an officer of experience as a let very eafly recoznifed, and little liable to be confounded. Their colours are reprelented by hatching, in the fame manner as in heraldry (See Heraldry).
Difference of hape, as flays, banners, or pendants, is another diftinction by which the expreffion may be varied. And in doing this, we muft recollect, that in light winds it may be difficult to dittinguifh a flag from a banner, as neither are fully difplayed for want of wiud to detach the fly from the ftaff.

And, lafty, fignals may be varied by their pofition, simplicitie which may be on any lofty and well detached part of the malts, yards, or rigging.
Simplicity is an eminent property in all fignals. They are addrefled to perfons not inuch accuftomed tò combinations, and who are probably much occupied by other preffing duties. It were to be wifhed that every piece of fervice could be iadicated by a fin fle flag. This is peculiarly defirable with refpect to the lignals ufed in time of battle. The rapid fucceffion of events on this occafion call for a multitude of orders from the commander in chief, and his thip is frequently clad over with flags and pendants, fo that it is exceedingly difficult for the fignal officer of a private fhip to diftinguifh the different groups, each of which make a particular fignal.
Thefe co

Thefe confiderations are the foundation of a certain And propriety in fignals, which directs us to a choice among prietyo marks which appear altogether arbitrary. Signals which run any rifk of being confounded, on account of fome refemblance, or becaufe their pofition hinders us from immediately perceiving their difference, fhould be appropriated to pieces of fervice which are hardly poffible to be executed, or can hardly be wanted, in the fanse fituation. No bad confequence could eafily refult though the fignal for coming to clofer altion fhould refemble that for unnooring, becaufe the prefent fituation of the fhips makes the laft operation impoffible or abfurd. Such confiderations direct us to felect for battle fi gnals, thofe which are of ealieft exhibition, are the moft fimple, and have the lealt dependence on the circumftance of pofition; fo that their fignification may not be affected by the danages futained in the malts or rigging of the flag fhip. Such fignals as are lefs ealily feen at a diftance, fhould be appropriated to orders which can orcur only in the middle of the fleet, \&c. \&c. Signals which are made to the admiral by private fhips may be the fame with fignals of command from the flag fhip, which will conliderably diminifh the number of fignals perfectly different from each other.

With all thefe attentions and precautions a fyftem of By whar fignals is at laft-made up, fitted to the code of failing nals are and fighting inftructions. It is accompanied by ano-difinctly ther fmall fet for the duty of convoys. It muft be en-sonveyed. groffed in, two books; one for the officer of the flag ihip, who is to make the fignals, and the other is

Navat Signals.
delivered to every private mip. In the Prft, the evolutions, movements, and other operations of fervice, are fet down in one column, and their correfponding fig. nals in another. The firf columa is arranged, either alphaherically, by the diftinguifhing phrafe, or fyttematically, accordin \(y\) to the arrangement of the failing and fighting inftructions. The officer whofe duty it is to nake the fignals, turns to this column for the order whicl he is to communicate, and in the other column he finds the appropriated fignal.

In the other book, which is confulted for the interpretation of the fignals, they are arranged in the leading column, either by the flags, or by the places of their exhibition. The firt is the beft method, becaufe the derangement of the flag fhip's mafts and rigging in time of action may occafion a change in the place of the fignal.

The Tasique Navale of the Chevalier de Morogues contains a very full and elaborate treatife on fignals. We recommend this work to every fea-officer, as full of inftruction. The art of fignals has been greatly fimplified fince the publication of this work, but we cannot but afcribe much of the improvements to it. We believe that the author is the inventor of that fyltematic manner of addreffing the order or efferlive fignal to the different fquadrons and divifions of the fleet, by which the art of fignals is made more concife, the execution of orders is rendered more fyltematic, and the commanders of private fhips are accuftomed to confider themfelves as parts of an army, with a mutual dependence and connection. We are ready enough to acknowledge the fuperiority of the French in manœuvring, but we affect to confider this as an imputation on their courage. Nothing can be more unjuft ; and dearbought experience fhould long ere now have taught us the value of this fuperiority. What avails that courage which we would willingly arrogate to ourfelves, if we cannot come to action with our enemy, or muft do it in a fituation in which it is almoft impoffible to fucceed, and which needlefsly throws away the lives of our gallant crews? Yet this muft happen, if our admirals do not make evolutions their careful fludy, and our captains do not habituate themfelves, from their firlt hoifting a pendant, to confider their own thip as connected with the moft remote fhip in the line. We cannot think that this view of their fituation would in the leaft leffen the character which they have fo juftly acquired, of fighting their thip with a courage and firmnefs unequalled by thofe of any other nation. And we may add, that it is only by fuch a rational ftudy of their profeffion, that the gentleman can be diftinguifhed from the mercenary commander of a privateer.

\section*{II. Night Signals.}

IT is evident, that the communication of orders by night mult be more difficult and more imperfect than by day. We muft, in general, content ourfelves with fuch orders as are neceffary for \({ }^{1}\) eeping the fleet togethe, by directing the more general movements and evolutions which any change of circumftances may ren. der neceffary. And here the divifion and fubordinate arrangement of the fleet is of indifpenfable neceffity, it being hardly poffible to particularife every fhip by a fignal of addrefs, or to fee her fituation. The orders are therefore addrefled to the commanders of the diffe-

\section*{472 S I G}
rent divifions, each of whom is diAinguifthed by his poop and top-lights, and is in the midft of, and not very remote from, the fhips under his more particular charge. Yet even in this unfavourable fituation, it is frequently neceffary to order the movements of particular fhips. Actions during the night are not uncommon. Purfuits and rallyings are ftill oftener carried on at this time. The common dangers of the fea are as frequent and more difaftrous. I'he fyttem of fignals therefore is very incomplete till this part be accomplifhed.
Night fignals muft be made by guns, or by lights, or by both combined.

Gun-fignals are fufceptible of variety both in num. How gu ber and in difpofition. The only diftinct variation which \({ }^{\text {Liguats }}\) n can be made in this difpofition, is by means of the be variec time elapfed between the difcharges. This will eafily admit of three varieties, flow, moderate, and quick.-Half-minute guns are as flow as can eafily be liftened to as appertaining to one fignal. Quarter-minute guns are much better, and adnit of two very diftinct fub. divifions. When the gunners, therefore, are well trained to this fervice (efpecially fince the employment of firelocks for caunon), intervals of 15 or 12 feconds may be taken for flow firing, 8 or 10 feconds for moderate, and 4 or 5 feconds for quick firing. If thefe could be recuced one lalf, and made with certainty and precifion, the expreffion would be incomparably more dittinct. A very fmall number of firings varied in this way will give a confiderable number of fignals. Thus five guns, with the variety of only quick and moderate, will give 20 very diftinguifhable fignals. The fame principle muft be attended to here as in the flag fignals. The moft fimple muft be appropriated to the moit inportant orders, fuch as occur in the wortt weather, or fuch as are moft liable to be mittaken. Quick firing fhould not make part of a fignal to a very diftant fhip, becaufe the noife of a gun at a great diftance is a lengthened found, and two of them, with a very fhort interval, are apt to coalefce into one long continued found. This mode of varying gun-figuals by the time muft therefore be employed with great caution, and we mult be very certain of the fteady performance of the gunners.

Note, that a preparatory fignal or advertifement that an effective fignal is to be inade, is a very neceffary circumftance. It is ufual (at leaft in hard weather) to make this by a double difcharge, with an interval of half a fecond, or at mofl a fecond.

Gun-fignals are feldom made alone, except in ordinary fituatinns and moderate weather; becaufe accident may derange them, and inattention may caufe them to efcape notice, and, once made, they are over, and their repetition would change their meaning. 'They are alfo improper on an enemy's coalt, or where an enemy's cruifers or fleets may be expected.

Signals by lights are either made with LIGHTS fimply signals fo called, \(i\). e. lanthorns thown in different parts of the lights. fhip, or by rockets. Lights may differ by number, and by pofition, and alfo by figure. For the flag thip always carrying poop or top-lights, or both, prelents an object in the darkeft night, fo that we can tell whether the additioual lights are exhibited about the mainmaft, the forematt, the nizenmaft, \&c. And if the lights fhown from any of thefe fituations are arranged in certain diffinguifhable fituations in refpect to each other, the

\section*{\(S\) I G \\ 473 ] S I G} big. number of fignals may be greatly increafed. Thus threc lights may be in a vertical line, or in a horizon. tal line, or in a triangle, and the point of this triangle may be up, or down, or forward, or aft, and thus may have many fignifications.

Lights are alfo exhibited by falfe fires or rockets: Thefe can be varied by number, and by fuch differences of appearance as to make them very ditinguifhable. Rockets may be with flars, with rain fire, or fimple fquibs.

By varying and combining thefe, a very great number of fignals may be produced, fully fufficient to direct every general movement or evolution, or any ordinary and important fervice. The Chevalier de Morogues has given a fpecimen of fuch a fyttem of night fignals, into which he has even introduced fignals of addrefs or direction to every flip of a large fleet; and has alfo given fignals of number, by which depths of foundings, poirts of the compars, and other things of this kind, may be expreffied both eafily and diftinctly. He has made the fignals by rockets perfectly fimilar in point of number to thofe by lanthorns, fo that the commander can take either ; a choice which may have its ufe, becaufe the fignals by rockets may caufe the prefence of a fleet to be more extenfively known than may be convenient.

The commander in chief will inform the fleet by fignal, that guns, or perhaps rockets, are not to be ufed that, night. This fignal, at the fame time, directs the fleet to clofe the line or columns, that the light fignals may be better obferved.

It is indeed a general rule to fhow as few lights as poffible ; and the commander frequently puts out his own' poop and top-lights, only fhowing them from time to time, that his fhips may keep around him.

The fignal lanthorns on board the flag fhip, and a lanthorn kept in readinefs on board of every private fhip, to anfwer or acknowledge fignals from the commander in chief, are all kept in bags, to conceal their lights till the moment they are fixed in their places, and the preparatory or advertifing fignal has been made.

The commander in chief fometimes orders by fignal every flaip to fhow a light for a minute or two, that he may judge of the pofition of the fieet; and the admiral's fignal muft always be acknowledged by thofe to whom it is addreffed.

It is of particular importance that the fleet be kept together. Therefore the leading fhips of the fleet, on either tack, are enjoined to acknowledge the fignals of the commander in chief by a fignal peculiar to their flation. Thus the commander in chief learns the pofition of the extremities of his fleet.

In fralining a fet of night fignals, great attention muft be given to their pofition, that they be not obfcured by the fails. The nature of the order to be given will frequently determine this. - Thus, an order for the year fhips to make more fail, will naturally direct us to exhibit the fignal at the mizen peek; and fo of other pieces of fervice. Lanthorns expofed in groups, fuch as triangles, lozenges, \&c. are commonly fufpended at the corners of large frames of laths, at the diitance of a fathom at leaf from each other. Attempts have been made to fhow lights of different colours; but the rifk of snitake or failure in the compofition at the laboratory,

Vol. XVII. Part II.
makes this rather hazardous. `Coloured lanthorns are Naval Sizmore certain ; but when the glaffes are made of a colour fufficiently intenfe, the vivacity of the light (which at no time is very great) is too much diminifhed. Befides, the very diftance changes the colour exceedingly and unaccountably.

\section*{III. Of Signals in a Fog.}

These can be made only by noifes, fuch as the firing of cannon and mufkets, the beating of drums and ringing of bells, \&c. For fignals are the mott difficult to contrive of any, and are furceptible of the leaft variety. The commander in chief is principally concerned to keep his fleet together ; and unlefs fomethins very urgent requires it, he will make no change in his courfe or rate of failing. But a fhift of wind or other caufes may make this neceffary. The changes which he will order, it will be prydent to regulate by fome fixed rule, which is in general convenient. Thus, when a flect is in the order of failing upon a wind, and a fog comes on, the fleet will hold on the fame courfe. If the wind fhould come a little more on the beam, the fleet will fill keep clofe to the wind. Certain general by obfer rules of this kind being agreed on, no fignals are ne-ving cerceffary for keeping the fleet together; and the fhips can tain genefeparate or run foul of each other only by difference in \({ }^{\text {ral }}\) rumes their rate of failing, or by inaccurate fteerage. To ringal a fog prevent this, the commander in chief fires a gun fromare in many time to time, and the fhips of the flect judge of his ficc.c.ess unnetuation and diftance by the found. The commanders effiry. of divifions fire guns, with fome diftinction from thofe of the commander in chief. This both informs the commander in chief of thic pofition of his fquadrons, and euables the private fhips of each divifion to keep in the neighbourhood of their own flag hip. On board of every private fhip the drum is beaten, or the bell is chimed, every quarter of an hour, according as the fhip is on the flarboard or larboard tack. By fuch contrivances, it is never difficult to keep a fleet in very good order when failing on a wind. The wind is almoft always moderate, and the fhips keep under a very eafy fail. It is much more difficilt when going large, and feparation can be prevented only by the mof unwearied attention. The greateft rifls is the falling in with ftrange fhips fteering another courfe.
But evolutions and other movements are frequently indifpenfable. The courfe mult be changed by tacking or wearing, and other fewices nuutt be performed. None, however, are admitted but the moft probable, the moft fimple, and the moft neceflary.
The commander in chief firt informs the fleet by How they the preparatory fog fignal, that he is about to order an are given evolution, and that he is to direct it by fog fignals. when ne This precaution is indifpenfable to prevent miftakes. ceflary. Along with this advertiling fignal he makes the fignal of the movement intended. This not only calls the attention of the fleet, but makes the fhips prepare for the precife execution of that movement. The commanders of divifions repeat the advertifing fignal, which informs their lhips of their fituation, and the private fhips beat their drums or chime their bells. Thus the whole finips of the fleet clofe a little, and become a little better acquainted with their mutual pofition. It is now underitood that a movement is to be made precife. ly a quarter of an hour after the advertifement. At

30 the

\section*{S I G}

Naval Sig- the expiration of this time, the effective fignal for this nals. movement is made by the commander in chief, and muft be inftantly repeated by the commanders of divifions, and then the movernent mult be made by each fhip, according to the failing and fighting inftructions. 'This muft be done with the utmoft attention and precifion, bocaufe it produces a prodigious change in the relative pofition of the fhips; and even although the good fenfe of the commander in chief will felect fuch movements for accomplifning his purpofe as produce the fmalleft alterations, and the leaft rifk of feparation or ruming foul of each other ; it is ftill extremely difficult to avoid thefe misfortunes. 'l'o prevent this as much as polfible, each thip which has executed the movement, or which has come on a courfe thwarting that of the fleet, intimates this by a fignal properly adapted, often adding the fignal of the tack on which it is now flanding, and even its particular fignal of recognizance. This is particularly incumbent on the flag fhips and the leading thips of each divition.

After a reafonable interval, the commander in chief will make proper fignals for bringing the fleet to a knowledge of their reunion in this new pofition.

This muft ferve for a general account of the circumftances which muft be attended to in framing a code of fignals. The arbitrary characters in which the language is written mult be left to the fagacity of the gentlemen of the profeffion. It mult be obferved, that the ftratarems of war make fecrecy very neceffary. It may be of iminenfe hazard if the enemy fhould underftand our fignals. In time of battle it might frequently fruftrate our attempts to deftroy them, and at all times would enable them to efcape, or to throw us into diforder. Every commander of a fquadron, therefore, iffues private fignals, fuited to his particular deftination ; and therefore it is neceffary that our code of fignals be fufceptible of endlefs variations. 'Ihis is exceedingly eafy without any increafe of their number. The conmmander needs only intimate that fuch and fuch a fignal is fo and fo changed in its meaning during his command.
We cannot leave this article without returning to an obfervation which we made almof in the beginning, viz. that the fyflem of fignals, or, to fpeak more properly, the manner of framing this fyttem, has received much improvement from the gentlemen of the French navy, and particularly from the moft ingenious thought of M. de la Bourdonna:r, of making the fignals the immediate expreffions of numbers only, which numbers may be afterwards ufed to indicate any order whatever. We fhall prefent our readers with a fcheme or two of the manner in which this may be done for all fignals, both day, night, and fog. This alone may be conlidered as a fyttem of fignals, and is equally applicable to every kind of information at a dittance. Without detractisg in the fmallet degree from the praife due to M. de la Bourdonnais, we muft obferve, that this prineiple of notation is of much older date. Bifhop Wilkins, in his Secret and Swift Meffenger, exprefsly recommends it, and gives fpecimens of the manner of execution; fo does Dr Hooke in fome of his propofals to the Royal Society. Gafpar Schettus alfo mentions it in his Technica Curiofla; and Kircher, among others of his Curicus Projects.
M. de la Bourdonnais's method is as follows : He choofes pendants for his effective fignals, becaufe they are the moft eafily difplayed in the proper order. Several pendants, making part of one fignal, may be M. de hoifted by one hallyard, being fopped on it at the di- bourd fance of four or fix feet from each other. If it be nai,'s found proper to throw out another fignal at the fame doing time and place, they are feparated by a red pendant without a point. His colours are chofen with judge. ment, being very diftinctly recosnifed, and not liable to be confounded with the addreffing fignals appropriated to the different thips of the fleet. I'hey are,
For \(\mathrm{N}^{\circ}\) I. Red. For \(\mathrm{N}^{\circ}\) 6. Red, with blue tail.
2. White.
7. White, with blue tail.
3 Blue.
8. White, with red tail.
4. Yellow.
9. Blue, with yellow tail.
5. Red, with
o. Yellow, with blue tail. white tail.

Three fets of fuch pendants will exprefs every number under a thoufand, by hoifting one above the other, and reckoning the uppermoft hundreds, the next below it tens, and the loweft units. Thus the number \(\sigma_{43}\) will be expreffed by a pendant red with blue tail, a yellow pendant below it, and a blue one below the laft.

This method has great advantages. The fignals may be hoifted in any place where beft feen, and therefore the fignification is rot affected by the derangement of the flag fhip's mafts and rigging. And by appropriating the finaller numbers to the battle fignals, they are more fimple, requiring fewer pendants.

As this method requires a particular fet of colours, Migh \({ }^{2}\) it has its inconveniences. An admiral is often obliged rende to fhift his fag, even in time of action. He cannot much eafily take the colours along with him. It is therefore pler b better to make ufe of fuch colours as every private fhip colou is provided with. One fet of II will do, with the ad. dition of tlire, at molt of four pendants, of fingular make, to mark \(100,200,300,400\). Two of thefe flags, one above the other, will exprefs any number under 100, by ufing the IIth as a fublitute for any flas that fhould be repeated. Thus the 1ith flag, along with the flag for eight or for fix, will exprefs the number 88 or 66 , \&c. Thus we are able to exprefs every number below 500, and this is fufficient for a very large code of fignals.

And in order to diminifh as much as poffible the number-of thefe compound fignals, it will be proper that a number of fingle flag fignals be preferved, and even varied by circumftances of pofition, for orders which are of very frequent occurrence, and which can hardly occur in fituations where any obifructions are occalioned by lofs of mafts, \&cc. And farther, to avoid all chance of miftake, a particular fignal can be added, intimating that the fignals now exhibited are numerary fignals; or, which is ftill better, all fiynals may be confidered as numerary fignals; and thofe which we have juft now called fingle flag fignals may be fet down oppolite to, or as expreffing, the largeft numbers of the code.

This method requires the fignal of advertifement, the annulling fignal, the fignal of addrefs to the partir cular fhip or divifion, the fignal of acknowledgment, the fignal of indiftinetnefs, of diftrefs, of danger, and

\section*{S I G}

\section*{S I G}

It is equally eafy to exprefs numbers by night fignals. Naval SigThus M. de la Bourdonnais propofes, that one difcharge of a great gun Rall exprefs 7 , and that \(1,2,3\),
\(\qquad\) 33 4,5,6 thall be exprefed by lights 'Therefore, to ex- Nuniber prefs 24 , we mult fire three guns, and thow three may be alfo lights. This is the moft perfect of all forms of night expreffed and fog fignals. For both the manner of firing guns hignals. and of exhibiting lights may be varied to a fufficient extent with very few guns or lights, and with great diftinctnefs.

Thus, for guns. Let \(F\) mark the firing of a fingle gun at moderate intervals, and \(f f\) a double grn, that is, two difcharged at the interval of a fecond. We may exprefs numbers thus:
\begin{tabular}{ll} 
I & F. \\
2 & \(\mathrm{~F}, \mathrm{~F}\). \\
3 & \(\mathrm{~F}, \mathrm{~F}, \mathrm{~F}\). \\
4 & \(\mathrm{~F}, \mathrm{~F}, \mathrm{~F}, \mathrm{~F}\) \\
5 & \(\mathrm{~F}, f f\). \\
6 & \(\mathrm{~F}, \mathrm{~F}, f f\). \\
7 & \(\mathrm{~F}, f f, \mathrm{~F}\). \\
8 & \(\mathrm{~F}, f f, \mathrm{~F}, \mathrm{~F}\) \\
9 & \(\mathrm{~F}, f f, \mathrm{~F}, f f\). \\
10 & \(f f\). \\
100, \&c. & ff,ff, or \(f f f\).
\end{tabular}

It might be done with fewer guns if the \(f f\) were admitted as the firit firing. But it feems better to begin always with the fingle gun, and thus the double gun beginning a fignal diftinguifhes the tens, \&ic.

In like manner, a fmall number of lights will admit of a great variety of very diftinct pofitions, which may ferve for all fignals to fh ips not very remote from the commander in chief. For orders to be underitood at a very great diftance, it will be proper to appropriate the numbers which are indicated by fiznals made with rockets. Thefe can be varied in number and kind to a fufficient extent, fo as to be very eafily diftinguifhed and underftood. It is fufficient to have fhown how the whole, or nearly the whole, notation of fignals may be limited to the expreffion of numbers.

We have taken little notice of the fignials made by concluding private fhips to the commander in chief. This is a comarks. very eafy bufinefs, becaufe there is little rink of confounding them with other fignals. Nor have we fpoken of fignals from the flag fhips whofe ultimate interpretation is number, as when hips are directed to change their courfe fo many points. Thofe alfo are eafily contrived in any of the methods already defcribed : alfo when a private fhip wifhes to inform the commander in chief that foundings are found at fo many fathoms. In like manner, by numbering the points of the compafs, the admiral can direct to chace to any one of them, or may be informed of ftrange flips being feen in any quarter, and what is their number.

SIGNATURE a dind a fign or mark inpreffed upon any thing, whether by nature or art. Such is the general fignification of the word; but in the plural number it has been ufed, in a particular fenfe, to denote thofe external marks by which phyfiognomifts and other dabblers in the occult fciences pretend to difcover the nature and internal qualities of every thing on which they are found. According to Lavater, cvery corporeal object is characterized by fignaturcs peculiar to itfelf.

The doctrine of fignatures, like alchemy and aftrology, was very prevalent during the 15 th and 16 th centuries; and was confidered as one of the occult fciences which conferred no fmall degree of honour on their refpective profeffors. Some of thefe philofophers, as they thought fit to ftyle themfelves, maintained that plants, minerals, and animals, but particularly plants, had fignatures impreffed on them by the hand of nature, indicating to the adept the tberapeutic ufes to which they might be applied. Others, fuch as the mytic theofophifts and chemitts of that day, proceeded much farther in abfurdity, maistaining that every fubftance in nature had either external fignatures immediately difcernible, or internal fignatures, which, when brought into view by fire or meaftrua, denoted its connection with fome fiderial or celeftial archetype. Of the doctrine of fignatures, as it relates merely to the therapeutic ufes of plants and minerals, traces are to be found in the works of fome of the greatelt anthors of antiquity ; but the celeftial fignatures, we believe, were difcovered only by
*IIjf: Nat. the moonlight of the monkifh ares. Pliny informs us*, like a ferpent, was difcovered by thofe fpots to be a fovereign remedy for the bite of that animal ; and that the colour of the hamatites or blood-fone intimated that it was fit to be employed to ftop an hemorrhagy ; but we do not recollect his attributing the virtues of thefe ninerals to a'fiderial or celeftial influence.

Signature, a figning of a perfon's name at the bottom of an act or deed written by his own hand.

Signature, in printing; is a letter put at the bottom of the firft page at leaft, in each fheet, as a direction to the binder in folding, gathering, and. collating, them. The fignatures confift of the capital.letters of the alphabet, which change in every flieet : if there be more fheets than letters in the alphabet, to the capital letter is added a fmall one of the fame fort, as \(A a, B b\); which are repeated as often as neceffary. In large volumes it is eafy to difinguifh the number of alphabets, after the firt thiee or four, by placing a figure before the fiunature, as \(5 \mathrm{~B}, 6 \mathrm{~B}\), \&c.

bill firgned under his majefty's hand : it is always in the cuftody of the fecretaries of fate.

Signet, in Scots law. See Law, Part III. § iy. Silene, Catchfly, or Vifous Campion, in botany: 'A genus of plants belonging to the clafs of decandria, and order of trigynia ; and in the natural fyftem arranged under the 22 d order, caryophyllece. The calyx is ventricofe; the petals are five in number, bifid and inguiculated, and crowned by a nectarium; the capfule is cylindrical, covered, and trilocular. There are 26 fpecies, of which 7 are natives of Britain and Ireland. I. Anglica, the finall corn campion or catchfly. The ftem is weak, hairy, and above a foo 4 high; the leaves are oblong, and grow in pairs at the joints; the flowers are fmall, white, and entire; they ftand on, footftalks which iflue from the alæ of the leaves; they are erect, alternate, fingle, and lateral. It grows in corn-fields, and flowers in June and July. 2. Nutans, Nottingham catchfly. The ftem is about two feet higli, and firm: the radical leaves are broad, obtufe, and grow in a tuft; thofe on the ftem are narrow and acute: the flowers are white, and grow in lateral panicles; the petals are bifid and curled; the calyx is lone, bellying a little, with ten longitudinal ftrix. It grows in paftures, and flowers in June and July. 3. Amana, fea-campion. The ftem is two or three feet long, flender, procumbent, and branched alternately : the leaves are long and narrow: the fowers are white, and grow on oppofite footttalks, three on each, in unilateral bunches: the calyx is hairy and purplifh, and has ten angles. It grows on the fouth coart, and flowers in June and July. 4. Conoidea, greater corn catchfly, or campion. The leaves are narrow and foft ; the calyx is conical, with 30 ftrix ; the flowers proceed from the divarications of the ftem; the petals are entire. It grows in corn fields, and flowers in June. 5. Nociflora, night-fowering catchfly. The ftem is about two feet high, and forked; the calyx has ten angles, is fomewhat clammy, and oval, with longer teeth than the other fpecies; the petals are of a reddifh. white. 6. Armeria, broad-leaved catchfly. The ftem is about 18 inches high, and erect, with few branches; the leaves are fmooth, feffile, and broad at the bafe; the flowers terminal, in faftigiate bundles, fmall, and red. It may be feen on the banks of rivers, and is in flower in July and Auguft. 7. Acaulis, mofs campion. The radical leaves are fpread on the ground like a tuft of mofs; the ftalks are about an inch long, and naked, bearing each a fingle purple flower. This laft fpecies grows on mountains, and has been found, ins Wales and Scotland, within half a mile from their top. It is in flower in July.

SILESLA, a duchy of Germany, bounded on the eaft by Poland ; on the weft, by Bohemia and Lower Lufatia; on the fouth, by a chain of mountains, and a thicket of confiderable extent which feparates it from Hungry; and to the north, by the marquifate of Brandenburg and Poland. From north-weft to foutheaft it is about. 274 miles, and about 100 where broadeft: but it is mueh contracted at both ends. Upon the frontiers of this country, to the weft and fouth, are very high mountains, and fome likewife in other parts of it. One of the ridges upon the frontiers is fyled the Riphean Mountains, another the Moravian, another the Bobemian, and another the Hungarian, Crapack, or Car.
pathian.

\section*{S I L [ 477 ] S I L}
lefia, partian. A branch of the Bohemian is called the Giant together with the county of Glatz, from his daughter Mountains. The winter on thefe hilly tracks is more fevere, fets in fooner, and lafts longer, than in the low lands. The inhabitants ufe a kind of fkates when the fnow is deep, as they do in Carnola. Little or no grain is raifed in the mountains and fome fandy tracks; but the reft of the country is abundantly fruitful, not only in grain, but fruits, roots, pafture, flax, hops, madder, tobacco, and hemp, yielding alfo fome wine, with confiderable quantities of filk and honey. In many places are great woods of pines, fir, beech, larch, and other trees, affording tar, pitch, rofin, turpentine, lamp. black, and timber for all ufes. In this country alfo is found marble of feveral forts, fome precious ftones, limeftone, millftone, pitcoal, turf, vitriol, fome filver ore, copper, lead, iron, and mineral fprings. Great numbers of black cattle and horfes are brought hither from Poland and Hungary for fale, thofe bred in the country not being fufficient ; but of fheep, goats, game, and venifon, they have great plenty. As for wild beafts, here are lynxes, foxes, weafels, otters, and beavers. The rivers, lakes, and ponds, yield fifh of feveral forts, particularly furgeons feveral ells in length, and falmon. Befides a number of fmaller freams to water this country, there is the Oder, which traverfes it almoft from one end to the other ; and the Viftula, which after a pretty long courfe through it enters Poland. The number of the cities and market-towns is faid to be about 200, the county of Glatz included, and that of the villages 5000 . The inhabitants, who are computed to be about a million and an half, are a mixture of Germans, Poles, and Moravians. The language generally fpoken is German ; but in fome places the vulgar tongue is a dialect of the Sclavonic. The flates conlift of the princes and dukes, and !thofe called fate-lırds, with the nobility, who are iminediately fubject to the fovereign, and the reprefentatives of the chief cities; but fince the country fell under the dominion of the king of Pruffia, no diets have been held. The king, however, when he took poffeffion of the country, confirmed all the other privileges of the inhabitants. With refpect to religion, not only Proteftants, but Papits, Jews, and Greeks, enjoy full liberty of confcience. The greateft part of Silefia lies in the diocefe of Brenaw, but fome part of it in the Polifh diocefes of Pofen and Cracow. The bifhop of Breflaw ftands inmediately under the pope with regard to fpirituals; but all ecclefiaftical benefices, not excepting the fee of Breflaw, is in the king's gift. BefidesLatin fchools, colleges, and feminaries, at Brellaw is an univerfity, and at Lignitz an academy for martial exercifes. The principal manufactures here are woollens, linens, and cottons of feveral forts, with hats, glafsware, gunpowder, and iror manufactures. Of thefe there is a confiderable exportation. Accounts are generally kept in rix-dollars, filver grofchens, and ducats. With .refpect to its revolutions and prefent government, it was long a part of the kingdom of Poland; afterwards it had feveral dukes and petty princes for its fovereigns, who by degrees became fubject to the kings of Bohemia, until at laft king. Charles IV. incorporated the whole duchy with Bohemia; and thus it continued in the poffeffion of the houfe of Auftria, until thie king of Pruffa in 1742 , taking advantage of the troublcs that enfued upon the death of the emperor Charles VI. and pretending a kind of claim, wrefted a great part of it,
and heirefs Maria Therefa, the late emprefs-dowager ; fo that now only a \{mall part of it is poffeffed by the houfe of Auflria, and connected with the empire, the knowledging any fort of dependence on the crown of Bohemia or the empire. For the adminittration of juftice in all civil, criminal, and feudal cafes, and fuch as relate to the revenue, the king of Pruffia has eftablifhed three fupreme judicatories, to which an appeal lies from all the inferior ones, and from which, when the fum exceeds 500 rix-dollars, caufes may be moved to Berlin. The Lutheran churches and fcthools are under the infpection of the upper confiftories, and thofe of the Papits under that of the bifhop's court at Breflaw ; but from both an appeal lies to the tribunal at Berlin. As to the revenue, the excife here is levied only in the walled towns, being on the fame footing as in the marquifate of Brandenburg; but in the reft of the country the contributions are fixed, and the fame both in peace and war. The feveral branches of the revenue are under the management of the war and domain offices of Breflaw and Glogau. The whole revenue arifing to the king of Pruffia from Silefia and the county of Glatz amounts to about four millions of rix-dollars per annum.
Silefia is divided into Upper and Lower, and each of thefe again into principalities and lordhlips; of fome of which both the property and juriddiction belong immediately to the fovereign, but of others to his fubjects and vaffals. In regard to the character of the people, the boors are accounted very dull and ftupid; but of thofé of a higher rank, many have diftinguifhed themfelves by their wit and learning, as well as by their military and political talents. However, in general, like their neighbours the Germans and Bohemians, they have more of Mars than Mercury in their compolition, and their parts are more folid than fhining.
SILESIAN EARTH, in the materia medica, a fine; aftringent bole. It is very heavy, of a firm compaet texture, and in colour of a brownifh yellow. It breaks eafily between the fingers, and does not flain the hands; is-naturally of a fmooth furface, is readily diffufible in water, and melts freely into a butter-like fubftance in the mouth. It leaves no grittinefs between the teeth, and does not ferment with acid menftrua. It is found in the perpendicular fiffures of rocks near the goldmines at Strigonium in Hungary, and is fuppofed to be impregnated with the fulphur of that metal. It is a good altringent, and better than nroft of the boles in ufe.
SILICERNIUM, among the Roman3, was a feaft of a private nature, provided for the dead fome time after the funeral. It confiftěd of beans, lettuces, bread, eggs, \&c. Thefe were laid upon the tomb; and they foolifhly believed that the dead would come out for the repaft. What was leit was gencrally burnt on the ftone. The word filicernium is derived from filex and crena, i. e. "a fupper upon a flone." Eating what had thus been provided for the dead, was efteemeda mark of the mol' iniferable poverty: A fimilar entertainnent was made by the Greeks at the tombs of the deceafed; but it was ufual among them to treat the ghofts with the fragments from the feal of the living. See Fu. neral and Inferife.

Siliceous earths. See Mineralogy, Part II. Order 4.
SILIUS (Italicus Catus), an ancient Roman poet, and author of an epic poem in 17 books, which contains an hiftory of the fecond Punic war, fo farnous for having decided the empire of the world in favour of the Romans. He was born in the reign of 'Tiberius, and is fuppofed to have derived the name of Italicus from the place of his birth ; but whether he was born at Italica in Spain, or at Corfinium in Italy, which, according to Strabo, had the name of Italica given it during the Eocial war, is a point which cannot be known : though, if his birth had happened at either of thefe places, the grammarians would tell us, that he fhould have been called Italicenfis, and not Italicus. When he came to Rome, he applied himfelf to the bar ; and, by a clofe imitation of Cicero, fucceeded fo well, that he became a celebrated advocate and moft accomplifhed orator. His merit and character recommended him to the higheft offices in the republic, even to the confullhip, of which he was pofiefled when Nero died. He is faid to have been aiding and affifting, in accufng perfons of high rank and fortune, whom that wicked emperor had devoted to deftruction : but he retrieved his character afterwards by a long and uniform courfe of virtuous behaviour. Vefpafian fent him as proconful into Afia, where he behaved with clean hands and unblemifhed reputation. After having thus fpent the beft part of his life in the fervice of his country, he bade adieu to public affairs, refolving to confecrate the remainder to polite retirement and the mufes. He had feveral fine villas in the country: one at Tufculum, celebrated for having been Cicero's; and a farm near Naples faid to have been Virgil's, at which was his tomb, which silius often vifited. Thus Martial compliments him on buth thefe accounts:

> Silius hac magni celebrat monumenta Maronis, Fugera facundi qui Ciceronis babet.
> Haredem Dominumque fui tumulique larifque Non alium mallet nec Maro nec Cicero.

Epigr. 49. lib. xi.
Of Tully's feat my Silius is poffefs'd,
And lis the tomb where Virgil's aftes reft.
Could thofe great fhades return to choofe their heir,
The prefent owner they would both prefer.
In thefe retirements he applied himfelf to poetry : led not fo much by any great force of genius, which would ceitainly not have fuffered him to flay till life was in the wane and his imagination growing cold, as by his exceeding great love of Virgil, to whofe memory he paid the highett vene:ation. He has imitated him in his poem ; and though he falls infinitely thort of bim, yet he has difcovered a great and univelfal genius, which would have enabled him to fucceed in fome degree in whatever he undertook.

Having been for fome time aflicted with an inpofthume, which was deemed incurable, he grew weary of life, to which, in the language of Pliny, he put an end with determined courage.
There have been many editions of Silius Italicus. A neat and correct one was publifhed at Leipfic in 1696 , in 8 vo , with fhort and ufeful notes by Cellarius : but the

SILK, a very foft, fine, bright thread, the work of an infect called bombyx, or the filk worm.

As the filk worm is a native of China, the culture of filk in ancient times was entirely confined to that country. We are told that the empreffes, furrounded by their women, fpent their leifure hours in hatching and rcaring filk worms, and in weaving tiffues and filk veils. That this example was foon imitated by perfons of all ranks, we lave reafon to conclude; for we are informed that the Chinefe, who were formerly clothed in fkins, in a thort time after were dreffed in veftments of filk. Till the reign of Juftinian, the filk worm was unknown beyond the territories of China, but filk was introduced into Perfia long before that period. After the coriqueft of the Perfian empire by Alexander the Great, this valuable commodity was brought into Greece, and thence conveyed to Rome. The firt of the Roman writers extant by whom filk is mentioned, are Virgil and Horace; but it is probable that neither of them knew ih from what country it was obtained, nur how it was of a produced. By fome of the ancients it was fuppofed to be a fine down adhering to the leaves of certain trees or flowers. Others imagined it to be a delicate fpecies of wool or cotton; and even thofe who had learned that it was the work of an infect, fhow by their defcriptions that they had no diftinct idea of the manner in which it was formed. Among the Romans, filk was deemed a drefs too expenfive and too delicate for men, and was appropriated wholly to women of eminent rank and opulence. Elagabulus is faid to have been the firft man among the Romans who wore a garment of fine filk: Aurelian complained that a pound of filk was fold at Rume for 12 ounces of gold; and it is faid he refured to give his wife permiffion to wear it on account of its exorbitant price.

For feveral centuries the Perfians fupplied the Ro- Brot man empire with the filks of China. Caravans tra- from verfed the whole latitude of Afia, in 243 days, from fian the Chinefe ocean to the fea-coaft of Syria, carrying time this commodity. Sometimes it was conveyed to the flimit ports of Guzerat and Malabar, and thence tranfported by fea to the Perfian Gulph. The Perfians, with the ufual rapacity of monopolifts, raifed the price of filk to Rover Ris \(_{7}\) fuch an exorbitant height, that Juftinian, eager not only conce to obtain a full and certain fupply of a commodity which Indic was become of indifpenfable ufe, but folicitous to deliver the commerce of his fubjects from the exactions of his enemies, endeavoured, by means of his ally, the Chriftian monareh of Abyfinia, to wreft fome portion of the filk trade from the Perfians. In this attempt he failed; but when he leaft expected it, he, by an unforefeen event, attained, in fome meafure, the object which he had in vicw. Two Perfian monks having been employed as miffionaries in fome of the Chritian churches, which were eftablifhed (as we are informed by Cofmas) ia different parts of Iudia, had penetrated into the coun-by try of the Seres, or China. There they obferved the non labours of the tilk werm, and became acquainted with all the arts of man in working up its productions into fuch a variety of elegant fabrics. The profpect of gain, or perhaps an indignant zeal, excited by feeing this lucrative branch of commerce engrofed by uibelieving nations,

\section*{S I L}
nations, prompted them to repair to Conftantinople. There they explained to the emperor the origin of f:lk, as well as the various modes of preparing and manufacturing it, myfteries hitherto unknown, or very imperfectly underftood in Europe ; and encouraged by his liberal promifes, they undertook to bring to the capital a fufficient number of thofe wonderful infeets, to whofe labours man is fo much indebted. This they accomplifhed, by conveying the ergs of the filk worm in a hollow cane. They were hatched by the heat of a dunghill, fed with the leaves of a wild mulberry tree, and they multiplied and worked in the fame maner as ia thofe climates where they futt became objects of human attention and care. Vatt numbers of thefe infects were foon reared in different parts of Greece, particularly in the Peloponnefiss. Sicily afterwards undertook to breed filk worms with equai fuccels, and was imitatec., from time to time, in feveral towns of Italy. In all thefe places extenfive manufactures were eftablifhed and carried on with filk of domeftic production. 'The demand for filk from the eaft diminifhed of courfe, the fubjects of the Greek emperors were no longer obliged to have recourfe to the Perfians for a fupply of it, and a confiderable change took place in the nature of the commercial intercourfe between Europe and India.

As filk is the production of a worm, it will be firf? neceffary to give a defcription of its nature and node of manufacturing. But before we give any account of the moft approved methods of managing filk worms in Europe, it will be proper to prefent a fhort defcription of the methods practifed in China, the original country of the filk worm. 'Thefe are two : they either permit them to remain at liberty on mulberry trees, or keep them in rooms. As the fineft filk is produced by worms confined in rooms, and as the firft method is very fimple, it will fuffice to defcribe the fecond.
' Fo begin with the egrs, which are laid on large fheets gilk of paper, to which they firmly adhere. The fheets are hung up on a beam of the room, with the eggs inward, and the windows are opened in the front to admit the wind; but no hempen ropes muft ever come near the worms or their eggs. After fome days the fheets are taken down, rolled up loofely with the eggs inward, and then hung up again, during the fummer and autumn. At the end of December, or the beginning of January, the eggs are put into cold water, with a little falt diffolved in it. 'Iwo days after they take them out, hanc. them up afain, and when dry roll them a little tighter, and cnclofe each feparately, ftanding on one end in an earthen veffel. Some put them into a lye made of mulberry tree afhes, and then lay them fome moments in fnow-water, or elfe hang them up three niohts on a mulberry tree to receive the fnow or rain, if not too violent. . The time of hatching them is when the leaves of the mulberry trees begirs to open, for they are haltened or impeded according to the different degrees of heat or cold to which they are expofed. When they are ready to come forth, the eggs fwell, and become a little pointed.

The third day before they are hatched, the rolls of paper are taken out of the veffle, firctched our, and hung up with their backs toward the fun, till they receive a kindly warmth; and then being rolled up clofe, they are fet upright in a veffel in a warm place. This is repeated the next day, and the eggs change to an afh-
grey, They then put two Meets together, and rolling Silk. them clofe tie the ends.

The third day, towards night, the fheets are unrolled and ftretched on a fine mat, when the egys appear blackifh. They then roll three fheets together, and carry them into a pretty warm place, fheltered from the fouth wind. The next day the people taking out the rolls, and upening them, find them full of worms like fmall black ants.

The apartment chofen for filk worms is on a dry ground, in a pure air, and free from noife. The rooms are fquare, and very clofe, for the fake of warmth ; the door faces the fouth, and is covered with a double mat, to keep out the cold; yet there fhould be a window on every fide, that when it is thought neceffary the air may have a free paffage. In opening a window to let in a refrefhing breeze, care mult be taken to keep out the gnats and flies. The room muit be furnifhed with nine or ten rows of frames, about nine inches one above the other. On thefe they place rufh hurdles, upon which the worms are fed till they are ready to fpin ; and, to preferve a regular heat, fove fires are placed at the comers of the room, or elfe a warming pan is carried up and down it ; but it muft not have the leait flame or fmoke. Cow-dung dried in the fun is efteemed the mof proper fuel.

The worms eat equally day and night. 'The Chinefe give them on the firft day forty-eight meals; that is, one every half hour; the next thirty; the third day they have ftill lefs. As cloudy and rainy weather takes away their ftomach, juft before their repalt a wifp of very dyy ftraw, the flame of which mult lie all alike, is held over the worms to free them from the cold and moifture that benumbs them, or elfe the blinds are ta* ken from the windows to let in the full day-light.

Eating fo often haftens their growth, on whicb the chief profit of the filk worm depends. If they come to maturity in 23 or 25 days, a large fheet of paper covered with worms, which at their firft foming from the eggs weigh little more than a drachm, will produce 25 ounces of filk; but if not till 28 days, they then yield only 20 ounces; and if they are a month or 40 days in growing, they then produce but ten.

They are képt extremely clean, and are often removed; and when they ave pretty well grown, the worms belonging to one hurdle are divided into three, afterwards they are placed on fix, and fo on to the number of 20 or more ; for being full of humours, they moft be kept at a due diftance from each other. The critical moment for removing them is when they are of a bright yellow and ready to fpin ; they mult be furrounded with mats at a fmall diffance, which muft cover the top of the place to keep off the outward air ; and becaufe they love to work in the dark. However, after the third day's labour, the mats are taken away from one o'clock till three, bur the rays of the fun muft not fhine upon them. They are at this time covered with the fheets of paper that were ufed on the hurdles.

I'he cocoons are completed ia feven days, after which the worin is metamorphofed into a chryfalis; the cocoons are then gathered, and laid in heaps, having firft fet apart thofe defigned for propagation upon a hurdle, in a cool airy place. The next care is to kill the moths in, thofe cones which are not to be bored. The belt way of doing this is to fill large earthen veffels with

\section*{S I L}
\(\stackrel{5}{5}\) and hittory of the filk worm.

The Bee, \(15^{\circ} 72\).
, cones in layers of ten pounds each, throwing in four ounces of falt with every layer, and covering it with large dry leaves like thofe of the water-lily, and clofely ftopping the mouth of the veffels. But in laying the cones into the veffels, they feparate the long, white, and glittering ones, which yield a very fine filk, from thofe that are thick, dark, and of the colour of the fkin of an onion, which produce a coarfer filk.

The filk worm is a fpecies of caterpillar, which, like all others of the fame clafs, undergoes a variety of changes, that, to perfons who are not acquainted with objects of this kind, will appear to be not a little furprifing.

It is produced from a yellowifh coloured egg, about the fize of a fmall pin head, which has been laid by a kind of greyifh coloured moth, which the vulgar confound with the butterfly.
'Thefe eggs, in the temperature of this climate, if .kept beyond the reach of the fire and fun thine, may be preferved during the whole of the winter and fpring -months without dauger of hatching: and even in fummer they may eafily be prevented from hatching if they be kept in a cool place; but in warmer climates it is farcely poffible to preferve them from hatching, even for a few days, or from drying fo much as to deftroy them. Hence it is ealy for a native of Britain to keep the eggs till the food on which the worm is to feed be ready for that purpofe. When this food is in perfection, the eggs need only be expofed to the fun for a day or two, when they will be hatched with great facility.

When the animal is firft protruded from the eagg, it is a fmall black worm, which is active, and maturally afcends to the top of the heap in fearch of food. At this fage of his growth the filk worm requires to be fed with the youngeft and moft tender leaves. On thefe leaves, if good, he will feed very freely for about eight days, during which period he increafes in fize to about a quarter of an inch in length. He is then attacked with his firf, ficknefs, which confifs in a kind of lethargic neep for about three days continuance ; during which time he refufes to eat, and changes his flin, preferving the fame bulk. This fleep being over, he begins to eat again, during five days, at which term he is grown to the fize of full half an inch in length ; after which follows a fecond ficknefs in every refpect like the former.

He then feeds for other five days; during which time he will have increafed to about three quarters of an inch in length, when he is attacked with his third ficknefs. This being over, he begins to eat again, and continues to do fo for five days more, when he is attacked by his fourth ficknefs, at which time he is arrived-at his full growth. When he recovers this ficknefs, he feeds once more dnring five days with a moft voracious appetite; after which he difdains his food, becomes tranfparent, a little on the yellowifh caft, and leaves his filky traces on the leaves where he paffes. Thefe figns denote that he is ready to begin his cocoon, and will eat no more.

Thus it appears that the whole duration of the life of the worm, in this ftate of its exiftence, in our climate, is ufually about 46 days; 28 of which days he takes food, and remains in his fick or torpid ftate 18; but it is to be obferved, that during warm weather the periods of ficknefs are fhortened, and in cold weather lengthened, above the terms here fpecified. In yery hot cli-
mates it may be faid to live fafter, and fooner to attain maturity, than in thofe that are colder. Dr Anderfon informe us, that at Madras the worm undergoes its whole evolutions in the fpace of 22 days. It appears, however, that it feeds fully as many days in India as in Europe, the difference being entirely occafioned by fhortening the period of ficknefs. The longeft ficknefs he had feen them experience there did not exceed two days; and during fummer it only lafts a few hours.

When the worm has attained its full growth, it fearches about for a convenient place for forming its cocoon, and mounts upon any branches or twigs that are. put in its way for that purpofe. After about two days fpent in this manner, it fettles in its place, and forms the cocoon, by winding the filk which it draws from its bowels round itfelf into an oblong roundifh ball.

During this operation it gradually lofes the appearance of a worm ; its length is much contracted, and its thicknefs augmented. By the time the web is finifhed, it is found to be transformed into an oblong roundifl ball, covered with a fmooth fhelly fkin, and appears to be perfectly dead. In this ftate of exiftence it is called an aurelia. Many animals in this ftate may be often feen Iticking on the walls of out-houfes, fomewhat refembling a fmall bean.

In this ftate it remains for feveral days entirely motionlefs in the heart of the cocoon, after which it burfts like an egg hatching, and from that comes forth a heavy dull looking moth with wings; but thefe wings it never ufes for flying; it only crawls flowly abont in the place it has been liatched. This creature forces its way through the filk covering which the worm had woven, goes immediately in queft of its mate, after which the female lays her eggs; and both male and female, without tafting food in this ftage of their exifence, die in a very fhort time.
The filk worm, when at its full fize, is from an inch and a quarter to an inch and a half in length, and about half an inch in circumference. He is either of a milk or pearl colour, or blackifh ; thefe laft are efteemed the beft. His body is divided into feven rings, to each of which are joined two very fhort feet. He las a fmall point like a thorn exactly above the anus. The fubltance which forms the filk is in his fomach, which is very long, wound up, as it were, upon two fpindles, as fome fay, and furrounded with a gum, commonly yellowifh, fometimes white, but feldom greenifh. When the worm fpins his cocoon, he winds off a thread from each of his fpindles, and joins them afterwards by means of two hooks which are placed in his mouth, fo that the cocoon is formed of a double thread. Having opened a filk worm, you may take out the fpindles, which are folded up in three plaits, and, on ftretching them out, and drawing each extremity, you may extend them to near two ells in length. If you then fcrape the thread fo Atretched out with your nail, you fcrape off the gum, which is very like bees wax, and performs the fame office to the filk it covers as gold leat does to the ing ot of filver it furrounds, when drawn out by the wire drawer. This thread, which is extremely ftrong and even, is about the thicknefs of a middling pin.

Of filk werms, as of moft other animals, there is a Particu confiderable variety of breeds, fome of which are much attentio more hardy, and poffefs qualities confiderably different ought t from others. This is a particular of much importance paid to
to be adverted to at the time of beginning to breed thefe creatures in any place; for it will make a great difference in the profit on the whole to the undertaker if he rears a good or a bad fort (A). Ihis is a department in refpect to the economy of animals that has been in every cafe much lefs adverted to than it deferves; and in particular with regard to the filk worm it has been almoft entirely overlooked. A few eggs of the filk worm can be eafily tranfported by poft in a letter from any part of Europe to another, efpecially during the winter feafon. It would therefore be an eafy matter for any patriotic fociety, fuch as the Society of Arts in Lonclon, to obtain a fpecimen of the eggs from every country in which filk is now reared, to put thefe under the care of a perfon who could be depended upon, and who undertood the management of them, with orders to keep each kind diftinet from another, and advert to every particular that occurred in their management, fo as to make a fair eftimate of their refpective merits. By thefe means the beft might be felected, and thofe of inferior value rejected. Forty or fifty of each fort might be enough for the experiment ; but it ought to be repeated feveral times before conclufions could be drawn from it that might be altogether relied upon; for it is well known that a variation of circumftances will make a change in the refult; and it is by no means certain that the fame particular would affect thofe of one breed exactly in the fame manner as it would do thofe of a different breed. One may be more hardy with regard to cold, another more delicate in refpect to food, and fo on. It is experience alone that can afcertain the circumftances here inquired for.

From the above-mentioned particulars, it is evident, that the management of filk worms muft be very different in hot climates from what is required in thofe that are colder. At Madras, it appears from Dr Anderfon's experiments that it is very difficult to prevent the eggs from hatching for a very few days, fo that many generations of them muft be propagated in one year. "In this hotteft feafon," fays he, in a letter to Sir Jofeph Banks, dated July 6. 1791," the fhorteft time I have been able to remark for the whole evolutions of the filk worm is 40 days; that is to fay, fix days an egg, 22 a worm, it a grub in the cocoon, and one a moth or butterfly." Fortunately, where the climate forces forward their production fo rapidly, nature hath been equally provident of food for their fubfiftence; for in thefe regions the mulberry continues to grow and pufh out leaves throughout the whole year.
ay he Though the filk worm be a native of China, there is no doubt but it might eafily be propagated perhaps in moft parts of the temperate zones. 'I'he eggs
of this infect, indeed, require a confiderable degree of warmth to hatch them, bat they can alfo endure a fevere froft. No lefs than 5402 lbs of filk was raifed in 2789 in the cold, fandy territories of Pruffia. In the province of Pekin, in China, where great quantities of filk are fabricated, the winter is much colder than even in Scotland. From the information of fome Ruffians who were fent thither to learn the Chinefe langurage, we find that Reaumur's thermometer was obferved from 10 to 15, and even 20 degrees below the freering point. Nor is it difficult to rear the food of the filk worm in Bee, No a temperate clime. The mulberry-tree is a hardy vege- 156. table, which bears, without injury, the winters of Sweden, and even of Siberia. Of the feven fpecies of the mulberry (fee Morus) enumerated by Linnæus, four of thefe (viz. the white, red, black, and Tartarian), there is every realon to believe could be reared both in Britain and Ireland. The white grows in Sweden ; the red is aburdant round Quebec ; the black delights in bleak fituations, expofed to wind on the fea fhore; and the Tortarian mulberry is reprefented as growing in the chilly regions of Siberia.

As to the fuperior qualities of the different fpecies, whether probably there is very little to be pointed out amongtt any fecies the four juft mentioned with regard to nourifhment, ex- of mulber. cept what may be drawn from the following fact : that fuperior to if the firft three are laid down together, the filk worm otherso will firft eat the white, then the red, and next the black, in the order of the tendernefs of the leaves. The Tartarian feems to hold as high a place in its efteem as either the red or black; but all muft yield to the white, which feems to be its natural food.

In Calabria the red mulberry is ufed; in Valencia the white; and in Granada, where excellent filk is produced, the mulberries are all black. The white feems to profper very well in a moift tiff foil: the black agrees well with a dry, fandy, or gravelly foil ; and the white is moft luxuriant in a moift rich loam.

It may juftly be afferted, that Britain poffeffes fome Britain pofo advantages in the saifing of raw filk which are not en- feftes fome joyed by warmer countries. Even in the fouth of advantages France, Mr Arthur Young informs us, the mulberry over warnileaves are often nipped by froft in the bud ; but this is for raifing fcarcely ever the cafe with us. It is well known that filk. thunder and lightning are hurtful to the filk worm. Now our climate can boaft that it is almoft wholly ex. empted from thofe dreadful ftorms of thunder and lightning which prevail fo much in hot climates. Nature has then furnifhed us with every thing requifite for the filk manufacture ; it remains only for us to improve the advantages which we poffefs. Let mulberry trees be planted by proprietors of lands, and let a few perfons 3 P
(A) As the fuccefs of the filk manufacture muft depend on the breed of worms, it is of great confequence to bring them from thofe countries where they are reckoned beft.
Mr Andrew Wright, an ingenious filk manufacturer of Pailley, has given the following directions for conveying the eggs of the filk worm from diftant countries by fea: As foon as the moth has laid her eggs, dry them inmediately, and put them into glafs vials; feal them fo clofe that damp air or water will not penetrate into them. Put thefe phials that contain the eggs into earther pots filled with cold water ; and as often as the water becomes warm renew it. Place the earthen veffels in the coldeft place of the fhip, and let them remain until the end of the voyage. It muft be obferved, that the mip chofen for this purpofe ought to be one that would arrive in Brio tain in the months of June or July.

\section*{S I L [ 482 ] S I L}
of frill and attention devote their time to the raifing of filk worms. This is an employment that will not interfere with any manufacture already eftablifhed; on the contrary, it would afford a refpectable, a lucrative, and agreeable employment to ladies, or to females in general, who have at prefent too few profeffions to which they can apply. The fociety inftituted at London for the encouragement of arts, manufactures, and commerce, much to their honour, have offered premiums to thofe who fhall plant a certain number of mulberry trees.

The following method of raifing mulberry trees from feed is practifed in the fouth of France, and has been repeated with fuccefs in the Eaft Indies by Dr Anderfon of Madras. "Take the ripe berries of the mulberry when it is full of juice and of feeds. Next take a rough horfe hair line or rope, fuch as we dry linen on, and with a good handful of ripe mulberries run your hand along the line bruifing the berries and mafhing them as much as poffible as your hand runs along, fo that the pulp and feeds of the berries may adhere in great abundance to the rope or hair line. Next dig a rench in the ground where you wifh to plant them, much like what is practifed in kitchen gardens in England for crops of various kinds. Next cut the rope or hair line into lengths according to the length of the trench you think fit to make, and plunge the line full of mafhed berries into the trench, and then cover it over well with earth, always remembering afterwards to water it well, which is effential to the fuccefs. The feeds of the berries thus fown will grow, and foon fhoot out young fuckers, which will bear young leaves, which are the beft food for the filk worm.
"'The facility and rapidity with which young leaves may by this means be produced is evident, for as many rows of trenches may thus be filled as can be wifhed; and it can never be neceffary to have mulberry trees higher than our rafpberries, currants, or goofeberry bufhes. Whenever they get beyond that, they lofe their value; and if thefe trenches fucceed, you may have a fupply coming frefh up day after day, or any quantity you pleafe:" Thus abundance of thefe trees mizht be reared. But as mulberry trees are not yet found in abundance in this country, it were to be wifhed that fome other food could be fubttituted in their place : attempts have accordingly been made by thofe who have reared filk worms, and it has been found poffible to fupport the filk worm upon lettuce ( B ).
Bee, No \(\eta 0\). 12 Mifs
cafes they produced very good cocoons, even when fed entirely on lettuce. She therefore with reafon fufpected that the death of the animal muft be occafioned by fome extraneous circumftance, and not from the poifonous quality of the food itfelf; the circumitance fhe fulpected, from fome incidental obfervations, was the coldnefs of that food; and therefore fhe thought it was not impoffible, but if they were kept in a very warm place, while fed on lettuce, they might attain, in all cafes, a due perfection.

General Mordaunt having been informed of this con-Gene jecture, refolved to try the experiment. He got fome Misid filk worms eggs, had them hatched in lis hot. houfe, and full n caufed them to be all fed upon lettuce and nothing clfe. 'i'hey profpered as well as any worms could do, few or none of them died; and they afforded as fine cocoons as if they had been fed upon mulberry leaves. As far as one experiment can go, this affords a very exhilara. ting profpect in many points of view. If one kind of food has been noxions, merely on account of an impro. per temperature, others may be found which have been hurtful only from a fimilar caule ; fo that it is not impoffible but we may at laft find that this delicate cieature may be fupported by a variety of kinds of food. Few, however, could be more eafily obtained than lettuce; and this plant, when cabbaged (the cois, or ice lettuce efpecially), would poffefs one quality that the mulberry leaf never can poffefs, from the want of which many millions of worms die in thofe countries where filk is now reared; for it is obferved, that when the leaves are gathered wet, it is fcarcely poffible to preferve the worms alive for any length of time; fo that during a continuance of rainy weather many of them are unavoidably cut off; but a lettuce, when cabbaged, refifts moifture. If gathered, even during rain, the heart of it is dry ; fo that if the outer leaves be thrown afide at that time, the worms would be continued in perfect health. The expence, too, of cultivating and gathering lettuce, would be fo much lefs than that of gathering mulberry leaves, as to occafion a faving that would be much more than fufficient to counterbalance the expence of heating the confervatory, as a little reflectiou, will fhow.

But the great point to be now afcertained is, whether it is a fact that worms fed on lettuce, if kept in a due temperature, will continue in good health, in general, till they hall have perfected their cocoon? One experiment is too little to eftablifh this fact with perfect certainty. It would therefore be neceffary that more experiments fhould be made on this fubject.

It is faid that Dr Lodovico Bellardi, a learned and iilk ingenious botanift of Turin, has, after a number of ex. faid peiments, difcovered a new method of feeding filk ed n worms, when they are hatched before the mulberry \({ }_{r y}\) le trees have produced leaves, or when it happens that the froft deftroys the tender branches. This new method confifts in giving the worms dried leaves of the mulberry-tree. One would think that this dry nourifh- 3
(B) It is not improbable, fays Dr Anderfon, to whofe valuable work entitled the Bee, we have been much indebted in the drawing up of this article, that other kinds of food may be found which will anfwer the fame purpofe. The chicorium intybus and common endive might be tried, as they have the fame lactefcent quality with the lettuce.

\section*{S I L}
ment would not be much relifhed by thefe infects; but repeated experiments made by our author, prove that they prefer it to any other, and eat it with the greateft avidity. 'I he mulberry leaves muft be gathered about the end of autumn, before the frofts commence, in dry weather, and at times when the heat is greatelt. 'They mult be dried afterwards in the fun, by fpreading them upon large cloths, and laid up in a dry place after they have been reduced to powder. When it is neceffary to give this powder to the worms, it thould be gently moiftened with a little water, and a thin coat of it muft be placed around the young worms, which will inmediate ly begin to feed upon it.

We have mentioned all the different kinds of food, which, as far as we liave heard, have been tried with any fuccefs to nourifh the filk worm; not, however, with great confidence, but as experiments which it might be worth while carefully to confider and perform. We muft not omit to mention that one perfon, who has had much experience in the managing of filk worms, affures us, that the filk produced from any other food than mulbery leaves is of an inferior quality, and that the worms are fickly. We think, however, that there is reafon to fufpect that the experiment has not been flzilfully performed; and therefore, before every other food except mulberry leaves is difcarded, the experiment ought to be performed with more attention and care. We know that many animals in a domeftic ftate can live upon food very different from that which fupported them whel running wild in the fields. Certain it is, however, that every animal, in its fate of nature, partakes of a food peculiar to itfelf, which is rejected by other animals as if it were of a poifonous quality; and it may be mentioned as a curious fact, as well as an admirable instance of the care of that Being who feeds the fowls of heaven, that notwithftanding the numberlefs infects that prey upon animals and vegetables, the mulberry tree is left untouched by them all, as the exclufive property of the filk worm, the chief of the infect tribe, which toils and fpins for the ufe of man.

Having now conlidered the food proper for the filk worm, we fhall next confider what fituation is moft favourable to them. In the opinion of fome perfons in this country who have been in the practice of rearing filk worms, they ouglit always to be kept in a dry place, well fheltered, and poffeffing a confiderable degree of warmth, and which is not expofed to fudden tranfitions from heat to cold. If the weather be too cold, a fmall fire mult be made : this is of molt importance when the worms are ready for fpinning. A fouthern expofure is therefore preferable. Some think light is of great utility to filk worms, others think that they thrive better in the dark. As to what apartments are beft accommodated for promoing the health of tilk worms, and molt convenient for thole who have the care of them, they may be various according to the extent of the menutacture or the wealth of the proprietors. Silk worms may be kept in boxes or in fhelves. When fhelves are to be ufed, they maybe conftructed in the following manner: The fhelves may be of wicker, ranged at the diftance af a foot and a half, and fixed in the middle of the room : their breadth ought to be fuch, that any perfon can eafily reach to the middle from either fide. This is perhaps the fimpleft and cheapeft apparatus for rearing filk worms; but there is another apparatus which
may be recommended to thole who are anxious to unite fome degree of elegance with convenience. 'I'his apparatus is the invention of the Rev. George Swayne of Puckle-churcl, a gentleman who, greatly to his honour, has ftudied this fubject much, in order to find out the way for promoting the culture of filk among the poorr. This apparatus, with the defcription of it, we have borrowed from that valuable and patriotic work; the Tranfactions of the Society for encouraging Arts, Manufactures, and Commerce, Vol. V1I. p. 148. The ap. Mr paratus confifts of a wooden frame four feet two inches swayre's higl, each fide 16 inches and a half wide, divided into apparacus eight partitions by fmall pieces of wood which form grooves, into which the flides iun, and are thus ealily thruft into or drawn out of the frame. 'The upper nide \((a)\) in the model fent to the fociety by Mr Swayne is of paper only, and defigned to receive the worms as foon as hatched; the two next \((b, b)\) are of catgut, the threads about one-tenth of an inch diftant from each other: thefe are for the infects when a little advanced in fize : the five lower ones, marked \(c, c, c, c, c\), are of wicker work; but, as MrSwayne afterwards found, netting may be fubitituted with advantage inftead of wicker bottoms. Under each of thefe, as well as under thofe of catgut, are fliders made of paper, to prevent the dung of the worms from falling on thofe feeding below them.
The management of filk worms is next to be at-Proper tended to. The proper time for hatching them is time for when the leaves of the mulberry are fill grown, or fillk worm nearly fo; that as foon as thefe infects are capable of receiving food they may obtain it in abundance. To attempt to hatch them fooner would be hurtful, as the weather would not be fufficiently warm. Befides, as leaves are neceffary to the life of a vegetable, if the young leaves of the mulberry-tree are cropped as foon as they are unfolded, the tree will be fo much weakened as to be incapable of producing fo many leaves as it would otherwife have done ; and if this practice be frequently repeated, will inevitably be deftroyed.

When the proper feafon is arrived, the eggs may be When the proper feafon is arrived, the eggs may be How they
hatched either by the heat of the fun, when it happens ought to bo to be ftrong enough, or by placing them in a fmall and fed. room moderately heated by a ftove or fire; and after being expofed for fix or feven days to a gentle heat, the filk worm iffues from the egg in the form of a fmall black hairy caterpillar. When Mr Swayne's apparatus is uted, the worms are to be kept on the drawers with paper bottoms till they are grown folarge as not readily to crecp through the gauze-bottomed drawers : they are then to be placed on thofe drawers, where they are to remain till their excrements are fo large as not readily to fall through ; when this is the cafe, they mult be removed to the drawers with the wicker or netting bottoms, and fed thereon till they fhow fymptoms of being about to fpin. It is fearcely neceffary to mention, that the paper nides bencath the gauze and wicker drawers are intended to receive the dung, which fhould be emptied as often as the worms are fed, at leaft once a-day ; or to direct, that when the worms are fed, the lides are to be firlt drawn out a confiderable way, and the drawers to \(r \in f t\) upon them.

It has been already mentioned, that wet or damp 20 food is exceedingly prejudicial to thefe infects. It pro- damp food duces contagious and fatal difeafes. 'T'o prevent the contagious neceffity of giving them wet or damp food, attention difeates.
nught to be paid to the weather, fo that when there \(i_{3}\) an immediate profpect of rain, a fufficient quantity of leaves may be gathered to ferve the worms two or three days. In this country, the leaves of the black or red mulberry tree may be preferved good for food, although kept four or five days, by the following method: When new gathered, lay them loofely in glazed earthen veffels, place thefe in a cold place, well aired, not expofed to drought.

The utmof attention muft be paid to preferve the place where filk worms are kept as clean as poffible: the houfe or room muft be well ventilated, that no noxious vapours be accumulated. By fome expériments of M . Taujas de St Fond, which are recorded in his hiftory of Languedoc, it appears that the filk worm is much injured by foul air. All decayed leaves mult be removed from them, as it is now well known that they emit bad sair in great abundance.

One of the molt difficult branches of the management of tilk worms has hitherto been the cleaning without bruifing them. To avoid this inconvenience, the peafants in France and Italy frequently allow the whole litter to remain without ever cleaning them, which is the caufe of that unwholefome ftench that has been fo often re marked by thofe who vift the places for rearing Gilk worms in thefe countries. This difficulty may be effectually removed by providing a net, or, what would be ftill better, a wire-bottomed frame, wrought into large mefhes like a riddle. Have that made of a fize exactly fufficient to cover the wooden box in which the worms are kept. When you mean to fhift them, fpread frefh leaves into the wire bafket; and let it down gently over the worms till it comes within their reach. They no fooner perceive the frefh food than they abandon the rubbifh below, and creep through the meftes, fo as to fix themfelves upon the leaves; then by gently raifing the frefh bafket, and drawing out the board below (which ought to be made to flip out like the flip bottom of a bird's cage), you get off all the excrements and decayed leaves, without incommoding the worms in the fmalleft degree; and along with the litter you will draw off an inch or two in depth of the fouleft mephitic vapours. To get entirely rid of thefe, the board, when thus taken out, fhould be carried without doors, and there cleaned; and the flip board immediately replaced to receive all the excrements and offals. After it is replaced, the wire frame that had been elevated a little, may be allowed to defcend to a convenient diftance above the board without touching it. Thua will there
be left a vacant fpace for the mephitic air to fall below the worms, fo as to allow them to inhabit a wholefome region of the atmofphere.

When a frefh fupply of food is to be given before cleaning, the wire fraine ought to be let down as clofe to the board as can be fafely done, and another wire. buttomed frame put over it, with frefh leaves, as before defcribed. When the worms have abandoned that in their turn, let the flip-board, together with the lower wire frame, be drawn out and removed, and fo on as often as neceffary. To admit of this alternate change, every table, confilting of one flip-board, ought to have two fets of wire-bottomed frames of the fame fize; the nip board to be always put into its place immediately after it is cleaned, and the wire frames referved to be afterwards placed ever the other. By this mode of management, it is probable that the worms would be faved from the difeafes engendered by the mephitic air, and the numerous deaths that are the confequence of it avoided.

Dr Anderfon, to whom we have already acknowled- Quickli ged our obligations, and to whom this country has been would a much indebted for valuable works on agriculture, the forb all fifheries, \&c. advifes thofe who have the management \({ }_{\text {which }}\) of filk worms to ftrew a thin ftratum of frefh flakedrounds quicklime upon the flip-board each time it is cleaned, im-them. mediately before it is put into its place. This would abforb the mephitic gas, for as foon as it is generated it would defcend upon the furface of the quicklime. Thus would the worms be kept coutinually in an atmofphese of pure air (c). Were the walls of the apartments to be trequently wafhed with quicklime and water, it would tend much to promote cleaulinefs at a fmall expence, and augment the healthinefs of the worms as well as that of the perfons who attend them.

When the filk worm refufes its food, and leaves filky \(\mathrm{Mr}^{24}\) traces on the leaves over which it paffes, it is a proof wayne that it is ready to begin its cocoon. It is now neceffa- receptac ry to form a new receptacle, which is commonly done for the by pinning togrether papers in the fhape of inverted cones when with broad bafes. "This method (fays Mr Swayne), ing to \(f_{1}\) where there are many worms, is exceedingly tedious, Tran/u\& waltes much paper, and ules a large number of pins; of the Soo befides, as the filk worin always weaves an outer cover- fy for tho ing or defenfive web before it begins the cocoon or mentira of oval ball, I apprehended that it caufed a needlefs watte Arts, vol of filk in forming the broad web at the top. The me- vit. p. 12 thod I make ufe of is, to roll a fmall piece of paper (an uncut octavo leaf, fuch as that of an old magazine, is lufficient
(c) To put this queftion beyond a doubt, Mr Blancard made the following comparative experiments, which were feveral times repeated. "I procured (fays he) four glafs jars nine inches high and five in diameter, clofing the mouth with cork ftoppers. After which I placed in each of them, in their fecond life (fo mue may be tranflated which means the ftage between the different fickneffes), twelve filk worms, which were fed four times a-day; and which I confined in this kind of prifon all their life, without taking away either their dead companions or their. ordure or litter. I fprinkled with chalk the worms of only two of thefe jars, and kept the two others to compare with them.
"In throfe without lime, I never obtahed neither more nor lefs than three fmall and imperfect cocions (ebiques ou bouffard), and in the two that were fprinkled with lime, I had very often twelve, and never lefs than nine fine full- Gized firm cocoons."

This experiment affords the moft fatisfactory proof of the utility of this procefs. From a number of trials he: found, that even when the worms were covered with a very large proportion of lime, they never were in any way: incommoded by ito.

\section*{S I L [ 485 S I L}
fufficient for three), round my fore-finger, and to give it a twilt at the bottom; which is done with the utmoft expedition, and gives no occafion for the ufe of pins. Thefe rolled paper-cafes being likewife of a form mere nearly refembling that of a cocoon, with a much narrower opening on the top than the others, takes away the neceffity of wafting much tilk in the outer web, and confequently leaves more to be employed in forming the ball. The filk is readily taken out of thefe cales by untwifting the bottom ; and if this be done with moderate care, and the papers are preferved, they will ferve feveral times for the like purpofe."

Others advife, that when the filk worms are preparing to fpin, little buthes of heath, broom, or twigs, fhould be ftuck upright near the fhelf or box in which they are inclofed: the worms mount thefe, and attach their web to them.

When the worms are ready to mount, in order to y pin, if the weather be hot, attended with thunder, you will fee them in a languifhing condition; your care muft then be to revive them, which is effected thus: Take a few eggs and onions, and fry them in a pan with fome ftale hog's lard, the ranker the better, and make paneake; which done, carry it fmoaking hot into the room where they are kept, and go round the chamber with it. You will be furprifed to fee how the fmell revives them, excites thofe to eat who have not done feeding, and makes the others that are ready to fpin ctimb up the twigs.

In about ten or twelve days, according to the accounts which we have received from Mr Andrew Wright of Paiflcy, it may be fafely concluded, that if the worms have finifhed their work; the cocoons may be collected.

We fhall now diftinguifh the cocoons from one another according to their value or their ufe, and confider the method of manaying each. They may be diftinguifhed intothe good and bad. The good cocoons may be known by thefe marks: they are little, ftrong, and firm; have a fine grain, both ends are roand, and they are fiee from fpots. Armong the good cocoons alfo may bearranged thofe which are called calcined cocoons, in which the worm, in confequence of ficknefs, is petrified or reduced to a fine powder. Thete cocoons produce more filk than others, and are fold in Piedmont at half as much again. They may be diftinguifhed by the noife which the worm makes when the cocoon is Shaken. Of the bad cocoons there are fix fpecies: 1. The pointed cocoons, one extremity of which ends in a point ; the filk whieh covers the point is weak, and foon breaks or tears. 2. The cocalons, which are bigger, but the contexture is weak. 3. The itupions, or double cocoons, whieh have been formed by the joint labour of two and fometimes of three worms. 4. The fuyflons, which have a loefe contexture, fometimes fo loofe that they are tranfparent. 5. The perforated cocoons, which have a hole at one end. 6. The bad iboquette, which is compofed of defective cocoons, fpotted or rotten. Befides thefe there is the good choquette, which does not properly belong to either of thefe two claffes: it is formed of thofe cocoons in which the worm dies before the filk is brought to perfection. The worms adhere to one fide of the cocoon, and therefore when the cocoon is fhaken will not rattle : the filk is as fine, but is not of fo bright a colour, nor is fo frong and nervous, as that which is obtained from good cocoons.

The cocoons which are kept for breeding are called royal cocoons. For felecting and preferving thefe, we have been favoured with fome valuable inftructions by \(\mathrm{Mr}^{28}\) Mr Wright of Paifley, which we thall prefent to our Wright's readers. - The largeft and beft cocoons ought to beinftructions kept for breed, about an equal number of nales and for felecfemales; the cocoons that contain the former are fharp- ting and er pointed at the ends than thofe that contain the lat-the royal. ter. Although it fhould happen that there are morecocoons. females than males, little ineonvenience or ill confequences can arife from it, as one male will ferve two or three females, it the time of their coming out of the cocoons anfwer. About 12 or 15 days after they begin to fpin, the coeoons for breed may be laid on fheets. of white paper ; about this time the moth opens for itfelf a paffage through the end of its cocoon, and iffues out. When the female has laid her egres, which. on an average may amount to 250, they are fpread upon fheets of paper and hung up to dry in fome place where they may not be expofed to the heat of the fun: after being dried they muft be kept in a cool: well-aired place, where neither vapours nor moifture can reach them. That they may be preferved from external accidents, as infects of different kinds will deftroy them, and mice is their enemy in all the ftajes of their exiftence, they fhould be kept in ftone pots or glafs. bottles with their mouths ftopped, and there remain until brought out next feafon to be hatched.

The cocoons. from which the lilk is to be immediately How to wound muft be expofed to the heat of an oven, in order prepare the: to kill the chry falis or aurelia, which would otherwife eat rocoons fors its way through the cocoon, and render it ufelefs. The being following directions are given for managing this procefs: by one of the firft filk manufacturers in Italy.

Put your cocoons in long thallow bakkets, and filliTranfiction them up within an inch of the top. You then cover of the Amethem with paper, and put a wrapper over that. Thefebaf- rican Pbilo. kets are to be difpofed in an oven, whofe heat is as near ciety, vol. ifo as can be that of an oven from which the bread is juft drawn after being baked. When your cocoons have remained therein near an hour, you nuft draw them out; and to fee whether all the worns are dead, draw out a dupion from the middle of your bakket and open it: if the worm be dead, you may conclude all the reft are \(\mathrm{f}_{\mathrm{s}}\); becaufe the contexture of the chupion being ftronger than that of the other cocoons, it is confequently lefs eafy to be penetrated by the heat. You mult obferve to take it from the middle of the bafket, becaufe in that part the heat is leaft perceptible. After you have drawn your bafkets from the oven, you nuif firft cover each of them with a woollen. blanket or rug, leaving the wrapper befides, and then you pile them above one another. If your baking has fucceeded, your woollen. cover will be ail over wet with a kind of dew, the thicknefs of your little finger. If there be lefs, it is a fign. your coceons have been too much or too little baked. If too much baked, the worm, being over-dtied, cannot. tranfpire a humour he no longer coitdins, and your eo-. coon is then burnt. If not enough baked, the worm: has not been fufficiently penetrated by the heat to diftil the liquor he eontains, and in that cafe is not dead.

You muft let your bafkets ftand thus covered five or fix hours if pofible, in order to keep in the heat, as this. makes an end of tiffing thofe worms which might have avoided the firf impreffion of the fire. You are like-

\section*{S I L \\ [ 486 ]}
difengage thefe thread 3 from the wikk, and purge them by drawing thefe ends with your fingers till they come off entirely clean. This operation is called la Battue.

When the threads are quite clear, you muft pafs four of them (if you will wind fine filk) through each of the holes in a thin iron bar that is placed horizontally at the edge of your bafon; afterwards you twift the two ends (which confift of four cocoons each) twenty or twenty-five times, that the four ends in each thread may the better join together in croffing each other, and that your filk may be plump, which otherwife would be flat.

Your windfer mult always have a bowl of cold water by her, to dip her fingers in, and to fprinkle very often the faid bar," that the heat may not burn the thread.

Your threads, when thus twifted, go upon two iron hooks called rampins, which are placed higher, and from thence they go upon the reel. At one end of the axis of the reel is a cog-wheel, which catching in the teeth of the poft-rampin, moves it from the right to thic left, and confequently the thread that is upon it; fo that your filk is wound on the reel crofsways, and your threads form two hanks of about four fingers broad.

As often as the cocoons you wind are done, or break or diminifh only, you muft join frefh ones to keep up the number requifite, or the proportion; becaufe, as the cocoons wind off, the thread being finer, you mult join two cocoons half wound to replace a new one: Thus you may wind three new ones and two half wourd, and your filk is from four to five cocoons.

When you would join a frein thread, you muft lay one end on your finger, which you throw lightly on the other threads that are winding, and it joins them immediately, and continues to go up with the reft. You muft not wind off your cocoons too bare or to the laft, becaufe when they are near at an end, the bairré, that is, the hufk, joins in with the other threads, and makes the filk foul and gouty.

When you have finifhed your firft parcel, you muft clean your bafons, taking out all the ftriped worms, as well as the cocoons, on which there is a little filk, which you firt open and take out the worm, and then throw them into a bafket by you, into which you likewife caft the loofe filk that comes off in making the battue.

You then proceed as before with other two or three handfuls of cocouns; you make a new battue; you purge them, and continue to wind the fame number of cocoons or their equivalent, and fo to the end.

As was already mentioned, the windtter muft always have a bowl of cold water by her, to fprinkle the bar, to cool her fingers every time fhe dips them in the hot water, and to pour into her bafon when neceffary, that is, when her water begins to boil. You mult be very careful to twift your threads a fufficient number of times, about 25 , otherwife your filk remains flat, inftead of being round and full ; befides, when the filk is not well croffed, it never can be clean, becaufe a gout or nub that comes from a cocoon will pafs through a fmall number of thefe twits, though a greater will flop it. Your thread then breaks, and you pafs what foulnefs there may be in the middle of your reel be-

\section*{S I L [ 487 ] S I L}
bilk. tween the two hanks, which ferves for a head-band to tie them.
You mult obfervethat your water be juft in a proper degree of heat. When it is too hot, the thread is dead, and has no body; when it is too cold, the ends which form the thread do not join well, and form a harfh ill-qualified filk.

You muft change the water in your bafon four times a-day for your dupions and choquette, and twice only for good cocoons when you wind fine filk ; but if you wind coarfe filk, it is neceffary to changre it three or four times. For if you were not to change the water, the filk would not be fo bright and gloffy, becaufe the worm contained in the cocoons foul it very confiderably. You mutt endeavour as much as poffible to wind with clear water, for if there are too many worms in it, your filk is covered with a kind of dult which attraets the moth, and deftroys your filk.

You may wind your filk of what fize you pleafe, from one cocoon to 1000 ; but it is difficult to wind more than 30 in a thread. The nicety, and that in which confirts the greateft difficulty, is to wind even ; becaufe as the cocoon winds off, the end is finer, and you muft then join other cocoons to keep up the fame fize. This difficulty of keeping the filk always even is fo great, that (excepting a thread of two cocoons, which tve call luch) we do not fay a filk of three, of four, or of fix cocoons; but a filk of three to four, of four to five, of fix to feven cocoons. If you proceed to a coarfer \(\mathrm{r}_{e} \mathrm{flk}\), you cannot calculate fo nicely as to one cocoon more or lefs. We fay, for example, from 12 to 15 , from 15 to 20 , and fo on.

What number of worms are neceffary to produce a certain quantity of filk has not been afcertained. And as different perfons who wifted to determine this point have had different refults, the truth feems to bc , that from various circumftances the fame number of worms may produce more filk at one time than at another. It is related in the fecond volume of the Tranfactions of the Society for encouraging Arts, \&c. that Mrs Williams obtained nearly an ounce and a half of filk from 244 cocoons. Mr Swayne from 50 cocoons procured 100 grairs. Mifs Rhodes obtained from 250 of the largeft cocoons, three quarters of an ounce and a dram. From a paper in the fecond volume of the American Tranfactions, which we have before referred to in the courfe of this article, we are informed that 150 ounces of good cocoons yield about II ounces of tilk from five to fix cocoons : if you wind coarfcr, fomething more. But what appears aftonihing, Mr Salvatore Bertezen, an Italian, to whom the Society for encouraging Arts, \&c. adjudged their gold medal, raifed five pounds of excellent filk from 12,000 worms.

The cocoons produce a thread of very unequal length ; you may meet with fome that yield 1200 ells, whilft others will fcarcely afford 200 ells. In general, you may calculate the production of a cocoon from 500 to 600 ells in length.

As there is every reafon to hope that the filk manufacture will foon be carried on with ardour in this country, end to a great extent, we are happy to learn that the filk-loom has been much improved lately by Mr Sholl of Bethnal-Green. It appears from the evidence of feveral gentlemen converfant in that branch of filk weaving to which this loom is particularly adapted, that
the advantages of this conftruction are, the gaining light, a power of hortening the porry occafionally, fo as to fuit any kind of work, being more portable, and Silk having the gibbet firmly fixed, together with the Tranfactions diminution of price; which, compared with the old of the soloom, is as five pounds, the price of a loom on the old ciety for enconftruction, to three pounds ten fhillings, the price of courarging one of thofe contrived by Mr Sholl ; and that, as the Arts, \& vo. propartion of light work is to ftrong work as nine to one, this fort of loom promifes to be of very confiderable advantage, particularly in making modes, or other black work.

34
As a plate of this loom, with proper references, will Defcriptions render its advantages moft intelligible, we fhall fubjoin "f it. thefe : I'late CCCCLXVI. Silk-Worm. See Silk.
SILPHA, Carrion-beetle, in natural hiftory ; a genus of animals belonging to the clafs of infeciac, and to the order of coleopterc. 'The antennæ arc clavated; the clava are perfoliated; the elytra marginated ; the head is. prominent ; and the thorax marginated. There are 94 (pecies, of which feven only are natives of Britain and Ireland. 1. 'i'he vefpillo. The margin of the thorax broad. The fhells abbreviated, black, with two yellow belts. The thighs of the hind legs large, with a fpine near their origin. Length near one inch. It infefts dead bodies. 2. The biphuffulata, is black; the antennæ are long and fmall, and there are two red fpots on the middle of each fhell. The length is one-third of an inch. 3. The puffulata, is black and oblong: there are four brown fpots on the fhells : the length is one-fifth of an inch. It lives on trees, 4. The qua. dripunclata. The head, antennæ, and legs black. Mar- Berkenbou* gin of the thorax and fhells are of a pale yellow, with vol. i. four black fpots. The length half an inch. It is found in Cain-wood, near Hampttead. 5. The fabulofa, is black; the antennæ are Mort and globular; there are five flriæ on each fhell. The fhells and wings are fhort. 'Ihere are five joints on the two firt feer, four on the reft. It lives in fand. 6. The aquatica, is brown, withe a green bronze tinge. There are four ribs on the thorax. On each fhell there are 1o ftrix. The length is one-fifth of an inch. 7. The pulicaria, is black and oblong ; the fhells are abbreviated ; the abdomen is rounded at the extremity ; the thorax and fhells are fcarce marginated; the length is one line. It is found fre* quently running on flowers.

SILPHIUM, in botany: A genus of plants belonging to the clafs of. fyngenefia, and to the order of poly. gamia neceffaria; and in the natural fyftem arranged under the 49th order, compofice. The receptacle is pa. leaceous; the pappus has a two horned margin, and the calyx is fquarrofe. There are eight fpecies; the laciniatum, terebinthinum, perfoliatum, connatum, afterif* cum, trifoliatum, foldaginoides, and trilobatum. The firlt fix of thefe are natives of North America.

\section*{S I L}

Silver.

Cronfiedt's
Mineralogy vol. ii. 8. 536.

SILVER, one of the perfeet metals, and the whiteft and moft brilliant among them all, is of the fpecific gravity, according to Bergman, of \(10.55^{2}\); but accord. ing to Kirwan, of 11.095 . Its ductility is not greatly inferior to that of gold, as a grain of filver leaf meafures fomewhat more than 51 . Guare inches; and the filver wire ufed for aftronomical purpofes meafures only the 750 th part of an inch in diameter ; which is no more than half the thicknefs of the hair of the human head. It is harder and more elaftic than lead, tin, or gold; but lefs fo than copper, platina, or iron: like other metals it grows hard by hammering, but is eafily reduced to its former ftate by annealing. It is more deftructible than gold, and is particularly acted upon by fulphureous vapours; hence its furface tarnifhes in the air, and affumes a dark brown colour.
"It has been long thought (fays Mr Fourcroy) that filver is indeftructible by the combined action of heat and air. It is certain, that this metal kept in fufion, without contact of air, does not appear to be fenfibly alter. ed; yet Junker had affirmed, that by treating it a long time in the reverberatory furnace, in the mamer of \(I\) frac Hollandus, filver was changed into a vitreous calx. This experiment has been confirmed by Macquer. That learned chemit expofed filver 20 times fucceffively in a porcelain crucible to the fire of the furnace at Seves; and at the 20 th fufion he obtained a vitriform matter of an olive green, which appeared to be a true glafs of filver. 'This metal, when heated in the focus of a burning glafs, has always exhibited a white pulverulent matter on its furface, and a greenith vitreous covering on the fupport it refted upon. Thefe two facts remove all doubt refpecting the alteration of filver: though it is much more difficult to calcine than other metallic matters, yet it is capable of being converted after a long time into a white calx, which, treated in a violent fire, affords an olive-coloured glafs. It may be poffible perhaps to obtain a calx of filver by heating this metal when reduced into very fine laminæ, or into leaves, for a very long time in a matrals, as is done with mercury."

Magellan informs us, that by melting in a due proportion with gold or feel, filver becomes greenifh or bluifh; fo that it is capable of producing the white, yellow, red, green, blue, and olive colours, more or lefs confpicuoufly according to the various circumitances of heat and proportions of the mixture. Though he makes mention of the vitrifications by Macquer already taken notice of, he denies that it can be calcined by heat alone. "Silver (fays he) is fo fixed by itfelf in the fire, that, after being kept a whole month in fufion, it had only loft one 60th part of its weight, which might be on account of fome alloy. It is therefore incapable of being calcined by mere heat; and the calx of filver, which can only be made by means of its folution in acids, is reducible to its metallic form without the addition of any oxigenous fubftance. But when filver is expofed to the violent heat of the folar rays collected by a powerful lens, a kind of fmoke is feen furrounding it, which proves at laft to be the minute particles of the metal raifed and difperfed by heat, as is evident if a thin plate of gold be expofed to it ; for then the particles of filver are feen upon the gold in the fame manner as thofe of gold are feen upon filver in a fimilar experiment."
By flow cooling after it has been melted, filver cry-

488 ] S I L
fallizes into quadrangular pywamids. M. Batimé obferves, that, in cooling, it aflumes a fymmetrical form, obfervable on the furface by fmall fibres refembling the feathers of a pen. M. Fourcroy oblerves, that the fine buttort obtained by cupellation, often prefents on its furface five or fix fides arranged amongtt each other like a pavement ; but the cryitallization in tetrahedral pyramids has not been obferved particularly exicepting by Meffrs 'Lillet and Mongez. It has been fuppofed that filver melts with a finaller degree or heat than copper ; but the late improved thermometer of Mr Wedgewood. Hows that this is a miftake; filver requiring \(130^{\circ}\) of Fahrenheit more than copper to bring it into fufion. It is found in the earth,
1. Native, geruerally of the finenefs of 16 carats; and of this there are feveral varieties. I. Thin plated or leaved. 2. Capillary filver, of fine or coarfe fibres or arborefcent, from Potofi in America and Kunfberg in Norway. 3. A kind is alfo met with refembling coarfe linen in the furface, which in Saxeny is called knit cobalt. Abundance of this kind is to be met with in Potofi, but more rarely in Saxony and Norway. 4. Sometimes native filver is met with in a cryftalline or regularly figured ftate with fhining furfaces. This is found at Kunferg, but is very fcarce. There appears likewife a kind of cryftallization on the thin plates of native filver, their furfaces being full of minute pyramidal cryitals. Moft of the A merican filver is of the native kind; fo is that at Kunßerg in Norway. It is not, however, met with native fo commonly in other European mines. A very fmall quantity of it is found in the mines of Salberg in Weftmanland, and of Lofafen in Dalarne, and feveral other places in Sweden. It has been found in pretty large lumps in clay mixed with nickel, partly decayed or withered ; in which fituation it formed the compound called the Bercus anferinum, or goofe dung ore. 5. A piece of native filver in coal is thown in the mineralogical acadeny at Freyberg; and Lahman, quoted by Le Camus, fpeaks alfo of a fimilar filver ore found in a mine of pit-coal \(\dagger .+C_{\text {Tonf }}\) 'I'he capillary filver, according to the obfervations of Mineral Henckel and Rome de Lifle, feems to have been pro- \({ }^{-}\) duced by a decompofition of red filver ore; and Wallerius affirms, that if fulphur is mixed in a gentle heat with filver, the latter takes a capillary form. 6. Native filver is likewife fometimes found in the form of fpider's wets, and for that reafon called by the Spaniards arane. 7. It is met with in branches formed by octaedrons inferted into one another. Some of thefe fhow the mark of a leaf of fern or of a tree; others are cubes or fingle octaedrons, whofe angles are truncated, tho \({ }^{*}\) thefe laft are but rare. 8. It is often fonsd difperfed through fand and ochre, as well as in grey limeftone in Lower Aultria, and in a greenifh clay near Schemnitz, or mixed with ochre, clay, and calciform nickel. It is generally alloyed with copper, fometimes with gold, iron, or regulus of antimony; and fometimes it contains even five per cent. of arfenic. That found near Kunberg contains fo much gold, that the coleur of it is yellow.
- Wallerius diftinguifhes feven fpecies of native filver : viz. I. In irregular maffes and lumps, at Kunferg in Norway and other places, in a bed of clay. 2. In a granular and jagged form in America and Norway. 3. Arborefcent, in the places already mentioned. 4. In

\section*{\(S\) I I}
\([489\)
thin leaves, between the fiffures of fones, in Norway and Gernany. In a capillary form, in the places already mentioned, including the cobweb filver of the Spaniards already mentioned. 6. Cryftallized. 7. Superficial. Mr Daubenton enumerates eight varieties of native white filver, of different forms, moft of which have been already enumerated. The materials in which this metal is mof commonly found in its native ftate are, bàro-felenite, limeftone, felenite, quartz, chert, flint, ferpentine, gneifs, agate, mica, calcareous fpar, pyrites, Schiftus, clay, \&cc. Sometimes it is met with in large maffes, of the weight of 60 pounds or more, in or near the veins of molt metallic ores, particularly in Peru and in various parts of Europe, of a white, brown, or yellowifh colour. In Norway and at Alface it is found in the form of folitary cubes and oftahedral lumps, of 50 and 60 pounds weight.
2. Native fliver alloyed with other metals. 1. With gold, as in Norway, where it contains fo much as to appear of a yellow colour. 2. With copper. 3. With gold and copper. 4. Annalgamated with mercury, as in the mines of Salberg. M. Rome de Lifle mentions a native amalgam of filver and mercury found at Mufchel Landberg in the duchy of Deux Ponts, in a ferruginous matrix, mixed with cinnabar, and cryftallized in a hexagonal form, and of a large fize. It was before the French revolution preferved in the king's cabinet at Paris. 5. With iron. According to Bergman, this ore contains two per cent. of iron; but Mongez informs us, that it often does not exceed one per cent. 6. With lead. "Silver (fays Mr Magellan) is always contained in lead, though the quantity is generally infufficient to defray the expence of feparating it. In the reign of Edward I. of England, however, near 1600 pounds weight of filver were obtained, in the courfe of three years, from a lead mine in Devonfhire, which had been difcovered about the year 900 . The lead mines in Cardiganfhire have at different periods afforded great quantities of filver; fo that Sir Hugh Middleton is faid to have cleared from them L. 2000 in a month. The fame mines in the year 1745 yielded 80 ounces of filver out of every ton of lead. The lead in only one of the fmelting houfes at Holywell in Flinthire produced no lefs than 3752 r ounces, or \(3126 \frac{3}{4}\) pounds of filver from the year 1754 to 1756 , and from 1774 to 1776 . There are fome lead ores in England, which, though very poor in that metal, contain between 300 and 400 ounces of filver in a ton of lead; and it is commonly obferved, that the pooreft lead ores are the richeft in filver; fo that a large quantity of filver is probably thrown away in England by not having the pooreft fort of lead ores properly effayed." 7. Mr Monnet found filver united with arfenic among the ores which came from Guadanal canal in Spain, and an ore of the fame kind is furnifhed by the Samfon mine near Andreaberg in the Hartz : but Mr Mongez very properly remarks, that thefe ores muft be diftingnifhed from fuch as have the arfenic in the form of an acid; for in this cale they are properly mineralized by it, whiltt there can only bc a mixture of native filver, or fome of its calces with arfenic in its reguline form. 8. Bergman mentions filver in a fate of union with antimony. The ore yiedds fome fmoke when roafted, but has not the garlic fmell obfervable in the arfenical ores. 9. The white filver ore, found in the mines near Freyberg, has the metal united
Vor. XVII. Part II.
to the regulus of arfenic and iron, the three metallic in. Silver.
gredients being nearly in equal proportions. All the extrancous matters with which the filveri is united are fometimes in exceedingly fmall proportion, but not to be neglected where they exceed the hundredth part of the whole mais. IO. A particular kind of ftony filver ores is mentioned by Wallerius under the title of lapis dea, and which contain the following varieties, viz. the calcareous filver ore at Annaberg' in Auftria, when the metal is mixed with an alkaline limeftone; the fathofe ore, either white, variegated, or yellowifh, found at Schemnitz in Hungary ; the quartzofe white ore in a powdery form, mixed with ferruginous fcoria, found at Potofi in America; the dark and variegated quartz ofe filver ores, with many other fubdivifions diftinguifh ed from one another by little elfe than their colour.

Silver is found mineralized by various fubftances; as,
1. With fulphur in the glaffy or vitreous filver ore: though this name feems rather to belong to the minera argenti cornea or horn filver ore, to be afterwards taken notice of more particularly. It is ductile, and of the fame colour with lead, but quickly becomes very black by expofure to the air ; though fometimes it is grey or black even when firt broken. It is found either in large lumps, or inhering in quartz, gypfum, gneifs, pyrites, \&c. Its fpecific gravity, according to Kirwan, is 7,205 . An hundred parts of it contain from 72 to 77 of filver, and it is rarely contaminated with any other metal.

Profeffor Brunnich fys that it contains 180 merks of filver in the hundred weight. The medium between the glafs ore and the red gilder ore is called rofch-gewechs in Hungary, and brittle glafs ore in Saxony. It is black, and affords a powder of the fame colour when pounded. In the mines of Himmelfurlt near Freyberg, it is faid to have held 140 merks, but thefe pieces are very fcarce at prefent; and indeed the Hungarian glafs ores in general are now very fcarce, as Profeffor Brunnich informs us, though they are now and then found in the windfhafts, which are frequently covered with a thin membrane or rather cruft, of the colour of pyrites. Mr Magellan fays that this ore is nothing elfe but native filver penetrated by fulphur; for, on being expofed to a fow heat, the latter flies off, and the filver fhoots into filaments. 'There are nine varieties of it. I. Like black lead. or plumbago, the moft common kind of any. 2. Bruckman mentions a kind brown on the outfide and greenifh within. 3. The yellow ore has its colour from fome arfenic contained in it, which forms an orpiment with the fulphur. 4. It is alfo found of a greenifh, and 5.bluifb colour ; the latter is friable, like the fcoria of metals, and is called at Freyberg Schlarekenerz, or the ore of fcoria. 6. It is found alfo in the arborefcent. 7. Lamellated. 8. C'ryfallized into octaedral or-hexaedral prifms, and into ten pyramids with ten fides. 9. Laftly, it is found fuperficial, or covering the ftones or mafles of other ores.
2. The pyrites argenteus of Henckel contains filver Cronfedts and iron mineralized with arfenic. There are three va- po 550 rieties of it. I. Hard, white, and fhining ore, of a compact, lamellar, or fibrous texture. The blighteft kind has leaft filver, only giving 6 or 8 ounces per quintal, and the richeft about ten per cent. It is found in Gerinany and Spain. It contains no fulphur. 2. Of a yellowifh white colour, and friated texture refembling bifmuth, but much harder. It is found in Spain, and yields about 60 per cent. of filver. 3. In another kind \(3 Q\)
the

\section*{SI L}

Silver.
the quantity of arfenic is fo great, that it would farceby deferve the name of filver ore if the arfenic were not very eafily diffipated. It is fort and eafily cut; has a brilliant metallic appearance, and confifts of conchoidal laminæ. A quintal contains only from four to fix ounces of filver, but it is eafily reduced by evaporating the arfenic, after which the filver is left behind nightly contaminated with iron.
3. The red or ruby fiver ore, the rotbrulden of the Germans, has the metal combined with fulphur and arfenic It is a heavy fining fubftance, fometimes tranfparent, and fometimes opaque ; the colour generally crimfon, though fometimes grey or blackifl. It is found in thapelefs maffes, or crystallized in pyramids or polygons, fometimes derdritical or plated, or with radated incruftations. It is formed in quartz, flint, fear, pyrites, , parry iron ore, lead ore, cobalt ore, jasper, ba-ro-felenite, gneifs, \&c. When radiated or friated, it is called rothzulden bluth. It cracks in the fire, and detonates with nitre. Its Specific gravity is from 5,400 to 5,684 . Bergman informs us, that this kind contains, in the hundred, 60 , fometimes 70 , pounds of filver, 27 of arfenic, and 13 of fulphur. The darkeft coloured ores are the richeft, the yellow kinds mach poorer; but the molt yellow do not belong to this Species, being in fact an orpiment with 6 or 7 per cent. of filer. This lat kind is brought chiefly from Potofi in America, and is called rofi-cler by the Spaniards.
4. The fchuartz gulden, or filler mum, contains the metal mineralized by fulphur and a mall quantity of arfenic and iron. It is of a black footy colour, and was fuppofed by Cronftedt to contain a good quantity of copper, to which its colour was owing; but later experiments have evinced, that there is no copper at all in it.
Kirman's It is either of a folid or brittle confiftence, and of a
Mineralogy. glaffy appearance when broken, or of a hoofer texture, and footy or deep black colour ; or it is found like mols, or thin leaves, lying on the furface of other fiver ores, or thole of lead and cobalt, or in clays, ponderous far, gneiss, \&c. It contains from 25 to 60 per cent. of filer.
5. The miner argent alba, the Weifgulden ore of the Germans, is a heavy, foft, opaque fubftance, fine grained or fcaly, bright and fining in its fractures, of a whitifh, ftecly, or lead colour ; fometimes cryftallized in myramedical or cylindrical forms, but often in amorphous grains, or refembling mols, or in the form of thin lamine incruftating other bodies, found in quartz, fear, ftelfein, pyrites, blend, lead-ore, cobalt-ore, ,parry iron ore, fluors, \&cc. It is very fufible. Its Specific gravity is from 5 to 5,300 . Its proportion of filler from 10 to 30 per cent. It is found, though not commonly, in Saxony, Hungary, the Hartz, and St Marie aux Mines.
6. The weifertz, or white filler ore, is an arsenical pyrites, containing fiver. It is met with in the Saxon mines fo exactly refembling the common arsenical PYrites, that it cannot be diftinguifhed from it by infpecion. Cronftedt fuppofes that the filer it contains may exit in a capillary form; but Profeffor Brunnich thinks this is not altogether the cafe. It is very farce, but met with near Freyberg. 'There is likewife a brown mum having the appearance of rags, met with in the crevices and upon the lumps of cubic lead ore in a mine
near Clautthal and other places, which contains a great quantity of filver. It is of a whitifh fining colour; hard, granulated, and folid, fometimes ftriking fire with tel. It difcovers a mixture of arfenic, by emitting a garlic final when heated.
7. The lebercriz of the Germans has the metal combine with fulphurated antimony. It is of a dark grey and fomewhat brownih colour. A variety of a blackifin blue colour is found in the form of capillary crystals, and called federertz or plumofe filer ore. It is met with in Saxony, and contains fometimes a mark or half a pound, fometimes only two, three, or four ounces, and fometimes only a mere trifle of filver, per cent. There is another filver ore, alpo called leberertz by the Ger* mans, which contains arfenic and regulus of antimony. This ore is fometimes alpo found of a dark grey colour; for the molt part amorphous, but fometimes cryftalli: zed into pyramids It appears red when fcraped, and contains from one to five per cent. of filer. 'The greateft part of this ore is copper, and the next arfenic. According to Bergman, the copper amounts to 24 per cent. It is found in Tranifylvania; and a kind was lately difcovered in Spain, of a hard fold conlittence, and of a greyifh blue colour.
8. The goofed dung ores contain filver mineralized with fulphur in combination with iron, arfenic, and cobalt. It looks like the zeijssulden, excepting that the cobalt, by its decompofition, gives it a rofl appearance. There are two varieties; one of a dull tarnifhed furface and ferruginous look; the other has a fining appearance like the leberertz. It contains from 10 to 40 or 50 per cent. of filver. The arfenic is in an acid fate, and united to the cobalt.
9. The dol fablertz contains filver mineralize with fulphurated copper and antimony, and refembles the dark-coloured zveiforulden, giving a red powder when rubbed. It is found either folid or crystallized, and is met with in the province of Dab, where it is melted by a very difficult process, calculated to preferve the different metals it contains. There is another kind which has arfenic united to the reft of the ingredients. It is only the grey copper ore impregnated with filver, of which it contains from one to twelve per cent. the quantity of copper being from 12 to 24 per cent. and the remainder confifting either of fulphur or arfenic, with a little iron. It is the molt common of all filer ores; and M. Monnet remarks, that where copper is united to arfenic, filver is always to be found. A variety has been found at Schemnitz, containing a portion of gold alfo.
10. The pecheblende is an ore of zinc containing fillvar, and is met with in the Saxon and Hungarian mines among the rich gold and filver ores. It is either of a metallic changeable colour or black. Of the fe there were formerly two varieties, viz. either in the form of fine feales or in balls, but the latter is now entirely unknown. A black blend is found in Bohemia, which is very heavy, with the furface fomewhat elevated like rome kinds of hæmatites, but no filler has yet been extracted from it
11. The bleyglanz, potters ore, or galena, contains filever mineralized with fulphurated lead. It is alpo called pyritous filver, and is of a brown colour, yielding but a very fall portion of metal. It is met with at Kunf-

\section*{S I L [ 49T] S I L}

Iver. bere in Norway. When the filver is combined wit fulphurated lead and antimony, the ore is called friperz.
12. The marcafite containing filver has the metal united with fulphurated iron. There are great varieties of this ore holding different proportions of the metal ; fome produce only half an ounce of filver per cent. A liver-coloured marcafite is found at Kunfberg in Norway, containing from three to three ounces and a half of filver per cent.
13. Silver is found mineralized with fulphurated and arfenical cobalt ; the fone fometimes containing dendries. Thefe kinds keep well in water, but generally decay in the air, and fofe the filver they contain. It is found at Morgenltern near Freyberg and Annaberg.
14. The butter milk ore contains filver mineralized by fulphur, with regulus of antimony and barytes. It is found in the form of thin particles or granular fpar. Wallerius fays that it is foft like mud, and feels like butter. He fufpects it to be produced from other filver ores wafhed away by running waters. Bomare adds, that the miners look upon it as a certain fign of other ores in the neighbourhood, though fome are perfuaded that it is only an unripened filver ore, which would foon become perfect.
15. The combuffible filver ore is a black brittle fub. ftance, leaving about fix per cent. of filver in its afhes. It is in fact a perfect coal in which filver is found.
16. The bornertz, or horn filver ore, in which the filver is united with the muriatic acid, is the fcarceft of all the filver ores. It is fometimes found in fnowy cubical cryftals, but is met with of many different colours. Its principal characteriftic is to clange to a violaceous brownifh colour when expofed to the furbeams, as happens alfo to the artificial luna cornea. It is frequently cryftallized in a cubic form, though not always of a white colour. Sometimes it refembles an earth eafily fufible without fmoke. There is a black kind, friable, and eafily reducible to powder; the other is in fome degree malleable, may be cut with a knife, and takes a fort of polifh when rubbed. The vitreous filver ore, which is fometimes mixed with the horn filver, is foluble in nitrous acid; and this affords a method of fe parating them, the horn filver ore being infoluble in that mentruum. When the horn filver is free from iron, it penerally contains 70 per cent. of filver at leait ; but theefe ores mofly contain fome portion of iron, a finall part of which is even united to the marine acid. This , kind of ore was firf analyfed by Mr Woulfe, who dif. il. Tranf.covered the prefence of the vitriolic acid in it.
17. Another kind of horn filver ore is mentioned by Mr Bergman, in which the metal is mineralized by the vitriolic and marine acids, along with fome fulphur. He doubts, however, whether the mineralization be perfect in this cafe, as the falt and fulphur do not admit of any other than a mechanical union. But fince iron is often found in thefe ores, a marcafite may thus be fometimes formed.
18. The filver goofe dung ore is of a greenifh colour, with a mixture of yellow and red. Some think it is a misture of red filver ore and calx of nickel.
19. The foliaceous filver ore. The colour of this ore is mortdoré. Some imagine it to be a native filver óre; others that it is a mixture of galena, ochre, and filver. It is fometimes found in the mountain cork, and is fo
light that it will fwim upon water. It contains but \(\qquad\)
Silver. one ounce of filver per quintal.

Thefe are all the varieties hitherto obferved in which filver is met with in the earth, though it may perhaps occur in various other forms. It would be worth while to examine whether, in thefe countries where gold and filver are found in large quantities, the precious metals may not be contained in fome proportion in the molt com mon ores, more efpecially when the particles of gold and filver have not been able to extricate themfelves in fuch a manner as to lie feparate in fiffures, veins, or hollow places of the mine. A mineralization of filver with alkali is faid to have been lately met with at Annaberg in Auftria ; but the account of it as yet can fcarcely be depended upon. Profeffor Brunnich fays, that the filver contained in the limeftone at that place appears to be native when the ftone is polifhed.

The pureft filver is that which is extracted from luna cornea, and is the only kind that ought to be trufted in the nice operations of chemiftry. The procefs, however, is very tedious, and prefents a very unexpected phenomenon, as this metal, though one of the moft fixed, is neverthelefs volatilized in the operation in fuch a manner that it exhales throush the porcs of the crucible; and fmall globules of filver are afterwards found in the cover, and even in the fupport of the crucible. According to Cramer, this lofs may be prevented by fmearing the crucible with black foap, and mixing with the luna cornea half its weight of oil or tallow, which laft mult alfo be added by little and little during the operation.
M. Magellan takes notice of a remarkable appearance Cronfect \(t_{2}\) obfervable in diffolving filver in the nitrons acid. He p. 537. obferves, that this acid is its fpecific menftruum, attacking it even when cold with confiderable effervefcence, growing hot, and emitting a confiderable quantity of orange-coloured fumes, which diminifh in proportion as the faturation advances. The metal appears of a pale brown colour in the conflict, and the folution becomes quite black. This laft appearance, however, is owing to a thin, black, fuliginous fubftance, like fmut, which is at once formed into a cruft on the furface of the thin plates of filver in the firft attack of the acid upon them. This is a very fingular phenomenon, and hitherto unaccounted for, thefe black crults being comminuted into fmaller and fmaller particles by the action of the acid; and, when the effervefcence is over, they are feen diftinctly to fall to the bottom of the veffel, and to form a black fediment, leaving the liquid folution quite tranfparent, but of a blue colour inclinin \(\gamma\) to green. This colour might be attributed to fome fmall mixture of copper, though the filver ufed in the experiment was of the purer kind. The chemifts of Dijon fay, that the nitrous folution of filver looks of a fine blue colour, if the acid be pure and well concentrated; but if it has any mixture of vitriolic c.r marine, a precipitation of vitriolated filver or luna cornea takes place. Aften wards the folution becomes as colourlef's as water, but gives a lafting black tinge to animal fubftances. This folution is of great ufe in chemiftry, ferving to form the lunar cauftic, to purify the common aquafortis from a mixture of the vitriolic and marine acids, and is a very nicc teft of the exiftence of thefe acids in mineral waters.

Silver does not combine with earths, even by the moft violent heat, though Mr Fourcroy fuppofes that its calx

\section*{S I I}
gilver, Silvering.
might give an olive green to glafs. Mr Magellan informs us, that its calx, precipitated by volatile alkali, gives a yellow colour to glafs, and that he has feen it ttained in this manner fo high as almoft to appear of a red colour. It unites with moft metals, even with iron. The nature of this alloy has been but little inquired into, though Fourcroy is of opinion that it may probably be of the greatelt utility in the arts. It combines in all proportions with copper, by which it is not deprived of its ductility, but renders it harder and more fonorous; by which means it is often ufed in bells. It is otherwife highly ufeful, on account of its indeftructibility by fire and air, and its extreme ductility. Its fine colour renders it extremely proper for ornamental purpofes, and it is applied like gold on the furface of different bodies, and even on copper. It likewife enters the texture of rich filks; but its moft confiderable ufe is that of being employed as money of an inferior value to gold. In this cafe, it is alloyed with one-twelfth part of copper. It is likewife often employed in making houfehold utenfils of all kinds, though its great price renders it lefs common than it would otherwife be for this purpofe. For plate, it is ufinally alloyed with one twenty-fourth of copper, which gives it a greater degree of hardnefs and coherence, without rendering it in the leaft noxious.

Silver has alfo been ufed in medicine ; but its extreme caufticity, when diffolved in the ritrous acid, and its inactivity otherwife, have brought it into difufe. The cryftals of filver have been recommended in very fmall quantity in dropfical cafes; but they are by no means fuperior, or even equal in efficacy, to much fafer medi. cines. The folution of filver, under the name of Greek water, has been ufed for the parpofe of dying hair of a dark colour; and the fame folution evaporated to a cornfiftence, and fufed, forms the lunar caultic of the fhops.

Shell Silver, is prepared of the fhreds of filver leaf, or of the leaves themfelves, for the ufe of painters, after the fame manner as fhell gold. See Shell-Goid.

SIL,VERING, the covering of any thing with filver. It is ufual to filver metals, wood, paper, \&ic. which is performed either with fire, oil, or fize. Metalgilders filver by the fire; painter-gilders all the other ways. See Gilding.

To filver copper or brafs. r. Cleanfe the metal with aquafortis, by wafhing it lightly, and immediately throwing it into pure water ; or by heating it red-hot, and fcouring it with falt and tartar and pure water with a fmall wire brufh. 2. Diffolve fome filver in aquafortis, in a broad-bottomed glafs veffel, or of glazed earth; then evaporate away the aquafortis over a chaffing difh of coals. 3. Put five or fix times its quantity of water, or as much as will be neceffary to diffolve it perfectly, on the remaining dry calx ; evaporate this water with the like heat; then put more frefh water, and evaporate again ; and, if need be, the third time, making the fire towards the latter end fo ftrong as to leave the calx perfectly dry, which, if your filver is good, will be of a pure white. 4. Take of this calx, common falt, cryftal of tartar, of each a like quantity or bulk, and mixing well the whole compofition, put the metal into pure water, and take of the faid powder with your wet fingers, and rub it well on, till you find every little cavity of the metal fufficiently filvered over. 5 . If you would have it richly done, you

49 ] S I M
muft rub on more of the powder; and in the laft place wafl the filvered metal in pure water, and rub it hard with a dry cloth.
Sistering of Glaffes. See Foliating of Looking. glaffes.

SILURIS, in ichthyology, a genus belonging to the order of pifces abdominales. The head is naked ; th mouth fet round with hairy filaments; the bronchir have from 4 to 14 rays; the ray of the pectoral fins, or the firft dorfal one, is prickly, and dentated backwards. There are 21 fpecies, mot of them natives of the In. dian and Amepican feas. Mr Haffelquift mentions one called the clarias by Linnæus, and fobeilan by the Arabians، If it pricks one with the bone of the breat-fin, it is dangerous; and our author faw the cook of a Swe. difh merchant fhip die of the poifon communicated by the prick of one of thefe fifh. See Electricity, \(n^{0} 261\).

SIMEON of DURHam, the cotemporary of William of Malmfury, took great pains in collecting the monuments of our hiftory, efpecially in the north of Eng. land, after they had been fcattered by the Danes. From thefe he compofed a hiftory of the kings of England, from A. D. 616 to 1130 ; with fome fmaller hiftorical pieces. Simeon both fludied and taught the fciences, and particularly the mathematics at Oxford ; and became precentor of the church at Durham, where he died, probably foon after the conclufion of his hiftory, which was continued by Johr, prior of Hexham, to A. D. 1156 .

SIMIA, the Moniey, a genus of quadrupeds belonging to the clafs of mammalia, and order of primates, in the Linnæan fyftem, but by Mr Pennant arranged under the digitated quadrupeds. According to the Linnæan fyttem, the characteriftics of this genus are thefe : There are four clofe fet fore-teeth on each jaw ; fingle tufks on each fide in both jaws, which are longer than the ref, and fomewhat remote from them. The grinders are obtufe, and the feet are formed like hands. Mr Pennant gives the following generic defcription of the fimia. 'I'here are four cutting teeth in each jaw, and two canine. Each of the feet are formed like hands, generally with flat nails, and, except in one inItance, have four fingers and a thumb. There are eyebrows both above and below.
They are a numerous race ; but almoft all confined to the torrid zone. They fill the woods of Africa from Senegal to the Cape, and from thence to Æthiopia. They are found in all parts of India, and its iflands; in Cochin-China, in the fouth of China, and in Japan ; (and one is "met with in Arabia) ; and they fwarm in the forefts of \({ }^{\prime \prime}\) South America, from the itthmus of Larien as far as Paraguay. They are lively, agile, full of frolic, chatter, and grimace. From the ftructure of their members, they have many actions in common with the human kind. Moft of them are fierce and untameable; fome are of a milder nature, and will fhow a degree of attachmelit; but in general they are endowed with mifchievous intellects; and are filthy, obfcene, lafcivious, and thieving. They inhabit the woods, and live on trees; feeding on fruits, leaves, and infects. In general, they are gregarious, going in vaft companies; but the different fpecies never mix with each other, alsways keeping lapart and in elifferent quarters. They leap with vaft activity from tree to tree, even
when

\section*{S I M [ [ 493 ] S.I M}
when loaded with their young, which cling to them. They are the prey of leopards and others of the feline race ; and of ferpents, which purfue them to the fummits of the trees, and fwallow them entire. 'They are not carnivorons, but for mifclief's fake will rob the nefts of birds of the eggs and young. In the countries where they moft abound, the fagacity of the feathered tribe is more marveloufly fhown in their contrivances to fix the neft beyond the reach of thefe invaders.
The finixe being more numerous in their fpecies than any other animals, and differing greatly in their ap. pearances, it feemed neceeflary to methodize and fubdivide the genus. Accordingly Mr Ray firlt diftributed them into three clafles.
Simia, Apes, fuch as wanted tails.
Cercopitheci, Monkeys, fuch as had tails.
Papiones, Baboons, thofe with fhort tails; to diftinguif them from the common monkeys, which have very long ones.

The principal marks by which the fpecies of this geof nus are diztinguifhable from each other, are derived, Ift, from the tail, which is either long, fhort, or altogether wanting, or is ftraight, or prehenfile ; zdly, from the buttocks, which are naked, and furnithed with callolitics, or are covered with hair; 3dly, from the nails, which are flat and rounded like thofe of man, or fharp pointed like the claws of beafts in general ; 4thly, from the prefence or abfence of a beard on the chin; and, 5 thly, from the cheeks being provided with, or wanting, pouches in their under parts. For greater convenience, the fpecies of this genus, which are very numerous, are arranged inder five fubordinate divifions, confidered as diftinet genera by fome authors, and not without reafon. Three of thefe fubdivifions were adopted by Linnæus; but Dr Ginelin, following Buffon, has added other two taken from the third divifion of his great precurfor. Thefe fubdivifions are the fimia, papiones, cercopitheci, Sapaji, and Jagoini.
I. 'The Simie, or Apes. They have no tails. The vilage is flat ; the teeth, hands, fingers, feet, toes, and nails, refemble thofe of man, and they walk naturally erect. This divifion includes the fimix, or apes properly fo called, which are not found in America.
1. The chimpanzee, the fimia troplodytes of Linnæus, common in the mountains of Sierra Leona, refembles man more than the orang-outang. This animal was fiff brought to Europe in 1738, when it was exhibited as a flow in London. T're following defeription of one that was kept fome months at the colony of Sierra Leona is given by Wadftrom, in his Effay on Colonization \(\dagger\). He was nearly two feet high ; but the full flature is nearly five feet. He was covered with black hair, long and thick on the back, but fhort and thin on the brealt and belly. His face was bare ; his laands and his head refembled thoie of an old black man, except that the hair on his head was ftraight. He ate, drank, flept, and fat at table, like a human being. At firt he crept on all fours, on the outfide of his hands; but, when grown larger, he endeavoured to go erect, fupporting limfelf by a flick. He was melancholy, but always good natured.
2. The fatyrus, orang-outang, or great ape, has a flat face, and a deformed refemblance of the human ; ears like thofe of a man ; the hair on the head longer than on the body. The budy and limbs are
covered with reddifh and fhaggy hair ; longelt on the back, thinneft on the fore parts. The face and paws

Simin. are fwarthy; the buttocks covered with hair. They inlabit the interior parts of Africa, the ifles of Sumatra, Borneo, and Java. Are folitary, and live in the mont defert places. They grow to the height of fix fect ; have prodigious itrength, and will overpower the ftrongeit man. The old ones are fhot with arrows, the young alone can be taken alive. They live entirely on fruits and nuts. They will attack and kill the negroes who wander in the woods; will drive away the elepliants, and beat them with their fifts or pieces of wood; and will throw ftones at people that offend them. They fleep in trees; and make a fort of fhelter from the inclemency of the weather. They are of a grave appearance and melancholy difpofition, and even when young not inclined to frolic. They go erect, and are vaftly fwift and agile. Thefe accounts are chiefly taken from Andrew Battel, an Englifh failor, who was taken prifoner 1589, and lived many years in the inner parts of Congo ; his narrative is plain, and feems very authentic. It is preferved in Purchas's collection. Froger * informs us, " that thofe along the banks of § \(D_{\text {efripe }}\) the river Ganges are larger and more mifchievous than Hiflorique in any part of Africa: the negroes dread them, and du Royaume cannot travel alone in the country without running the de Macacar, hazard of being attacked by thefe animals, who often \({ }^{\text {P. } 51 .}\) prefent them with a ftick, and force them to fight. I have heard the Portuguefe fay, that they have often feen them hoift up young girls, about feven or eight years old, into trees, and that they could not be wrefted from them without a great deal of difficulty. The moft part of the negroes imagine them to be a foreign nation come to inhabit their country, and that they do not fpeak for fear of being compelled to work." When taken young, they are capable of being tamed, and taught to perform many menial offices. Francis Pyrard \(\dagger+\) Voyages a's relates, "that in the province of Sierra Leoma, there is Francois a fpecies fo ftrong limbed, and fo indultrious, that, \(P_{\text {Prom }}\) tom, ii. when properly trained and fed, they work like fervants; p. \(33^{12}\). that they generally walk on the two hind feet ; that they pound amy fubfances in a mortar; that they go to bring water from the river in fmall pitchers, which they carry full on their heads. But when they arrive at the door, if the pitchers are not foon taken off, they allow them to fall; and when they perceive the pitchers overturned and broken, they weep and lament." Father Jarric \(\frac{\text { If }}{}\), quoted by Nieremberg, fays the fane thing, nearly in the fame terms. With regard to the educa- Niere tion of thefe animals, the teftimony of Shoutten \(\dagger\) Neremberg cords with that of Pyrard. "They are taken (he re-Peregrin. marks) with fnares, taught to walk on their hind feet, lib. ix. and to ufe their fore feet as hands in performing diffe. \(\$ V\) oy. 45 . rent operations, as rinfing glaffes, carrying drink round de Guat. the company, turning a fpit, \&c." "I faw at Java Shout ten (fays Guat \(\ddagger\) ) a very extraordinary ape. It was a fe- \({ }^{\text {aux }}\) Indes male. She was very tall, and often walked erect on her \(\ddagger\) rientayage des. hind feet. On thefe occafions, fhe concealed with her \(\mathrm{F}_{\mathrm{r}}\). \(\mathrm{l}_{\mathrm{e}}\) Guut \(\mathrm{C}_{\text {, }}\). hands the parts which diftinguifh the fex. Except the tem. ii. eye-brows, there was no hair on her face, which pretty \({ }^{P} 9^{6 .}\) much refembled the grotefque fumale faces I faw among the Hottentots at the Cape. She made her bed very neatly every day, lay upon her fide, and covered herfelf with the bed cloaths. When her head ached, fhe bound it up with a handkerchief; and it was amufing to fee
her thus hooded in bed. I could relate many other lictle articles which appeared to me extremely fingular. But I admired them not fo much as the multitude; becaufe, as I knew the defign of bringing her to Europe to be exhibited as a fhow, I was inclined to think that fhe had been taught many of thefe monkey tricks, which the people confidered as being natinal to the animal. She died in our fhip, about the latitude of the Cape of Good Hope. The figure of this ape had a very great refemblance to that of man, \&c." Gmelli Carreri tells us, that he faw one of thefe apes, which cricd like an infant, walked upon its hind feet, and carried a matt under its arm to lie down and fleep upon.

An orano-outanos which Buffon faw, is defcribed by him as mild, affectionate, and good-natured. His air was melancholy, his gait grave, his movements meafured, his difpolitions gentle, and very different from thofe of other apes. He had neither the impatience of the Barbary ape, the malicioufnefs of the baboon, nor the extravagance of the monkeys. "It may be alleged, (fays our author), that he had the benefit of inftruction; but the other apes which I hall compare with him, were educated in the fame manner. Signs and words were alone fufficient to make our orang-outang act; but the baboon required a cudyel, and the other apes a whip; for none of them would obey without blows. I have feen this animal prefent his hand to conduct the people who came to vifit him, and walk as gravely along with them as if he had formed a part of the company. I have feen him fit down at table, unfold his towel, wipe his lips, ufe a fpoon or a fork to carry the victuals to his mouth, pour his liquor into a glafs, and make it touch that of the perfon who drank along with him. When invited to take tea, he brought a cup and a faucer, placed them on the table, put in fugar, poured out the tea, and allowed it to cool before he drank it. All thefe actions he performed without any other inftigation than the figns or verbal orders of. his matter, and often of his own accord. He did no injury to any perfon: he even approached company with circumfpection, and prefented himfelf as if he wanted to be careffed. He was very fond of dainties, which every body gave him: And as his brealt was difeafed, and he was afflicted with a teazing cough, this quantity of fweetmeats undoubtedly contributed to fhorten his life. He lived one fummer in Paris, and died in London the following winter. He eat almoft every thing; but preferred ripe and dried fruits to all other kinds of fooc. He drank a little wine; but fpontaneoufly left it for milk, tea, or other mild liquors." This was only two feet four inches high, and was a young one. 'There is great poffibility that thefe animals may vary in fize and in colour, fome being covered with black, others with reddifh hairs.They are not the fatyrs of the ancients ; which had tails (A), and were a fpecies of monkey. Linnæus's
bomo noclurnus, an animal of this kind, is unneceffarily feparated from his fimin fatyrus.

To enable the reader to form a judgment of this animal, which has fo great a refemblance to man, it may not be unacceptable to quote from Buffon the differences and conformitics which make him approach or recede from the human fpecies. "He differs from \(I d\). man externally by the flatnefs of his nofe, by the fhortnefs of his front, and by his chin, which is not elevated at the bafe. His ears are proportionally too large, his eyes too near each other, and the diflance between his nofe and mouth is too great. Thefe are the only differences between the face of an orang-outang and that of a man. With regard to the body and members, the thighs are proportionally too fort, the arms too long, the fingers too fmall, the palm of the hands too long and narrow, and the feet rather refemble hands than the human foot. The male organs of generation differ not from thofe of man, except that the prepuce has no frenum. The female organs are extremely fimilar to thofe of a woman.
" The orang-outang differs internally from the human fecies in the number of ribs: man has only 12, but the orang-outang has 13 . The vertebre of the neck are alfo fhorter, the bones of the pelvis narrow, the buttocks flatter, and the orbits of the eyes funk deeper. He has no fpinal procefs on the firft vertebra of the neck. 'The kidneys are rounder than thofe of man, and the ureters have a different figure, as well as the bladder and gall.bladder, which are narrower and longer than in the human fpecies. All the other parts of the body, head, and members, both external and internal, fo perfectly refemble thofe of man, that we cannot make the comparifon without being aftonifhed that fuch a fimilarity in ftructure and organization fhould not produce the fame effects. The tongue, and all the organs of fpeech, for example, are the fame as in man ; and yet the orang-outang enjoys not the faculty of fpeaking; the brain has the fame figure and proportions; and yet he poffeffes not the power of thinking. Can there be a more evident proof than is exhibited in the orang-outang, that matter alone, though perfectly organized, can produce neither language nor thought, unlefs it be animated by a fuperior principle? Man and the orang-outang are the only animals who have buttocks and the calf of the legs, and who, of courfe, are formed for walking erect ; the only animals who have a broad cheit, flat fhoulders, and vertebræ of the fame ftructure; and the only animals whofe brain, heart, lungs, liver, fpleen, ftomach, and inteftines, are perfectly fimilar, and who have an appendix vermiformis, or blind-gut. In fine, the orang-outang has a greater refemblance to man than even to the baboons or monkeys, not only in all the parts we have mentioned, but in the largenefs of the face, the figure of the cranium, of the jaws, of the teeth, and of the other benes of the head
(A) AElian gives them tails, lib. xvi. c. 2I. Pliny fays they have teeth like dogs, lib. vii. c. 2. circumftances common to many monkeys. Polomy, lib. 7. c. \(2:\) f peaks of certain iflaids in the Indian ocean inhabited by people with tails like thofe with which fatyrs are painted, whence called the ifles of fatyrs. Kœping, a Swede, pretended to have difcovered thefe bomines caudati; that they would have trafficked with him, offering him live parrots ; that afterwards they lsilled fome of the crew that went on fhore, and eat them, \&c. \&c. Aman. Acad. wi. 71.

\section*{S I M [ 495 ] S I M}
and face; in the thicknefs of the fingers and thumb, the likewife naked; the hair of the head defcends on both figure of the nails, and the number of vertebre; and, lafly, in the conformity of the articulations, che magnitude and figure of the rotula, flernum, \&c. Hence, as there is a greater fimilarity between this animal and man, than between thofe creatures whicli refemble him moft, as the Barbary ape, the baboon, and monkey, who have all been defigned by the gencral name of apes, the Incians are to be excufed for affociating him with the human fpecies, under the denomination of orangoutang, or wild man. In fine, if there were a fcale by which we could defcend from human nature to that of the brutes, and if the effence of this nature confifted entirely in the form of the body, and depended on its organization, the orang-outang would approach nearer to man than any other animal. Placed in the fecond rank of beings, he would make the other animals feel his fuperiority, and oblige them to obey him. If the principle of initation, by which he feems to mimic human actions, were a refult of thouglt, this ape would be fill farther removed from the brutes, and have a greater affinity to man. But the interval which feparates them is immenfe. Mind, reflection, and language, depend not on figurc or the oryanization of the body. Thefe are endowments peculiar to man. The orangouteng, though, as we have feen, he has a body, memhers, fenfes, a brain, and a tongue, perfectly fimilar to thofe of man, neither fpeaks nor thinks. 'Though he counterfeits every human movement, he performs no action that is characteriftic of man, no action that has the fame principle or the fame defign. With regard to initation, which appears to be the moft frriking character of the ape kind, and which the vulgar have attributed to him as a peculiar talent, before we decide, it is neceffary to inquire whether this imitation be fpontaneous or forced. Does the ape imitate us from inclination, or becaufe, without any exertion of the will, he feels the capacity of doing it? I appeal to all thofe who havc examined this animal without prejudice; and I am convinced that they will agree with me, that there is nothing voluntary in this imitation. The ape, laviving arms and hands, ufes them as we do, but without thinking of us. 'The fmilarity of his members and organs neceffarily produces movements, and fometimes fucceffions of movements, which refemble ours. Bcing endowed with the human flucture, the ape muft move like man; but the fame motions imply not that he acts from imitation. Two bodies which receive the fame impulfe, two fimilar pendulums or machises, will move in the fame manner; but thefe bodies or machines can never be faid to imitate each other in their motions. The ape and the human body are two machines fimilarly conftructed, and neceffarily move nearly in the farme manner ; but parity is not imitation. The one depends on matter, and the other on mind. Imitation prefup. pofes the defiga of imitating. The ape is incapable of forming this defign, which requires a train of thinking ; confequently man, if he inclines, can imitate the ape; but the ape cannot even incline to imitate man."
3. Pongo, or Jocko, are confidered as one fpecies by Pennant and Gmelin. It inhabits the ifland of Java, and the interior parts of Guinea. Has no pouches within his cheeks, no tail, and no callofities on the buttocks; which laft are plump and flefhy. All the teeth are fimilar to thofe of man. The face is flat, naked, and tawny ; the ears, hands, feet, breaft, and belly, are
temples in the form of treffes; the hair on the back and
Simia. loins is in fmall quantities. It is five or fix feet high, and walks always erect on the two hind feet. It has not been afcertained whether the females, of this fpecies or varicty, are fubject to periodical difclarges; but analogy renders this almof unqueftionable. This animal is, by !Yr G melin, con'dered only as a variety of the orang-outang.
4. The great gibbon, long.armed ape, or fimia lar, Fig. \(3 \cdot\) with a flat fiwarthy face firrounded with grey hairs: hair on the body black and rough; buttocks bare; nails on the hands flat ; on the feet long; arms of a mof difproportioned lenoth, reaching quite to the ground when the animal is erect, its natural pofture ; of a hideous deformity. - Inhabits India, Malacca, and the Molucca ifles; a inld and gentle animal; grows to the height of four feet. - The great black ape of Mangfi, a province in China, feems to be of this kind.
5. The leffer gibbon, or fimia lar minor, but is much Fig. 40 lefs, being only about a foot and a half high ; the body and face are of a brown colour, refernbles the former. The fimia lar argentea is probably a variety of this fpecies.
6. The pigmy, or fimia filvanus, has no tail; the Fig. 5 . buttocks are naked; the head roundifh, and the arms fhorter than the body. It inhabits Africa; and is not uncommon in our exhibitions of animals; is very tractable and good-natured, and was moft probably the pigmy of the ancicnts. It abounds in Æthiopia, one feat of that imaginary nation; was belicved to dwell near the fountains of the Nile, whence it defcended annually to make war on the cranes, i. e. to fteal their eggs, which the birds may be fuppofed naturally to defend; whence the fiction of their combats.
7. The magot, fimia inuus, or Barbary ape, has a Fig. 6 . long face, not unlike that of a dog; canine teeth, long and 7 . and Atrong; cars like the human; nails flat; buttocks bare; colour of the upper part of the body a dirty greenif brown ; belly, of a dull pale yellow; grows to above the length of four feet. - 'They inhabit many parts of India, Arabia, and all parts of Africa except Egypt, where none of this genus are found. A few are found on the hill of Gibraltar, which breed there; prabably from a pair that had efcaped from the town; as they are not found in any other part of Spain. -They are very ill-natured, mifchievous, and fierce ; agreeing with the character of the ancient Cynocephali. They arc a very common kind in exhibitions. By force of difcipline they are made to play fone tricks; otherwifc they are more dull and fullen than the reft of this genus. They affemble in great troops in the open fields in India, and will attack women going to market, and take their provifions from them. 'i'he females carry the young in their arms, and will leap from tree to trec with thein. Apes were worfhipped in India, and had magnificent temples ereeted to them. When the Portuguefe plundered one in \({ }^{\circ}\) Ceylon, they fonnd in a little golden cafket the tooth of an ape; a relic held by the natives in fuch veneration, that they offered 700,000 ducats to. redeem it, but in vain ; for it was burnt by the viceroy, to ftop the progrefs of idolatry.
II. Papiones, or Baboons. Thefe have hart tails, a long face; a broad high muzzlc; longifh dog-like tufls, or canine teeth; and naked callofities on the buttocks. They are only found in the old world, and are the papiones and Kuvox\&pa \(a\) of the ancients.
8. The maimon, fimia papio nemeftrina, or pig-tailed \(c\)

Rennant's Quadrupeds vol. i .
P. 172.
baboon, with a pointed face, which is naked, of a fwarthy redinefs ; two fharp canine teeth; ears like the human ; hair on the limbs and body brown inclining to afh-colour, paleft on the belly; fingers black; nails long and flat ; thumbs on the hinid-feet very long, connected to the neareft toe by a broad membrane; tail four inches long, flender, exactly like a pig's, and almoft naked; the bare faces on the rump red, and but fmall : length, from head to tail, 22 inches. Inhabits the ines of Sumatra and Japan; is very docile. In Japan it is taught feveral tricks, and carried about the country by mountebanks. Kempfer was informed by one of thefe people, that the baboon he had was 102 years old.
9. The great baboon, or fimia papio fphinx, with hazel irides; ears finall and naked; face canine, and very thick; middle of the face and forehead nalked; and of a bright vermilion colour; tip of the nofe of the fame, and ending truncated like that of a hog; fides of the noie broadly ribbed, and of a fine violet hue; the opening of the mouth very fmall ; cheeks, throat, and goat-like beard yellow; hair on the fore head very long, turns back, is black, and forms a kind of pointed crelt. Head, arms, and legs, covered with fhort hair, yellow and black intermixed; the breaft with long whitifh yellow hairs, the fhoulders with long brown hair. Nails flat; feet and harids black ; tail four inches long, and very hairy; buttocks bare, red, and filthy; but the fpace about them is of a mott elegant purple colour, which reaches to theinfide of the upper part of the thighs.

This was defcribed by Mr Pennant from a fluffed fpecimen in Sir Afhton Lever's mufeum. In Auguft 1779 , a live animal of this fpecics was fhown at Edinburgh, and in October following at Chefter, where being feen by Mr Pennant, that inquifitive naturalift has defcribed it in his Hiftory of Quadrupeds. "It differed little (he obferves) in colour from the above, being in general much darker. Eyes much funk in the head, and fmall. On the internal fide of each ear was a whitc line, pointing upwards. The hair on the forehead turned up a like a toupee. Feet black, in other refpects refembled the former. In this I had an opportunity of examining the teeth. The cutting teeth were like thofe of the reft of the genus; but, in the upper and lower jaw, were two canine, or rather tufks, near ihree inches long, and exceedingly fharp and pointed. This animal was five feet high, of a moft tremendous Atrength in all its parts; was exceffively fierce, libidinous, and Atrong."

Mr Schreber fays, that this fpecies lives on fucculent fruits, and on nuts; is very fond of eggs, and will put eight at once into its pouches, and, taking them out one by one, break them at the end, and fwallow the yolk and white; rejects all fefh-meat, unlefs it be dreffed; would drink quantities of wine or brandy; was lefs agile than other baboons; very cleanly; for it would immediately fling its excrements out of its hut. 'Ihat which was hown at Chefter was particularly fond of cheefe. Its voice was a kind of roar, not unlike that of a lion, but low and fomewhat inward. It went upon all fours, and never ftood on its hind legs, unlefs forced by the keeper ; but wonld frequently fit on its rump in a crouching manner, and drop its arms before the belly. Inhabits the hotter parts of Africa.
Eig. 10.
10. The little baboon, or fimia papio apedia, has a roundih head, with a projecting muzzle, and roundif
naked ears; the hair on the body is yellow, tipt with black; the face is brown, and almoft naked, having only a fev fcattered hairs; the nails are all comprefied and oblong, except on the thumbs and great toes, the nails of which refemble man; the tail is very thort, being hardly an inch long; the body is about the fize of a cat. It is uncertain, fays Gmelin, if this animal fhould be confidered as a diftinct fpecies, or only as a variety of the fimia fciurea.
II. The mantegar, or fimia papio mermon, common- Fig. ly called the tufted ape, but it is improperly named an ape, as it bas a tail. It is defcribed in the abridgment of the Philofophical Tranfactions, in9 290 . It had a nofe and head 14 inches in length; the nofe of a deep red, face blue, both naked; black eye-brows; ears like the human; on the top of the head a long upright tuft of hair; on the chin another; two long tufks in the upper jaw ; fore feet exactly refembling hands, and the nails on the fingers flat ; the fore-part of the body, and the infide of the legs and arms, naked; the outfidc covered with mottled brown and olive hair. Length, from the nofe to the rump, three feet two inches. It was very fierce and falacious; went on all fours, but would fit up on its rump, and fupport itfelf with a ftick; in this attitude, it would hold a cup in its hand, and drink out of it. Its food was fruits.
12. The mandril, fimia papio maimon, or ribbed nofe baboon, has a fhort tail, and a thin beard on the chin; the cheeks are blue and friped, and the buttocks are naked. This fpecies of baboon is found on the Gold Coaft, and in the other fouthern provinces of Africa, where he is called boggo by the negrees, and mandril by the Europeans. Next to the orang-outang, he is the largeft of all the apes or baboons. Smith relates, that lie had a prefent of a female mandril, which was only fix months old, and that it was as large as an adult baboon. He adds, that thefe mandrils walk always on two feet; that they weep and groan likc men; that they have a violent paffion for women, which they never fail to gratify when they find a woman at a diftance fros relief. We have given figures both of the male and female, which may be eafily dittinguifhed by their fize and appearance.
13. The wood-baboon, or fimia papio fylvatica, with a long dog-like face, covered with a fmall gloffy black fkin; hands and feet naked, and black like the face; hair on all parts long, elegantly mottled with black and tawny; nails white: about three feet high when erect; tail not three inches, and very hairy on the upper top. Inhabits Guinea, where it is called by the Englif the man of the wood.
14. The brown baboon, or fimia papio platypygos, with pointed ears; face of a dirty white; nofe large and broad; hairs round the face fhort and ftraight; colour of the upper part of the body brown; of the under, afhcolour: tail about four inches long; toper, and almoft bare of hair; beneath is quite naked. The animal which Mr Pennant called the nerw baboon, in the firft edition, feems by the tapernefs of the tail, and general form, to be of this kind.
15. The hoggifh baboon, or fimia papio porcaria, has a fhort tail, and coloured buttocks; the head is like that of a hog, with a naked fnout; the body is of an olive brown colour ; the nails are fharp and compreffed. Inhabits Africa, and is about three feet and a lialf high

\section*{S I M [ 497 ] S I M}
when flanding erect. This, in all probability, is the fame animal with the hog-faced ape, adopted from Pennant.
III. Moneeys, Cfrcopitheci, have long tails, which are not prehenfile ; the under parts of their cheeks are furnifhed with pouches, in which they can keep their victuals; the partition between the noftrils is thin, and the apertures are, like thofe of man, placed in the under part of the nofe; the buttocks are naked, and provided with callofities. Thefe animals, which are never found native in America, are the cercopitheci, and Ku \(\beta 0\), , of the ancients.
16. The'I'artarin, dog faced baboon of Fennant, and cercopithecus hamadryas of Gmelin, with a long, thick, and ftrong nofe, covered with a fmooth red fkin ; ears pointed. and hid in the hair ; head great, and flat ; hair on the head, and fore.part of the body as far as the waift, very long and fhagry ; grey and olive-brinded; the fides of the head very full, the hair on the limbs and hind part of the body very fhort; limbs ftrong and thick; hands and feet durky ; the nails on the fore-feet flat; thofe on the hind like a dog's ; buttocks very bare, and covered with a fkin of a bloody colour ; tail fcarce the length of the body, and carried generally erect. They inhabit the hottelt parts of Atrica and Afia; where they keep in vaft troops, and are very ficree and dangerous. They rob gardens. They will run up trees when paffengers go by, fhake the boughs at them with great fury, and chatter very loud. They are exceffively impudent, indecent, lafcivious; moft deteftable animals in their manners as well as appearance. They range the woods in hundreds ; which obliges the owners of the coffee-plantations to be continually on their guard againt their depredations. One of them was fhown in London fome years ago: it came from Mokha, in the province of Yeman, in Arabia Felix in the Perlian gulph; and was above five feet high . It was very fierce and untameable; fo flrong as eafily to mafter its keeper, a ftout young man. Its inclinations to women appeared in the moft violent manner. A footman, who brought a girl to fee it, in order to teaze the animal, kiffed and hurged her : the beatt, enraged at being fo tantalizeed, caught hold of a quart pewterpot, which he threw with fuch force and fo fure an aim, that, had not the man's hat and wig foftened the blow, his \(\mathfrak{J k u l l}\) mult have been fractured ; but he fortunately efcaped with a common broken head.
17. The white-bearded black wandcru, the fimia fi. lenus of Linnæus, the ouanderou of Buffon, and liontailed baboon of Pennant, the cercopithecns filenus albibarbatus of Gmelin, has a do \(r\)-like face, is naked, and of a dufky colour; a very large and full white or hoary heard; large canine teeth; body covered with black hair; belly of a light colour ; tail terminated with a tuft of hair like that of a lion. Its bulk that of a middling fized dog. It inhabits the Eaft Indies and the hotter parts of Africa.
18. The purple-faced monkey, or cercopithecus filenus purpuratus, with a great triangular white beard, fhort and pointed at the bottom, and on each fide of the ears, extending a winged fathion far beyond them; face and hands purple, body black. Iuhabit Ceylon. 'They are very harmlefs; live in the woods, and feed on leaves and buds of trees; and when taken foon become tame.

Vok. XVII. Part II.
19. Malbrouk, or cercopithecus faunus, has a long sinin, tail, and is bearded: the tail is buthy at the extremity. It is a native of Bengal. This fpecies has cheekpouches, and callofities on the buttocks; the tail is nearly as long as the body and head; and it is a mif. take of Clufius that it terminates in a tuft ; the face is of a cinereous grey colour, with a large muzzle, and large eyes, which have flefh-coloured eyelids, and a grey band crofs the forehead in the place of eye-brows; the ears are large, thin, and flefh-coloured ; the upper parts of the body are of a uniform yellowifh brown colour, and the lower of a yellowif grey: It walks on all fours, and is about a foot and a half from the muzzle to the extremity of the tail. The fernales menftruate.
20. Macaque, or cercopithecus cynomologus, the hare-lipped monkey of Pennant, has no beard; the noftrils are thick and divided ; the tail is long and arched, and the buttocks are naked. He has cheek-pouches and callofities on the buttocks. His tail is from 18 to 20 inches long. His head is large, his muzzle very thick, and his face naked, livid, and wrinkled. His ears are covered with hair. His body is thort and fquat, and his limbs thick and Chort. The hair on the fuperior parts of his body is of a greenifh afh-colour, and of a yellowifh grey on the breaft and belly. He has a fmall crelt of hair on the top of the head. He walks on fou: and fometimes on two feet. The length of his body, comprchending that of the head, is about 18 or 20 inches.
21. The dog-headed monkey, or cercopithecus cynocephalus, has no beard, and is of a yellow colour ; the muzzle is long; the tail long and Atraight, and the buttocks naked. It is a native of Africa.
22. The fpotted monkey, or cercopithecus Diana, with a long white beard: colour of the upper parts of the body reddifh, as if they had been finged, marked with white fpecks; the belly and chin whitifh; tail very long ; is a fpecies of a middle fize. It inhabits Guinea and Congo, according to Marcgrave ; the Congefe call it exquima. M. de Buffon denies it to be of that country ; but from the circumftance of the curl in its tail, in Marcgrave's figure, and the defcription of fome voyagers, he fuppofes it to be a native of South Ame. rica. Linnæus defcribes his S. Diana fomewhat differently : he fays it is of the fize of a large cat ; black, fpotted with white ; hind part of the back ferruginous; face black; from the top of the nofe is a white line paffing over each eye to the ears, in an arched form ; beard pointed, black above, white beneath, placed on a fattifh excrefcence; breaft and throat white; from the rump, crofs the thighs, a white line ; tail long, ftraight, and black; ears and feet of the fame colour; canine teeth, large.
23. The green monkey, or cercopithecus fabreus, has a black and flattifh face: the fide of it bounded by long white hairs, falling backwards, and almoft covening the ears, which are black, and like the human : head, limbs, and whole upper part of the body and tail covered with foft hair, of a yellowifh green colour at their ends, ci. nereous at their roots : under fide of the body and tail, and inner fide of the limbs, of a filvery colour: tail very long and flender. Size of a fmall cat. Inhabit different parts of Africa: keep in great flocks, and live in the woods: are fcarce difcernible when among the leaves, except by their breaking the boughs with their

gambols:

\section*{S 1 M}
26. The egret, or cercopithecus aygula, has a long face, and an upright flarp-pointed tuft of hair on the top of the lead. The hair on the forehead is black: the
tuft, and the upper part of the body light-grey; the of the head. The hair on the forehead is black: the
tuft, and the upper part of the body light-grey ; the belly white : the eye-brows are large; the beard very
fmall. Size of a fmall cat. They inlabit Java. They belly white : the eye-brows are large; the beard very
?mall. Size of a fmall cat. They inlabit Java. They fawn on men, on their own fpecies, and embrace each other. They play with dogs, if they have none of their own fpecies with them. If they fee a monkey of another kind, they greet him with a thoufand grimaces. When a number of them fleep, they put their heads together. They make a continual noife during night.
27. The rillow, cercopithecus finicus, or Chinefe bonnet, has a long finooth nofe, of a whitifh colour; hair on the crown of the head long, lying flat, and parted like that of a man ; colour, a pale cinereous brown, Inhabit Ceylon. They keep in great troops; and rob gardens of their fruit, and fields of their corn; to prevent which, the natives are obliged to watch the whole day : yet thefe animals are fo bold, that, when driven from one end of the field, they will immediately enter at the other, and carry off with them as much as their mouth and arms can hold. Bofman, fpeaking of the thefts of the monkeys of Guinea, fays, that they will take in each paw one or two ftalks of millet, as many under their arms, and two or three in their mouth ; and thus laden, hop away on their lind-legs : but, if purfued, they fling away all, except what is in their mouths, that it may not impede their flight. They are very nice in the choice of the millet; examine every ftalk: and if they do not like it, fling it away: fo that this delicacy does more harm to the fields than their thievery.
Rer's Tran- 28. The tawny monkey, or cercopithecus fulvus, has Ration of long tufks in the lower jaw : the vifage is long and flefh Gmelin's Linneus. gambols : in which they are very agile and filent : even when fhot at, do not make the leaft noife: but will unite in company, knit their brows, and gnafh their teeth, as if they meant to attack the enemy : are very common in the Cape de Verd iflands.
24. The mutache, or cercopithecus cephus, has a beard on the checks; the crown of the head is yellowifh: the feet are black, and the tip of the tail is of an ath colour. Its tail is much longer than the body and head, being 19 or 20 inches in length. The female menftruates.
25. The mangabey, cercopithecus æthiops, or whiteeyed monkey, has a long, black, naked, and dog-like face: the upper eye-lids of a pure white : ears black, and like the human : no canine teeth : hairs on the fides of the face beneath the cheeks, longer than the reft: tail long : colour of the whole body tawny and black : flat nails on the thumbs and fore-fingers; blunt claws on the others : hands and feet black - Shown in London fome ycars ago : place uncertain : that defcribed by M. de Buffon came from Madagafcar ; was very good. natured ; went on all-fours.

\section*{} on the body are of a fhining black, long, yet lie fo clofe on each other that the animal appears quite fmooth: the feet and end of the tail are brown ; the tail very long, and always twifted at the end. Size of a fox. Inhabit the woods of Brazil and Guiana in vaft numbers, and make a moft dreadful howling. Sometimes one mounts on a higher branch, the reft feat themfelves beneath : the firl begins as if it was to harangue, and fets up fo loud and fharp a howl as may be heard a vaft way, and a perfon at a diftance would think that a hundred joined in the cry: after a certain fpace, he gives a fignal with his hand, when the whole affembly joins in chorus; but on another fignal is filent, and the orator: finifhes his addrefs ( B ). Their clamour is the moft difagreeable and tremendous that can be conceived; ow ing to a hollow and hard bone placed in the throat,
which
which, at the extremity, is generally deprived of hair on the under fide, and covered with a fmooth fkin; this part they can fold, extend, curl up, and unfold at plea-
fure ; by which they are enabled to hang upon branches, part they can fold, extend, curl up, and unfold at plea-
fure ; by which they are enabled to hang upon branches, or to lay hold of any thing which is beyond the reack of their hands, ufing the extremity of the tail like a fin-
ger or hand; the partition between the noftrils is very of their hands, ufing the extremity of the tail like a fin-
ger or hand; the partition between the noftrils is very thick, and the apertures are fituated on the fides of thick, and the apertures are fituated on the fides of
the nofe; the buttocks are clothed with hair, and have no callofities; the females of this fubgenus do not men-
ftruate ; and this race of animals is only to be found in no callofities; the females of this fubgenus do not men-
ftruate ; and this race of animals is only to be found in America: This fubdivifion of the gents is made with great propriety by Dr Gmelin, in imitation of the Count de Buffon.
30. The guariba, fapajus Beelzebub, or the preacher monkey, has black fhining eyes ; flort round ears ; and a round beard under the chin and throat. The hairs
Mr Brook, an animal merchant and exhibitor in London: The upper parts of the body are covered with a pale tawny coloured fur, which is afl coloured at the roots ; the hinder part of the back is orange coloured, the legs afh coloured, the belly white, and the tail fhorter than the body.
29. King monkey, full-bottom monkey, or cercopithecus regalis, has no thumb on the hands; the head, checks, throat, and fhoulders, are covered with long, flowing, coarfe hairs. Inhabits the forefts of Sierra Leona in Guinea, where it is called bey, or king monkey. It is above three feet liogh when erect: The head is fmall, with a fhort, black, naked facc ; and the head; cheeks, throat, neck, and fhoulders, are covered with long, coarfe, flowing hairs, of a dirty ycllowifh colour, mixed with black, and refembling a full-bottomed wig; the body, arms, and legs, are covered with Thort hairs of a fine glofly black colour ; the hands are naked, and have no thumbs; the feet have five very long flender toes, which are armed with narrow pointed claws; the tail is very long, and is covered with fnow white hairs, having a tuft at the end; the body and limbs are very fender : Its fkin is held in high eftimation by the negroes for making pouches and gun cafes.
IV. Sapajous, Sapaji, have prehenfile tails, and cheek-pouches. Thefe animals have long tails, Th.
(B) A fingular account, yet related by Marcgrave and feveral other writers. Marcgrave is a writer of the: firt authority, and a moft able naturalift, long refident in the Brafils, and fpeaks from his own knowledge.

\section*{S I M \\ [ 499 ] \\ \(S\) I M}
which the Englifh call the throttle-bone. Thefe monkeys are very fierce, untameable, and bite dreadfully. There is a variety of a ferruginous or reddifh bay colour, which the Indians call the king of the monkeys: it is large, and as noify as the former. The natives eat this fpecies, as well as feveral other forts of monkeys, but are particularly fond of this. Europeans will alfo eat it, efpecially in thofe parts of America where food is fcarce: when it is fcalded in order to get off the hair, it looks very white; and has a refemblance flocking to humanity, that of a child of two or three years old when crying ( c ).

3I. The quato, fapajus panifcus, or four-fingered monkey, has a long flat face, of a fwarthy flefh colour: the eyes are funk in the head; ears like the human; limbs of a great length, and uncommonly flender: the hair is black, long, and rough. There are only four fingers on the hands, being quite deftitute of a thumb ; five toes on the feet. The tail is long ; and naked below, near the end. The body is flender ; about a foot and a half long; the tail near two feet, and fo prehenfile as to ferve every purpofe of a hand. They inhabit the neighbourhood of Carthagena, Guiana, Brafil, and Peru; affociate in vaft herds; and are fcarce ever feen on the ground. Dampier defcribes their gambols in a lively manner: "There was (fays he) a great company dancing from tree to tree over my head, chattering, and making a terrible noifc and a great many: grim faces and antic geftures; fome broke down dry fticks and flung them at me, others fcattered their urine and dung about my ears: at laft one bigger than the reft came to a fmall limb juft over my head, and leap. ing directly at me, made me leap back; but the monkey caught hold of the bough with the tip of its tail, and there continued fwinging to and fro, making mouths at me. The females with their young ones are much troubled to leap after the males; for they have commonly two, one fhe carries under her arm, the other fits on her back, and claps its two fore-paws about her neck: are very fullen when taken; and very lard to be got when fhot, for they will cling with their tail or feet to a bough as long as any life remains. When I have fhot at one, and broke a leg or arm, I have pitied the poor creature to fee it look and handle the broken limb, and turn it from fide to fide."-They are the moft active of monkeys, and quite enliven the forefts of A merica. In order to pafs from top to top of lofty trees, whofe branches are too diftant for a lcap, they will form a chain, by hanging down, linked to each other by their tails, and fwinging in that manner till the loweft catches hold of a bough of the next tree, and draws up the reft; and fometimes they pafs rivers by the fame expedient. 'They are fometimes brought to Europe ; but are very tender, and feldon live long in our climate.
32. The fai, fapajus, capucinus, or weeper, with a round and flat face, of a reddih brown colour, very deformed : the hair on the head and upper part of the body black, tinged with brown; beneath and on the
limbs tinged with red : tail black, and much longer thar the head and body: the young exceffively deformed; their hair very long, and thinly difperfed. - In the Britih Mufeum are fpecimens of old and young. M: de Buffon has a variety with a white throat. Inhabits Surinam and Brafil: appear as if it was always weeping ; of a melancholy difpofition ; but very full of imitating what it fees.done. Thefe probably are the monkeys Dampier faw in the Bay of All Saints, which he fays are very ugly, and fmell ftrongly of mukk. They keep in large companies; and make a great chattering, efpecially in formy weather; refide much on a fpecies of tree which bears a podded fruit, which they feed on.
33. Sapajus fatuellas, or horned fapajou, has two Fig. 25. tufts of hair on the head, refembling little horns: Is beardlefs. Inhabits South America. The face, fides, belly, and fore-parts of the thighs are brown; the top of the head, middle of the back, tail, legs, and pofterior parts of the thighs, are black; the nails are long and rather blunt ; the tail is prehenfile and twifted fpirally. Perhaps of the fame fecies with the fimia apella or capuchin (Gm.). This, in all probability, is one of the factitious fpecies, purpofely deformed, by exhibitors of wild beafts, to impofe on the public.
34. Saimiri, fapajus fciureus, or orange monkey, has no beard ; the hinder part of the head is prominent ; and the nails on the four toes of the hind paws are narrow and pointed. It inhabits South America, and is the moft beautiful of all the fapajous; its movements are graceful; its fize fmall ; its colour a brilliant yellow ; its vifage round, with large vivacious eyes, furrounded by flefh-coloured rings; it has hardly any forehead ; the nofe is clevated at the bafe, and flattened at the point : the mouth is fmall, the face flat and naked, and the ears are garnifhed with hair, and a little pointed ; the tail is only half prehenfile: It fands with eafe on two feet, but commonly walks on all four.

V: Sagoins, Sagoini. Thefe have long tails, Ker's Trana which are proportionally longer than thofe of the fapa-/lation of jous, Atraight, flaccid, entirely covered with hair, and Gmelin's \(^{\text {Ginnus. }}\) not prehenfile ; that is, incapable of laying hold of any Linnaus. object : the cheeks have no pouches; and the buttocks, which are covered with hair, have no callofities: the partition between the noftrils is very thick, and the apertures are placed on the fides of the nofe. The females do not menftruatc. This race of animals is only found in America.
35. The faki, fagoinus pithecia, or fox-tailed monkey, with a fwarthy face, covered with fhort white down: forehead and fides of the face with whitih, and pretty long hair : body with long dufky brown hairs; white or yellowifh at their tips : hair on the tail very long and bufhy ; fometimes black, fometimes reddifh : belly and lower part of the limbs a reddifh white: length from nofe to tail near a foot and a half : tail longer, and like that of a fox: hands and feet black, with claws inftead of nails. Inhabits Guiana.
36. The fanglin, fagoinus iacchus, or ftriated mon- Fig. 26. \(3 \mathrm{R}_{2}\)
key,
(c) Ulloa's Voy. I. II 3. Des Marchais, III. 3II. fays, they are excellent eating, and that a foupe aux fiuges will be found as good as any other, as foon as you have conquered the averfion to the bouilli of their heads, which sook very like thofe of little children.

\section*{S I M [ 500 ] S I M}
key, with a very round head : about the ears two very long full tults of white hairs ftanding out on each fide: irides reddifh : face a fwarthy flefh colour : ears like the human : head black: body ath coloured, reddifh, and dulky; the lait forms ftriated bars crofs the body: tail full of hair, annulated with afh colour and black : body feven inches long; tail near eleven : hands and feet covered with fhort hairs: fingers like thofe of a fquirrel : nails, or rather claws, fharp. Inhabits Brafil : feeds on vegetables; will allo eat fihh: makes a weak noife : very refllefs : often brought over to Europe.
37. Pinche, fagoinus œdipus, or red-tailed monkey, is beardlefs; has a flowing head of hair, which hangs down on each fede; a red tail and fharp claws. It has neither cheek-pouches nor callofities on the buttocks. His tail is not prehenfile, and is more than twice the length of the head and body. The partition of the noftrils is thick, and the apertures are placed at a fide. The face, throat, and ears are black ; on the head are long white hairs. The muzzle is broad, and the face round. The hair on the body is pretty long; of a ycllowifh brown or reddifh colour till near the tail, where it becomes orange; on the breaft, belly, hands, and feet, it is white, and fhorter than on the body. The tail, from the origin to one-half of its length, is a vivid red, then brownifh red, and toward the point it is black. He is about nine inches in length, and walks on four feet. The females are not fubject to the menftrual evacuation.
38. The marikina, fagoinus rofalius, or filky monkey, is beardlefs; has a very hairy head : the circumference of the face and the feet are red; and the claws are flarp and narrow. It inhabits South America. A brifk animal, lefs impatient of cold than the reft of this race : the body is of a yellowih white colour; the nails on the thumbs and great toes are rounded; the ears are naked, but are hidden beneath the fur: It has a round head, and a brown face, which is furrounded with a kind of mane of a bright red colour ; the hair on the body and tail is long, filky, and of a pale but vivid yellow colour, almoft white, with a contiderable tuft at the extremity of the tail. It walks on four feet, and is eight or nine inches in lenyth, from the muzzle to the rump; and the tail is above 13 inches long. This fpecies has the fame manners and vivacity with the other fagoins, but is more robult in conftitution, as an individual lived five or fix years in Paris, being kept in a warm room during winter.
39. The mico, fagoinus argenteus, or fair monkey, with a fmall round head : face and ears of the moft lively vermilion colour: body covered with molt beautiful long hairs of a bright and lilvery whitenefs, of matchlefs elegance: tail of a fhining dark chefnut: head and body eisht inches long; tail 12. Inhabits the banks of the Amazons; difcovered by M. de Condamine.
40. The tamarin, fagoinus Midas, or great-eared monkey, with a round head, fwarthy, fleh coloured, naked tace: upper lip a little divided: ears very large, erect, naked, aind almoft fquare : hair on the forehead upright and long; on the body foft, but fhaggy : the head, whole body, and upper part of the limbs black, except the lower part of the back, which is tinged with yellow: hands and feet covered with orange-coloured hairs, very fine and fmooth : nails long and
crooked : tail black, and twice the length of the body: teeth very white. It is of the fize of a fquirrel. It inhabits the hotter parts of South America, and the ine of Gorgona, fouth of Panama, in the South Sea. There are, fays Dampier, a great many little black monkeys : at low-water they come to the fea-fide to take mulcles and perriwinkles, which they dig out of the fhells with their claws.

Befides thefe which we have defcribed, there are a great many fpecies which we have omitted. Thofe who wifh to be better acquainted with the fimix, may confult Buffon, Pennant, and Gmelin's edition of the Zoology of Linnæus by Mr Ker .

SIMLle, or Similitude, in rhetoric, a comparifon of two things, which though different in other refpects, yet agree in fome one. The difference between a fimile and comparifon is faid to conlift in this, that the fimile properly belongs to whatever we call the quality of a thing, and the comparifon to the quantity. See Comparison; and Oratory, nif8.

SIMILOR, a name given to all alloy of red copper and zinc, made in the beft proportions, to imitate hlver and gold.
SIMON Maccabeus, a celebrated leader and highprictt of the Jews, who, after rendering the molt imsportant fervices to his country, was at lalt treacheroully flain by his fon-in-law. See the Hifory of the Fiws, n 15.

Simon Magus, or the Sorcerer, was a native of Git. ton, a village of Samaria. According to the utual practice of the Afiatics of that age, he vifited Egypt, and there probably becane acquainted with the fubline myfteries taught in the Alexandrian fchool, and learned thofe theurgic or magical operations by means of which it was believed that men might be delivered from the power of evil demons Upon his return into his own country, the author of the Clementine Recognitions relates, that he impofed upon his countrymen by high pretenfions to fupernatural powers. And St Luke attefts, that this artful fanatic, ufing forcery, had bewitched the people of Samaria, giving out that he was Some great one; and that he obtained fuch general attention and reverence in Samaria, that the people all gave heed to him from the leaft to the greatef, faying, "This man is the great power of God."

By the preaching of Philip the Deacon, he was with other Samaritans converted to the Chriftian faith, and admitted into the infant church by the ordinance of baptifm. His converfion, however, feems not to have been real; for, upon feeing the miraculous effects of the laying on of the apofle's hands, he offered them money, laying, "Give me alfo this power, that on whomfoever I lay hands he may receive the Holy Gholt." He prubably thought Peter and John magicians like himfelf, but better fkilled in the art of deceiving the multitude.

Being fharply reproved for this impiety, he feems by his anfwer to have been made fenfible of his fin; but his repentance, if fincere, was of fhort duration. Returning to his former practices of impolture, he travelled through various provinces of the empire, oppofing the progrefs of the gofpel; and arriving at Rome, he led altray valt numbers of people by his pretended miracles. How long he lived in that metropolis of the world, or in what manner he died, we have no accounts

\section*{S I M [ 501\(] \quad\) S I M}
that can be fully depended on. The Chrilian writers rell us, that being raifed in the air by two dæmons, he was deprived of their fupport by the prayers of St Pe ter and St Paul, and fallinis, broke his le:ss. By fome he is thought to have been the perfon mentioned by Suetonins, who, undertaking to fly in the prefence of Nero, fell to the ground with fuch violence, that his blood fpurted up to the gallery where the emperor was fitting.
'The fum of this impoftor's doctrine, divefted of allegory, was, that from the Divine Being, as a fountain of light, flow various orders of æons, or eternal natures, fubfifting within the plenitude of the divine effence; that beyond thefe, in the order of emanation, are different claffes of intelligences, among the lowe it of which are humar fouls ; that matter is the moft remote production of the emanative power, which, on account of its infinite diftance from the Fountain of Light, poffeffes fluggifh and malignant qualities, which oppofe the divine operations, and are the caufe of evil; that it is the great defign of philofophy to deliver the foul from its imprifonment in matter, and reftore it to that divine light from which it was derived; and that for this purpofe God had fent him one of the firt æons among men. To his wife Helena he alfo alcribed a fimilar kind of divine nature, pretending that a female zon inhabited the body of this woman, to whom he gave the name of Evvor, Wifdom; whence fome ChriItian fathers have faid, that he called her the Holy Spirit. He alfo taught the tranfmigration of fouls, and denied the refurrection of the body.

Simon (Richard), was born at Dieppe the \(15^{\text {th }}\) May 16.38. He beran his ftudies among the priefts of the Oratory in that city, but quitted their fociety in a Chort time. From Dieppe he went to Paris, where he made grear progrels in the fludy of the oriental lan. guages. Some time afterwards he joined the fociety of the Oratory again, and became a prieft of it in 1660. In 1670 he publifhed fome pieces of a fmaller kind. In 1678 his Critical Hiftory of the Old Teftament appeared, hut was immediately fuppreffed by the intrigues of Meffieurs du Port Royal. It was reprinted the year after, and its excellence foon drew the attention of foreigners; an edition of it was accordingly publifhed at Amfterdam in Latin, and at London in Englifh.

He died at Dieppe in 1712 , at the age of 74.
He certainly poffeffed a vaft deal of learning: his criticifm is cxact, but not always moderate; and there reigns in his writings a fpirit of novelty and fingularity which raifed him a great many adverfaries. The moft celebrated of thele were Le Clerc, Voffius, Jurieu, Du Piil, and Boffuet. Simon wrote an anfwer to moft of the books that were publihed againft lim, and difplays a pride and obftinacy in his controverfial writings which do him little honour.

He was the author of a great many books. The following are the principal: 1 . The Ceremonies of the Jews, tranflated from the Italian of Leo of Modena, with a fupplement conceruing the fects of the Barraites and Samaritans 2. L'Hifoire Critique du Vicux 'TeAament, "The Critical Hifory of the Old Teftament." I kis is a very important work, and deferves the atten. tion of every clergyman. He fometimes, however, deviates from the road of integrity, to ferve the caufe of
the church of Rome, particularly in his endeavours to Simonical, prove the uncertainty of the Hebrew language. Thefe Simonide... paffages have been very juftly expofed and confuted by D: Campbell, in his ingenious Preliminary Differtations to his new Tranflation of the Gofpels. 3. Critical Hiftory of the Text of the New Teftament. 4. Critical Hiftory of the Verfions of the New 'Teftament. 5, Critical Hiltory of the principal Commentators on the New Teftament. 6. Infpiration of the Sacred Books. 7. A tranflation of the New Teftament. This book was cenfured by Cardinal Noailles and Boffuet. 8. 'The Hittory of the rife and progrefs of Ecclefiaftical Revenues, which is commended by Voltaire, as is his Critical Hiftory of the Old Teflament. It refulted from a quarrel with a community of Benedictines. 9 . A new felect Library, which points out the good books in various kinds of literature, and the ufe to be made of them. 10. Critical Hiftory of the Belief and Cuftoms of the Nations on the Levant. 11. Critical Letters, \&c.
SIMONICAL, is applied to any perfon guilty of fimony. See Simony.

SIMONIDES, the name of feveral poets celebrated in antiquity ; but by the Marbles it appears that the eldeft and moft illuftrious of them was born in the 55 th Olympiad, 538 years B. C. and that he died in his goth year ; which nearly agrees with the chronology of Eufebius. He was a native of Ceos, one of the Cyclades, in the neighbourhood of Attica, and the preceptor of Pindar. Both Plato and Cicero give him the character not only of a good poet and mufician, but fpeak of him as a perfon of great virtue and wifdom. Such longevity gave him an opportunity of knowing a great number of the firft characters in antiquity with whom he was in fome meafure connefed. It appears in Fa bricius, from ancient authority, that Simonides was cotemporary and in friendfhip with Pittacus of Mitylene, Hipparchus tyrant of Athens, Paufanias king of Sparta, Hiero tyrant of Syracufe, with Themittocles, and with Alevades king of Theffaly. He is mentioned by Herodotus; and Xenophon, in his Dialogue upon. Tyranny, makes him one of the interlocutors with Hiero king of Syracufe. Cicero alleges, what has often been quoted in proof of the modefty and wifdom of Simonides, that when Hiero afked him for a definition of God, the poet required a whole day to meditate on fo important a queftion: at the end of which, upon the prince putting the fame quettion to him a fecond time, he afked two days refpite; and in this manner always doubled the delay each time he was required to anfwer it ; till at length, to avoid offending his patron by more difappointments, he frankly confeffed that he found the queftion fo difficult, that the more he meditated upon it, the lefs was his hope of being able to folve it.

In his old age, perhaps from feeing the refpect which money procured to fuch as had lolt the charmes of youth and the power of attaching mankind by other means, he became fomewhat mercenary and avaricious. He was frequently employed by the victors at the games to write panegy yics and odes in their praife, before his pupil Pindar had exercifed his talents in their behalf: but Simonides would never gratify their vanity in this particular, till he had firf tied them down to a ftipulated: fum for his trouble; and upon being upbraided for his

\section*{S I M}
[
5
Simonides, meannefs, he faid, that he had two ceffers, in one of Simony. which he had for many years put his pecuniary re-
wards; the other was for honours, verbal thanks, and promifes; that the firft was pretty well filled, but the laft remained always empty. A nd he made no fcruple to confers, in his old age, that of all the enjoyments of life, the love of money was the only one of which time had not deprived him.

He was frequently reproached for this vice ; however, he always defended himfelf with good humour. Upon being afked by Hiero's queen, Whether it was molt defirable to be learned or rich ? he anfwered, that it was far better to be rich; for the learned were always dependent on the rich, and waiting at their doors ; whereas, he never faw rich men at the doors of the learned. When he was accufed of being fo fordid as to fell part of the provifions with which his table was furnifhed by Hiero, he faid he had done it in order " to difplay to the world the magnificence of that prince and his own frugality." To others he faid, that his reafon for accumulating wealth was, that " he would rather leave money to his enemies after death, than be troublefome to his friends while living."

He obtained the prize in poetry at the public games when he was fourfcore years of age. According to Suidas, he added four letters to the Greek alphabet; and Pliny affigns to him the eighth flring of the lyre; but thefe claims are difputed by the learned.

His poetry was fo tender and plaintive, that he acबquired the cognomen of Melicertes "fweet as honey;" and the tearful eye of his mufe was proverbial. Dionyfius places him among thofe polifhed writers who excel in a fmooth volubility, and flow on like plenteous and perennial rivers, in a courfe of even and uninterrupted harmony.

It is to Diony frus that we are indebted for the prefervation of the following fragment of this poct. Danae being by her mercilefs father inclofed in a cheft, and thrown into the fea with her child, when night comes on, and a ftorm arifes which threatens to overfet the cheft, fhe, weeping and embracing the young Perfeus, cries out :

Sweet child ! what anguifh does thy mother know, Ere cruel grief has taught thy tears to flow! Amidft the roaring wind's tremendous found, Which threats deftruction as it howls around; In balmy fleep thou lieft, as at the breaft, Without one bitter thought to break thy reft. The glimm'ring moon in pity hides her light, And fhrinks with horror at the ghaftly fight. Didft thou but know, fweet inıocent! our woes, Not opiate's pow'r thy eyelids now could clofe. Sleep on, fweet babe! ye waves in filence roll; And lull, O lull, to reft my tortur'd foul!
There is a fecond great poet of the name of Simonides recorded on the Marbles, fuppofed to have been his grandfon, and who gained, in \(47^{8} \mathrm{~B}\). C. the prize in the games at Athens.

SIMONY, is the corrupt prefentation of any one to an ecclefiaftical benefice for money, gift, or reward. It is fo called from the refemblance it is faid to bear to the fin of Simon Magus, though the purchafing of holy orders feems to approach nearer to his offence. It was by the canon law a very grievous crime: and is fo much
the mo e odious, becaufes, as Sir Edward Coke obferves, it is ever accompanied with perjury; for the prefentee is fworn to have committed no fimony. However, it was not an offence punifhable in a criminal way at the common law : it being thought fufficient to leave the clerk to ecclefiaftical cenfures. But as thefe did not affect the fimoniacal patron, nor were efficacious enough to repel the notorious practice of the thing, divers acts of parliament have been made to reftrain it by means of civil forfeitures; which the modern prevailing ufage, with regard to fpiritual preferments, calls aloud to be put in execution. The ftatute 3 I Eliz. c. 6. enacts, that if any patron, for money or any other corrupt confideration or promife, directly or indirectly given, fhall prefent, admit, inftitute, induct, inftall, or collate any perfon to an ecclefiaftical benefice or dignity, beth the giver and taker fhall forfeit two years value of the benefice or dignity ; one moiety to the king, and the other to any one who will fue for the fame. If perfons alfo corruptly refign or exchange their benefices, both the giver and taker fhall in like manner forfeit double the value of the money or other corrupt confideration. And perfons, who fhall corruptly ordain or licenfe any minitter, or procure him to be ordained or licenfed (which is the true idea of fimony), fhall incur a like forfeiture of forty pounds; and the minifter himfelf of ten pounds, befides an incapacity to hold any ecclefiaftical preferment for feven years afterwards. Corrupt elections and refignations in colleges, hofpitals, and other elcemofynary corporations, are alfo punifhed, by the fame flatute, with forfeiture of the double value, vacating the place or office, and a devolution of the right of election, for that turn, to the crown.

SIMOOM, a hot wind which blows occafionally in the deferts of Africa, and probably in other widely extended countries parched in the fame manner by a vertical fun. Its effects on the human body are dreadful. If inhaled in any quantity, it produces inftant fuffocation, or at leaft leaves the unhappy fufferer oppreffed with afthma and lownefs of fpirits. The approach of this awful fcourge of God is indicated by a rednefs in the air, well underftood by thofe who are accuftomed to journey through the defert ; and the only refuge which they have from it, is to fall down with their faces clofe to the ground, and to continue as long as poffible without drawing in their breath.

Mr Bruce, who, in his journey through the defert, fuffered from the fimoom, gives of it the following graphical defcription: "At eleven o'clock, while we con- Bruce's templated with great pleafure the rugged top of Chig- Travels, gre, to which we were faft approaching, and where we vol. iv. were to folace ourfelves with plenty of good water, P. 5590 Idris our guide cried out, with a loud voice, fall upon you faces, for here is the finoom. I faw from the fouth-eaft a haze come, in colour like the purple part of the rainbow, but not fo compreffed or thick. It did not occupy twenty yards in breadth, and was about twelve feet "high from the ground. It was a kind of blufh upon the air, and it moved very rapidly ; for I fcarce could turn to fall upon the ground with my head to the northward, when felt the heat of its current plainly upon my face. We all lay flat on the ground as if dead, till Idris told us it was hlown over. The meteor or purple haze which I faw was indeed paffed, but the light air that ftill blew was of heat to threaten

\section*{S I M}
mp'c, threaten fuffocation. For my part, I found diftinctly
free of an afthmatic fenfation till I had been fome months in 1 taly, at the baths of Poretta, near two years afterwards." Though the feverity of this blaft feems to have paffed over them almof inflantaneoufly, it continued to blow fo as to exhauft them till twenty minutes before five in the afternoon, lafting through all its flages very near fix hours, and leaving them in a flate of the utmoft defpondency.

SIMPLE, fomething not mixed or compounded ; in which fenfe it ftands oppofed to compound.

Simple, in the materia medica, a general name for all herbs or plants, as having each its particular virtue, whereby it becomes a fimple remedy.

SIMPLICITY in writing. If we examine the writers whofe compofitions have flood the teft of ages, and obtained that higheft honour, "the concurrent approbation of diftant times and nations," we thall find that the character of fimplicity is the unvarying circumflance whicl alone hath been able:to gain this univerfal homage from mankind. Among the Greeks, whofe writers in general are of the fimple kind, the divineft poet, the moft commanding orator, the finelt hiftorian, and deepeft philofopher, are, above the reft, confpicuoufly eminent in this great quality. The Roman writers rife towards perfection according to that meafure of fimplicity which they mingle in their works; indeed they are all inferior to the Greek models. But who will deny that Lucretius, Horace, Virgil, Livy, Terence, Tully, are at once the fimpleft and beft of Roman writers ? unlefs we add the noble annalift who appeared in after-times; who, notwithftanding the political turn of his genius, which fometimes interferes, is admirable in this great quality, and by it far fuperior to his contemporaries. It is this one circumflance that hatl raifed the venerable Dante, the father of modern poetry, above the fucceeding poets of his country, who could never long maintain the local and temporary honours beflowed upon them; but have fallen under that juit neglect which time will ever decree to thofe who defert a juff fimplicity for the florid colourings of ftyle, contratted phrafes, affected conceits, the mere trappin s \(^{\text {s }}\) of compofition and Gothic minutix. It is this hath given to Boileau the mof lafting wreath in France, and to Shakefpeare and Milton in England ; efpecially to the former, whofe writings contain fpecimens of perhaps the pureft and fimpleft Englifh that is anywhere to be found, except in the Bible or Book of Common Prayer. As it appears from thefe inftances, that fimplicity is the only univerfal characteriftic of juft writing, fo the fuperior eminence of the facred Scriptures in this quality hath been generally acknowledged. One of the greateft critics in antiquity, himfelf confpicuous in the fublime and fimple manner, hath borne this teftimony to the writings of Mofes and St Paul ; and by parity of reafon we muft conclude, that had he been converfant with the other facred writers, his tafte and candour would have allowed them the fame encomium.

It hath been often obferved even by writers of no mean rank, that the "Scriptures fuffer in their credit by the difadvantage of a literal verfion, while other ancient writings enjoy the advantage of a free and embellifhed tranflation." But in reality thefe gentlemens concern is ill-placed and groundlefs : for the truth is, "that
moft other writings are impaired by a literal tranflation; whereas giving only a due regard to the idiom of different languages, the facred writings, when literally tranflated, are then in their full perfection."
Now this is an internal proof, that in all other writings there is a mixture of local, relative, exterior orna. ment, which is often loft in the transfufion from one language to another. But the internal beauties, which depend not on the particular conftruction of tongues, no change of tongue can deftroy. Hence the Bible preferves its native beauty and flrength alike in every language, by the fole energy of unadorncd phrafe, natural images, weight of fentiment, and great fimplicity.

It is in this refpect like a rich vein of gold, which, under the fevereft trials of heat, cold, and moifture, retains its original weight and fplendour, without either lofs or alloy; while hafer metals are corrupted by earth, air, water, fire, and affimilated to the various elemento through which they pafs.
This circuuntance, then, may be jufly regarded as fufficient to vindicate the compofition of the facred Scriptures, as it is at once their chief excellence and greatelt fecurity. It is their excellence, as it renders them intelligible and ufeful to all ; it is their fecurity, as it preve nts their being difguifed by the falfe and capricious ornaments of vain or weak tranflators. We may fafely appeal to experience and fact for the confirmation of thefe remarks on the fuperior fimplicity, utility, and excellence, of the tyle of the Holy Scripture. Is there any book in the world fo perfectly adapted to all capacities? that contains fuch fublime and exalted precepts, conveyed in fuch an artlefs and intelligible ftrain, that can be read with fuch pleafure and advantage by the lettered fage and the unlettered peafant ?
SIMPLOCE. See Oratory, no 72.
SIMPSON ('Thomas), profeffor of mathematics at the royal academy at Woolwich, fellow of the Royal Society, and member of the Royal Academy at Stockholm, was born at Market Bofworth in Leicefterhire in 1710 . His father, a fuff-weaver, taught him only to read Englifh, and brought him up to his own bufinefs ; but meeting with a fcientifical pedlar, who likewife practifed fortune-telling, young Simpron by his affiftance and advice left off weaving, and profeffed aftrology. As he improved in knowledge, however, he grew difgufted with his pretended art ; and renouncing it, was driven to fuch difficulties for the fubfiftence of his family, that he came up to London, where he worked as a weaver, and taught mathematics at his fpare hours. As his fcholars increafed, his abilities became better known, and he publifhed his Treatife on Fluxions, by fubfcription, in 1737 : in 1740, he publifhed his Treatife on the Nature and Laws of Chance ; and Effays in Speculative and Mixed Mathematics. After thefe appeared his Doctrine of Annuities and Reverfions; Mathematical Differtations ; Treatife on Algebra; Elements of Geometry ; Trigonometry, Plane and Splerical ; Select Exercifes; and his Doctrine and Application of Fluxions, whiclt he profeffes to be rather a new work, than a fecond edition of his former publication on fluxions. In 1743, he obtained the mathematical profeflorlhip at Woolwich academy ; and foon after was chofen a member of the Royal Society, when the prefident and council, in confideration of his moderate circumfiances, were pleafed to excufe his admiffion 8

Sumplicity simpfon.

\section*{S \(1 \quad \mathrm{M}\)}

Nilmifon, fees, and his giving bonds for the fetted future paySimf \(\cdots\) ments. At the academy he exerted all his abilities in
infructing the pupils who were the immediate objeas of his duty, as well as others whom the fuperior officers of the ordnance permitted to be bnarded and lodged in his houre. In his manner of teaching he had a peculiar and happy addrefs, a certain dignity and perfpicuity, tempered with fuch a degree of mildnefs, as engaged the attention, efteem, and friendihip, of his fclolars. He therefore acquired great applaufe from lis \({ }^{\circ}\) fuperiors in the difcharge of his duty. His application and clofe confinement, however, iujured his health. Execcife and a proper regimen were prefribed to him, but to little purpofe: for his fpirits funk gradually, till he became incapable of performing lis duty, or even of reading the letters of liis fiiends. The effects of this decay of nature were greatly increafed by vexation of mind, owing to the laughty and infulting behaviour of his fuperior the firt profeffor of mathematics. This perfon, greatly his inferior in mathematical accomplifhments, did what he could to make his fituation uneafy, and even to depreciate him in the public opinion: but it was a vain endeavour, and only ferved to deprefs himfelf. At length his phyficians advifed his native air for his recovery, and he fet ont in February 176r; but was fo fatigued by his journey, that upon his arrival at Bofworth, he betook himfelf to his chamber, and grew continually worfe till the day of his death, which happened on the \(14^{\text {th }}\) of May, in the 5 ff year of his age.

SIMSON (Dr Robert), profeflor of mathematics in the univerfity of Glafgow, was born in the year 1687 of a refpectable family, which had held a fmall eftate in the courty of Lanerk for fome generations. He was, we think, the fecond fon of the family. A younger brother was profeffor of medicine in the univerlity of St Andrew's, and is known by fome works of reputation, particularly a Difertation on the Nervous Syitem, occafioned by the Diffection of a 1 Brain completely Oflified.

Dr Simfon was educated in the univerfity of Glafgow under the eye of fome of his relations who were profeffors. Earcer after knowledge, he made great progrefs in all his Itudies; and, as his mind did not, at the very firlt openings of fcience, ftrike into that path which afterwards fo ftrongly attracted him, and in which he proceeded fo far alnnof without a companion, he acquired in every walk of Ccience a flock of information, which, though it had never been much augmented afterwards, would have done credit to a profeffienal man in any of his ftudies. He became, at a very early period, an adept in the philofoply and theology of the fchools, was able to fupply the place of a fick relation in the clafs of oriental languages, was noted for hiftorical knowledge, and one of the moit knowing botanitts of his time.

It was during his theological ftndies, as preparatory for his entering into orders, that mathematics took hold of his fancy. He ufed to tell in his convivial moments how he amufed himelelf when preparing his exercifes for the divinity hall. When tired with vague fpeculation, in which he did not meet with certainty to reward his labours, he turned up a book of oriental philology, in which he found fomething which he could difcover to be true or to be falfe, without going out of the line of fludy which was to be of ultimate ufe to
him. Sometimes even this could not relieve his fatigue. He then had recourfe to mathematics, which never tailed to fatisfy and refrefh him. For a long while he reItricted hinfelf to a very moderate ufe of the cordial, fearing that he would foon exhauft the fmall flock which fo limited and abftract a fcience could yield ; till at laft hie found, that the more he learned, a wider field opened to his view, and feenes that were inexhauflible. Becoming acquainted with fubjects far beyond the elements of the fcience, and with numbers of names celebrated during that period of ardent refearch all over Europe, he found it to be a manly and important fludy, by which he was as likely to acquire reputation as by any other. A bout this time, too, a profpect began to open of making mathematics his profeflion for life. He then gave himfelf up to it without referve.

His original incitement to this ftudy as a treat, as fomething to pleafe and refrefh his mind in the midh of feverer tafks, gave a particular turn to his mathematical ftudies, from which he never could afterwards deviate. Perfpicuity and elegance are more attainable, and more difceruible, in pure geometry, than in any other parts of the fcience of meafure. To this therefore he chiefly devoted himfelf. For the fame reafon he preferred the ancient method of ftudying pure geometry, and even felt a difilike to the Cartefian method of fubllituting fymbols for operations of the mind, and ftill more was he difgulted with the fubflitution of fymbols for the very objects of difcuffion, for lines, furfaces, folids, and their affections. He wes rather difpofed in the folution of an algebraic problem, where quantity alone was confidered, to fubflitute figure and its affections for the algebraic fymbols, and to convert the algeiraic formula into an analogous geometrical theorem. And he came at laft to confider algebraic analyfis as little better than a kind of meclianical knack, in which we proceed without ideas of any kind, and obrain a refult without meaning, and without being confcious of any procefs of reafoning, and therefore without any conviction of its truth. And there is no denying, that if genaine unfophifticated tafte alone is to be confulted, Dr Simfon was in the right : for though it muft alfo be acknowledged, that the reafoning in algebra is as ftrict as in the pureft geometry of Euclid or Apollonius, the expert analyyl has little perception of it as he goes on, and his final equation is not felt by himfelf as the refult of ratiocination, any more than if he had obtained it by Pafcal's arithmetical mill. 'This does not in the leaft diminifh our admiration of the algebraic analy fis; for its almoof boundlefs grafp, its rapid and certain procedure, and the delicate metaphyfics and great addrefs which may be difplayed in conducting it. Such, however, was the ground of the ftrong bias of Dr Simfon's mind to the analyfis of the ancient geometers. It in creafed as he went forward; and lis vencration (we may call it his love or affecion) tor the ancient geometry was carried to a degree of idolatry. His chief labours were exerted in efforts to reflore the works of the ancient geometers; and he has nowhere beftowed much pains in advancing the modern difcoveries in mathematics. The noble inventions, for example, of fluxions and of logarithms, by which our progrefs in mathematical knowledge, and in the ufeful application of this knowledge, is fo much promoted, attracted the notice of Dr Simfon ; but he has contented himfelf with de-

\section*{S I M}
monftrating their truth on the genuine principles of the ancient geometry. .Yet was he very thoroughly acquainted with all the modern difcoveries; and there are to be feen among his papers difcuffions and inveftigations in the Cartefian method, which fhow him thoroughly acquainted with all the principles, and even expert in the tours de main, of the moft refined fymbolical analyfis (A).

About the age of 25 Dr Simfon was chofen regius profefior of mathematics in the univerfity of Glafgow. He went to London immediately after his appointment, and there formed an acquaintance with the moft eminent men of that bright era of Britifh fcience. Among thefe he always mentioned Captain Halley (the celebrated Dr Edmund Halley) with particular refpect ; faying, that he had the moft acute penetration, and the moft juft tafte in that fcience, of any man he had ever known. And, indeed, Dr Halley has ftrongly examplified both of thcfe in his divination of the work of Apollonius de Seçione Spatii, and the 8th book of his Conics, and in fome of the moft beautiful theorems in Sir Ifaac New. ton's Principia. Dr Simfon alfo admired the wide and mafterly fteps which Newton was accuftomed to take in his inveftigations, and his manner of fubftituting geometrical figures for the quantities which are obferved in the phenomena of nature. It was from Dr Siinfon that the Writer of this article had the remarks which has been oftener than once repeated in the courfe of this Work, "That the 39th propofition of the firlt book of the Principia was the moft important propofition that had ever been exhibited to the phyfico-mathematical philofopher;" and he ufed always to illuftrate to his more advanced fcholars the fuperiority of the geometrical over the algebraic analyfis, by comparing the folution given by Newton of the inverfe problem of centripetal forces, in the 42 d propofition of that book, with the one given by John Bernoulli in the Memoirs of the Academy of Sciences at Paris for 1713 . We have heard him fay, that to his own knowledge Newton frequently inveftigated his propofitions in the fymbolical way, and that it was owing chiefly to Dr Falley that they did not finally appear in that drefs. But if Dr Simfon was well informed, we think it a great argument in favour of the fymbolic analyfis, when this moft fuccefsful pratical artif (for fo we mult call Newton when engaged in a tafk of difcovery) found it conducive either to difpatch or perhaps to his very progrels.

Returning to his academical chair, Dr Simfon difcharged the duties of a profeffor for more than 50 years with great honour to the univerfity and to himielf.

It is almoft needlefs to fay, that in his prelections he followed ftrictly the Euclidian method in elementary geometry. He made ufe of 'Theodofius as an introduction to Spherical trigonometry In the higher geometry he prelected from his own Conics; and he gave a finall fpecimen of the linear problems of the ancients, by explaining the properties, fometimes of the conchoid,

Vol. XVII. Part II.

\section*{505 ] I M}
fometimes of the ciffoid, with their application to the folution of fuch problems. In the more advanced clafs he was accuftomed to give Napier's mode of conceiving logarithms, i. e. quantities as generated by mution ; and Mr Cotes's view of them, as the fums of ratiunculæ ; and to demondrate Newton's lemmas concerning the limits of ratios ; and then to give the elements of the fluxionary calculus; and to tinifh his courfe with a felect fet of propofitions in optics, gromonics, and central forces. His method of teaching was fimple and perfpicuous, his elocution clear, and his manner. eafy and impreffive. He had the refpect, and fill more the affection, of his fcholars.
With refpect to lis ftudies, we have already informed the reader that they got an early bias to pure geometry, and to the elegrant but fcrupulous methods of the ancients.

We have heard Dr Simfon fay, that it was in a great meafure owing to Dr Halley that he fo early directed his efforts to the reftoration of the ancient geometers. He had recommended this to him, as the moft certain way for him, then a very young man, both to acquire reputation, and to improve his own knowledge and tafte, and he prefented him with a copy of Pappus's Mathe matical Collections, enriched with fome of his own notes. The perfpicuity of the ancient geometrical analyfis, and a certain elegance in the nature of the folntions which it affords, efpecially by means of the local theorems, foon took firm hold of his fancy, and made him, with the fanguine expectation of a young man, direct his very firt efforts to the recovery of this in toto; and the reftoration of Euclid's Porifms was the firt tank which he fet hinfelf. The accomplifhed geometer knows what a defperate tank this was, from the fcanty and mutilated account which we have of this work in a fingle paffage of Pappus. It was an ambition which nothing but fuccefs could juftify in fo young an adventurer. He fuc. ceeded ; and fo early as 1718 feemed to have been in complete poffeffion of this method of inveltigation, which was confidered by the eminent geometers of anltiquity as their fureft guide through the labyrinths of the higher geometry. Dr Sinfon gave a fpecimen of his difcovery in 1723 in the Philofophical Tranfac. tions. And after this time he ceafed not from his endeavours to recover that choice collection of Porifins which Euclid had collected, as of the inott general ufe in the folution of difficult queltions. What fome of thefe muft lave been was pointed out to Dr Simfon by the very nature of the general propofition of Pappus, which he has reltored. Others were pointed out by the lemmas which Pappus has given as helps to the young mathematician towards their demonftration. And, being thus in poffeffion of a confiderable number, their mutual relations pointed out afort of fyftem, of which thefe made a part, and of which the blanks now remained to be filled up.

Dr Sinfon, having thus gained lis favourite point, 3 S had
(A) In 1752 the writer of this article being then his fcholar, requefted him to examine an account which he gave him of what he thought a new curve (a conchoid having a citcle for its balc). Dr simfon returned it next day with a regular lift of its leading properties, and the inveltigation of fuch as he thought his Icholar would nod fo eafily trace. In this hafty ferawl the lines related to the circle were familiarly confidered as arithmee ical fractions of the raditis confidered as unity. This was before Euler publifhed his Aithmetic of the Sines and T'angents, now in univerfal ufe.

\section*{S I M [ 506}

Sinifon. had leifure to turn his attention to the other works of the ancient geometers, and the porifms of Euclid now had only an occalioual thare. The loci plani of Apollonius was another tafk which he very early engaged in, and completed about the year \(173^{8}\). But, after it was printed, he imagined that he had not given the itfif/ima propofitiones of Apollonius, and in the precife fpirit and order of that author. The impreffion lay by him for forne years; and it was with great reluctance that he yielded to the intreaties of his mathematical friends, and publifhed the work, in 1746, with fome emendations, where he thought he had deviated fartheft from his author. He quickly repented of this fcanty conceffion, and recalled what he could of the fmall number of copies which he had given to the bookfellers, and the impreffion again lay by him for years. He afterwards re-corrected the work, and fill with fome reluctance allowed it to come abroad as the Reftitution of Apollonius. The public, however, had not been fo faftidious as Dr Simfon, and the work had acquired great celebrity, and he was now confidered as one of the firft and the moft elegant geometers of the age : for, in the mean time, he had publifhed his Conic Sections, a work of uncommon merit, whether we confider it as equivalent to a complete reftitution of the celebrated work of Apollonius Pergrus, or as an excellent fyftem of this important part of mathematics. It is marked writh the fame features as the loci plani, the moft anxious folicitude to exhibit the very text of A pollonius, even in the propofitions belonging to the books which had been completely loft. Thefe could be recovered in no other way but by a thorough knowledge of the precife plan propofed by the author, and by taking it for granted that the author had accurately accomplifhed this plan. In this manner did Viviani proceed in the firf attempt which was made to rettore the conics of Apollonius; and he has given us a detail of the procefs of his conjectures, by which we may form an opinion of its juinnefs, and of the probability how far he has attained the defired object. Dr Simfon's view in his performance was fomething different, deviating a little in this one cafe from his general track. He was not altogether pleafed with the work of Viviani, even as augmented by the eighth book added by Halley, and his wifh was to rettore the ancient original. But, in the mean time, an academical text book for conic fections was much wanted. He was much diffatisfied with thofe in common ufe; and he was not infenfible of the advantage refulting from the confideration of thefe fections, independent of the cone firt introduced by Dr Wallis. He therefore compofed this excellent treatife as an elementary book, not to fuperfede, but to prepare for the ftudy of A pollonius; and accordingly accommodates it to this purpofe, and gives feveral important propofitions in their proper places, exprefsly as refitutions of Apollonius, whom he keeps conftantly in view through the whole work.

Much about this time Dr Simfon ferioufly began to prepare a perfect edition of Euclid's Elements. The intimate acquaintance which he had by this time acquired with all the original works of the ancient geometers, and their ancient commentators and critics, encouraged him to hope that he could reftore to his original luftre this leader in mathematical fcience ; and the errors which had crept into this celebrated work, and
which fill remained in it, appeared of magnitude fufficient to merit the moft careful efforts for their removal. The data alfo, which were in like manner the intro* duction to the whole art of geometrical inveltigation, feemed to call more loudly for his amending hand. For it appears that the Saracens, who have preferved to us the writings of the ancients, have contented themfelves with admiring thefe celebrated works, and |have availed themfelves of the knowledge which they contain ; but they have fhown no inclination to add to the ftock, or to promote the fciences which they had received. They could not do any thing without the fynthetical books. of the geometers; but, not meaning to go beyond the difcoveries which they had made, they neglected all the books which related to the analytic art alone, and the greateft part of them (about 25 out of 30 ) have irrecoverably perifhed. The data of Euclid have fortunately been preferved, but the book was neglected, and the only ancient copies, which are but three or four, are miferably erroneous and mutilated. Fortunately, it is no very arduous matter to reinftate this work in its original perfection. The plan is precife, both in its extent and its method. It had been reftored, therefore, with fuccefs by more than one author. But Dr Simfon's comprehenfive view of the whole analytical fyttem pointed out to him many occafions for amendment. He therefore made its inftitution a joint takk with that of the elements. All the lovers of true geometry will acknowledge their obligations to him for the edition of the Elements and data which he publifhed about 1758. The text is corrected with the moft judicious and fcrupulous care, and the notes are ineftimable, both for their information, and for the tendency which they: mult have to form the mind of the ftudent to a true judgment and tafte in mathematical fubjects. The more accomplifhed reader will perhaps be fometimes difpofed to fmile at the axiom which feems to pervade the notes, "that a work of Euclid muft be fuppofed without error or defect." If this was not the cafe, Euclid has been oblived to his editor in more inftances than one. Nor fhould his greateft admirers think it impoffible that in the progrefs of human improvement; a geometrical truth hould occur to one of thefe latter days, whicis efcaped the notice of even the Lincean Euclid. Such merit, however, Dr Simfon nowhere claims, but laye every blame of error, omiffion, or oblcurity, to the charge of Proclus, Theon, and other editors and commentators of the renowned Grecian.

There is another work of Apollonius on which Dr Simfon has beftowed great pains, and has reftored, as we imagine, omnibus numeris perfectum, viz. the Sectio determinata; one of thofe performances whicl are of indifpenfable ufe in the application of the ancient analyfis. 'I'his alfo feems to have been an early tafk, tho' we do not know the date of his labours on it. It did not appear till after his death, being then publifhed along with the great work, the Porifms of Euclid, at the expence of the late Earl Stanhope, a nobleman intimately converfant with the ancient geometry, and zealous for its reception among the mathematicians of the prefent age. He had kept up a conftant correfpondence with Dr Simfon on mathematical fubjects; and at his death in 1768 , engaged Mr Clow profeffor of logic in the univerfity of Glafgow, to whofe care the Doctor had left all his valuable papers, to make a

\section*{S I M \\ [ 507 ]} his well earned reputation as the Restorer of ancient Geometry.
We have been thus particular in our account of Dr Simfon's labours in thefe works, becaufe his manner of execution, while it does honour to his inventive powers, and fhows his juft tafte in mathematical compofition, alfo confirms our former affertion, that he carried his refpect for the ancient greometers to a degree of fuperftitious idolatry, and that his fancy, unchecked, viewed them as incapable of error or imperfection. This is diftinelly to be feen in the emendations which the has given of the texts, particularly in his editions of Euclid. Not only every imperfection of the reading is afcribed to the ignorance of copyitts, and every indiftinctnefs in the conception, inconcluivenefs in the reafoning, and defeet in the method, is aicribed to the ignorance or miftake of the commentators; but it is all along aflumed that the work was perfect in its kind ; and that by exhibiting a perfect work, we reftore the genuine original. This is furely gratuitous; and it is very poffible that it has, in fome inftances, made Dr Simfon fail of his anxious purpofe, and give us even a better than the original. It has undoubtedly made him fail in what /hould have been his great purpofe, viz. to give the world a connected fyftem of the ancient geometrical analyfis; fuch as would, in the firft place, exhibit it in its moft engaging form, elegant, perfpicuous, and comprehenfive ; and, in the next place, fuch as fhould engage the mathematicians of the prefent age to adopt it as the moft certain and fuccefstul conductor in thofe laborious and difficult refearches in which the demands of modern fcience continually engage them. And this might have been expected, in the province of fpeculative geometry at leaft, from a perfon of fuch extenfive knowledge of the properties of figure, and who had fo eminently fucceeded in the many trials which he had made of its powers. We might have expected that he would at leaft have exhibited in one fyftematic point of view, what the ancients had done in feveral detached branches of the fcience, and how far they had proceeded in the folution of the feveral fucceffive claffes of problems; and we might have hoped, that he would have inftructed us in what manner we fhould apply that method to the folution of problems of a more elevated kind, daily prefented to us in the queftions of phyfico-mathematical fcience. By this he would have acquired diftinguifhed honour, and fcience would have received the moft valuable improvement. Bur Dr Siinfon has done little of all this; and we cannot fay that great helps have been derived from his labours by the eminent mathematicians of this age, who are ficcefsfully occupied in advancing our knowledge of nature, or in improving the arts of life. He has indeed contributed greatly to the entertainment of the speculative mathematician, who is more delighted with the confcious exercife of his own reafoning powers, than with the final refult of his refearches. Yet we are not even certain that Dr Simfon has done this to the extent he wifhed and hoped. He has not engaged the liking o: mathematicians to this analyfis, by prefenting it in the moft agreeable form. His own extreme ant xiety to tread in the very footfeps of the original authors, has, in a thoufard inftances, precluded him from ufing his own extenfive knowledge, that he might not
employ principles which were not of a clafs inferior to that of the queftion in hand. Thus, of neceflity, did the method appear trammelled. We are deterred from employing a procefs which appears to reftrain us in the application of the knowledge which we have already acquired ; and, difgufed with the tedious, and perhaps indirect path, by which we muft arrive at an object which we fee clearly over the hedge, and which we could reach by a few fteps, of the fecurity of which we arc otherwife perfectly affured. Thefe prepoffeffions are indeed founded on miftake; but the iniftake is fuch, that all fall into it, till experience has enlarged their views. This circumftance alone has hitherto prevented mathematicians from acquiring that knowledge of the ancient analyfis which wonld enable then to proceed in their refearches with certainty, difpatch, and delight. It is therefore deeply to be regretted, that this eminent genius has occupied, in this fuperftitious palæology, a long and bufy life, which might have been employed in original works of infinite advantage to the world, and honour to himfelf.

Our readers will, it is hoped, confider thefe obfervations as of general fcientific importance, and as intimately connected with the hiftory of mathematics ; and therefore as not improperly introduced in the biographical account of one of the moft eminent writers on this fcience. Dr Simfon claimed our notice as a mathematician; and his affectionate admiration of the ancient analyfis is the prominent feature of his literary character. By this he is known all over Europe ; and his name is never mentioned by any foreign author without fome very honourable allufion to his diftinguifhed geometrical elcgance and fkill. Dr James Moor, profeffor of Greek in the univerfity of Glafgow, no lefs eminent for his knowledge in ancient geometry than for his profeffional-talents, put the following appofite infcription below a portrait of Dr Simfon :

\section*{Geometriam, sub Tyranno barbaro sefva Servitute diu squalentem, in Libertatem Et decus antiquum vindicavit Unus.}

Yet it muft not be underfood that Dr Simfon's predilection for the geometrical analy fis of the ancients did fo far mifead him as to make him neglect the fymbolical analyfis of the prefent times; on the contrary, he was completely mafter of it, as has been already obferved, and frequently employed it. In his academical lectures to the fudents of his upper claffes, he ufed to point out its proper province (which he by no means limited by a fcanty boundary), and in what cafes it might be applied with fafety and advantage even to queftions of pure geometry. He once honoured the writer of this article with the fight of a very fhort differtation on this fubject (perhaps the cne referred to in the preface to his Conic Sections). In this piece he was perhaps more liberal than the moft zealous partifans of the fymbolical analyfis could defire, admitting as a fufficient equation of the Conic Sections \(L=\frac{p^{2} c}{x^{2}}\), where \(L\) is the latus rectum, \(x\) is the diftance of any point of the curve from the focus, \(p\) is the perpendicular drawn from the focus to the tangent in the given point, and \(c\) is the chord of the equicurve circle drawn thro' the focus. Unfortunately this differtation was not found among his pa\(3 \mathrm{~S}_{2}\)
pers,

\section*{S I M}

Simfon.
pers. He fpoke in high terms of the Analytical Works of Mr Cotes, and of the two Bernoullis. He was confulted by Mr M claurin during the progrefs of his ineftimable Treatife of Fluxions, and contributed not a little to the reputation of that work. The fpirit of that moft ingenious al yebraic demonftration of the fluxions of a rectangle, and the very procefs of the argument, is the fame with Dr Simfon's in his differtation on the limits of quantities. It was therefore from a thorough acquaintance with the fubject, and by a jut tafte, that he was induced to prefer his favourite analyfis, or, to fpeak more properly, to exhort mathematicians to employ it in its own fphcre, and not to become ignorant of fcometry, while they fuccefsfully employed the fymbolical analyfis in cafes which did not require it, and which fuffered by its admiffion. It mult be acknowledged, however, that in his later years, the diffuft which he felt at the artificial and fovenly employment on fubjects of pure geometry, fometimes hin dered hinn from even looking at the moft refined and ingenieus improvements of the algebraic analyfis which secur in the writings of Euler, D'Alembert, and other eminent mafters. But, when properly informed of them, he never failed to give them their due praife; and we remember him fpeaking, in terms of great faisfaction, of an improvement of the infinitefimal calculns, by D'Alembert and De la Grange, in their refearches concerning the propagation of found, and the vibrations of mufieal cords.

And that Dr Simfon not only was mafter of this calculus and the fymbolical calculus ingeneral, but held them in proper efteem, appears from two valuable differtations to be found in his pofthumous works; the one on logarithms, and the other on the limits of ratios. The laft, in particular, fhows how completely he was fatisfied with refpeet to the folid foundation of the method a) fluxions; aud it contains an clegant and flrict demonftration of all the applications which have been made of the method by its illuftrious author to the ob. jects of pure geometry.

We hoped to have given a much more complete and inftructive account of this eminent geometer and his works, by the aid of a perfon fully acquainted with both, and able to appreciate their value; but an accident has deprived us of this affiftance, when it was too late to procure an equivalent : and we mult requelt our readers to accept of this very imperfect account, fince we cannot do juftice to Dr Simfon's merit, unlefs almoft equally converfant in all the geometry of the ancient Greeks.

The life of a literary man xarely teems with anecdote; and a mathematician, devoted to his fludies, is perhaps snore abftracted than any other perfun from the ordinary occurrences of life, and even the ordinary topics of converfation. Dr Simfon was of this clafs; and, having never married, lived entirely a college life. Having no oecafion for the commodious houfe to which his place in the univerfity iatitled him, he contented himfelf with. chambers, good indeed, and fpacious enourh for his fober acenmmodation, and for receiving his choice collection of mathematical writers, but without any decoJation or commodious furniture. His official fervant fufficed for valet, footman, and chambermaid. As this retirement was entirely devoted to ftudy, he entertained no company in his chambers, but in a neighbouring.

\section*{508 ]}
houfe, where his apartment was facred to him and his gucts.

Having in early life devoted limfelf to the reftoration of the works of the ancient geometers, he fudied them with unremitting attention; and, retiring from the promifcuous intercourfe of the world, he contented himfelf with a fmall fociety of intimate friends, with whom he could lay afide every reftraint of ceremonyor referve, and indulge in all the innocent frivolities of life. Every Friday evening was fpent in a party at whitt, in which he ex. celled, and took delight in inftructing others, till increafing years made him lefs patient with the dulnefs of a feholar. The card-party was followed by an hour or two dedicated folely to playful converfation. In likc manner, every Saturday he had a lefs felect party to dinner at a houfe about a mile from town. The Doctor's long life gave him occafion to fee the dramatis perfone of this little theatre Ceveral times completely changed, while he continued to give it a perfonal identity : fo that, without any defign or wifh of his own, it became, as it were, his owni houfe and his own family, and went by lis name In this fate did the prefent writer firl fee it, with Dr Simfon as its father and head, refpected and beloved by every branch; for, as it was for relaxation, and not for the enjoyment of his acknowledged fuperiority, that he continued this habit of his early youth ; and as his notions "of a fine talk" did not confit in the pleafure of having " toffed and gored a good many to day," his companions were as much at their eafe as he wifhed to be himfelf; and it was no fmall part of their entertainment (and of his too), to fmile at thofe innocent deviations from common forms, and thofe miftakes with refpect to life and manners, which an almolt total retirement from the world, and inceffant occupation in an abtraç fcience, caufed this venerable prefident. frequently to exhibit. 'I hele are remembered with a more affecting regret, that they are now "with the days that arc paft," than the molt pithy apophthegms, ufhesed in. with an emphatical, "Why, Dir!" or "No, Sir!", which precludes all reply. Dr Simfon never exerted his prefidial authority, unlefs it were to check fome infringement of good breeding, or any thing that appeared unfriendly to relicion or purity of manners; for thefe he had the higheft reverence. We have twice lieard him fins (he had a fine voice and moft accurate ear) fome lines of a Latin hymn to the divine geometer, and each time the rapturous tear ftood in his eyc.

But we afk the reader's pardon for this digreffion; it is not however ufelefs, lince it paints the man as much as any recital of his itudies; and to his acquaintances we are certain that it will be an acceptable memorandum. 'To them it was often matter of regret, that a perfon of fuch cminent talents, which would have made him fhine equally in any line of life, fhould have allowed himfelf to be fo completely devoted to a fudy which abftracted lum from the ordinary purfuits of men, unfitted him for the active enjoyment of life, and kept him out of thofe walks which they frequented, and where they would liave rejoiced to meet him.

Dr Simfon was of an advantageous ftature, with a: fine countenance; and even in his old age had a graceful carriage and manner, and always, except when in mourning, dreffed in white cloth. He was of a cheerful difpofition; and though he did not make the firt
advancea.

\section*{S I N [ 509 ] S I N} and ftrangers were at perfect eafe in his company. He enjoyed a long courfe of uninterrupted health ; but towards the clofe of life fuffered from an acute difeare, and was obliged to employ an affiftant in his profeffional labours for a few years preceding his death, which hap. pened in 1768, at the age of 8 I . He left to the univerfity his valuable library, which is now arranged apart from the reft of the books, and the public ufe of it is * limited by particular rules. It is confidered as the moft choice collection of mathematical books and manufripts in the kingdom, and many of them are rendered doubly valuable by Dr Simfon's notes.

SIN, a breach or tranfgreflion of forme divine law or command.
SINAI, or Sina, a famous mountain of Arabia Petrea, upon which God gave the law to Mores. It flands in a kind of peninfula, formed by the two arms of the Red Sea, one of which fretches out towards the north, and is called the Gulpb of Kolfum; the other extends towards the eaft, and is called the Gulph of Elan, or the Elani ifo Sen. At this day the Arabians call Mount Sinai by the name of Tor, that is, the "mountain,' "j way of excellence; or Gibel or 7 Fibel Moufa, "the mountain of Mofes." It is 260 miles f:om Cairo, and generally it requires a journey of ten days to travel thither. The wildernefs of Sinai, where the Ifraelites continued incamped for almoft a year, and where Mofes erected the tabernacle of the covenant, is confiderably devated above the reft of the country; and the afcent to it is by a very craggy way, the greateft part of which is cut out of the rock; then one comes to a large fpace of ground, which is a plain furrounded on all fidea by rocks and eninences, whofe length is neally 12 miles. Towards the extremity of this plain, on the north fide, two high mountains fhow themfelves, the higheft of which is called Sinai and the other Horeb. The tops of Horeb and Sinai have a very fleep afcent, and do not ffand upon much ground, in comparifon to their extraordinary height : that of Sinai is at leaft one-third part higher than the other, and its afcent is more upright and difficult.
T'wo German miles and a half up the mountain f.ands the con vent of St Catharine. 'The body of this monattery is a building 120 feet in length and almo't as many in breadth. Before it ftands another fmall building, in which is the only gate of the convent, which remains always fhut, except when the iffoe is here. At other times, whatever is introduced within the convent, whether men or provifions, is drawn up by the roof in a bafket, and with a cord and a pulley. 'The whole building is of hewn fone; which, in fuch a defert, muft have coft prodigious expence and pains. Near this chapel iffues a fountain of very good frefh water; it is looked upon as miraculous by fomc who cannot conceive how water can flow from the brow of fo high and barren a mountain. Five or fix paces fron it they fhow a flone, the height of which is four or five feet, and breadth about thrce, which, they fay, is the very flone whence Mofes caufed the water to guifh out. Its colour is of a fpotted grey, and it is as it were fet in a kind of earth, where no other rock appears. This fone has 12 holes or channels, which are about a foot wide, whence it is thought the water came forth for the If. raelites to drink.

Much has been faid of the writings to be feen at Si- Sinapico nai and in the plain about it; and fuch were the hopes of difcoveries refpecting the wanderings of the Ifraelites from thefe writings, that Dr Clayton bifhop of Clogher offered L. 500 Sterling to defray the expences of journey to any man of letters who would undertake to copy them. No man, we believe, undertook this tank : and the accurate Danifh traveller Niebuhr found no writings there but the names of perfons who had vifited the place from curiofity, and of Egyptians who had chofen to be buried in that region.

SINAPIS, Mustard, in botany: A genus of plants belonging to the clafs of tetradynamia, and to the order of filiquofa; and in the natural fyftem ranged under the 3 gth order, Siliquofe. The calyx confifts of four expanding frap-fhaped deciduous leaves; the ungues or bafes of the petals are Araisht; two glandules between the fhorter ftamina and piltillum, alfo between the longer and the calyx. There are 17 fpecies; the arvenfis, orientalis, brafficata, alba, nigra, pyrenaica, pubefcens, chinenfis, juncea, erucoides, allioni, hifpanica, millefolia, incana, lævigata, cernua, and japonica. Three of thefe are natives of Britain; the alba, nigra, and arvenfis.
1. 'The alba, or white muftard, which is generally cultivated as a falad herb for winter and fpring ufe. This rifes with a branched hairy ftalk two feet high; the Ieaves are deeply jagged on their edges and rough. The flowers are difpofed in loofe fpikes at the end of the branches, flanding upon horizontal footीalks; they have four yellow petals in form of a crofs, which are fucceeded by hairy pods, that end with long, compreffed, oblique bcaks; the pods generally contain four white feeds.
2. The nigra, or common muftard, which is frequently found growing naturally in many parts of Britain, but is alfo cultivated in fields for the feed, of which the fauce called muflard is made. 'I his rifes with a branching falk four or five feet high; the lower leaves are large, rough, and very like thofe of turnip; the upper leaves are finaller and lefs jarized. The flowers are fmall, yellow, and grow in fpiked clufters at the end of the branches; they have four petals placed in form of a crofs, and are fucceeded by imooth four-cornered pods.
3. The arvenfis, grows naturally on arable land in many parts of Britain. The feed of this is commonly fold under the title of Durham mufard-feed. Of this there are two varieties, if not ditinct fpecies; the one with cut, the other with entire leaves. The ftalks rife two feet high; the leaves are rough; in the one they are jagged like turnip-leaves; in the other they are long and cntire. The flowers are yellow' the pods are turgid; an yular, and have long beaks.

Muftard, by its acrimony and pungency, ftimulates the folids, and attenuates vifcid juices; and hence ftands defervedly recommended tor exciting appetite, affifting digeftion, promoting the fluid fecretions, and for the other purpofes of the acrid plants called antijcorbuti: It imparts its tafte and fmell in perfection to aqueous liquors, and by diftillation with water yields an effential cil of great acrimony. To rectified fpirit its feeds give out very little either of their fmell or tafte. Subjected to the prefs, they y ield. a confiderable quantity of mild infipid oil, which is as free from acrimony as that

\section*{S I N [ 510 ] S I N}
of almonds. They are applied as an external Almulant to benumbed or paralytic limbs; to parts affected with fixed rheumatic pains; and to the foles of the feet, in the low flage of acute difeafes, for raifing the pulfe : in this intention, a mixture of equal parts of the powdered feeds and crumb of bread, with the addition fometimes of a little bruifed garlic, are made into a cataplafm with a fufficient quantity of vinegar.

SINAPISM, in pharmacy, an external medicine, in form of a cataplafm, compofed chiefly of muftard-feed pulverized, and other ingredients mentioned in the preceding article.

SINCERITY, honefty of intention, freedom from hypocrify. See Moral Philosofhy, \({ }^{0} 15 \%\)

SINCIPUT, in anatomy, the forepart of the head, reaching from the forehead to the coronal future.

SINDY, a province of Hindoftan Proper, bounded on the weft by Makran, a province of Perfia; on the north by the territories of the king of Candahar ; on the north-eaft by thofe of the Seiks; on the eaft by a fandy defert ; and on the fouth-eaft by Cutch. It extends along the courfe of the river Sinde or Indus from its mouth to Behker or Bhakor, on the frontiers of Moultan. Reckoned that way, it is 300 miles long; and its breadth, in its wideft part, is about 160 . In many particulars of foil and climate, and in the general appearance of the furface, Sindy refembles Egypt ; the lower part of it being compofed of rich vegetable mould, and extended into a wide dell ; while the upper part of it is a narrow llip of country, confined on one fide by a ridge of mountains, and on the other by a fandy defert, the river Indus, equal at leaft / to the Nile, winding through the midft of this level valley, and annually overflowing it. During great part of the fouth-weft monfoon, or at leaft in the months of July, Auguft, and part of September, which is the rainy feafon in moft other parts of India, the atmofphere is here generally clouded; but no rain falls except very near the fea. Indeed, very few fhowers fall during the whole year ; owing to which, and the neighbourhood of the fandy deferts, which bound it on the eaft and on the northweft, the heats are fo violent, and the winds from thofe quarters fo pernicious, that the houfes are contrived fo as to be occafionally ventilated by means of apertures on the tops of them, refembling the funnels of fmall chimneys. When the hot winds prevail, the windows are clofely thut ; and the loweft part of the current of air, which is always the hotteft, being thus excluded, a cooler, becaufe more elevated, part defcends into the houfe through the funnels. By this contrivance allo vaft clouds of duft are excluded; the entrance of which would alone be fufficient to render the houfes uninhabitable. The roofs are compofed of thick layers of earth inftead of terraces. Few countries are more unwholefome to European conttitutions, particularly the lower part of the Delta. The prince of this province is a Mahometan, tributary to the king of Candahar. He refides at Hydrabad, although Tatta is the capital. The Hindoos, who were the original inhabitants of Sindy, are by their Mahometan governors treated with great rigour, and denied the public exercife of their religion; and this feverity drives valt numbers of them into other countries. The inland parts of Sindy produce faltpetre, fal-ammoniac, borax, bezoar, lapis la.
zuli, and raw filk. They have alfo manufactories of cotton and filk of various kinds; and they make fine cabinets, inlaid with ivory, and finely lackered. They alfo export great quantities of butter, clarified and wrapt up in duppas, made of the hides of cattle. The ladies wear hoops of ivory on both their arms and legs, which when they die are burnt with them. They have large black cattle, excellent mutton, and fmall hardy horfes. Their wild game are deer, hares, antelopes, and foxes, which they hunt with dogs, leopards, and a fmall fierce creature called a fhiahgufh.

SINE, or Right SINE of an Arch, in trigonometry, is a right line drawn from one end of that arch, perpen dicular to the radius drawn to the other end of the arch ; being always equal to half the cord of twice the arch. See Trigonometry and Geometry.
SINECURE, a nominal office, which has a revenue without any employment.

SINEW, a tendon, that which unites the mufcles to the bones.

SINGING, the action of making divers inflections of the voice, agreeable to the ear, and correfpondent to the notes of a fong or piece of melody. See Me. LODY.
The firft thing to be done in learning to fing, is to raife a fcale of notes by tones and femitones to an octave, and defcend by the fame notes; and then to rife and fall by greater intervals, as a third, fourth, fifth, \(\& \mathrm{cc}\). and to do all this by notes of different pitch. Then thefe notes are reprefented by lines and fpaces, to which the fyllables \(f a\), fol, la, mi, are applied, and the pupil taught to name each line and fpace thereby ; whence this practice is called fol-faing, the nature, reafon, effects, \&c. whereof, fee under the article Solfaing.

Singing of Birds. It is worthy of obfervation, that the female of no fpecies of birds ever fings : with birds it is the reverfe of what occurs in human kind. Among the feathered tribe, all the cares of life fall to the lot of the tender fex; theirs is the fatigue of incubation; and the principal fhare in nurfing the helplefs brood: to alleviate thefe fatigues, and to fupport her under them, nature hath given to the male the fong, with all the little blandifhments and foothing arts; thefe he fondly exerts (even after courthip) on fome fpray contiguous to the neft, during the time his mate is performing her parental duties. But that fhe fhould be filent is alfo another wife provifion of nature, for her fong would difcover her neft ; as would a gaudinefs of plumage, which, for the fame reafon, feems to have been denied her.

On the fong of birds feveral curious experiments and obfervations have been made by the Hon. Daines Bar rington. See Pbil. Tranf. vol. 1xiii.
SINGULAR NUMBER, in grammar, that number of nouns and verbs which fands oppofed to plural. See Grammar, ne 14.

SINISTER, fomething on or towards the left hand. Hence fome derive the word finifer, à finendo ; becaufe the gods, by fuch auguries, permit us to proceed in our defigns.

Sinister, is ordinarily ufed among us for unlucky ; though, in the facred rites of divination, the Romans ufed it in an oppofite fenfe. Thus avis finiftra, or a bird on the left hand, was efteemed a happy omen : whence,

\section*{S I P [ 511\(]\) S I R}
itter in the law of the 12 tables, Aoc finiftra populi magifer eflo.

Sinister, in heraldry. The finiter fide of an efcutcheon is the left-hand fide; the finitter chief, the left angle of the chief; the finitter bafe, the left-hand part of the bafe.

Sinister \(A / p e c\), among aftrologers, is an appearance of two planets happening according to the fucceffion of the figns ; as Saturn in Aries, and Mars in the fame degree of gemini.

SINISTRT, a fect of ancient heretics, thus called becaufe they held the left hand in abhorrence, and made it a point of religion not to receive any thing therewith.

SINKING fuND, a provifion made by parliament, confifting of the furplufage of other funds, intended to be appropriated to the payment of the national debt; on the credit of which very large fums have been borrowed for public ufes. See National Debt and Re. venue.

SINOPICA TERRA, in natural hiftory, the name of a red earth of the ochre kind, called alfo rubrica, finopica, and by fome authors finopis. It is a very clofe, compact, and weighty earth, of a fine glowing purple colour. It is of a pure texture, but not very hard, and of an even but dufty furface. It adheres firmly to the tongue, is perfectly fine and fmooth to the touch, does not crumble eafily between the fingers, and fains the hands. It melts very flowly in the mouth, is perfectly pure and fine, of an auftere aftringent tafte, and ferments violently with aquafortis. It was dug in Cappadocia, and carried for fale to a city in the neighbourhood called Sinope, whence it had its name. It is now found in plenty in the New Jerfeys in America, and is called by the people there bloodfone. Its fine texture and body, with its high florid colour, mult make it very valuable to painters; and from its aftringency it will probably be a powerful medicine.

SINOPLE, in heraldry, denotes vert, or green colour in armories.-Sinople is ufed to fignify love, youth, beauty, rejoicing, and liberty ; whence it is that letters of grace, ambition, legitimation, \&c. are always fealed with green wax.

SINUOSITY, a feries of bends and turns in arches or other irregular figures, fometimes jutting out and fometimes falling in.

SINUS, in anatomy, denotes a cavity in certain bones and other parts, the entrance whereof is very narrow, and the bottom wider and more facions.

Sinus, in furgery, a little cavity or facculus, frequently formed by a wound or ulcer, wherein pus is collected.

\section*{SIPHON. See Hydrostatics, \(\mathrm{n}^{\circ} 25\).}

SIPHONANTHUS, in botany; a genus of plants belonging to the clafs of tetrandia and order of monogynia. The corolla is monopetalous, funnel-fhaped; the tube is very narrow, and much longer than the caiyx. There are four berries, each containing one feed. There is only one fpecies, the indica.

SIPONTUM, Sepuntum, or Sifus (anc. geog.), a town of Apulia, fo denominated (according to Strabo) from the great quantity of fepice or cuttlefinh that are thrown upon the coatt. Diomed is fuppofed by the fame author to have been the founder of this place;
which appears from Livy to have become a colony of Sipunculus Roman citizens. In the early ages of Chriftian hierarchy, 'a bifhop was fixed in this church; but, under the \(\qquad\) Lombards, his fee was united to that of Beneventum. Being again feparated, Sipontum became an archiepif copal diocefe in 1094, about which time it was fo ill treated by the Barbarians, that it never recovered its fplendour, but funk into fuch mifery, that in 1260 it was a mere defert, from the want of inhabitants, the decay of commerce, and the infalubrity of the aire Manfred having taken thefe circumftances into confideration, began in 1261 to build a new city on the fea-fhore, to which he removed the few remaining Sipontines. (See the article Manfredonia). Sipontum was fituated at the diftance of a mile from the fhore. Excepting a part of its Gothic cathedral, fcarce one fone of the ancient city now remains upon another.

SIPUNCULUS, in natural hiftory, a genus of the inteftina clafs of worms in the Linnrean fyftem. Its characters are thefe: the body is 1 ound and elongated; the mouth attennated and cylindrical ; and the lateral aperture of the body rugged. There are two fpecies: one found under ftones in the European, and the other in the Indian ocean.
SIR, the title of a knight or baronet, which, for diftinction's fake, as it is now given indifcriminately to all men, is always prefixed to the knight's Chriftian name, either in fpeaking or writing to them.

SIRCAR, any office under the government in Hindoftan. It is fometimes ufed for the fate of government itfelf. Likewife a province, or any number of Pergunnahs placed under one head in the government books, for conveniency in keepìng accounts. In common ufage in Bengal, the under banyans of European gentleman are called fircars.

SIRE, a title of honour formerly given to the king of France as a mark of fovereignty.

Sire, was likewife anciently ufed in the fame fenfe with feur and feigneur, and applied to barons, gentlemen, and citizens.

SIRENS, in fabulous hiftory, certain celebrated fongtreffes who were ranked among the demigods of antiquity. Hyginus places their birth among the confequences of the rape of Proferpinc. Others make them daughters of the river Acheloïs and one of the mufes*. The number of the Sirens was three; and *Ovid Mets their names were Parthenope, Lygea, and Leucofia. Some lib. iv. make them half women and half fifh; others, half women and half birds. There are antique reprefentations of them ftill fublifting under both thefe forms. Paufanias tells us, that the Sirens, by the perfuafion of Jnno, challenged the Mufes to a trial of fkill in finging; and thefe having vanquifhed them, plucked the golden feathers from the wings of the Sirens, and formed them into crowns, with which they adorned their own heads. The Argonauts are faid to have been diverted from the enchantment of their fongs by the fuperior ftrains of Orpheus: Ulyffes, however, had great difficulty in fecuring himfelf from feduction. See Odyf. lib. xii.
Pope, in his notes to the twelfth book of the Odyffey, obferves, the critics have greatly laboured to explain what was the foundation of this fiction of the Sirens, We are told by fome, that the Sirens were queens of certain fmall iflands named Sirenufe, that lie near Ca .

\section*{S I R}

\section*{S I S}

Sirchs, Siren.
præa in Italy, and chiefly inhabited the promontory of Minerva, upon the top of which that goddefs had a temple, as fome affirm, built by Ulyffes. Here there was a renowned academy, in the reign of the Sirens, famous for eloquence and the liberal fciences, which gave occafion to the invention of this fable of the fweetnefs of the voice and attracting fongs of the Sirens. But why then are they fabled to be deftroyers, and painted in fuch dreadful colours? We are told, that at daft the ftudents abufed their knowledge, to the calouring of wrong, the corruption of manners, and the fub: vertion of government : that is, in the language of poe. try, they were feigned to be transformed into monfters, and with their mufic to have enticed paffengers to their ruin, who there confumed their patrimonies, and poi. foned their virtues with riot and effeminacy. 'I'he place is now called Maffa. Some writers tell us of a ccrtain bay, contracted within winding ftraits and broken cliffs, which, by the finging of the winds and beating of the waters, returns a delightful harmony, that allures the paffenger to approach, who is immediately thrown againft the rocks, and fwallowed up by the violent eddies. Thus Horace, moraliling, calls idlenefs a Sisen.

\section*{Vitanda efl improba Siren Deficlia.}

But the fable may be applied to all pleafures in general, which, if too eagerly purfued, betray the incautious into ruin ; while wife men, like Ulyfles, making ufe of their reafon, ftop their ears againt their infinuations.
The learned Mr Bryant fays, that the Sirens were Cuthite and Canaanitifh priefts, who had founded temples in Sicily, which were rendered infamous on account of the women who officiated. They were much addicted to crucl rites, fo that the fhores upon which they refided are defcribed as covered with the bones of men deftroyed by their artifice. Virgil. Aneid. lib. v. v. 864 .

All andient authors agree in telling us, that Sirens in habited the coalt of Sicily. The name, according to Bochart, who derives it from the Phœenician language, implies a fongltyefs. Hence it is probable, fays Dr Burney, that in ancient times there may have been excellent fingers, but of corrupt morals, on the coalt of Sicily, who, by feducing voyagers, gave rife to this fable. And if this conjecture be well founded, he obferves, the Mufes are not the only pagan divinities who preferved their influence over mankind in 'modern times; for every age has its Sirens, and every Siren her vota: ries ; when beauty and talents, both powerful in themfelves, are united, they become ftill more attractive.

Siren, in zoology, a genus of animals belonging to the clafs of amphibia and the order of meantes. It is a biped, naked, and furnifhed with a tail ; the feet are brachiated with claws. This animal was difcovered by Dr Garden in Carolina; it is found in fwampy and Pi,it. Tram?:muddy places, by the fides of pools, under the tuonks woll lvi. of old trees that lang over the water. The natives 3. \(18 \%\) 。
well as from the fituation of the anus, that it could not be the larva of the lizard, and therefore formed of it a new genus under the name of /iren. He was alfo obliged to eftablifh for this uncommon animal a new order called meantes or gliders : the animals of which are amphibious; breathing by means of gills and lungs, and furnifhed with arms and claws.

SIREX, in zoology, a genus of animals belonging to the clafs of infects, and to the order of hymenopterix. The mouth has two ftrong jaws; there are two truncated palpi or feelers, filiform antennæ, an . xferted, ftiff, ferrated iting a feffile, mucronated abdomen, and lanceolated wings. There are feven fpecies.
SIRIUM, in botany; a genus of plants belonging to the clafs of tetrandria and order of monogynia. The calyx is quadrifid; there is no corolla; the nectarium is quadriphyllous and crowning the throat of the calyx; the germen is below the corolla; the ftigma is tritid, and the berty trilocular. There is only one fpecies, the myrtifolium.

SIRIUS, in aftronomy, a bright ftar in the conftellation Canis. See Astronomy, n \({ }^{\circ} 403\), \&c.

SIRLET (Flavius), an eminent Roman cngraver on precious ftones: his Lacoon, and reprefentations in miniature of antique ftatues at Rome, are very valuable and fcarce. He died in 1737 .
-SIROCCO, a periodical wind which generally blows in Italy and Dalmatia every year about Eafter. It blows from the fouth-eaft by fouth: it is attended with heat, but not rain; its ordinary period is twenty Fortis's days, and it ufually ceafes at funfet. When the férocco Travels does not blow in this mantier, the fummer is almoft free \({ }^{\text {in to Do Datmo }}\) from wefterly winds, whirlwinds, and ftorms. This \({ }^{\text {tia, }}\) P. \({ }^{277}\) wind is prejudicial to plants, dryin: \(\begin{gathered}\text { and burning up }\end{gathered}\) the buds; though it hurts not men any otherwife than by caufing an extraordinary weaknefs and laffitude; inconveniences that are fully compenfated by a plentifu! fifhing, and a good crop of corn on the mountains. In the fummer tine, when the wefterly wind ceafes for a day, it is a fign that the firocco will blow the day fol lowing, which ufually begins with a fort of whirlwind.

\section*{SISKIN. See Fringilla.}

SISON, bastard-stonr parsley, in botany: A genus of plants belonging to the clafs of peniandria, and to the order of disynia; and in the natural fyltem arranged under the 45 th order, umbellate. 'The fruit is egg-fhaped and ftreaked; the involucra are fubtetra. phyllons. Therc are feven fpecies; the amomum, inundatum, fegetum, verticillatum, falfum, canadenfe, and ammi. The four firft are natives of Great Britain. 1. The amomum, common bartard parney, or field itonewort, is a biennial plant about three feet high, growing wild in many places of Britain. Its feeds are fmall, ftriated, of an oval figure and brown colour. Their tafte is warm and aromatic. Their whole flavour is extracted by fpirit of wine, which elevates very little of it in diftillation; and hence the firituous extract has the flavour in great perfection, while the watery extract has very little. A tincture drawn with pure foirit is of a green colour. The feeds have been eiteemed aperient, diuretic, and carminative; but are little regarded in the prefent practice. 2. The inundatum, leatt water-pal fnep. The femt is about eight or ten iuches high, branched,

\section*{S I S} [ 5

frum, and creeping : the leaves, below the water, are capillary; above it are pinnated: the umbels are bifid. It grows in ditches and ponds. 3. Segetum, corn parfley, or honeywort. The ftems are numerous, flender, ftriated, branched, and leaning; the leaves are pinnated ; the pinnæ are oval, pointed, and ferrated, fix or eight pair, and one at the end; the umbels fmall and drooping ; the flowers minute and white. It grows in corn-fields and hedges. 4. Verticillatum, verticillate \(\mathrm{f}_{1}\) fon, has fmall leaves in whirls, and capillary; the ftem is two feet, with few leaves; the common umbel is compofed of 8 or 10 rays, the partial of 18 or 20 ; both involucra are compofed of five or fix oval acute foliola; the flowers are all hermaphrodite, and the petals white.

SISTRUM, or Cistrum, a kind of ancient mufical inftrument ufed by the priefts of Ifis and Ofiris. It is defcribed by Spon as of an oval form, in manner of a racket, with three fticks traverfing it breadthwife; which playing freely by the agitation of the whole inftrument, yielded a kind of found which to them feemed melodious. Mr Malcolm takes the fiftrum to be no better than a kind of rattle. Oifelius obferves, that the fiftrum is found reprefented on feveral medals, and on talifmans.

SISYMBRIUM, water-cresses, in botany : A genus of plants belonging to the clafs of tetradynamia, and to the order of filiquofa; and in the natural fyltem ranged under the 39 th order, Siliquofa. The filiqua, and almoft totally to exhale in drying the leaves, or infpiffating by the gentleft heat to the confiftence of an extract, either the expreffed juice, or the watery or fpirituous tinctures. Both the infpiffated juice, and the watery extract, difcover to the tafte a faline impregnation, and in keeping throw up cryftalline efflorefcences to the furface. On diftilling confiderable quantities of the herb with water, a fmall proportion of a fubtile volatile very pungent oil is obtained.

Water-creffes obtain a place in the Materia Medica for their antifcorbutic qualities, which have been long very generally acknowledged by phyficians They are alfo fuppofed to purify the blood and humours, and to open vifceral obftructions. They are nearly allied to fcurvy-grafs, but are more mild and pleafant, and for this realon are frequently eaten as falad. In the pharmaempoias the juice of this plant is directed with that of fcurvy-grafs and Seville oranges : and Dr Cullen has remarked, that the addition of acids renders the juices of

Vol. XVII. Part II.

13 1 S I T
the plantæ filiquolie more certainly effectual, by determining them more powerfully to an acefcent fermentation.
2. Silveftre, or water-rocket. The ftem is weak, branched, and above a foot high. The leaves are pinnated; Berrus) the pinnæ lance-fhaped, and ferrated ; the flowers fmall,

\section*{Hijzory.}

 ed over them; tongue fhort, horny at the end, and P .647 , 8\&c. jagged ; toes placed three forward and one backward;

\section*{S I V \\ [ 5 I4 ] \(\quad \mathrm{S}\) I U}
the middle toe joined clofely at the bafe to both the outmolt ; back toe as large as the middle one.There are II fpecies : the europæa, canadenfis, carolinenfis, jamaicenfis, pufilla, major, nævia, furinamenfis, cafra, longiroftra, and chloris. The europæa, or nuthatch, is in length near five inches three-quarters, in breadth nine inches; the bill is ftrong and ftraight, about three quarters of an inch long; the upper mandible black, the lower white : the irides are hazel ; the crown of the head, back, and coverts of the wings, of a fine bluifh grey; a black ftroke paffes over the eye from the mouth : the cheeks and chin are white; the breaft and belly of a dull orange-colour; the quill-feathers dufky; the wings underneath are marked with two fpots, one white at the root of the exterior quills, the other black at the joint of the baftard-wing ; the tail confifts of twelve feathers; the two middle are grey, the two exterior feathers tipt with grey ; then fucceeds a tranfverfe white fpot ; beneath that the reft is black: the legs are of a pale yellow; the back toe very ftrong, and the claws large. 'the female is like the male, but lefs in fize, and weighs commonly 5 or at molt 6 drams. The eggs are fix or feven in number, of a dirty white, dotted with rufous; thefe are depofited in fome hole of 2 tree, frequently one which has been deferted by a woodpecker, on the rotten wood mixed with a little mofs, \&c. If the entrance be too large, the bird nicely fops up part of it with clay, leaving only a fmall hole for itfelf to pafs in and out by. While the hen is fitting, if any one puts a bit of fick into the hole, fhe hiffes like a fnake, and is fo attached to her eggs, that fhe will fooner fuffer any one to pluck off her feathers than fly away. During the time of incubation, the male fupplies her with fuftenance, with all the tendernefs of an affectionate mate.

The bird runs up and down the bodies of trees, like the woodpecker tribe; and feeds not only on infects, but nuts, of which it lays up a confiderable provifion in the hollows of trees. "It is a pretty fight, fays Mr Willoughby, to fee her fetch a nut out of her hoard, place it faft in a chink, and then, ftanding above it with its head downwards, ftriking it with all its force, break the fhell, and catch up the kernel. It is fuppofed not to fleep perched on a twig like other birds; for when confined in a cage, it prefers fleeping in a hole or corner. When at reft it keeps the head down. In autumn it begins to make a chattering noife, being filent for the greateft part of the year." Dr Plott tells us, that this bird, by putting its bill into a crack in the bough of a tree, can make fuch a violent found as if it was rending afunder, fo that the noife may be heard at leaft twelve fcore yards.

SITOPHYLAX, 亡ıтори入a , formed from \(\sigma\) iros "corn," and \(q u \lambda \alpha \xi\), "keeper," in antiquity, an Athenian magiAtrate, who had the fuperintendence of the corn, and was to take care that nobody bought more than was neceffary for the provifion of his family. By the Attic laws, particular perfons were prohibited from buying more than fifty meafures of wheat a man; and that fuch perfons might not purchafe more, the fitophylax was appointed to fee the laws properly executed. It was a capital crime to prevaricate in it. There were 15 of thefe fitophylaces, ten for the city, and five for the Pireæus.

SIVA, a name given by the Hindoos to the Supreme

Being, when confidered as the avenger or deftroyer. Sir William Jones has fhown that in feveral refpects the cha. racter of Jupiter and Siva are the faine. As Jupiter overthrew the Titans and giants, fo did Siva overthrow A/fatic \(\bar{K}\) the Daityas, or children of Diti, who frequently rebelled againt Heaven; and as during the conteft the god of Olympus was furnifhed with lightning and thunderbolts by an eagle, fo Brahma, who is fometimes reprefented riding on the Garuda, or cagle, prefented the god of deftruction with fiery fhafts. Siva allo correfponds with the Stygian Jove, or Pluto; for, if we can rely on a Perfian tranllation of the Bhágavat, the forereign of Pátála, or the infernal regions, is the king of ferpents, named Se/banaga, who is exhibited in painting and fculpture, with a diadem and fceptre, in the fame manner as Pluto. There is yet another attribute of Siva, or Mahádéva, by which he is vifibly diftinguifhed in the drawings and temples of Bengal. 'To deftroy, according to the Vedantis of India, the Sufis of Perfia, and many philofophers of our European fchools, is only to generate and rcproduce in another form. Hence the god of deftruction is holden in this country to prefide over generation, as a fymbol of which he rides on a white bull. Can we doubt that the loves and feats of Jupiter Genitor (not forgetting the white bull of Europa), and his extraordinary title of Lapis, for which no fatisfactory reafon is commonly given, have a connection with the Indian philofophy and mythology ?

SIUM, Water Parsnep, in botany: A genis of plants belonging to the clafs of pentandria, and order of digynia, and in the natural fyttem ranging under the 45 th order, Umbellata. The fruit is a little ovated, and ftreaked. The involncrum is polyphyllous, and the petals are heart-fhaped. There are 12 fpecies; the latifolium, anguftifolium, nodiforım, fifarum, ninfi, rigidius, japonicum, falearica, græcum, ficulum, repens, and decumbens. The three firft are natives of Britain. 1. The latifolium, or great water-parfnep, which grows fpontaneoully in many places both of England and Scotland on the fides of lakes, ponds, and rivulets. The ftalk is ereet and furrowed, a yard high or more. The leaves are pinnated with three or four pair of large elliptic pinnæ, with an odd one at the end, all ferrated on the edges. The ftalk and branches are terminated with ereck umbels, which is the chief charaeteriftic of the fpecies. Cattle are faid to have run mad by feeding upon this plant. 2. The anguflifolium, or narrowleaved water-parfnep, has pinnated leaves; the axillary umbels are pedunculated, and the general involucrum is pinnatifid. It grows in ditches and rivulets, but is not common. 3. The nodiflorum, reclining water-parfnep, has pinnated leaves, but the axillary umbels are feffile. It grows on the fides of rivulets.

The fium fifarum, or fkirret, is a native of China, but has been for a long time cultivated in Europe, and particularly in Germany. The root is a bunch of flefhy fibres, each of which is about as thick as a finger, but very uneven, covered with a whitifh rough bark, and has a hard core or pith running thro' the centre. From the crown of this bunch comefeveral winged leaves, confifting of two or three pair of oblong dentated lobes each, and termina. ted by an odd one. The ftalk rifes to about.two feet, is fet with leaves at the joints, and breaks into branches towards the top, each terminating with an umbel of fmall white flowers, which are fucceeded by ftriated

\section*{\(515] \quad \mathrm{S}\) I X}
c'erks feeds like thofe of parney. Skirrets come nearelt to II Sixtus. parfneps of any of the efculent roots, both for flavour and nutritive qualities. They are rather fweeter than
the parfnep, and therefore to fome few palates are not altogether fo agreeable.

Mr Margraaf extracted from \(\frac{y_{2}^{2}}{2} \mathrm{lb}\). of fkirret root \(\frac{\mathrm{I}_{\frac{1}{2}}^{2}}{}\) ounces of pure fugar.
SIX-Cierks, officers in chancery of great account, next in degree below the twelve mafters, whofe bufinefs is to inrol commiffions, pardons, patents, warrants, \&c. which pafs the great feal, and to tranfact and file all proceedings by bill, anfwer, \&c. They were anciently clerici, and forfeited their places, if they married; but when the conflitution of the court began to alter, a law was made to permit them to marry. Stat. I4. and 15 . Hen. VIII. cap. 8. They are alfo folicitors for parties in fuits depending in the court of chancery. Under them are 6 deputies and 60 clerks, who, with the under clerks, do the bufinefs of the office.

SIX Nations. See Niagara.
SIXTH, in mufic, one of the fimple original concords, or harmonical intervals. See Interval.

SIXTUS V. (Pope), was born the \(133^{\text {th }}\) December 1521, in La Marca, a village in the feigniory of Montalto. His father, Francis Peretti, was a gardener, and his mother a fervant maid. He was their eldeft child, and was called Felix. At the age of nine he was hired out to an inhabitant of the village to keep fheep; but difobliging his mafter, he was foon after degraded to be keeper of the hogs. He was engaged in this employment when Father Michael Angelo Selleri,' a Francifcan friar, akked the road to Afcoli, where he was going to preach. Young Felix conducted him thither, and ftruck the father fo much with his converfation and eagen nefs for knowledge, that he recommended him to the fraternity to which he had come. Accordingly he was received among them, invefted with the habit of a lay brother, and placed under the facritan, to affift in fweeping the church, lighting the candles, and other offices of that nature ; for which he was to be taught the refponfes, and the rudiments of grammar. His progrefs in learning was fo furprifing, that at the age of 14 he was thought qualified to be. gin his noviciate, and was admitted the year following to make his profeffion.

He purfued his ftudies with fuch unwearied affiduity, that he was foon reckoned equal to the bett difputants. He was ordained prieft in 1545 , when he affumed the name of Father Montalto; foon after he took his doctor's degree, and was appointed profeffior of theology at Siemna. it was then that he fo effectually recommenced himfelf to Cardinal di Carpi, and his fecretary Boffius, that they ever remained his fteady friends. Meanwhile the feverity and obftinacy of his temper inceffantly engaged him in difputes with his monaitic brethren. His reputation for eloquence, which was now fpread over Italy, about this time gained him fome new friends. Among thefe were the Colonna family, and Father Ghifilicri, by whofe recommendation he was appointed inquifitor-general at Venice ; but he exercifed that office with to much feverity, that he was obliged to fee precipitately from that city. Upon this he went to Rome, where he was made procurator-general of his order, and foon after accompanied Cardinal Buon Cormpagnon into Spain, as a
chaplain and confultor to the inquifition. There he was treated with great refpect, and liberal offers were made him to induce him to continue in Spain, which, however, he could not be prevailed on to accept.

In the mean time, news were brought to Madrid that Pius IV. was dead, and that Father Ghiflieri, who had been made Cardinal Alexandrino by Paul IV. had fucceeded him under the name of Pius V. Thefe tidings filled Montalto with joy, and not without reafon, for he was immediately invefted by the pontiff with new dignities. He was made general of his order, biflop of St Agatha, was foon after raifed to the dignity of cardinal, and received a penfion. About this time he was employed by the Pope to draw up the bill of excommunication againt Queen Elizabeth.

He began now to caft his eyes upon the papacy; and, in order to obtais it, formed and executed a plan of hypocrify with unparalleled conttancy and fuccefs. He became humble, patient, and affable. He changed his drefs, his air, his words, and his actions, fo complctely, that his moft intimate friends declared him a new man. Never was there fuch an abfolute victory gained over the paffions; never was a fictitious character fo long maintained, nor the foibles of human nature fo artfully conccaled. He courted the ambaffadors of every foreign power, but attached himfelf to the interefts of none; nor did he accept a fingle favour that would have laid him under any peculiar obligation. He had formerly treated his relations with the greateft tendernefs, but he now changed his behaviour altogether. When his brother Anthony came to vifit him, he lodged him in an inn, and feut him home next day, charging him to inform his family that he was now dead to his relations and the world.

When Pius V. died in \(157^{2}\), he entered the conclave with the other cardinals, but feemed altogether indifferent about the clection, and never left his apartment except to his devotion. When folicited to join any party, he declined it, declaring that he was of no confequence, and that he would leave the choice of a Pope entirely to perfons of greater knowledge and experience. When Cardinal Buon Compagnon, who affumed the name of Gregory XIII. was elected, Montalto affured him that he never wifhed for any thing fo much in his life, and that he would always remember his goodnefs, and the favours he had conferred on him in Spain. But the new Pope treated him with the greateft contempt, and deprived him of his penfion. The cardinals alfo, deceived by his artifices, paid him no greater refpect, and uled to call him, by way of ridicule, the Roman beaft ; the afs of La Marca.

He now aflumed all the infirmities of old age; his head hung down upon his fhoulders; he tottered as he walked, and fupported himfelf on a ftaff. His voice became feeble, and was often interrupted by a cough \(\mathrm{f}_{0}\) exceedingly fevere, that it feemed every moment to threaten his diffolution. He interfered in no public traufactions, but fpent his whole time in acts of devotion and benevolence. Mean time he conftantly employed the ableft fies, who brought him intelligence of every particular.

When Gregory XIII. died in 1585 , he entered the conclave with the greateft reluctance, and immediately flut himfelf up in his chamber, and was no more thought of than if he had not exifted. When he went

\section*{S I X [ \(5: 6\) ] S I X} to mafs, for which purpofe alone he left his apartment, he appeared perfectly indifferent about the event of the election. Fie joined no party, yet flattered all.

He knew early that there wrould be great divifions in the conclave, and he was aware that when the leaders of the different parties were difappointed in their own views, they all frequently agreed in the election of fome cld and infirm cardinal, the length of whofe life would merely enable them to prepare themfelves fufficiently for the next vacancy. 'Thefe views directed his conduct, nor was he miftaken in his hopes of fuccefs.

Three cardinals, the leaders of oppofite factions, being unable to procure the election which each of them wifhed, unanimoufly agreed to make choice of Montalto. When they came to acquaint him with their intention, he fell into fuch a violent fit of coughing that every perfon thought he wonld expire on the fpot. He told them that his reign would laft but a few days; that, befides a continual difficulty of breathing, he wanted ftrength to fupport fuch a weight, and that his fmall experience rendered him very unfit for fo important a charge. He conjured them all three not to abandon him, but to take the whole weight of affairs upon their own thoulders; and declared that he would never accept the mitre upon any other terms: "If you are refolved," added he, " to make me Pope, it will only be placing yourfelves on the throne. For my part, I fhall be fatisfied with the bare title. Let the world call me Pope, and I make you heartily welcome to the power and authority. The cardinals fwallowed the bait, and exerted themfelves fo effectually that Montalto was elected. He now pulled off the mafk which he had worn for 14 years. No fonner was his election fecured, than he ftarted from his feat, flung down his ftaff in the middle of the hall, and appeared almoft a foot taller than he had done for feveral years.

When he was afked, according to cuftom, if he would accept of the Papacy, he replied, "It is trifling to ank whether I will accept what I have already accepted.However, to fatisfy any fcruple that may arife, I tell you that I accept it with great pleafure, and would accept another if I could get it; for I find myfelf able, by the Divine affitance, to manage two papacies." His former complaifance and humility difappeared, together with his infirmities, and he now treated all around him with referve and haughtinefs. The firft care of Sixtus V. the name which Montalto affumed, was to correct the abufes, and put a ftop to the enormities, which were daily committed in every part of the ecclefiaftical itate. The lenity of Gregory's government had introduced a general licentioufnefs of manners, which burft forth with great violence, after that Pontiff's death. It had been ufual with former Popea to releafe delinquents on the day of their coronation, who were therefore accuftomed to furrender themfelves voluntary prifoners immediately after the eleetion of the Pope. At prefent, however, they were fatally difappointed. When the governor of Rome and the keeper of St Angelo waited on his Holinefs, to know his intention in this particular, he replied, "What have you to do with pardons, and releafing of prifoners? Is it not fufficient that our predeceffor has fuffered the judges to remain unemployed thefe 13 years? Shall we alfo ftain our pontificate with the fame neglect of juftice? We have too long feen, with inexpreffible concern, the prodi-
gious degree of wickednefs that reigns in the fate to think of granting pandons. Let the prifoners be brought to a fpeedy trial, and punikhed as they deferve, to fhow the world that Divine Providence has called us to the chair of St Peter, to reward the good, and chaftife the wicked; that we bear not the fword in vain, but are the minifters of Cood, and a revenger to execute wrath on them that do evil."
He appointed commiffioners to infpect the conduct of the judges, difplaced thofe who were inclined to lenity, and put others of fevere difpolitions in their room. He offered rewards to any perfon who could convict them of corruption or partiality. He ordered the fyndics of all the towns and figniories to make out a complete lift of the diforderly perfons within their diftricts, and threatened the ftrapado for the fmalleft omiffion. In confequence of this edict, the fyndic of Albino was fcourged in the market-place, becaufe he had left his nephew, an incorrigible libertine, out of his lift.

He made very fevere laws againft robbers and affaffins. Adulterers, when difcovered, fuffered death; and they who willingly fubmitted to the proftitution of their wives, a cuftom then common in Rome, received the fame punifhment. He was particularly careful of the purity of the female fex, and never forgave thofe who attempted to debauch them.

His execution of juftice was as prompt as his edicts were rigorons. A Swifs happening to give a Spanifh gentleman a blow with his halberd, was ttruck by him fo rudely with a pilgrim's ftaff that he expired on the fpot. Sixtus informed the governor of Rome that he was to dine early, and that juflice muft be executed on the criminal betore he fat down to table. The Spanifh am baflador and four cardinals intreated him not to difo grace the gentleman by fuffering him to die on a sib bet, but to order him to be beheaded. "He fhall be hanged (replied Sixtus), but I will alleviate his difg races by doing him the honour to affilt perfonally at his death." He ordered a gibbet to be erected before his own windows, where he continucd fitting during the whole execution. He then called to his fervants to bring in dinner, declaring that the act of juftice which he had juft feen had increafed his appetite. When he rofe from table, he exclaimed, "God be praifed for the good appetite with which I have dined!"

When Sixtus afcended the throne, the whole ecclefiaftical itate was infefted with bands of robbers, who, from their numbers and outrages, were exceedingly formidable ; by his prudent and vigorous conduct, however, he in a fhort time extirpated the whole of thefe banditti.
Nor was the vigour of his conduct lefs confpicuous in his tranfactions with foreign nations. Before he had been pope two months he quarrelled with Philip II. of Spain, Henry III. of France, and Henry king of Na= varre. His intrigues indced in fome meafure influenced all the councils of Europe.
After his acceffion to the pontificate he fent for his family to Rome, with exprefs orders that they fhould appear in a decent and modeft manner. Accordingly, his fifter Camilla came thither, accompanied by her daughter and two grandchildren. Some cardinals, in order to pay court to the pope, went out to meet her, and introduced her in a very magnificent drefs. Sixtus pretended not to know her, and afked two or three times

\section*{S I X}
times who me was: Upon this one of the cardinals faid, "It is your fitter, holy father." "I have but one li. fter (replied Sixtus with a frown), and the is a poor woman at Le Grotte; if you have introduced her in this difguife, I declare I do not know her; yet I think I would know her again, if I faw her in the clothes fhe ufed to wear."

Her conductors at laft found it neceffary to carry her to an inn, and Arip her of her finery. When Camilla was introduced a fecond time, Sixtus embraced her tenderly, and faid, "Now we know indeed that it is our fifter: nobody fall make a princefs of you but ourfelves." He Atipulated with his fifter, that the fhould neither afk any favour in matters of government, nor intercede for criminals, nor interfere in the adminiflration of juftice; declaring that every requeft of that kind would meet with a certain refufal. Thefe terms being agreed to, and punctually obferved, he made the moft ample provifion not only for Camilla but for his whole relations.

This great man was alfo an encourager of learning. He ciufed an Italian tranflation of the Bible to be publifhed, which raifed a good deal of difcontent anong the Catholics. When fome cardinals reproached him for his conduct in this refpect, he replied, "It was publifhed for the benefit of you cardinals who cannot read Latin."

Sixtus died in 1590 , after having reigned little more than five years. His death was afcribed to poifon, faid to have been adminiftered by the Spaniards; but the fory feems rather improbable.

It was to the iudulgence of a difpofition naturally formed for feverity, that all the defects of this wonderful man are to be afcribed. Clemency was a Itranger to his bofom ; his punifhments were often too cruel, and feemed fometimes to border on revenge. Pafquin was dreffed one morning in a very nafty fhirt, and being afked by Martorio why he wore fuch dirty linen? replied, that he could get no other, for the pope liad made his wafherwoman a princefs, alluding to Camilla, who had formerly been a laundrefs. The pope ordered ftrict fearch to be made for the author of this lampoon, and offered him his life and a thoufand pittoles if he would difcover himfelf. The author was fimple enough to make his appearance and claim the reward. "It is true (faid the pope) we made fuch a promife, and we thall keep it ; your life thall be fpared, and you thall receive the moncy prefently: but we have referved to ourfelves the power of cutting off your hands and boring your tongue through, to prevent your being fo witty for the future." It is needlefs to add, that the fentence was immediately executed. This, however, is the only inftance of his refenting the many fevere fatires that were publifhed againt him.

But though the conduct of Sixtus feldom excites love, it generally commands our efteem, and fometimes our admiration. He ftrenuoufly defended the caule of the poor, the widow, and the orphan : he never refufed audience to the injured, however wretched or forlorn their appearance was. He never forgave thofe magiftrates who were capable of partiality or corruption ; nor fuffered crimes to pafs unpunifned, whether committed by the rich or the poor. He was frugal, tempesate, fober, and never neglected to reward the fmalleft
favour which had been conferred on him before his ex. Siya ghufly altation.

Sizar,
When he mounted the throne, the treafury was not only exhaufted, but in debt: at his death it contained five millions of gold.

Rome was indebted to him for feveral of her greateft embellihments, particularly the Vatican library : it was by him, too, that trade was firft introduced into the Ecclefiaftical State.
SIYA-ghUSH, the caracal of Buffon, an animal of the cat kind. See Felis, n \({ }^{\circ}\) xviii.

SIZAR, or Sizer, in Latin Sizator, an appellation by which the lowelt order of ftudents in the univerfities of Cambridge and Dublin are dittinguifhed, is derived from the word fize, which in Cambridge, and probably in Dublin likewife, has a peculiar meaning. 'To \(f_{2} z e\), in the language of the univerfity, is to get any fort of victuals trom the kitchens, which the ftudeuts may want in their own rooms, or in addition to their commons in the hall, and for which they pay the cooks or butchers at the end of each quarter. A fize of any thing is the fmalleft quantity of that thing which can be thus bought : two fizes, or a part of beef, being nearly equal to what a young perfon will eat of that difh to his dinner ; and a fize of ale or beer being equal to half an Englifh pint.

The fizars are divided into two claffes, viz. fublizatores or fizars, and Izatores or proper fizars. The former of thefe are fupplied with commons from the table of the fellows and fellow-commoners; and in former times, when thefe were more fcanty than they are now, they were obliged to fupply the deficiency by fizing, as is fometimes the cafe ftill. The proper fizars had tormerly no cominons at all, and were therefore obliged to fize the whole. In St John's college they have now fome commons allowed thens for dinner, from a benefaction, but they are fill obliged to fize their fuppers : in the other colleges they are allowed a part of the fellow-commons, but, muft fize the reft : and from being thus obliged to fize the whole or part of their vietuals, the whole order derived the name of fizars.

In Oxford, the order fimilar to that of fizar is denominated fervitor, a name evidently derived from the menial duties which they perform. In both univerlities thefe orders were formerly diftinguifhed by round caps and gowns of different materials from thofe of the penfioners or commoners, the order immediately above them. But about \(3 \odot\) years ago the round cap was entirely abolifhed in both feminaries. There is Itill, however, in Oxford, we believe, a diltinction in the gowns, and there is allo a trifling difference in fome of the fmall colle eres in Cambridge; but in the large colleges the drefs of the penfioners and fizars is entirely the fame.

In Oxford, the fervitors are Itill obliged to wait at table on the fellows and gentlemen-commoners; but much to the credit of the univerfity of Cambridge, this moft degrading and difgraceful cuftom was entirely abolihied about 10 or 12 years ago, and of courfe the fizars of Cambridere are now on a much more refpectable footing than the fervitors of Oxford.

The fizars are not upon the foundation, and therefore while they continne fizars are not capable of being clected fellows; but they may at any time, if they 4

\section*{S [ Z [ 518\(] \quad\) S K A}
sue. choofe, become penfioners: and they generally fit for fcholarflips immediatcly before they rake their firft defr:ec. If fuccefsful, they are then on the foundation, and are entitled to become candidates for fellowfhips when they have got that degree. In the mean time, while they continue fizars, befides free commons they enjoy many benefactions, which have been made at different times, under the name of fizar's pretor, ex.. bibitions, \&xc. and the rate of tuition, the rent of rooms, and other things of that fort within their refpective colleges, is lefs than to the other orders. But tho' their education is thus obtained at a lefs expence, they are not now confidered as a menial order; for fizars, penfioner-fcholars, and even fometintes fellow-commoners, mix together with the utmoft cordiality. It is worthy of remark, that at every period this order has fupplied the univerfity with its moft diftinguifhed officers; and that many of the moft illuftrious members of the church, many of the moft diftinguifhed men in the other liberal profeffions, have, when under-graduates, been fizars, when that order was on a lefs refpectable footing than it is now:

SIZE, the name of an inftrument ufed for finding the bignefs of fine round pearls. It confifts of thin pieces or leaves, about two inches long, and half an inch broad, faftened together at one end by a rivet. In each of thefe are round holes drilled of different diameters. Thofe in the firft leaf ferve for meafuring pearls from half a grain to feven grains; thofe of the fecond, for pearls from eight grains or two carats to five carats, \&c.; and thofe of the third, for pearls from fix carats and a half to eight carats and a balf.
\(S_{1 z E}\), is alfo a fort of paint, varnifh, or glue, ufed by painters, \&.c
'The threds and parings of leather, parchment, or vellum, being boiled in water and ftrained, make fize. This fubftance is much ufed in many trades.- The manner of ufing fize is to melt fome of it over a gentle fire; and fraping as much whiting into it as will juft colour it, let them be well incorporated together ; after which you may whiten frames, \&c. with it. After it dries, melt the fize again, and put more whiting, and whiten the frames, \&c. \{even or eight times, letting it dry between each timk: but-before it is quite dry, between each walhing with fize, you muft fmoothe and wet it over with a clean brufh-pencil in fair water.

To make gold-lize. Take gum-animi and aSphaltum, of each one ounce; minium, litharge of gold, and amber, of each half an ounce: reduce all into a very fine powder, and add to them four ounces of lin-Teed-oil, and eight ounces of drying oil : direft them over a gentle fire that does not flame, fo that the mixture may only fimmer, but not boil; left it Should run over and fet the houfe on fire, ftir it conflamly with a ftick till all the ingredients are dif. folved and incorporated, and do not leave off ftirring till it becomes thick and ropy ; after being fufficiently boiled, let it Itand till it is almoft cold, and then ftrain it through a coarfe linen cloth, and keep it for ufe.-'To prepare it for working, put what quantity you pleafe in a horfe-mufcle fhell, adding as much oil of turpentine as will diffolve it ; and making it as thin as the bottom of your feed-lac varnifh, hold it over a candle, and then ftrain it through a linen-rag into another fhell; add to thefe as much vermilion as will make
it of a darkinh red : if it is too thick for drawing, you Skat may thin it with fome oil of turpentinc. The chief ufe of this fize is for laying on metals.

The beft gold-fize for burnifhing is, made as follows: Take fine bole, what quantity you pleafe; grind it finely on a piece of marble, then fcrape into it a little beef fuet; grind all well together; after which mix iw a fmall proportion of parchment-fize with a double proportion of water, and it is done.

To make filver-fize. Take tobacco-pipe clay in fine powder, into which fcrape fome black-lead and a little Genoa foap, and grind them all together with parchment fize as already directed.

SKATING, an exercife on ice, both graceful and healthy. Although the ancients were remarkable for their dexterity in moft of the athletic fports, yet kk ating feems to have been nnknown to them. It may therefore be confidered as a modern invention; and probably it derived its origin in Holland, where it was practifed, not only as a graceful and elegant amufement, but as an expeditious mode of travelling when the lakes and canals were frozen up during winter. In Holland long journeys are made upon fkates with eafe and expedition; but in general lefs attention is there paid to graceful and elegant movements, than to the expedition and celerity of what is called journey fkating. It is only in thofe countries where it is confidered as an amufe. ment, that its graceful attitudes and movements can be ftudied; and there is no exercife whatever better calculated to fet off the human figure to advantage. The acquirement of moft exercifes may be attained at an advanced period of life ; but to become an expert flkater, it is neceffary to begin the practice of the art at a very early age. It is difficult to reduce the art of Aka. ting to a fyftem. It is principally by the imitation of a grood fkater that a young practitioner can form his own practice. The Englifh, though often remarkable for feats of agility upon fkates, are very deficient in gracefulnefs; which is partly owing to the conftruction of the flates. They are too much curved in the furface which embraces the ice, confequently they involuntarily bring the ufers of them round on the outfide upon a quick and fmall circle; whereas the fikater, by ufing fkates of a different conftruction, lefs curved, has the command of his ftroke, and can enlarge or diminifh the circle according to his own wifh and defire. The metropolis of Scotland has produced more inftances of elegant fkaters than perhaps any other country whatever; and the inftitution of a Skating Club about 40 years ago, has contributed not a little to the improvement of this elegant amufement. We are indebt. ed for this article to a gentleman of that Club, who has made the practice and improvement of fakating his particular ftudy; and as the nature of our work will not permit the infertion of a full treatife on flkating, we fhall prefent our readers with a few inftructions.
'Thofe who wifh to be proficients Thould begin at an early period of life ; and fhould firft endeavour to throw off the fear which always attends the commencement of an apparently hazardous amufement. They will foon acquire a facility of moving on the infide: when they have done this, they muft endeavour to acquire the movement on the outfide of the flkates; which is nothing more than throwing themfelves upon the outer edgeof the nkate, and making the balance of their body tend towards that

\section*{S K E [ 519 ] S K Y}
sting, file, which will neceffarily enable them to form a feluton. micircle. In this, much affiftance may be derived from placing a bag of lead-hhot in the pocket next to the foot employed in making the outfide froze, which will produce an artificial poife of the body, which afterwards will become natural by practice. At the commencement of the outfide froze, the knee of the employed limb thould be a little bended, and gradually brought to a rectilinear pofition when the froze is com. plated. When the practitioner becomes expert in forming the femicircle with both feet, he is then to join them together, and proceed progreffively and alternately with both feet, which will carry him forward with a graceful movement. Care fhould be taken to use very little mufcular exertion, for the impelling moton should proceed from the mechanical impulfe of the body thrown into fuch a pofition as to regulate the ftroke. At taking the outfide ftroke, the body ought to be thrown forward eafily, the unemployed limb kept in a direct line with the body, and the face and eyes directly looking forward : the unemployed foot ought to be ftretched towards the ice, with the toes in a direct line with the leg. In the time of making the curve, the body mut be gradually, and almoft imperceptibly, railed, and the unemployed limb brought in the fame manner forward; fo that, at finifing the curve, the body will bend a fall degree backward, and the unemployed foot will be about two inches before the other, ready to embrace the ice and form a correspondent curve. The muscular movement of the whole body mut correspond with the movement of the fate, and Should be regulated fo as to be almoft imperceptible to the fpectators. Particular attention fhould be paid in carrying round the head and eyes with a regular and imperceptible motion; for nothing fo much diminifhes the grace and elegance of fating as fudden jerks and exertions, which are too frequently ufed by the generality of fkaters. The management of the arms likewife deferves attention. There is no mode of difpoling of them more gracefully in fating outfide, than folding the hands into each other, or ufing a muff.

There are various feats of activity and manoeuvres unfed upon fates; but they are fo various that we cannot pretend to detail them. Moving on the outride is the primary object for a fkater to attain ; and when he becomes an adept in that, he will eafily acquire a facility in executing other branches of the art. There are few excrcifes but will afford him hints of elegant and graceful attitudes. For example, nothing can be more beautiful than the attitude of drawing the bow and arrow whilst the fkater is making a large circle on the outride: the manual exercife and military flutes have likewife a pretty effect when ufed by an expert: Skater.

SKELETON, in anatomy, the dried bones of any animal joined together by wires, or by the natural linamont dried, in fuch a manner as to flow their pofition when the creature was alive.

We have, in the Philofophical Tranfactions, an account of a human fkeleton, all the bones of which were fo united, as to make but one articulation from the back to the os facrum, and downwards a little way. On fawning forme of them, where they were unnaturally joined, they were found not to cohere throughout their whole fubftance, but only about a firth of an inch deep.
all round. The figure of the trunk was crooked, the fine making the convex, and the infide of the vertebro the concave part of the fegment. The whole had been found in a charnel-houfe, and was of the fize of a full grown perfon.

SKIDS, or Seeds, in fea-language, are long compaffing pieces of timber, notched below fo as to fit clofely upon the wales, extending. from the main-wale to the top of the fide, and retained in this pofition by bolts or fpike-nails. 'They are intended for preferving the planks of the fide, when any heavy body is hoifted or lowered.

SKIE (fIne of). See Sky.
SKIFF, a fall boat refembling a yawl, usually employed for paffing rivers.

SKIMMER, black. See Shearbill.
SKIMMIA, in botany: A genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 40 th order, Perfonata. The calyx is quadripartite; the corolla confifts of four concave petals; and the berry contains four feeds. There is only one fpecies, viz. the aponita.

SKIN, in anatomy, the general covering of the body of any animal. See Anatomy, \({ }^{\circ} 74\).

Skin, in commerce, is particularly unfed for the membrane tripped off the animal to be prepared by the tannet, finer, parchment-maker, \&c. and converted into leather, \&c. See Tanning.

SKINNER (Stephen), an Englifh antiquarian, born in 1622. He travelled, and ftudied in Several foreign univerfities during the civil wars; and in 1654 , returned and fettle at Lincoln, where he practifed phyfic with fuccefs until the year 1667, when he died of a malignant fever. His works were collected in folio in 1671 , by Mr Henfhaw, under the title of Etymologicon Lingua Anglicane, \&c.

SKIPPER, or SAury, a Species of Esox, which fee.
SKIRMISH, in war, a flight engagement between fall parties, without any regular order ; and is therefore eafily diftinguifhed from a battle, whish is a general engagement between two armies continued for forme time.
SKULL, in anatomy, the bony cafe in which the brain is inclofed. See Anatomy, no in. \&c.
Skull-Cap. See Scutellaria.
SKY, the blue expanfe of air or atmofphere. For the reafon of its blue colour and concave figure, feeOptics.

SKy, one of the greaten of the Weftern Inands of Scotland, fo called from Skianach, which in the Erie dialect fignifies winged, becaufe the two promontories of Valernefs and Troternifh, by which it is bounded on the north-weft and north-eaft, are fuppofed to refemble wings. The inland lies between the fire of Rolls and the weftern part of Lewis. According to the computation of Mr Pennant, Dr Johnfon, and Dr Campbell, it is 60 miles in length, and nearly the fame in width where broadeft ; according to others it is 50 miles in length, and in forme places 30 broad. The inland of Sky is divided between two proprietors; the fouthern part belongs to the laird of Macleod, Said to be lineally de. fended from Leod for to the black prince of Man: the northern diftrict, or barony of Troternifh, is the property of Lord Macdonald!, whole anceftor was Do- rous clan of Macdonalds, who are counted the moft warlike of all the Highlanders. Sky is part of the thire of Invernefs, and formerly belonged to the diocefe of the Inles: on the fouth it is parted from the main land by a channel three leagues in breadth; tho', at the ferry of Glenelly, it is fo narrow that a man may be heard calling for the boat from one fide to the other. Sky is well provided with a variety of excellent bays and harbours.

The face of the country is roughened with mountains, fome of which are fo high as to be covered with fnow on the top at midfummer; in general, their fides are clothed with heath and grass, which afford good pafturage for theep and black cattle. Between the mountains there are fome fertile valleys, and the greater part of the land towards the fea-coaft is plain and arable. The inland is well watered with a great number of rivers, above 30 of which afford falmon; and fome of them produce black mufcles in which pearls are bred, particularly the rivers Kilmartin and Ord : Martin was affured by the proprietor of the former, that a pearl hath been found in it valued at 201 . Sterling. Here is alfo a confiderable number of frefhwater lakes well ftored with trout and eels. The largeft of the fe lakes takes its denomination from St Columba, to whom is dedicated a chapel that ftands upon a fmall ifle in the middle of the lake. Sky likewife affords feveral cataracts, that roar down the rocks with great impetuofity. That the ifland has been formerly covered with woods, appears from the large trunks of fir and other trees daily dug out of the bogs and peatmarthes in every part of this country.

From the height of the hills, and proximity of the fea, the air feldom continues long of the fame temperature ; fometimes it is dry, oftener moift, and in the latter end of winter and beginning of fpring cold and piercing; at an average, three days in twelve throughout the year fcarcely free from rain, far lefs from clouds. Thiefe, attracted by the hills, fometimes break in ufeful and refrefhing fhowers; at other tines fuddenly burt. ing, pour down their contents with tremendous noife, in impetuous torrents that deluge the plains below, and render the fmallett rivulet impaffable; which, together with the ftormy winds fo common in this country in the months of Auguit and September, frequently blaft the hopes, and difappoint the expectations, of the hufbandman. Snow has been often known to lie on the ground from three to feven weeks; and on the higheft hills, even in the middle of June, fome fpots of it are to be feen. To this various temperature of the air, and uncertainty of weather, the fevers and agues, headachs, rheumatifins, colds, and dyfenteries, which are the prevailing diftempers, may be afcribed. That it is far, however, from being unwholefome, is fufficiently evinced by experience; for the inhabitants are, in general, as ftrong and healthy, and arrive at as advanced an age, as thofe who live in milder climates, and under a ferener fky. The gout is fearcely known in this ifland.

The foil is generally black, though it likewife affords clay of different colours; fuch as white, red, and blue, and in fome places fuller's earth. It is, however, much lefs adapted for agriculture than for pafture, and feldom, unlefs in very good years, fupplies itfelf with a fuf.
ficiency of provitions. Yet, though the foil is not ve. ry fertile or rich, it might with proper management be made to produce more plentiful crops. But the generality of the farmers are fo prejudiced in favour of old cuftoms, and indeed fo little inclined to induftry, that they will not cafily be prevailed on to change them for better; efpecially if the alteration or amendment propofed be attended with expence. Therefore, with refpect to improvements in agriculture, they are ftill much in the fame fate as they were 20 or 30 years ago. Ploughs, on a new and improved model, that in comparifon to the advantages derived from them might be had at a moderate expence, have lately been introduced into feveral diftricts around, where their good efo fects are manifelt, in improving the crops and diminifhing the labour of man and beaft ; but the laird of Raa. fay and one other gentleman are the only perfons in Portree that have ufed them. The cafcroim, a crooked kind of fpade, is almolt the only inftrument for labouring the ground ufed among the ordinary clafs of tenants. 'The average crops of corn are 8000 bolls.

When Mr Knox vifited this ifland in 1786, the number of inhabitants amounted to 15,000 : but fome gentlemen who refided there affirmed there were 16,000 . It is divided into eight parifhes, in each of which there is a fchool, befides three charity-fchools in different places.

The minerals found here are lead and iron ore, which, however, have never been wrought to any advantage. Near the village of Sartle, the natives find black and white marcafites, and variegated pebbles. The Applefglen, in the neighbourhood of Loch.fallart, produces beautiful agates of different fizes and colours: ftones of a purple hue are, after great rains, found in the rivulets: cryftal, of different colours and forms, abounds in feveral parts of the inland, as well as black and white marble, free-ftone, lime-ftone, and talc: fmall red and white coral is found on the fouthern and weftern coafts in great abundance. The fuel confifts chiefly of peat and turf, which are impregnated with iron ore and faltpetre; and coal has been difcovered in feveral difricts.

The wild birds of all forts moft common in the country are, folan geefe, gulls, cormorants, cranes, wild geefe, and wild ducks; eagles, crows, ravens, rooks, cuckoos, rails, woodcocks, moor-fowl, partridges, plover, wild pigeons, and blackbirds, owls, hawks, fnipes, and a variety of fmall birds. In mild feafons, the cuckoo and rail appear in the latter end of A pril; the former difappears always before the end of June; the latter fometimes not till September. The woodcock eomes in October, and frequently remains till March. The tame forts of fowl are geefe, ducks, turkeys, cocks, pullets, and tame pigeons.
The black cattle are here expofed to all the rigoars of the fevere winter, without any other provender than the tops of the heath and the alga marina; fo that they appear like mere fkeletons in the fpring; though, as the grafs grow's up, they foon become plump and juicy, the beef being fweet, tender, and finely interlarded. The amphibious animals are feals and otters. Among the reptiles they reckon vipers, afps, weafels, frogs, toads, and three different kinds of ferpents ; the firft fpotted black and white, and very poifonous; the fecond yel-

\section*{S K Y [ 52 I\(] \quad \mathrm{S}\) L A}
low, with brown fpots ; and the third of a brown colour, the fmalleft and leaft poifonous.

Whales and cairbans, or fun-fifh, come in fometimes to the founds after their prey, but are rarely purfued with any fuccefs. The fifhes commonly caught on the coaft are herrings, ling, cod, fcate, haddock, mackerel, lythe, fye, and dog-fifh. The average price of ling at home is L. 13,13 s. per ton; when fold, one by one, if frefh, the price is from 3 d . to 5 d . ; if cured, from 5 d . to 7 d . The barrel of herrings feldom fells under 19 s . which is owing to the great difficulty of procuring falt, even fometimes at any price; and the fame caufe prewents many from taking more than are fufficient for their own ufe.
The kyle of Scalpe teems with oyfters, in fuch a manner, that after fome fpring-tides, 20 horfe-loads of them are left upon the fands. Near the village of Bernftill, the beach yields mufcles fufficient to maintain 60 perfons per day ; this providential fupply helps to fupport many poor families in times of fcarcity.

The people are ftrong, robult, healthy, and prolific. They generally profefs the Proteftant religion ; are honeft, brave, innocent, and hofpitable. They fpeak the language, wear the habit, and obferve the cultoms that are common to all the Hebrides. The meconium in new-born infants is purged away with frefh butter : the children are bathed every morning and evening in water, and grow up fo ftrong, that a child of ro months is able to walk alone: they never wear fhoes or ftockings before the age of eight or ten, and night-caps are hardly known; they keep their feet always wet ; they lie on beds of ftraw or heath, which laft is an excellent reftorative : they are quick of apprehenfion, ingenious, and very much addicted to mufic and poetry. They eat heartily of fifh; but feldom regale themfelves with flefh-meat : their ordinary food confifts of butter, cheefe, milk, potatoes, colewort, brochan, and a difh called oon, which indeed is no other than the froth of boiled milk or whey raifed with a ftick like that ufed in making chocolate.

A fort of coarfe woollen cloth called cloa, or caddoes, the manufacture of their wives, made into fhort jackets and troufers, is the common drefs of the men. The philibeg is rarely worn, except in fummer and on Sundays; on which days, and fome other occafions, thofe iu better circumitances appear in tartans, a bonnet, and fhort hofe, and fome in a hat, fhort coat, waiftcoat, and breeches, of Scotch or Englifh manufacture. The women are in general very cleanly, and fo exceffively foud of drefs, that many maid-fervants are often known to lay out their whole wages that way.

There are two fairs held annually at Portree, to which almoft every part of Sky fends cattle. The firft is held in the end of May, and the fecond in the end of July. The fair commonly continues from Wednefday till the Saturday following. The commodities which are fold in thefe are horles, cows, fheep, goats, hides, butter, cheefe, fifh, and wool. The cattle fold in thefe fairs fwim over to the main land throngh a mile or half a mile of fea. Thoufands of thefe are yearly exported, at from L. 2 to L. 3 each. Many of them are driven to England, where they are fatted for the market, and counted delicious eating.

In Sky appear many ruins of Danifh forts, watchVol. XVII. Part II.
towers, beacons, temples, and fepulchral monuments. All the forts are known by the term Dun; fuch as Dun-Skudborg, Dun-Derig, Dun-Skerinefs, Dun-David, \&c.
\(S_{K Y-C o l o u r . ~ T o ~ g i v e ~ t h i s ~ c o l o u r ~ t o ~ g l a f s, ~ f e t ~ i n ~ t h e ~}^{\text {g }}\) furnace a pot of pure metal of fritt from rochetta or bae rilla, but the rochetta fritt does beft; as foon as the metal is well purified, take for a pot of twenty pounds of metal fix ounces of brafs calcined by itfelf; put it by degrees at two or three times into the metal, ftirring and mixing it well every time, and diligently nkimming the metal with a ladle : at the end of two hours the whole will be well mixed, and a proof may be taken; if the colour be found right, let the whole ftand 24 hours longer in the furnace, and it will then be fit to work, and will prove of a moft beautiful fky colour.

SLAB, an outlide fappy plank or board fawed off from the fides of a timber-tree. The word is alfo ufed for a flat piece of marble.

SLab-Line, in fea-language, a fmall cord paffing up behind a fhip's main-fail or fore-fail, and being reeved through a block attached to the lower part of the yard, is thence tranfmitted in two branches to the foot of the fail, to which it is faftened. It is ufed to trufs up the fail as occafion requires, and more particularly for the convenience of the pilot or fteerfman, that they may look forward beneath it as the fhip advances.

SLACK-water, in fea-language, denotes the interval between the flux and reflux of the tide, or between the laft of the \(\epsilon b b\) and the firft of the flood, during which the current is interrupted, and the water apparently remains in a ftare of reft.

SL.ACKEN, in metallurgy, a term ufed by the miners to exprefs a fpongy and femivitrified fubftance, which they ufed to mix with the ores of metals, to prevent their fufion. It is the fcoria or fcum feparated from the furface of the former fufions of metals. To this they frequently add limeftone, and fometimes a kind of coarfe iron-ore, in the running of the poorer gold ores.

SLATE (Stegania), a fone of a compact texture and laminated ftructure, fplitting into fine plates.

Dr Hill diftinguifhes four fpecies of ftegania. x. The whitifh fteganium, being a foft, friable, flaty ftone, of a tolerably fine and clofe texture, confiderably heavy, perfectly dull and deftitute of brightnefs, variegated with a pale brown or brownifh yellow. This fpecies is common in many counties of England, lying near the furface of the ground. It is generally very full of perpendicular as well as horizontal cavities, many of which are filled up with a fpar a little purer and more cryftalline than the reft; and is commonly ufed for covering houfes. 2. The red fteganium is a very fine and clegant flate, of a fmooth furface, firm and compact texture, confiderably heavy, and of a very beautiful pale purple, glittering all over with fmall gloffy fpangles: it is compofed of a multitude of very thin plates or flakes, laid clofely and evenly over one another, and cohering pretty firmly: this is very common in the northern parts of England, and is much valued as a ftrong and beautiful covering for houfes. 3. The common blue feganium is very well known as an ufeful and valuable ftone, of a fine fmooth texture and gloffy furface, moderately heavy , and of a pale greyifh blue ; compofed of a multi- -

II Slavery. tude of even plates, laid clofe upon one another, and eatily fplitting at the commiffures of them : this is alfo very common in the north parts of England, and is ufed in moft places for the covering of houfes. There are other fpecies of this flate, viz. the brownifh blue friable fleganium, ufually called coal-flate; the greyifh black friable fteganium, commonly called Biver; and the greyifh blue fparkling fteganium. 4. The friable, aluminous, black fteganium, being the Irifh fate of the fhops: this is compofed of a multitude of thin flakes, laid very evenly and regularly over one another, and fplits very regularly at the commiffures of them. It is common in many parts of Ireland, and is found in fome places in England always lying near the furface in very thick frata. In medicine it is ufed in hemorrhagies of all kinds with fuccefs, and is taken often as a good medicine in fevers.

The ifland of Eufdale, one of the Hebrides on the veeft coaft of Scotland, is entirely compofed of flate. The fratum is 36 fect thick. About two millions and a half, at the rate of twenty fhillings per thoufand, are fold annually to England, Canada, the Weft Indies, and Norway.

SLAvE. See Slavery.
Slavery de.
SLAVERY is a word, of which though generally fined.
underftood, it is not eafy to give a proper definition. An excellent moral writer has defined it to be "an obligation to labour for the benefit of the mafter, without the contract or confent of the fervant." But may not he be properly called a flave who has given up his freedom to difclarge a debt which he could not otherwife pay, or who has thrown it away at a game of hazard? In many nations, debts have been legally difcharged in this manner:; and in fome favage tribes, fuch is the univerfal ardour for gaming, that it is no uncommon thing for a man, after having loft at play all his other property, to ftake, on a fingle throw of dice, himfelf, his wife, and his children (A). That perfons who have thus loft their liberty are llaves, will hardly be denied; and furely the infatuated gamefter is a flave by his own contract. The debtor, too, if he was aware of the law, and contracted debts larger than he could reafonably expect to be able to pay, may juftly be confidered as having come under an obligation to labour for the benefit of a matter avith his own confent; for every man is anfwerable for all the known confequences of his voluntary actions.
'This definition of flavery feems to be defective as well as inaccurate. A man may be under an obligation to labour through life for the benefit of a mafter, and yet
that mafter have no right to difpofe of him by fale, or in any other way to make him the property of a third perfon ; but the word \(/\) ave, as ufed among us, always denotes a perfon who may be bought and fold like a beaft in the market (B). In its original fenfe, indeed, it was of the fame import with noble, illuffrious; but vaft numbers of the people among whom it had that fignification being, in the decline of the Roman empire, fold by their countrymen to the Venetians, and by them difperfed over all Europe, the word gave came to denote a perfon in the loweft flate of fervitude, who was confidered as the abfolute property of his mafter. See Philology, \(\mathrm{n}^{\circ} 220\).

As nothing can be more evident than that all men Inequalit have, by the law of nature, an equal right to life, liber-of rank il ty, and the produce of their own labour (fee R IGHT, \({ }^{\text {evitable. }}\) \(n^{\circ} 5\). ), it is not eafy to conceive what can have firft led one part of them to imagine that they had a right to enflave another. Inequalities of rank are indeed inevitable in civil fociety ; and from them refults that fervitude which is founded in contract, and is of temporary duration. (Sce Moral Philosophy, n \({ }^{\circ}\) I4I.) He who has mucl: property has many things to attend to, and mult be difpofed to hire perfons to affift and ferve him ; while thofe who have little or no property muft be equally willing to be hired for that purpofe. And if the mafter be kind, and the fervant faithfinl, they will both be happier in this connection than they could lave been out of it. But from a fate of fervitude, where the flave is at the abfolute difpofal of his mafter in all things, and may be transferred without his own confent from one proprietor to another, like an ox or an afs, happinefs muft be for ever banifhed. How then came a traffic fo unnatural and unjuft as that of flaves to be originally introduced into the world ?
'I'he common anfwer to this queftion is, that it took its rife among favages, who, in their frequent wars with each other, either maffacred their captives in cold blood, or condemned them to perpetual flavery. In fupport of this opinion we have heard it obferved, that the Latin word fervus, which fignifies not a bired fervant, but a Jluve, is derived from fervare, "to preferve;" and that fach men were called fervi, becaufe they were captives, whofe lives were preferved on the condition of their becoming the property of the victor.
'Ihat flavery had its origin from war, we think ex- Origin \({ }^{3}\) tremely probable ( \(c\) ), nor are we inclined to controvert flavery. this etymology of the word fervus; but the traffic in men prevailed almoft univerfally long before the Latin
(A) Aleant (quod mircre) fobrii inter feria exercent, tanta lucrandi perdendive temeritate, ut cum omnia defecerunt, extremo ac noviffimo jactu de libertate et corpore contendant. Victus voluntariam fervitutem adit ; quamvis junior, quamvis robultior, alligari fe ac venire patitur.-Tacitus de Mor. Germ.

The favages of North America are equally addicted to gaming with the ancient Cermans, and the negroes on the Slave Coaft of Guinea perhaps ftill more.
(в) The Roman orator's definition of favery, Parad. V. is as accurate as any that we have feen. "Servitus eft obedientia fracti animi et abjecti et arbitrio carentis fuo;" whether the unhapppy perfon fell into that fate with or without his own contract or confent.
(c) In the article Society, the reader will find another account of the origin of flavery, which we think likewife probable, though we have not transferred it to this place; as it would, in our opinion, be wrorig to give to one writer what we know to belong to another. It may be proper, however, to obferve here, that between the two articles there is no contradiction, as barbarous wars were certainly one fource of flavery.

\section*{G L A [. 523 T S L A}
avery. language or Roman name was heard of; and there is no good evidence that it began among favages. The word \(72 y\), in the Old Teftament, which in our verfion is rendered lervant, fignifies literally a fave, either born in the fanily or bought with money, in contradiftinction to שכיר, which denotes a hired fervant : and as Noah makes ufe of the word in the curfe which he denounces upon Ham and Cariaan immediately after the deluge, it would appear that flavery had its origin before that event. If fo, there can be little doubt but that it began among thofe violent perfons whom our tranflators have called giants*, though the original word a wretches feem firft to have feized upon women, whom they forcibly compelled to miniter to their pleafures ; and from this kind of violence the progrefs was natural to that by which they enflaved their weaker brethren among the men, obliging them to labour for their benefit, without allowing them fee or reward. to fer the deluge the firtt dealer in flaves feems "to be a mighty one in the earth, and was a mighty hunter, before the Lord." He could not, however, be the firft hunter of wild beafts ; for that fpecies of hunting mult have been practifed from the beginning; nor is it prebable that his dexterity in the chafe, which was then the univerfal employment, could have been fo far fuperior to that of all his contemporaries, as to entitle him to the appellation of the " the mighty hunter before the Lord." Hence moft commentators have concluded, that he was a hunter of men ; an opinion which they think receives fome countenance from the import of his name, the word Nimrod figniifying a rebel. Whatever be in this, there can be little doubt but that he became a mighty one by violence; for being the fixth fon of his father, and apparently much younger than the other five, it is not likely that his inheritance exceeded theirs either in extent or in population. He enlarged it, however, by conqueft ; for it appears from Scripture, that he invaded the territories of \(A\) fhur the fon of Shem, who had fettled in Shinar ; and obliging him to remove into Affyria, he feized upon Babylon, and made it the capital of the firf kingdom in the world. As he had great projects in view, it feems to be in a high degree probable that he made bondfervants of the captives whom he took in his wars, and employed them in building or repairing the metropolis of his kingdom; and hence we think is to be dated the origin of pofldeluvian flavery.
That it began thus early can hardly be queftioned; for we know that it prevailed univerfally in the age of Abraham, who was born within feventy years after the death of Nimrod. That patriarch had three hundred and eighteen fervants or flaves, born in his own houfe, and trained to arms, with whom he purfued and conqueled the four kings who had taken captive his bro-
Gen. xiv. ther's fon \(\dagger\). And it appears from the converlation
which took place between him and the king of Sodom Slavery. after the battle, that both believed the conqueror had a right to confider his prifoners as part of his fpoil. "Give me (fays the king) the perfons, and take the grods to thyfelf." It is indeed evident from numberlefs paffages of fcripture, that the domeftics whom our tranflators call fervants were in thofe days univerfally confidered as the moft valuable part of their mafter's property, and claffed with his flocks and herds. Thus when the facred hiftorian defcribes the wealth of Abraham, he fays, that " he had theep and oxen, and he-affes, and men-fervants, and maid-fervants, and ihe-affes, and camels." And when Abimelech wifhed to make fome reparation to the patriarch for the unintended injury that he had done hiim, " he took fheep and oxen, and men-fervants, and women-fervants, and gave them unto Abraham, and reftored to him Sarah his wife." The riches and power of Ifaac and Jacob are eftimated in the very fame manner. Of the former it is faid, that " the man waxed great, and went forward and grew, until he became very great: for he had poffeffion of flocks, and poffeffion of herds, and great flore of fervants, ועבדה of flaves; and the Philiftines envied him." The latter, we are told, " increafed exceedingly, and had much cattle, and maid-fervants, and men-fervants, and camels, and affes \(\ddagger\)."

That the practice of buying and felling fervants thus \({ }^{\text {16. }}\) xx. \(14^{\circ}\) early begun among the patriarch defcended to their xiv. 35 . early begun among the patriarchs defcended to their \(\mathrm{xxvi} . \mathrm{I}_{3}, \mathbf{1} \mathrm{~m}_{0}\)
pofterity, is known to every attentive reader of the xxx .43. Bible. It was exprefsly authorifed by the Jewiif law, in which are many directions how fuch fervants were to Authorifed be treated. They were to be bought only of the hea- by the Mo then; for if an lfraelite grew poor and fold himfelf either to difcharge a debt, or to procure the means of fubfiftence, he was to be treated not as a flave 7בy, but as a hired fervant שכיר, and reftored to freedom at the year of Jubilee. "Both thy bond men and thy bondmaids (fays Mofes) thall be of the heathen that are round about you: of them fhall ye buy bond men and bond-maids. And ye fhall take them as an inheritance for your children after you, to inherit them for a poffeffion; they thall be your bond-men for ever \(\|\). ." Un- \| Lev. xav. limited as the power thus given to the Hebrews over \(39,40,44\), their bond fervants of heathen extraction appears to have been, they were itrictly prohibited from acquiring fuch property by any other means than fair purchafe: " he that fealeth a man and felleth him," faid their great lawgiver, " fhall furely be put to death §." § Lev. xxio

Whilft flavery, in a mild form, was permitted among \({ }^{16 .} 8\) the people of God, a much worfe kind of it prevailed spread ove among the heathen nations of antiquity. With other the whole abominable cuftoms, the traffic in men quickly fpread world.
from Chaldea into Egypt, Arabia, and over all the eaft, and by degrees found its way into every known region under heaven (D).

Of this hateful commerce we fhall not attempt to trace the progrefs thro' every age and countiy, but thall con3 U 2 tent
(D) If credit be due to a late account of China, the people of that vaft empire have neter made merchandife of men or women. The exception, however, is fo fingular, that we fhould be glad to fee it better authenticated; for it is apparent from works of the moft undoubted credit, that over all the other eaftern countries with which we are acquairted flavery has prevailed from time immemorial, and that fome of the Indian nations make long journeys into Africa for the fole purpofe of buying flaves,

\section*{S L A [ 524 ] S L A}

Slavery, tent ourfelves with taking a tranfient view of it among the Greeks and Romans, and a fewother nations, in whofe cuftoms and manners our readers muft be interefted.
One can hardly read a book of the Iliad or Odyffey, without perceiving that, in the age of Homer, all prifoner's of war were liable to be treated as flaves, and compelled, without regard to their rank, lex, or years, to labour for their mafters in offices of the vileft d:udgery. So univerfally was this cruel treatment of captives admitted to be the right of the victor, that the poet introduces Hector, in the very act of taking a tender and perhaps laft farewell of his wife, when it was furely his bufinefs to afford her every confolation in his power, telling her, as a thing of courfe which could not be concealed, that, on the conqueft of Troy, fhe would be compelled

To bear the victor's hard commands, or bring
The weight of water from Hyperia's fpring ( E ).
Pope.
At that early period, the Phœnicians, and probably the Greeks themfelves, had fuch an eftablifhed commerce in flaves, that, not fatisfied with reducing to bondage their prifoners of war, they fcrupled not to kidnap in cold blood perfons who had never kindled their refentment, in order to fupply their foreizn markets. In the 14 th book of the Odyffey, Ulyffes reprefents himfelf as having narrowly efcaped a fnare of this kind laid for him by a falfe Phœenician, who had doomed the hero to Libyan flavery: and as the whole narrative, in which this circumftance is told, is an artful fiction, intended to have the appearance of tuuth to an Ithacan pealant, the practice of kidnapping flaves could not then have appeare incredible to any inhabitant of that ifland.

Such were the manners of the Greeks in the heroic age; nor were they much improved in this refpect at periods of greater refinement. Philip of Macedon having conquered the Thebans, not only fold his captives, but even took money for permitting the dead to be buried *; and Alexander, who had more generofity than
* Yypfin.
lib. iii.
cap. 4.
+ Fuftin et Arrian. Philip, afterwards razed the city of Thebes, and fold the inlabitants, men, women, and children, for flavest. This cruel treatment of a brave people may indeed be fuppofed to have proceeded, in the firft inftance, from the avarice of the conqueror; and in the fecond, from the momentary refentment of a man who was favage and generous by turns, and who had no command of his paffions. We fhall not pofitively affign it to other caufes; but from the manner in which the Spartans behaved to their flaves, there is little reafon to imagine that had they received from the Thebans the fame provocation with Alexander, they would lave treated their captives with greater lenity. "At Sparta (fays a humane and elegant writer) flaves were treated with a degree of rigour that is hardly conceivable; although to them, as their hufbandmen and artificers, their proud and idle mafters were indebted for all the neceffaries of life. The Lacedemonian youth, trained up in the practice of deceiving and butchering thofe poor men, were from time
to time let loofe upon them, in order to fhow their pro. ficiency in ftratagem and maffacre. And once, without any provocation, and merely for their own amufement, we are told that they murdered three thoufand in one night, not only with the connivance of law, but by its avowed permiffion. Such, in promoting the happinefs of one part of fociety and the virtue of another, are the effects of flavery."

It has been laid, that in Athens and Rome naves were better treated than in Sparta: but in the former city their treatment cannot have been good, nor their lives comfortable, where the Athenians relifhed that tragedy of Euripides in which Hecuba, the wife of Priam, is introduced as lamenting that fhe was chained like a dog at Agamemnon's gate! Of the eftimation in which flaves were held in Rome, we may form a tolerable notion from the well known fact, that one of thofe unhappy beings was often chained at the gate of a great man's houfe, to give admittance to the guefts invited to a feaft. In the carly periods of the common. wealth it was cuftonary, in certain facred fhews exhibited on folemn occafions, to drag through the circus a flave, who had been fcourged to death holding in his hand a fork in the form of a gibbet \(\dagger\). But we need + Cicero not multiply proofs of the cruelty of the Romans to Div, lib. their flaves. If the inhuman combats of the gladiators cap. 26. (fee Gladiators) admit of any apology on account of the martial fpirit with which they were thought to infpire the fpectators, the conduct of Vedius Pollio muft have proceeded from the moft wanton and brutal cruelty. T'his man, who flourifhed not in the earlieft periods of the republic, when the Romans were little better than a favage banditti, but in the polifhed age of Auguftus, frequently threw fuch flaves as gave him the flighteft offence into his fifh-ponds to fatten his lainpreys; and yet he was fuffered to die in peace! The emperor, indeed, upon coming to the knowledge of his cruelty, ordered his lampreys to be deftroyed, and his ponds to be filled up; but we do not recollect that any other punifhment was inflicted on the favage mafter. Till the reign of the fame emperor the depofitions of flaves were never admitted in the courts of judicature; and then they were received only when perfons were accufed of treafonable practices.
The origin of flavery in Rome was the fame as in Origin every other country. Prifoners of war were of courfe Roman reduced to that ftate, as if they had been criminals. The flavery, dictator Camillus, one of the moft accomplifhed generals of the republic, fold his Hetrurian captives to pay the Roman ladies for the jewels which they had prefented to Apollo. Fabius, whofe cautious conduct fa. ved his country when Hannibal was victorious in Italy, having fubdued Tarentum, reduced 30,000 of the citizens to flavery, and fold them to the higheft bidder. Coriolanus, when driven from Rome, and figlting for the Volfci, fcrupled not to make flaves of his own countrymen; and Julius Cæfar, among whofe faults wanton
cruelty
(E) In thofe early times drawing water was the office of the meaneft flaves. This appears from Jofhua's curfe upon the Gibeonites who had deceived him. -"Now therefore ye are curfed, and there fhall none of you be freed from being bond-men, and hewers of wood, and drawers of water, for the houfe of my God." To this ftate of bondage Homer makes Hector fay, that Andromache would neceffarily be brought upon the deftruction of T'roy ;

\section*{S L A [ 525 ] S L A}
eruclty has never been reckoned, fold at one time fiftythree thoufand captives for faves. Nor did the flaves in Rome confift only of foreigners taken in war. By one of the laws of the twelve tables, creditors were empowered to feize their infolvent debtors, and keep them in their houfes till, by their fervices or labour, they had difcharged the fum they owed: and in the beginning of the commonwealth they were authorifed to fell fuch debtors, and even to put them to death (F). The children of flaves were the property not of the commonwealth, or of their own parents, but of their mafters; and thus was flavery perpetuated in the families of fuch unhappy men as fell into that ftate, whether through the chance of war or the cruelty of a fordid creditor ( G ). The confeguence was, that the number of naves belonring to the rich Patricians was almoft incredible. Caius Cæcilius Ifidorus, who died about feven years before the Chriftian era, left to his heirs 4 II 6 flaves; and if any one of thofe wretched creatures made an unfuccefsful attempt to regain his liberty, or was even fufpected of fuch a defign, he was marked on the forehead with a red hot iron (н). In Sicily, during the moft flourifhing periods of the commonwealth, it feems to lave been cuftomary for mafters to mark their flaves in this manner; at leaft we know that fuch was the practice of Damophilus, who, not fatisfied with this fecurity, flut up his flaves every night in clofe prifons, and led them out like bealts in the morning to their daily labour in the field. Hence arofe the fervile war in Sicily.

Though many laws were enacted by Auguftus and other patriotic emperors to diminifh the power of cre: ditors over their infolvent debtors ; though the influence of the mild fpirit of Chrifianity tended much to meliorate the condition of flaves, even under Pagan mafters; and though the emperor Adrian made it capital to kill
a ीave without a juft reafon; yet this infamous commerce prevailed univerfally in the empire for many ages after the converfion of Conftantine to the religion of Chrift. It"was not indeed completely abolifhed even in the reign of Juttinian ; and in many countries which had once been provinces of the empire it continued long after the empire itfelf had fallen to pieces.
It has already been obferved, that among the ancient Slavery a Germans it was not uncommon for an ardent gamefter mong the to lofe his perfonal liberty by a throw of the dice. 'This ancient was indeed a ftrong proof of favage manners; but the general condition of flaves among thofe favages feems to have been much better than among the polifhed Greeks and Romans. In Germany the flaves were generally attached to the foil, and only employed in tending cattle, and carrying on the bufinefs of agriculture; for the menial offices of every great man's houfe were performed by his wife and children. Such flaves were feldom beaten, or chained, or imprifoned. Sometimes in. deed they were killed by their mafters in a fit of fudden paffion; but none were confidered as materials of commerce, except thofe who had originally been freemen, and loft their freedom by play. Thefe, indeed, the fuccefsful gamefter was very ready to fell, both becaufe he felt them an ufelefs. burden, and becaufe their prefence continually put him in mind of that ftate to which a throw of the dice might one day reduce himfelf.

Such is the account which Tacitus gives \(\ddagger\) of flavery \(\ddagger\) De Moro among the ancient Germans. The Anglo-Saxons, how. ever, after they were fettled in this ifland feem not to have carried on that traffic fo honourably. By a ftatute of Alfred the Great \(\dagger\), the purchafe of a mun, a borfe, \(\dagger\) Wilkins's or an \(o x\), without a voucher to warrant the fale, was Collection of ftrictly forbidden. That law was, doubtlefs, enacted Laws fromt to prevent the fealing of men and cattle; but it fhows \(\begin{gathered}\text { Ethelluert ITO } \\ \text { IIT. }\end{gathered}\)
\(\qquad\)
us
( F ) After a certain number of citations, the law granted to the debtor thirty days of grace to raife the fum for which he was accountable. The words of the law are: "Aris confefli, rebufque jure judicatis, triginti dies jufti funto. Poft dein manum endojacito.-Vincito aut nervo; aut compedibus." "When the debt is confeffed, and the trial paffed, let there be thirty days of forbearance : afterwards lay hands on him ; bind him either with a cord or fetters." After the thirty days were expired, if the debtor had not difcharged the debt, he was led to the pretor, who delivered him over to the mercy of his creditors; thefe bound him and kept him in chains for the ipace of fixty days. Afterwards, for three market-days fucceffively, the debtor was brought to the tribunal of the prætor; then a public crier proclaimed in the forum the debt for which the prifoner was detained. It often happened, that rich perfons redeemed the prifoner by paying lis debts ; but if nobody appeared in behalf of the debtor after the third market-day, the creditor had a right to inflict the punifhments appointed by the law. "Tertiis nundinis capite pœnas dato aut trans Tiberim peregre venumduito;" that is, "Let him on the third market-day be punifhed with death, or fold beyond the Tiber as a flave." If there were feveral creditors, they werc allowed, in confequence of this fevere law, to divide the body of the prifoner into feveral parts, and Share it among them in proportion to the fum which they demanded.
(G) This is evident from the ftory of Appius and Virginia. See Rome, \({ }^{\circ}{ }^{\circ}{ }_{11} 3\).
( H ) How capricioufly and unjuftly this infamous mark was inpreffed, we learn from the ftory of Retio. This man being profcribed, and a reward offered for his head by the triumvirs Octavianus, Antony, and Lepidus, concealed himfelf from the fury of the tyrants in the beft way that he could. A flave whom he had marked with the hot iron having found out the place of his retreat, conducted him to a cave, and there fupported him for fome time with what he earned by his daily labour. At length a company of foldiers coming that way, and approaching the cave, the faithful flave, alarmed at the danger his mafter was in, followed them clofe, and falling upon a poor peafant, killed him in their prefence, and cut off his head, crying out, "I am now revenged on my mafter for the marks with which he has branded me." The foldiers, feeing the infamous marks on his forehead, and not doubting but he had killed Reftio; fnatched the head out of his hand, and returned with it in all hafte to the triumvirs. 'I hey were no fooner gone, than the flave conveyed his mafter to the fea-fide, where they had the good luck to find cne of Sextius Pompeius's veffels, which tranforted them fafe into Sicily.

us that fo late as the ninth or tenth century a man, when fairly purchafed, was, in England, as much the property of the buyer as the horfe on which he rode, or the ox which dragged his plough. In the fame country, now fo nobly tenacious of freedom and the rights of man, a fpecies of flavery fimilar to that which prevailed among the ancient Germans fubfifted even to the end of the fixteenth century. This appears from a commiffion iffned by Queen Elizabeth in 1574, for inquiring into the lands and goods of all her bond-men and bond-women in the counties of Cornwall, Devon, Somerfet, and Gloncefter, in order to compound with them for their manuniffion, that they might enjoy their lands and goods as freemen \(\|\). In Scotland there certainly exifted an order of flaves or bond-men, who tilled the ground, were attached to the foil, and with it were trausferable from one proprietor to another, at a period fo late as the thirteenth century; but when or how thofe villains, as they were called, obtained their freedom, feems to be unknown to every lawyer and antiquary of the prefent day. Coalliers and falters were, in the fame country, flaves till little more than 20 years ago, that they were manumitted by an act of the Britif legifature, and reftored to the rights of freemen and citizens. Before that period the fons of coalliers conld follow no bufinefs but that of their fathers; nor were they at liberty to feek employment in any other mines than thofe to which they were attached by birth, without the confent of the lord of the manor, who, if he had no ufe for their fervices himfelf, transferred them by a written deed to fome neighbouring proprietor.
'That the favage nations of Africa were at any period of hiftory exempted from this opprobrium of our nature which fpread over all the reft of the world, the enlightened reader will not fuppofe. It is indeed in that valt country that flavery has in every age appeared in its uglieft form. We have already obferved, that about the era of the Trojan war, a commerce in ीaves was carried on between Phœnicia and Lybia: and the Carthaginians, who were a colony of Plœenicians, and revered the cuftoms, manners, and religion of their parent ftate, undoubtedly continued the Tyrian traffic in human flefh with the interior tribes of Africa. Of this we might reft affured, although we had no other evidence of the fact than what refults from the practice of human facrifices fo prevalent in the republic of Carthage. 'The genuine inftincts of nature are often fubdued by dire fuperftition, but they cannot be wholly eradicated; and the rich Carthaginian, when a human vietim was demanded from him to the gods, would be ready to fupply the place of his own child by the for of a poor franger, perficioufly purchafed at whateverprice. That this was, indeed, a very common practice among them, we learn from the tellimony of varions hiftorians *, who affure u's, that when A gathocles the tyrant of Syracufe had overthrown their generals Hanno and Bomilcar, and threatened Carthage itfelf with a fiege, the people attributed their misfortunes to the jult anger of Saturn for having been worihippec, for fome years, by the facrifices of children meanly born and \(f e\). cretly boryht, inflead of thofe of noble extraction. Thefe fubftitutions of one offering for another were confidered as a profane deviation from the religion of their forefathers; and therefore to expiate the guilt of fo horrid an impiety, a facrifice of two hundred children of the

\section*{526 ] S L A}
fint rank was on that occation made to the bloody god. As the Carthaginians were a commercial people, we cannot fuppofe that they purchafed flaves only for facrifices. They undoubtedly condemned many of their prifoners of war to the ttate of fervitude, and either fold them to foreigners, or diffributed them among their fenators and the leaders of their arnies. Hanno, who endeavoured to ufurp the fupreme power in Carthage whilt that republic was engaged in war with Timoleon in Sicily \(f\), armed twenty thoufand of his flaves in order to carry his nefarious purpofe into execution; and Hannibal, after his decifive victory at Cannæ, fold to the Greeks many of his prifoners whom the Roman feriate refufed to redeem \(\pi\). That illuftrious commander was indeed politic, than the generality of his countrymen. Before Zonaras his days it was cuftomary with the Carthaginians either to maffacre their captives in cold blood, that they might never again bear arms againft them, or to offer them in facrifice as a grateful acknowledgment to the gods by whofe affillance they believed that they were vanquifhed; but this was not always done even by their mott fuperftitious or moft unprincipled leaders. Among other rich fpoils which Agathocles, after his victory already mentioned, found in the camp of Hanno and Bumilcar, wereftwenty thoufand pair of fetters and manacles, which thofe generals had provided for fuch of the Sicilian prifoners as they intended to preferve alive and reduce to a ftate of flavery.

With the ancient flate of the other African nations we are but very little acquainted. The Numidians, Mauritanians, Getulians, and Garamantes, are indeed And \({ }^{17} \mathrm{Nu}\) mentioned by the Roman hiftorians, who give us ample midians, details of the battles which they fought in attempting to preferve their national independence; but we have no particular account of their different maurers and cuftoms in that age when Rome was difputing with Carthage the fovereignty of the world. All the African ftates of which we know any thing, were in alliance with one or other of thofe rival republics; and as the people of thofe ftates appear to have been lefs enlighten-ed-than either the Romans or the Carthaginians, we cannot fuppofe that they had purer morals, or a greater regard for the facred rights of man, than the powerful nations by whom they were either protected or oppreffed. They would, indeed, infenfibly adopt their cuftoms; and the ready market which Marius found for the prifoners taken in the town Capfa, althotigh Salluft acknowledges \(\ddagger\) that the fale was contrary to the laws \(\ddagger\) Bell. \(y_{2}\) of war, fhows that flavery was then no ftrange thing to cap. 9I. the Numidians. It feems indeed to have prevailed through all Africa from the very tilt peopling of that unexplored country; and we doubt if in any age of the world the unhappy negro was abfolutely fecure of his perfonal freedom, or even of not being fold to a foreign trader.

It is the common opinion that the practice of ma. Slave-era 18 king flaves of the negroes is of a very modern date; that with the it owes its origin to the incurtions of the Portuguefe on cona of the weitern coait of Africa; and that but for the cun-guinea not ning or cruelty of Europeans, it would not now exift, the Portu and would never have exifted. But all this is a compli-guefe, cation of miftakes. A learned writer has lately proved, *Wbitake with a force of evidence which admits of no reply *, Renierw \({ }^{\text {of }}\) that from the Coaft of Guinea a great trade in flaves Roman

\section*{\(S\) L \(A\) \\ [ 527 ] S L A}
ery. was carried on by the Arabs fome hundreds of years before the Portuguefe embarked in that traffic, or had even feen a woolly-headed negro. Even the wandering Arabs of the defert, who never had tny friendly correfpondence with the Chriftians of Europe, have from time immemorial been ferved by negro flaves. "The Arab muft be poor indeed (fays M. Saugnier) not to have at leaft one negro flave. His fole occupation is the care of the herd. They are never employed in'war, but they have it in their power to marry. Their wives, who are captive negreffes, do all the domeftic work, and are roughly treated by thē Arabian women, and by the A rabs themfelves. 'Their children are flaves like them, and put to all kinds of drudgery." Surely no man whofe judgement is not completely warped by prejudice, will pretend that thofe roving tribes of favages, fo remarkable for their independent fpirit and attachment to ancient cuf. toms, learned to enflave the negroes from the Europeans. In all probability they have, without interruption, continued the practice of favery from the days of their great anceltor Ifimael; and it feems evident, that none of the European nations bad ever feen a woolly-beaded negro till the year 1100, when the crufaders fell in with a fmall party of them near the town of Hebron in Judea, and were fo firuck with the novelty of their appearance, that the army burit into a general fit of langhter \(\|\). Long before the crifades, however, we know with certainty that the natives of Guinea had been expofed to fale in foreign countries. In \(\mathrm{G}_{5} \mathrm{I}\) the Mahometan Arabs of Egypt fo haraffed the king of Nu. bia or Ethiopia, who was a Chnittian, that he agreed to fend them annually, by way of tribute, a vaft number of Nubian or Fthiopian flaves into. Egypt. Such a tribute as this at that time, we are told, was more agreeable to the khalif than any other, as the Arabs then made no fimall account of thofe flaves \(\ddagger\).

The very propofal of fuch a tributc, and the eftima. tion in which black flaves were held in Egypt, fhows that a commerce in bond.fervants could not then be a new branch of trade either to the Arabs or the Ethiopians; but the valt number which the Ethiopian monarch was now compelled to furnifh every year, induced him to feed this great drain upon his fubjects from the natives of the neighbouring countries. "He ranged accordingly into all that vaft blank of geograpby upon the map of the world, the fpreading bofom of the African continent ; and even pufhed through it to its fartheft extremities in the weft. He thus brought the blacks of Guinea, for the firf time, into the fervice and families of the eaft; and the naves which he paid in tribute to the Arabs, whether derived from the nearer neighbourhood of Ethiopia, fetched from the mediterranean regions of Africa, or brought from the ditant fhores of the Atlantic, were all denominated Etbiopians, from the country by which they were conveyed into Erypt \(\ddagger\). "At this time, therefore, according to Mr Whitaker, begran that kind of traffic in human flefh
"Which fpoils unhappy Guinea of its fons."
There are not many anthors from whom, in queftions of antiquity, we differ with greater hefitation ; bur, as we meet with a female Ethiopian flave in the Eunuch of Terence, we cannot help fufpecting that Guinea was occalionally "fpoiled of its fons", at a much earlier period. Al any rate, from the obfervations made by the European
travellers who firf penetrated into that continent, it appears undeniable that favery muft have prevailed from time immemorial among fuch of the tribes as had never carried The neon any commerce with foreign nations. When Battel firl groes have vilited the Griagas*, thofe people had never before feen enllaved a white man ; yet they welcomed him and the Englifh, one anowith whom he had come, to their country, invited them time imto bring their goods on fhore, and without hefitation memorial. loaded the fhip with flaves. The Giagas were indeed *Modern warging war with the kingdom of Benguela; and being Univerfai cannibals, who prefer human flefh to all others, the Hifory, flaves whom they had fold to the Englifh were pro•chap. 47* bably prifoners whom they would have killed and eaten fect. 2 . if they had not found anr opportunity of otherwife difpofing of them to greater advantage. But as they had not been incited by the Europeans to eat their prifoners, there can be no reafon to fuppofe that by the Europeans they had been firt induced to fell them: for we have feen that this kind of commerce prevailed in Africa among people much more polifhed than the Giagas fo early as in the reign of Jugurtha.

That it was not introduced among the negroes either by the Arabs or by the Portuguefe, appears ftill more evident from the behaviour of the Dahomans at the conqueft of Whidah, and from the manner in which the people of Angola at the earlieft ftase of their foreign \({ }^{*}\) trade procured a fupply of flaves for the Portugnefe market. The greater part of the flaves whom the Angolans exported from St Paulo de Loanda were brought from interior countries; fome hundreds of leagues diftant, where they could not have been regularly purchafed had that commerce been till then unknown in thofe countries. The Dahomans, in the beginning of the year 1727 , had never feen a white man: and when their victorious prince and his army, in their rout through Whidah, firft met with fome Europeans in the town of Sabi, they were fo flocked at their complexion and their drefs, that they were afraid to approach them, and could not be perfuaded that they were men till they heard them fpeak, and were affured by the Whidanefe that thefe were the merchants who purchafed all the faves that were fold in Guinea \(\dagger\). Slavery, + Moderm . . therefore, if it prevailed among the Dahomans before Univerfat that period, could not have been introdnced among Hiffory, them by European or Arabian intrigues: but we are vol, xiii. aflured by Snelgrave, who was then in the army, that \({ }^{\text {p. } 340, \text { \& }}\) - - : thofe people treated their captives with fuch horrid cruelty as was fhocking to the natives of the fea-coaft, and leaves no room for doubt but that flavery had been practifed among them from the earlieft ages. A great part of their prifoners were facrificed to their gods or eaten by the foldiers; and when our author expreffed to a colonel of the guard fome furprife that a prince fo enlightened as the fovereign of Dahomy fhould facrifice fo many men whom lie might have fold to great advantage, he was gravely told, that it had been the cuftom of their nation, from time immemorial, to offer; after victory, a certain number of prifoners to the gods; and that they felected the old men for victims, becaufe they were of lefs value at market, and more dangerous fron their experience and cunning, than the young men. To thofe perfons who fancy that the wars between the African princes are carried on for the fole purpofe of fupplying the European fhips with flaves, it may be proper to remark, that one of the kings of Dan homy flaughtered at once not only all the captives ta-

\section*{S L A [ 528 ] S L A}

Slavery, ken in war, but alfo r27 prifoners of different kinds, that he might have a fufficiency of fkulls to adorn the walls of his palace; though at the very time of that maflacre he knew that there were fix flave-fhips in the road of Whidah from which he could have got for every prime flave a price little fhort of thirty pounds Ster-

21
The route by which the Arabs carried on the flave. trade, Whitakcr's Resieru, p. 185 .

Thefe facts, and numberiefs others which the reader will find detailed in the 13th volume of the Modern Univerfal Hiftory, by writers who were at the greateft pains to procure authentic̣ information; who were neither biaffied by intereft nor blinded by enthufiafm; and who appear to have held the infamous traffic in utter abhorrence-prove beyond the pofibility of doubt, that flavery of the wort kind muft have prevailed among all the negro nations before they were vifited either by the Portuguefe or by the Arabs (1). Thefe two nations may indeed have been the firt who dragged the unhappy negro from his native contirent, and made his flavery doubly fevere, by compelling him to labour, without his own confent, for matters whom he hardly confidered as human beings.

On the beginning of this commerce, or the dreadful cruelty with which it has been carried on to the prefent day, it is impoffible to reflect without horror: but there is fome confolation, however fmall, in knowing that its original authors were not Europeans. The purchafe of Guinea blacks for flaves by foreionn nations commenced ages before the Portuguefe had laid that country open to the intercourfe of Europe. Even after they had made many incurfions into it, the inhabitants were as regularly purchafed for \(\mathrm{fl}_{\text {aves }}\) by fome of the adjoining flates as they are now by the maritime Europeans.
"The Arabs of Egypt having reduced all the north of Africa, and carrying with them their love of black fervants, would be fure to open a ready communication for themfelves to their country. They certainly had one fo early as 1512 , and before the Europeans had any for that purpofe ( k ). They went from Barbary by a route that was fo much practifed, as to be denominated exprefsly 'the way of the camels.' Meeting to. gether at the town of Cape Cautin, that of Valadie riear it, the commercial caravan traverfed the vaft deferts,
thofe of Sarra, which run like the tropic of Cancer over them in a long line acrofs the country ; to a place of great population called Hoden, the Waden or Haden of of maps, and a little to the fouth-weft of Cape Blanco. From Hoden they turned to the left, and pufhed directly into the interio: of the continent, to reach Tegazza, the Tagazel or Tagaza of our maps, and lying nearly eaft of Hoden. Here affuredly they did, as the caravan does certainly at this day; and added to the other wares upon their camels a quantity of falt from thofe mines of rock-falt, which are extraordinary enough to be noticed as rocks in our maps. This they carried, as they fill carry it, to Tanbut, the Tombut of the maps, and a town in the heart of the African continent. And from this town they turned on the right for the fea-coaft again, and reached it in the great kingdom of Mele, the Melli of our maps, to the fouth of the Gambia, and juft at the fpringing as it were of that grand arch of fea which curves fo deeply into the body of the land, and conftitutes the extenfive gulph of Guinea. At Melli and at Tombut they received a meafure of gold for a meafure of falt. The caravan collects gold at Tombut to the prefent time; but at Melli they purchafed gold, and alfo filver, in pieces as large as peb. bles. And at Hoden they had a great mart for flaves; the blacks being brought thither from the countries adjoining, and bartered away to the traders. Such was the Slave Coaft and the Gold Coaft of former days. The ftaple commodity of Hoden is only transferred now to Whidah; and diverted from the Arabs of Barbary to the Chriftians of Europe," by whom the negroes are carried to the continent of America or to the Sugar lflands in the Weft Indies. In thefe countries they are all fold like beafts in a market; but they experience very different degrees of fervitude from the different maters who hold them as property. Such of them as are reconciled to the appearance of white men, or have been born in the European colonies, feel themfelves as happy under a humane mafter as they could be in their native continent ( L ) ; and we believe that few of them in fuch circumftances have expreffed a defire to return."

In the French Weft India iflands, before the late revolution
(1) The fame thing appears from the voyages of M. Saugnier, who had an opportunity of converfing with many tribes of negroes, and who always fpeaks of flavery as an eftablifhed practice among them; adding, that fuch as are fold for crimes are put to death by their own countrymen if they fly from their mafter. It appears likewife in a ftill more ftriking light from Dalzel's Hiftory of Dahomy, where we are told that all the Dahomans, from the lowef to the higheft, acknowledge the right of the fovereign to difpofe of their perfons and properties at pleafure ; and where we learn, that the fovereign himfelf affured Mr Abfon the Englifh governor at Whidah, that all his anceftors had from time immemorial put to death every prifoner of war whom they could not fell as a flave.
(k) In the year 1442, Anthony Gonfalez, a Portuguefe adventurer, reftored to their native country fome Mooriih prifoners whom he had two years before forcibly carried off from the coaft of Africa. He landed them at Rio del-Oro, and received from the Moors in exchange ten blacks and a quantity of gold duft. This tranfaction proves, that a commerce in black fervants was then regularly carried on by the Moors and not by the Portuguefe. So early as the year 1502, the Spaniards began to employ a few negroes in the mines of Hifpaniola ; but in the year following, Ovando, the governor of that ifland, forbade the further importation of them, alleging that they taught the Indians all manner of wickednefs, and rendered them lefs tractable than formerly: and it was not till the year 1517 that the fupply of negroes to the Spanifh American plantations became an eftablifhed and regular branch of commerce. Eaward's Hiflory of the IVeft Indies, Book IV. Chap. ii.
( L ) "I have obferved many of my flaves go on board the veffel with joy, on my affurance that they would be well treated and happy on the plantation where I was going to fend them. When the Banbarans find that they are trufled by the whites, they never think of making their efcape, choofing to be the flaves of Europeans rather

\section*{S L A [ 529 S L A}
volution in the mother country, which has produced in all its dependencies anarchy and maflacre, the condition of the negro-laves was better than that of the bondmen among the ancient Germans. "Thofe of them who cultivated the plantations were attached to the foil, and could not be drawn off to pay debts, or be fold feparately from the eftate on which they lived. This gave them a lafting property in their huts and little fpots of ground, which they might fafely cultivate without dread of being turned out of poffeffion, or transferred contrary to their intereft and feelings from one proprietor to another. They were under the protection of law as foon as they arrived in the colony. Proper mif. fionaries were appointed for the purpofe of training them up to a certain degree of religious knowledge, and ample funds were allotted for the maintenance of thofe ecclefiaftics. On ill treatmeat received from his mafter, or on being deprived of his allowance of food and raiment, the flave was directed to apply to the king's attorney, who was obliged to profecute the mafter forthwith. That officer was alfo bound to profecute, if by any other means he heard of the abufe; the law adding as the reafon, This we will to be obferved, to check the abufe of power in the mafler \(\ddagger\)."
We widh it were in our power to fay, that in the Britifh Weit India colonies flaves are equally protected by law as they were in the French iflands under the old government, and that the fame care is taken of their moral and religious improvement. This, however, we are afraid, cannot be faid with truth. In the ifland of Ja-
 not many years ago, a white man, whether proprietor or not, who had killed a negro, or by an act of feverity been the caufe of his death, was, for the firt offence, intitled to benefit of clergy, and not liable to capital punifhment till a repetition of the crime. By the prefent law, it is enacted, " That if any perfon, whether owner or fuperintendant of flaves, fhall be convieted of having, by any act of paffion or cruelty, occafioned the death of any negro, it fhall be capital for the firfo offence : and for the greater fecurity of the property, and as a check on thofe who may have the punifhment of flaves in their power, it is particularly required, that every furgeon or doctor belonging to each eftate fhall fwear to the caule of the death of each negro, to the beft of his knowledge and belief; and if any negro dies, and is interred by the owner or overfeer, without the doctor's having feen or been fent for to fuch negro, in this cafe, the owner or overfeer caufing the negro to be fo interred is liable to a profecution for fuch conduct."

This law muft doublefs be productive of good effects; but being a colonial act, it cannot have the vigour of the Code Noir; nor do we know of any attorney in the inland who is obliged to defend the rights of the negroes, or profecute the matter whofe cruelty has by any means Vox. XVII. Part II.
come to his knowledge. The juftices and veftry of each parifh are indeed conftituted a council of proterion, for the exprefs purpofe of making full enquiry into the barbarities exercifed on flaves, and bringing the authors to punifhment at the public expence; and by a new laveact of Grenada, the juftices are required annually to nominate three freeholders to be guardians of the flaves, who are to take an oath to fee the law duly executed \(\ddagger \cdot \ddagger\) Edvuards's Thefe are benevolent regulations; but we doubt if pro- Hifory of tection can be fo promptly afforded by a council of guar. the \(W_{\text {efs }}\) dians as by an individual attorney who has no other em-hook iv. ployment. In fome of the other Britifh iflands, we have chap. \(5^{\circ}\) been confidently told that the unfortunate fons of Africa have no protection whatever againdt the tyranny of a fordid owner, or the caprice of a boyifh overfeer (M) ; though it is added, that the humanity of many mafters more than fupplies the want of laws in every refpect but that of improvement, and that the attachment of others has in them a like effect. In fome cafes good fenfe, a regard for their reputation, and a well-informed conviction of their intereft, induce men to treat their flaves with difcretion and humanity. The flaves of many a planter poffefs advantages beyond what the labourer even of Britain enjoys \(\dagger\);" yet thefe advantages \(\dagger\) Ramfay'd all depend upon the good will of his matter; and in no \(E \int J_{\text {ay }}\), part of the Britifh colonies are the flaves attached to the p. 66 . and foil. This fingle circumftance, together with the total neglect of their moral and religious culture, makes their fituation much lefs eligible than was that of the French flaves under the old government; and affords a ftriking proof of what the humane author whon we have juft quoted well obferves, that " thofe men and nations whom liberty hath exalted, and who therefore ought to regard it tenderly in others, are conftantly for reftraining its bleffings within their own little circle, and delight more in augmenting the train of their dependants than in adding to the rank of fellow-citizens, or in diffufing the benefits of freedom among their neighbours."

Having given this ample detail of the rife and pro. The law grefs of havery in the world, and fhown that it has pre-fulacfs of vailed in every age, and under all religions, we fhall now flavery ins proceed to enquire whether a practice fo general be in quired in* proceed to enquire whether a praetice fo general be in to. any inftance lawful; and if it be, how it mult be modified, in order to be rendered confiftent with the rights of man and the immutable laws of virtue.

That in a ftate of nature one man has a right to feize upon another, and to compel him by force to labour for his fubfiftence, is a pofition which we believe has never been ferioully maintained. But independent communities fand to each other in the very fame relation that individuals do in a ftate of nature ; and therefore if in fuch a ftate the man of greater bodily ftrength or mental fagacity would have no right to convert his weaker neighbour into perfonal property, neither can 3 X the
than of a bluck man who would treat them with the greateft cruelty. Voyages to the Conf of Africa by Mefrs Saugnier and Brifon, p. 332. 335. Englifh 'Tranfation.
(m) In Barbadoes there is faid to be a law for the protection of flaves, which is the mof infolent trifling with juftice and humanity that the writer of this article has ever feen. It is enacted, forfooth, "That if any mak Ghall, of wantonnefs, or only of bloody-mindednefs, or cruel intention, wiiffllyy kill a negro or other flave, if his own he hall pay into the public treafury ffteen pounds Sterling! See Dickjon's Letters on Slavery, p. 4 .

\section*{S L A}

Slavery. the more powerful and enlightened nation have a right to carry off by force, or entice by fraud, the fubjects of a weaker and more barbarous community for the purpofe of reducing them to a ftate of fervitude. This is a truth fo obvious as to admit neither of proof nor of denial.

In thus fating the cale between two indcpendent nations, we have in our eye that traffic in ीlaves which is carried on between the civilized Europeans and the barbarous Africans: and the ntmoft length which we think an apologit for that trade can go is to contend, that we may lawfully purchafe flaves in thofe countries where

The com. n:en apology for it infufficient. from time immemorial they have been a common branch of conmerce. But the European right to purchafe cannot be better than the African right to fell; and we have never yet been informed what gives one African a right to feil another. Such a right cannot be natural, for the reafon which we have elfewhere affigned (fee Right) : neither can it be adventitious; for adventitious rights are immediately derived from the mu. nicipal law, which is the public will of the ftate. But the fate has no authority to deprive an innocent man of his perfonal freedom, or of the produce, of his own labour; for it is only to fecure thefe, by protecting the weak from the violence of the ftrong, that ftates are formed, and individuals united under civil govern. ment.

It may perhaps be faid, that by patiently fubmitting to governments which authorife the traffic in human flefh, men virtually give up their perfonal liberty, and veft their governors with a right to fell them as flaves: but no man can veft another with a right which he poffeffes not himfelf; and we fhall not hefitate to affirm, that in a ftate of nature, where all have cqual rights, no individual can fubmit himfelf to the abfolute difpofal of another without being guilty of the greateft
kind and degree of labour mutt be precifely afcertained, and the conduct of the criminal not left to the capricious direction of any individual.

Pùnifhments can be juftly inflicted only for one or other of two ends, or for both. They may be calculated either to reform the criminal or to be a warning to the innocent; and thofe which moft effectually anfwer both thefe purpofes are furely to be preferred to fuch as anfwer but one of them. For this reafon we confider hard labour as a much fitter punifhment for moft crimes than death : but to intitle it to preference, the kind and degree of the labour muft be afcertained by the law ; for if thefe circumftances be omitted, and the offender delivered over as a nave to the abfolute difpofal and caprice of a private mafter, the labour to which he is condemned, inftcad of operating to his reformation, may be converted into the means of tempting him to the commiffion of new crimes. A young weman, in the flate of fervitude, would hardly be able to maintain her virtue againft the folicitations of a matter who fhould promife her liberty or a remiffion of toil upon her yielding to his defires; and the felon, who had long been accuftomed to a life of vagrancy and idlenefs, would not ftrenuoully object to the perpetration of any wickednefs to obtain lis freedom, or even a diminution of his daily tafk. Indeed fuch temptations might be thrown in his way, as human nature could not relift but by means of much better principles than felons can be fuppofed to poffefs. He might be fcourged into compliance ; or his labour might be fo increafed as to make him for a little refpite eagerly embrace the molt nefarious propofal which his mafter could make: for being abfolute property, there is no earthly tribunal to which lie could appeal for juftice; and felons do not commonly fupport themfelves under trials by pious meditation on a future ftate.

By reafoning in this way, we are far from meaning to infinuate that flavc-holders in general torture their flaves into the commiffon of crimes God forbid! Many of them we know to be rcligious, humane, and benevolent: but they are not infallible; and fome of them may be inftigated, fome of them undoubtedly have been inftigated, by avarice and other worfe principles, to compel creatures, who are fo abfolutely their dependents, to execute deeds of darknefs too hazardous for themfelves. But the morality or immorality of any action, and the moral fitnefs of any ftate, are to be judged of by their natural tendency, if the one were univerfally practifed and the other univerfally prevalent (fee Moral Philosuphy, \({ }^{\circ}{ }^{156}\).) : and as the natural tendency of abfolute domeftic flavery among fuch creatures as men is to throw the moft powerful temptations to vice in the way both of mafter and of flavc, it muft be in every inftance, even when employed as a punihment, inconfiftent with the fundamental principles of moral virtue.

Some writers indecd have maintained, and the civil Children 29 law feems to fuppofe, that children are the propcrty of not the their parents, and may by them be fold as flaves in cafes property of urgent neceffity : but if we duly confider how pro- rents. perty is acquircd (fee Property), and attend to the natural confequences of flavery, we fhall foon be convinced that this opinion is very ill founded. The rights of parents refult from their duties; and it is certainly the duty of that man who has been the inflrument of bringing into the world an intellectual and moral being,

\section*{S L A [ 53 r ] S L A}
to to every thing in his power to render the exiftence of that being happy both in the prefent life and in that which is to come. If this duty be confcientiouly difcharged, the parent has a manifelt right to the gratitude, love, and reafonable obedience, of his child ; but he cannot, in confequence of any duty performed, claim a right to tiansfor that child as property to the uncontrolled difpofal of any private matter; for this plain reafon, that the man who is confidered as the private property of another, cannot reafonably be fuppofed to enjoy happinefs in this world, and is under many teriptations to do what muft neceffarily render him miferable in the next. See Moral Philosophy, no 138.

If ciiminals cannot be lawfully reduced to a fate of abfolute privatc flavery, much lefs furely can it be lawful to reduce infolvent debtors and prifoners of war to that ftate. Many a virtuous inan, who has contracted debts witl the fairelt profpect of paying them, has been fuddeniy rendered iufolvent by fire, by hipwreck, or by the bankruptcy of others with whom he was neceffarily engaged in the courfe of his trade. Such a man can be confidered in no refpect as criminal. He has been indeed unfortunate ; but it would be grofsly unjuft, as well as fhockingly cruel, to add to his misfortune by reducing him to a flate to which we have juft fcen that the vileft felon cannot be reduced without a violation of the laws of morality. Fraudulent bankrupts indeed, of whom we daily fee many, might with great propriety and the ftricteft juftice be compelled to extenuate their debts by labouring for the benefit of thofe whom they have injured; and criminals of other defcriptions might be made to work for the benefit of the public: but in both cafes the tafis to be performed fhould be afcertained by the law, and the perfons of the labourers be protected by the ftate. If fuch can be called laves, their flavery is undoubtedly confiftent with every principle of virtuc and religion; for they fuffer nothing but the due teward of their deeds. Prifoners of war, however, can upon no honeft principle be reduced even to this 1tate of niitigated bondage ; for they are fo far from incurring guilt by fighting for their country, that even to their enemies their conrage and conduct in fuch a caufe muit appear worthy of reward. A victorious general has certainly a right to prevent the prifoners taken in battle from again drawing their fwords asainft him during the continuance of the war ; but there are many ways by which this may be done effectually without chaining the unfortunate captives to the oar, or felling them like cattle to private purchafers, by whom they may be treated with capricious cruelty, and driven to the perpetration of the greateit crimes. To thete conclufions, and the reafoning on which they are built, we are aware it may be objected, that if private flavery were in every inflance unlawful and inconfitent with the fundamental principles of morality, it would not have prevailed among the ancient patriarchs, and far lefs have been authorifed by the Jewifh law.

In reply to this objection, it may be obferved, that Abraham, Ifaac, and Jacob, though excellent men, were not characters abfolutely perfect; that as their practice does not authorife polygamy or inceft among us, it will not authoife the reducing of our fellow-creatures to a state of hopelefs fervitude; and that from the circumftances of the age in which they lived, many things
were permitted to them, and were indeed harmlefs, which are forbidden to us, and would now be pernicious. The character of Abraham appears to have been much more perfect than that of his fon or grandfon ; and was certainly cqual, if not fuperior, to that of any other mere man of whom we read either in profane or even in facred hifory. We are to remember, however, that he was born amidft idolaters, and was probably an idolater himfelf till enlightened by the infpiration of Jehovah, and called from his kindred and from his father's houfe. Before his converfion, he muft have had much cattle and many flaves, which conftituted the riches of that early period ; and his cafe would indeed liave been peculiarly hard, had he been commanded to divett himfelf of his fervants, and to depart into a ftrange country very thinly inhabited, without people to protect his flocks and herds from bcalts of prey. Nor would his lofs have contributed in any degree to the benefit of lis flaves, who, as the ranks of men were then adjufted, could not long have preferved their liberty: Had they not been forcibly reduced to their former ftatc by their idolatrous countrymen, which in all probability they would have been, they mut have foon fubmitted to it, or perifhed by hunger. Let it be remembered, too, that the bond-fervants of Abraham, though conftituting the moft valuable part of his property, were not confidered as a fpecies of inferior beings, but were treated rather as childeren than as flaves. This is evident from his fpeaking of the feward of his houfe as his heir, when complaining to God of the want of feed. Indeed the manner in which this circumfance is mentioned, fhows that it was then the general practice to confider domeflic flaves as members of the family; for the patriarch does not fay, "I will leave my fubftance to this Eliezer of Damafcus;" but his words are, "Behold to me thou haft given no feed; and, lo! one born in my houfe is my beir \(\ddagger\)." From this mode of expreffion \(\ddagger\) Gcn. xv; we are ftrongly inchned to think that captives taken 3. in war were in that age of fimplicity incorporated into the family or tribe ot the conqueror, as they are faid to be at prefent amo:g the North American Indians, to fupply the place of thofe who had fallen in battle. If
 the evils which are now in its train, and muft often have been highly beneficial to the captive.

The other part of the objection appears at firlt fight Anfwer to mere formidable: but perhaps a little attention to the the othero defign of the Mofaic economy may cnable us to remove it even more completely than this. We need not inform our theological readers, that one great purpofe for which the pollerity of Abraham were feparated from the heathen nations around them, was to preferve the knowledge of the true God in a world run headlong into idolatry. As idolatry appears to have had fomething in its forms of worfhip extremely captivating to rude minds, and as the minds of the 1 fraclites at the era of their departure from Egypt were exceedingly rude, every method was taken to keep their feparation from their idolatrous neighbours as complete as poffible. With this view they were commanded to facrifice the animals which their Egyptian mafters had worShipped as gods, and were taught to confider hogs and fuch other creatures as the heathen offered in facrifice, when celebrating their myftical ard magic rites, as ton unclean to be eaten or even to be touched. Of this di-

Itinction

\section*{S L A [ 532 ] S L A}
siavery. ftinction between clean and unclean bealts, God him- carnot help being of opinion that the heathen, who was felf affigns the reafon: " I am the Lord your God (fays he), who have feparated you from other people ; ye thall therefore put difference between clean and un-
\(\ddagger\) Lev. \(x x\).
\(24,25,26\). beats, and between unclean fowls and clean \(\ddagger\)." For the fame reafon they wcre prolibited from intermarrying with the heathen, or having any tranfaction whatever with them as neighbours ; and the feven idolatrous nations of Canaan they were frisly commanded to exterminate. "When the Lord thy God (fays Moifs) fhall deliver them before thee, thou fhalt fmite then, and utterly deftroy them : thou thalt make no covenant with them, nor fhow mercy unto them: neither fhalt thou make narriagres with them: thy daugh ter thou fhalt not give unto his fon, nor his daughter fhalt thou take to thy fon ; for they will turn away thy reduced to flavery in Judea, might be happier, if he pleafed, than when living as a freeman in his own country. But whether this be fo or not, is a matter with which we have no concern. On account of the hardnefs of their hearts, and the peculiarity of their circumftances, many things, of which flavery may have been one, were permitted to the Jews, which, if practifed by Chriftians, would render them liighly guilty.

After treating thus largely of flavery in general, we need not occnpy much of the reader's time with the

SLAVE-trade carried on at prefent by the mer-Siave-tr chants of Europe with the natives of A frica. It is well known that the Portuçuefe were the firf Europeans who embarked in this trade, and that their example was foon followed by the Dutch and the Enclifh. Of the rife and progrefs of the Englifh commerce in flaves, the reader will find a fufficient account in other articles of this work§. That commerce, though long cherithed by § See the government as a fource of national and colonial wealth, was from its commencement confidered by the thinking part of the nation as a traffic irconfiltent with the rights of man, and fulpected to be carried on by acts of violence. Thefe fufpicions have been gradually fpread through the people at large, and confirmed, in many inftances, by evidence incontrovertible. Laws have in confequence been enacted to make the negroes more comfortable on what is called the middle paffage, and to protect them againft the wanton cruelty of their mafters in the Weft Indies : but the humanity of the nation was roufed; and not many years ago a number of gentlemen, of the moft refpectable characters, finding that no adequate protection can be afforded to perfons in a flate of hopelefs fervitude, formed themfelves into a fociety at London, for the purpofe of procuring a total abolition of the flave-trade. That the motives which influence the leading men of this fociety are of the pureft kind, cannot, we think, be queftioned; for their object is to deliver thofe who had none to help them, and from whom they can expeet no other reward for their labours of love than the bleffings of them who are ready to perifh. '1'o a caufe fo truly Chriftian, who would not pray for fuccefs? or who but muft feel the moft pungent regret, if that fuccefs has been rendered doubtful, or even been delayed, by the imprudence of fome of the agents employed by the fociety? This we apprehend to have been really the cafe. Language calculated only to exafperate the planters cannot ferve the negroes ; and the legiflature of Great Britain will never fuffer itfelf to be forced into any meafure by the menaces of individuals.

In the year 1793, petitions were prefented to parlia. Petition ment for the abolition of this inhuman traffic, which for the gave a pleafing picture of the philanthropy of the nation ; but, unfortunately for the caufe of freedom, it was difcovered that many of the names fubjoined to thofe. petitions had been collected by means not the moft honourable. This difcovery, perhaps, would never have been made, had not the infulting epithets indifcriminately heaped upon the @ave-holders provoked thofe men to watch with circumpection over the conduct of, their opponents. The confequence was, that fufpicions of unfair dealing on the part of the petitioners were excited:
eited in the breafts of many who, though they ardently wihed well to the caufe, chofe not to add their namies to thofe of fchool-boys under age, and of peafants who knew not what they were fubfribing. Let the rights of the Africans be maintained with ardour and firmnefs; but never let their advocates fuppofe that the caufe of humanity requires the fupport of artifice.
 regulated by the caprice of another, is a flate demonftrably inconfiftent with the obvious plan of the moral government of the world. It degrades the mental faculties of the flave, and throws, both in his way and in his mafter's, temptations to vice almoft infurmountable. Let thefe truths be fet in a proper light by thofe who have doubtlefs feen them exemplified; and they will furely have their full effect on the minds of a generous, and, we truft, not yet an inimious people ( N ). The trade will be gradually abolifhed; pains will be taken to cultivate the minds of the Weft Indian negroes; and the era may be at no great ditance when ीlavery fhall ceale through all the 1ritifh dominions.

But what benefit, it will be afked, wonld the negroes of Africa reap from an abolition of the flave trade? Should any thing fo wildy incredible happen, as that all the nations of Chriftendom, in oue common paroxyfm of philantliropy, fhould abandon this commerce in fervants, which lias been profecuted in all ages, and under all religions ; they would only abandon it to thofe who were originally poffeffed of it, who ftill penetrate into the country, and who even pufh up to Gago at the very head of the flave coaft; and leave the wool-headed natives of it to Mahometan mafters, in preference to Chriftian. Under fuch mafters they were in Judea at the time of the crufades. Under fuch, as we learn from Meffrs Saugnier, Briffon, and others, they ftill are in the deferts of Africa, as well as in the iflands of Johanna \(\ddagger\) and Madagafcar: and it is univerfally known that they enflave one another as a punifhment for the moft whimfical crimes. Among them, indeed, flavery feems to be reduced to a fyitem, and to deicend, as it has done in more polifhed nations, from father to fon ; for both Saugnier and Wadftrom § fpeak of particular families of negroes who are exempted from that degrading fate by the laws of the country.
All this we admit to be true. Moft certainly the negroes would not be exempted from the miferies of fervitude, though Europe and the Weft Indies were

\section*{\(533]\) \\ S L A}
fwailowed up in the occan. The cuffoms of the country, as the king of Dahomy aflured Mr Abfon §, will be made as long as black men fall continue to poffefs their own territories, in their prefent fate of depravity \(H\), Dalzel's and ignorance; and thefe cuitoms appear to involve flavery of the cruelleft kind. But if flavery be in itfelf unlawful, is it a fufficient excufe for our continuing the traffic that it is carried on by the rude negroes and the favage Arabs? Are people, whom we fometimes affect of no to confider as an inferior order of beings, to furnifh ex. Arengtho amples of conduct to thofe who boatt of their advancements in fcience, in literature, and in refinement? Or will the benevolent Lord of all things pardon us for oppreffing our helplefs brethren, merely becaufe they are cruelly oppreffed by others? It is indeed true that the natives of Guinea cannot be made really free but by introlucing among them the bleffings of religion and the arts of civil life; but furely they would have fewer temptations than at prefent to kidnap one anuther, or to commence unprovoked wars for the purpofe of making. captives, were the nations of Europe to abandon the commerce in flaves (o). That commerce, we grant, would be continued by the Arabs, and perhaps by others of the eadern nations; but the fame number of people could not be carried off by them alone that is now carried off both by them and by the Europeans.

Were it indeed poffible to put the flave-trade under proper regulations, fo as to prevent all kidnapping and minjuft wars among the Africans, to fupply the markets; and were it likewife to enfure to the negroes in the Weft Indies mild treatment and religious inftruction; we are far from being fure that while the natives of Guinea continue fo rude, and their neighbours the Arabs fo felfifhly favage, it would be proper to abandon at once to hordes of barbarians the whole of this commerce in bond fervants. "'I he trade, which in its prefent form is a reproach to Britain, might be made to take a new fhape, and become ultimately a bleffing to thoufands of wietches: who, left in their native country, would have dragged. out a life of miferable ignorance, unknowing the hand. that framed them, unconfcious of the reafon of which they were made capable, and heedlefs of the happinefs laid up for them in fore \(\delta\).

Slavery is, inceec, in every form an \({ }^{2}\) Ramfay"s to be one of thofe many evils which, having long pre-p. \(2 y^{2}, \& \mathrm{c}_{2}\) vailed in the world, can be advantageounly removed only by degrees, and as the moral cultivation of the flaves

\footnotetext{
may
}
(s) We have not infifted upon the impolicy of the flave-trade, or endeavoured to prove that its abolition would be advantageous to the fugar-planters; for the planters furely underftand their own intereft better thanthofe can do, who, having never been in the Weft Indies, are obliged to content themfelves with what information they can glean on the fubject from a number of violent and contradictory publications. To countenance flavery under any form is undoubtedly immoral. This we know : and therefore upon this ground only have we oppofed the flave-trade, which cannot be continued without preferring intereft to virtue.
(o) In a fpeech which Mr Dalzel fays the king of Dahomy made to Mr Abfon, when he was informed of what had paffed in England on the fubject of the flave-trade, are thefe remarkable words: "In the name of my anceftors and myfelf, I aver that no Dahoman ever embarked in war merely for the fake of procuring wherewithal to purchafe your commodities." With all due refpect for his fable majefty, we mult take the liberty to queftion the truth of this folemn averment. That the flave-trade is not the fole caufe of the Dahoman wars every man will admit, who does not fancy that thofe people have neither paffions nor appetites, but for the commodities of Europe: but the bare affirmation of this bloody defpot, who boafted of having killed many: thoufands at the cufloms, will not convince thofe who have read gither Wadftrom's Effay on Colonization, or: the evidence refpecting the flave-trade given at the bar of the Houfe of Commons, "that no Dahoman ever: embarked in war merely to prosure daves to barter for European commoditiess",

\({ }^{7} 8\) The aboli tion fhould be gradual. Slaves.
may enable them to fupport the rank and difcharge the duties of free men. 'this is doubtlefs the reafon why it was not exprefsly prohibited by the divine Author of our religion, but fuffered to vanith gradually before'the mild influence of lis Heavenly doctrines. It has vanifhed before thefe doctrines in moft countries of Europe ; and we truft that the time is at hand when our traffic in human flefh with the imhabitants of Africa fhall ceafe ; and that the period is not very diitant when the flaves in the Weft Indies fhall be fo much improved in moral and religious knowledge, as that they may be fafely trufted with their ow:n freedom. 'Lo fet them free in their prefent ftate of ignorance and depravity, is one of the wildeft propofals that the ardour of innovation lias ever made. Such freedom would be equally ruinous to theinfelves and to their mafters; and we may fay of it what Cicero faid of fome unfeafonabie indulgences propofed to be granted to the flaves in Sicily ; Que cum accidunt, nemo eft, quin intelligat ruere illam reinpublicam; bac ubi veniunt, nemo eft, qui ullam fpem falutis reliquam effe arbitretur.

SLAUGHTER. See Man-staughter, Homicide, Murder, \&c.

SLEDGE, a kind of carriage, without wheels, for the conveyance of very weighty things, as huge ftones, bells, \&c. The fiedge for carrying criminals, condemned for high treafon, to execution, is called hurdee. The Dutch have a kind of nedge on which they can carry a veffel of any burden by land. It confifts of a plank of the length of the keel of a moderate fhip, raifed a little behind, and hollow in the middle; fo that the fides go a little aflope, and are furnifhed with holes to receive pins, \&c. The reft is quite even.

Sledge is a large fmith's hammer, to be ufed with both hands: of this there are two forts, the up-hand fledge, which is ufed by under workmen, when the work is not of the largeft fort ; it is ufed with both the lands before, and they feldom raife it higher than their head. But the other, which is called the about-fledge, and which is ufed for battering or drawing out the largeft work, is held by the handie with both hands, and fwung round over their heads, at their arm's end, to ftike as hard a blow as they can.
SLEEP, that flate of the body in which, though the vital functions continue, the fenfes are not affected by the ordinary impreffions of external objects. Sce 1)reams; and Physiology, \(\mathrm{n}^{2} 287\).

SIEFP-W alker, one who walks in his fleep. Many inflances might be related of perfons who were addicted to this practice; but it will be fufficient to felect one renarkable inflance from a report made to the Phyfical Society of Laufanne, by a cominittee of gentlemen apprinted to examine a young man who was accuitomed to walk in his fleep.
"'The difpofition to fleep-walking feems, in the opirion of this committee, to depend on a particular affection of the nerves, which both feizes and quits the patient duning fleep. Under the influence of this affection, the imagination reprefents to him the objects that ftruck him while awake, with as much force as if they really afected his fenfes; but does not make him perceive any of thofe that are actually prefented to his funfes, except in fo far as they are connected with the dreams which engrofs lim at the time. If, during this ftate, the imagination has no deternined purpole, he receives the impreffion of objects as if he were awake;
only, however, when the imagination is excited to bend its attention towards them. I lee perceptions obtained in this fate are very accurate, and, when once received, the imagination renews them occationally with as much force as if they were again acquired by means of the fenfes.' Laftly, thefe academicians fuppofe, that the impreffions received during this ftate of the fenfes dif. appear entirely when the perfon awakes, and do not return till the return of the fame difpofition in the rervous fyftem.
"Their remarks were made on the Sieur Devaud, a lad thirteen years and a half old, who lives in the town of Vevey, and who is fubject to that fingular affection or difeale called Somnambulijm or fleep-walking. This lad poffeffes a ftrong and robuft conftitution, but his nervous fyltem appears to be organifed with peculiar delicacy, and to difcover marks of the greateft fentibility and irritability. His fenfes of fmell, tafte, and touch, are exquifite ; he is fubject to fits of immoderate and involuntary laughter, and he fometimes likewife weeps without any apparent caule.
"This young man does not walk in his necp every night ; feveral weeks fometimes pafs without any appearance of a fit. He is fubject to the difeafe generally two nights fucceffively, one fit lafting for feveral hours. The longeft are from three to four hours, and they commonly begin about three or four o'cluck in the morning.
"The fit may be prolonged, by gently paffing the finger or a feather over his upper lip, and this flight irritation likewife accelerates it. Having once fallen afleep upon a ftaircafe, his npper lip was thus irritated with a feather, when he imniediately ran down the fteps with great precipitation, and refumed all his accuittomed activity. This experiment was repeated feveral times.
"The young Devaud thinks he has ubferved, that, on the evenings previous to a fit, he is fentible of a certain heavinefs in his head, but efpecially of a great weight in his eyelids.
"His fleep is at all times urquiet, but particularly when the fits are about to feize him. During his fleep, motions are obfervable in every part of his body, with flarting and palpitations; he utters broken words, fometimes lits up in his bed, and afterwards lics down again. He then begins to pronounce words more diftinctly, he rifes abruptly, and acts as he is inftigated by the dream that then poffeffes him. He is fometimes in fleep fubject to continued and involuntary motions.
"The departure of the f.t is always preceded by two or thrce minutes of calm fletp, during which he finores. I-e then awakes rubbing his eyes like a perion who has flept quietly.
"It is dangerous to awaken him during the fit, efpecially if it is coue fuddenly; for then he lometimes falls into convulfions. Having rifen one night with the intention of going to eat grapes, he left the houfe, pafied through the town, and went to a vineyard where he expected good cheer. He was followed by feveral perfons, who kept at fome diftance from him, one of whom fired a pittoi, the noife of which inftantly awakened him, and he fell dowp without fenfe. He was carried home and brought to limfelf, when he recollected very well the laving been awakened in the vincyard; but nothing more, except the tright at being loupd there alone, which had niade him iwoon.
". After the fits be generally teels a degree of laffi-

\section*{S L E}
sude : fometimes, though rarely, of indifpofition. At the end of one of thofe fits, of which the gentlemen of the cominittee were witneffes, he was affected with vomitings; but he is always foon reftored.
"When he is awaked, he never for the moft part recollects any of the actions he has been doing during the fit.
"The fubject of his dreams is circumfcribed in a finall circle of objects, that relate to the few ideas with which at his age his mind is furnifhed ; fuch as his leffons, the church, the bells, and efpecially tales of ghofts. It is fufficient to frike his imagination the evening before a fit with fome tale, to direct his Comnambulifm towards the object of it. There was read to him while in this fituation the fory of a robber; he imagined the very next moment that he faw robbers in the room, However, as he is much difpofed to dream that he is furrounded with them, it cannot be affirmed that this was an effect of the reading. It is obferved, that when his fupper has been more plentiful than ufual, his dreams are more difmal.
"In their report, the gentlemen of the committee dwell much on the flate of this young man's fenfes, on the impreffion made upon them by ftranse objects, and on the ufe they are of to him.
"A bit of ftrong fmelling wood produced in him a degree of reftleffnefs; the fingers had the fame effect, whether from their finell or their tranfpiration. He knew wine in which there was wormwood by the fmell, and faid that it was not wine for his table. Metals make no impreffion on him.
"Having been prefented with a little common wine while he was in a ftate of apathy, and all his motions were performed with languor, he drank of it willingly ; but the irritation which it occafioned produced a deal of vivacity in all his words, motions, and actions, and caufed him to make involuntary grimaces.
"Once he was obferved dreffing himfelf in perfect darknefs. His clothes were on a large table, mixed with thofe of fome other perfons; he immediately perceived this, and complained of it much; at laft a finall light was brought, and then he dreffed himfelf with fufficient precifion. If he is teafed or gently pinched, he is always fenfible of it, except he is at the time ftronsly engroffed with fome other thing, and wifhes to ftrike the offender ; however, he never attacks the perfon who has done the ill, but an ideal being whom his imagination prefents to him, and whom he purfues thro' the chamber without running againft the furniture, nor can the perfons whom he meets in his way divert him from his purfuit.
"While his imagination was employed on various fubjects, he heard a clock ftrike, which repeated at every froke the note of the cuckoo. There are cuckoos here; faid he ; and, upon boing defired, he imitated the fong of that bird immediately.
"When he wifhes to lee an object, he makes an effort to lift his eyelids; but they are fo little under his command, that he can hardly raife them a line or two, while he draws up his eyebrows; the iris at that time appears fixed, and his eye dim. When any thing is prefented to him, and he is told of it, he always half opens his eyes, with a degree of difficulty, and then fhuts them after he has taken what was offered to him.
"The report infers from thefe facts, and from many
others relative to the different fenfes, that their functions are not fufpended as to what the fleep-walker wifhes to fee, that is, as to all thofe perceptions which accord with the objects about which his imagination is occupied; that he may alfo be difpofed to receive thofe impreffions, when his imagination has no other object at the time; that in order to fee, he is obliged to open his eyes as much as he can, but when the impreffion is once made, it remains; that objects may itrike his fight without ftriking his imagination, if it is not intereited in them; and that he is fometimes informed of the prefence of objects without either feeing or touch. ing them.
"Having engaged him to write a theme, fay the committee, we faw him light a candle, take pen, ink, and paper, from the drawer of his table, and begin to write, while hrs matter dictated. As he was writing; we put a thick paper before his eyes, notwithfanding which he continued to write and to form his letters very diftinctly; fhowing figns, however, that fomething was incommoding him, which apparently proceeded from the obftruction which the paper, being held too near his nofe, gave to his refpiration.
" Upon another occafion, the young fomnambulift arofe at five o'clock in the morning, and took the neceffary materials for writing, with his copy-book. He meant to have begun at the top of a pare; but finding it already written on, he came to the blank part of the leaf, and wrote fome time from the following words, Fiunt ignari pigritia-ils deviennent ignorans par la pareffe; and, what is remarkable, after feveral lines he perceived he had forgot the \(s\) in the word ignorans, and had put erroneoufly a double \(r\) in pareffe; he then gave over writing, to add the she had forgot, and to erafe the fuperfluous \(r\).
" Another time lie had made, of his own accord, a piece of writing, in order, as he faid, to pleafe his mafter. It confifted of three kinds of writing, text, half text, and fmall writ ; each of them performed with the proper pen. He drew, in the corner of the fame paper, the figure of a hat; he then afked for a penknife to take out a blot of ink which he had made between two letters, and he erafed it withont injuring thern. Laftly, he made fome aritlınetical calculations with great accuracy.
"In order to explain fome of the facts obferved by the academicians which we have here mentioned, they eflablif two general obfervation, which refult from what they have faid with refpect to the fenfes and the dreams of this flecp-walker.
" r . That he is obliged to open his eyes, in order to recognife objects which he wifhes to fee; but the impreffion once made, although rapidly, is vivid enough to fuperfede the neccffity of his opening them again, to. view the fame objects anew ; that is, the farne objects are afterwards prefented to his imagination with as much force and precifion as if he actually faw them.
" 2 . That his imagination, thus warmed, reprefents. to him objects, and fuch as he figures to himfelf, with as much vivacity as if he really faw them; and, laftly, that all his fenfes, being fubordinate to his imagination, feem concentrated in the object with which it-is occupied, and have at that time no perception of any thing. but what relates to that object.
"Thefe two caufes united feem to them fufficient:

Sleep.
walker.

Sleep walker.
for explaining one of the molt fingular facts that occurred to their obfervation, to wit, how the young Devaud can write, although he has his eyes flut, and an obftacle before them. His paper is imprinted on his imagination, and every letter which he means to write is allo painted there, at the place in which it ought to ftand on the paper, and without being confounded with the other letters; now it is clear that his hand, which is obedient to the will of his imagination, will trace them on the real paper, in the fame order in which they are reprefented on that which is pictured in his head. It is thus that he is able to write feveral letters, feveral fentences, and entire pieces of writing ; and what feems to confirm the idea, that the young Devaud writes according to the paper painted on his imagination is, that a certain neep-walker, who is defcribed in the French Encyclopédie (article Somnambulifm), having written fomething on a paper, another piece of paper of the fame fize was fubftituted in its ftead, which he took for his own, and made upon this blank paper the corrections he meant to have made on the other which had been taken away, precifely in the places where they would have been.
" It appears from the recital of another fact, that Devaud, intending to write at the top of the firft leaf of a white paper book, Vevey, le-ftopped a moment as if to recollect the day of the montll, left a blank fpace, and then proceeded to Decembre 1787; after which he afked for an almanac: a little book, fuch as is given to children for a new year's gift, was offered to him; he took it, opened it, brought it near his eyes, then threw it down on the table. An almanac which he knew was then prefented to him ; this was in German, and of a form fimilar to the almanac of Vevey: he took it, and then faid, 'What is this they lave given me; here, there is your German almanac.' At laft they gave him the almanac of Berne; he took this likewife, and went to examine it at the bottom of an alcove that was perfectly dark. He was heard turning over the leaves, and faying 24, then a moment afterwards 34. Returning to his place, with the almanac open at the month of December, he laid it on the table and wrote in the fpace which he liad left blank the 24 th. This fcene happened on the 23 d ; but as he imagined it to be the 24 th, he did not iniftake. The following is the explication given of this fact by the authors of the report.
"The dates \(23 \mathrm{~d}, 24 \mathrm{th}\), and 25 th, of the mouth of December, had long occupied the mind of the young Devaud. The 23 d and 25 th were holidays, which he expected with the impatience natural to perfons of his age, for the arrival of thofe moments when their little daily labours are to be fufpended. The 25 th efpecially was the object of his hopes; there was to be an illumination in the church, which had been defcribed to him in a manner that quite tranfported him. The 24th was a day of labour, which came very difagreeably between the two happy days. It may eafily be conceived, how an imagination fo irritable as that of the young Devaud would be ftruck with thofe pleafing epochs. Accordingly, from the beginning of the month he had been perpetually turning over the almanac of Vevey. He calculated the days and the hours that were to elapfe before the arrival of his withed-for ho
lidays; he fhowed to his friends and acquaintance the dates of thofe days which he expected with fo much impatience; every time he took up the almanac, it was only to confult the month of December. We now fee why that date prefented itfelf to his mind. He was performing a tafk, becaufe he imagined the day to be the Monday which had fo long engroffed him. It is not furprifing, that it frould have occurred to his imagination, and that on opening the almanac in the dark he might have thought he faw this date which lhe was feeking, and that his imagination might lave reprefented it to him in as lively a manner as if he had actually feen it. Neither is it furprifing that he fhould have opened the almanac at the month of December; the cuftom of perufing this month muft have made him find it in the dark by a mere mechanical operation. Man never feems to be a machine fo much as in the ftate of fomnambulifm; it is then that habit comes to fupply thofe of the fenfes that cannot be ferviceable, and that it makes the perfon aft with as much precifion as if all his fenfes were in the utmoft activity. Thefe circumftances deftroy the idea of there being any thing miraculous in the behaviour of young Devaud with refpect to the date and the month that he was in queft of and the reader, who has entered into our explanations, will not be furprifed at his knowing the German almanac; the touch alone was fufficient to point it out to him; and the proof of this is the fhortnefs of the time that it remained in his hands.
"An experiment was made by changing the place of the ink-ftandifl during the time that Devaud was writing. He had a light befide him, and had certified himfelf of the place where lis ink-holder was ftanding by means of fight. From that time he continued to take ink with precifion, withont being obliged to open his eyes again: but the ink-ftandifh being removed, he returned as ufual to the place where he thought it was: It muft be obferved, that the motion of his hand was rapid till it reached the height of the ftandifh, and then he moved it flowly, till the pen gently touched the table as he was feeking for the ink: he then perceived that a trick had been put on him, and complained of it ; he went in fearch of his ink-ftandifh and put it in its place. This experiment was feveral times repeated, and always attended with the fame circumftances. Does not what we have here ftated prove, that the ftandifh, the paper, the table, \&c. are painted on his imagination in as lively a manner as if he really faw them, as he fought the real ftandifh in the place where his imagination told him it ought to have been? Does it not prove that the fame lively imagination is the caufe of the moft fingular actions of this fleep-walker? And laftly, does it not prove, that a mere glance of his eye is fufficient to malke his impreffions as lively as durable?
"The committee, upon the whole, recommend to fuch as wifh to repeat the fame experiments, I. 'Io make their obfervations on different fleep walkers. 2. To examine often whether they can read books that are unknown to them in perfect darknefs. 3. 'To obferve whether they can tell the hours on a watch in the dark. 4. To remove when they write the ink-tandifh from its place, to fee whether they will return to the fame place in order to take ink 5. And, laftly, to take notice whether they walk with the fame confidence in a dark

Sleep. walker.

\section*{S I E [ 537 ] S L r}
and unknown place, as in one with which they are acquainted.
"They likewife recommend to fuch as would confirm or invalidate the above obfervations, to make all their experiments in the dark; becaule it has been hitherto fuppofed that the eyes of neep-walkers are of no ufe to them."

SLEEPERS, in natural hiftory, a name given to thofe animals which fleep all winter; fuch as bears, marmots, dormice, bats, liedgehogs, fwallows, \&c. Thefe do not feed in winter, have no fenfible evacuations, breathe little or none at all, and molt of the vifcera ceafe from their functions. Some of thefe creatures feem to be dead, and others return to a fate like that of the feetus before birth : in this ftate they continue, till by new heat the fluids are attenuated, the animal is reftored to life, and the functions begin where they left off.

Sleepers, in a fhip, timbers lying before and aft in the bottom' of the finip, as the rungheads do: the lowermoft of them is bolted to the rungheads, and the uppermoft to the futtocks and rungs.

SLEIDAN (John), an excellent German hiftorian, born of obfcure parents, in 15 c 6 , at Sleidan, a fmall town on the confines of the duchy of Juliers. After Atudying fome time in his own country, together with his townfman the learned John Sturmius, he went to France, and in 1535 entered into the fervice of the cardinal and archbifhop John du Bellay. He retired to Strafburg in 1542 , where he acquired the efteem and friendflip of the moft confiderable perfons, particularly of James Sturmins; by whofe advice and affiltance he was enabled to write the hiftory of his own time. He was employed in fome public neqociations ; but the death of his wife, in 1555 , plunged him into fo deep a melancholy, that he loft his memory entirely, and died the year following. In 1555 came out, in folio, De flatu Religionis et Reipublice fub Carolo Quinto, \&c. in 25 books; from the year \(15^{17}\), when Luther began to preach, to the year of its publication; which hiftory was prefently tranflated into moft of the languages of Europe. Befides this great work, he wrote, De quatumr fiummis Imperiis, libri tres; with fome other hiftorical and political pieces.

SLEIGHT of Hand, See Legerdemain.
SLEU'I-hounde, the ancient Scots name of the blood-lound. The word is from the Saxon llot, "the impreffion that a deer leaves of its foot in the mire," and bound " a dog"; fo they derive their name from following the track. Sce the article BLood-Hound.

SLESWICK, an ancient and confiderable town of Denmark, and capital of a duchy of the fame name in the province of Gotiorp, with a bifhop's fee, fecularized in 1586 . Clofe to it is the old palace of Gottorp, formerly the ducal refidence, but at prefent inhabited by the ftadtholder or governor. This town was once much more confiderable than it is at prefent, having fuffered greatly by the wars of Germany. It is feated on the gulph of Sley, where there is a good harbour, 60 miles north-weft of Lubeck, and 125 fouth-weft of Copenhagen. E. Long. 10. O. N. Lat. \(54 \cdot+0\).

Sleswick, the duchy of, or Soutb Futland, is about 100 miles in length and so in breadth. It is bounded on the north by North Jutland, on the eaft by the Baltic Sea, on the fouth by Holltein, and on the welt by Vol. XVII. Part II.
the ocean. It contains 14 citics, i 7 towns, 13 caitles, \(27^{8}\) parifhes, 1480 villages, 162 farms, 116 water-mills, and rof gentlemens feats. It is a pleafant, fertile, populous country, and a fovereign duchy. Formerly the king of Denmark had half of it, and the other belonged to the houfe of Holftein-Gottorp; but the former having conquered this duchy, had the poffeffion of it confirmed to him by the treaty of the north in 1720. In 1731, a prince of Bareith.Culmbach was made go. vernor of this duchy, who refides at Gottorp.

SLICH, in metallurgy, the ore of any metal, particularly of gold, when it has been pounded, and prepa. red for farther working.

The manner of preparing the flich at Chremnitz in Hungary is this; they lay a foundation of wood three yards deep, upon this they place the ore, and over this there are 24 beams, armed at their bottoms with iron; thefe, by a continual motion, beat and grind the ore, till it is reduced to powder: during this operation, the ore is covered with water. There are four wheels ufed to move thefe beams, each wheel moving fix; and the water, as it runs off, carrying fome of the metalline particles with it, is received into feveral bafons, one placed behind another; and finally, after having paffed through them all, and depofited fome fediment in each, it is let off into a very large pit, almoft half an acre in extent; in which it is fuffered to ftand fo long, as to depofit all its fediment, of whatever kind, and after this it is let out. This work is carried on day and night, and the ore taken away and replaced by more as ofter as occafion requires. That ore which lies next the beams, by which it was pounded, is always the cleane!t or richeft.

When the flich is wafhed as much as they can, a hundred weight of it ufually contains about an ounce, or perhaps but half an ounce of metal, which is not all gold ; for there is always a mixture of gold and filver, bint the gold is in the largeft quantity, and ufually is two-thirds of the mixture : they then put the flich into a furnace with fome limeftorie, and flacken, or the fcoria of former meltings, and run them together. 'The firft melting produces a fubftance called lech; this lech they burn with charcoal, to make it lighter, to open its body, and render it porous, after which it is called roft; to this roft they add fand in fuch quantity as they find neceffary, and then melt it over again.

At Chremnitz they have many other ways of reducing gold out of its ore, but particularly one, in which they employ no lead during the whole operation; whereas, in general, lead is always neceffary, after the before mentioned proceffes. See Gold.

SLIDING rule, a mathematical inftrument, ferving to work queftions in gausing, meafuring, \&c. without the ufe of compaffes; merely by the fliding of the parts of the inftrument one by another, the lines and divifions whereof give the anfwer by infpection.

This inftrument is varioufly contrived, and applied by various authors, particularly Everard, Coggefhall, Gunter, Hunt, and Partridge ; but the moft common and ufeful are thofe of Everard and Coggefhall.

SLIGO, a county, in the province of Connaught, Ireland, 25 miles in length, and as much in breadth; bounded on the eaft by that of Leitrim, on the weft by the county of Mayo, on the north and north weft by the weftern ocean, and on the fouth and fouth-welt
by
town in the county, and is feated on a bay of the fame name, 30 miles weft of Killalla, and 110 north-eaft of Dublin. W. Long. 8. 26. N. Lat. 54 . 13.
SLING, an inftrument ferving for cafting flones wilh great violence. The inhabitants of the Balearic iflands were famous in antiquity for the dexterous ma. nagrement of the fling : it is faid they ufed three kinds of flings, fome longer, others fnorter, which they ufed according as their enemies were either nearer or more remote. It is added, that the firft ferved them for a lead band, the fecond for a girdle, and that the third they conftantly carried in their hand.

SLINGING is ufed variounly at fea; but chiefly for hoifting up cafks or other heavy things with flings, i.e. contrivances of ropes fpliced into themfelves at either end, with one eye big enough to receive the caflk or whatever is to be flung. There are other flings, which are made longer, and with a fmall eye at each end; one of which is put over the breech of a piece of ordnance, and the other eye comes over the end of an iron crow, which is put into the mouth of the piece, to weigh and hoife the gun as they pleafe. There are alfo flings by which the yards are bound faft to the crofs-tree aloft, and to the head of the maft, with a ftrong rope or chain, that if the tie flould happen to break, or to be thot to pieces in fight, the yard, neverthelefs, may not fall upon the hatches.
\(S_{\text {LINGing a Man overboard, in order to fop a leak in }}\) a flip, is done thus: the man is trufied up about the midtle in a piece of canvas, and a rope to keep him from linking, with his arms at liberty, a mallet in one hand, and a plug, wrapped in oakum and well tarred in a tarpawling clout, in the other, which he is to beat with all difpatch into the hole or leak.

LOANE (Sir Hans), baronet, eminently difirrguifhed as a phyfician and a naturalift, was of Scotch extraction, his father Alexander Sloane being at the head of that colony of Scots which King James I. 位tled in the north of Ireland, where our author was born, at Killieagh, on the 16 th of April r660. At a very early period, he difplayed a ftrong inclination for natural hiftory ; and this propenfity being encouraged by a fuitable education, he employed thofe hours which young people generally lofe by purfuing low and trifling amufements, in the ftudy of nature, and contemplating her works. When about fixteen, he was attacked by a fpitting of blood, which threatened to be attended with confiderable danger, and which interrupted the regular courfe of his application for three years; he had, however, already learned enough of phyfic to know that a malady of this kind was not to be removed fuddenly, and he prudently abitained from wine and other liquors that were likely to increafe it.

By ftrictly obferving this fevere regimen, which in fome meafure he continued ever after, he was enabled to prolong his life beyond the ordinary bounds; being an example of the truth of his own favourite maxim, that fobriety, temperance, and moderation, are the beft and moit powerful prefervatives that nature has granted to mankind.

As foon as he recovered from this infirmity, he re-
folved to perfect himfelf in the different branches of phyfic, which was the profeffion he had made choice of; and with this view he repaired to London, where he hoped to receive that affitance which he could not find in his own country.

On his arrival in the metropolis, he entered himfelf as a pupil to the great Stafforth, an excellent chemift, bred under the illuftrious Stahl; and by his inftructions he gained a perfect knowledge of the compofition and preparation of the different kinds of medicines then in ufe. At the fame time, he ftudied botany at the celebrated garden at Chelfea, affiduoully attended the public lectures of anatomy and phylic, and in fhort neglected nothing that he thought likely to prove ferviceable to him in his future practice. His principal merit; however, was his knowledge of natural hiftory; and it was this part of his character which introduced him early to the acquaintance of Mr Boyle and Mr Rayr, two of the moft eminent naturalifts of that arre. His intimacy with thefe diftinguifhed characters continued as long as they lived; and as he was careful to communicate to them every object of curiofity that attracted his attention, the obfervations which he occafionally made often excited their admiration and obtained their applaufe.

After ftudying four years at London with unremit. ting feverity, Mr Sloane determined to vifit foreign countries for farther improvement. In this view he fet out for France in the company of two other ftudents, and having croffed to Dieppe, proceeded to Pro ris. In the way thither they were elegantly entertained by the famous M. Lemery the elder; and in return Mr Sloane prefented that eminent chemift with a fpecimen of four different kinds of phofphorus, of which, upon the credit of other writers, M. Lemery had treat ed in his book of chemiftry; though he had never feen any of them.

At Paris Mr Sloane lived as he had done in London. He attended the hofpitals, heard the lectures of Tournefort, De Verney, and other eminent malters; vifited all the literati, who received him with particular
marks of efteem, and employed himfelf wholly in marks of efteem, and employed himfelf wholly in fúdy.

From Paris Mr Sloane went to Montpelier ; and, being furnifhed with letters of recommendation from M . Tournefort to M. Chirac, then chancellor of that univerfity, he found eafy accefs, through his means, to all the learned men of the province, particulally to M: Maguol, whom he always accompanied in his botanical excurfions in the environs of that city, where he beleh? witl pleafure and admiration the fpontaneous productions of nature, and learned under his inftructions to clafs them in a proper manner.

Having, here found an ample field for contemplation, which was entirely fuited to his tafte, he took leave of his two companions, whom a curiofity of a differel: \(\varepsilon\) kind led into Italy.

After fpending a whole year in collecting plants, he travelled through Languedoc with the fame defign; and paffing through Thouloufe and Bourdeaux, returned to Paris, where he made a flort ftay. About the end of the year 1684 he fet out for England, with an intention of fettling there as a phyfician. On his arrival in London, he made it his firt bufinefs to vifit his two illuftrious friends Mr Ray and Mr Boyle, in order

\section*{S L O \\ [ 539 ] \\ S L O}
to communicate to them the difcoveries he had made in his travels. 'l'he latter he found at home, but the former had retired to Effex ; to which place Mr Sloane tranfmitted a great variety of plants and feeds, which Mr Ray has defcribed in his Hiftory of Plants, and for which he makes a proper acknowledgment.

About the year 1706 our author became acquainted with the celebrated Sydenham ; who foon contracted fo warm an affection for him that he took him into his houfe, and recommended him in the ftrongeft manner to his patients. He had not been long in London before he was propofed by Dr Martin Lifter as a candidate to be admitted a member of the Royal Society, on the 26 th of November 1684; and being approved, he was elected on the 2 if of January following.

In 1685 he communicated fome curiofities to the Society ; and in July the fame year he was a candidate for the office of their affiftant fecretary, but without fuccefe, as he was obliged to give way to the fuperior in. tereft of his competitor Dr Halley. On the 12th of April 1687, he was chofen a fellow of the college of phyficians in London ; and the fame year his friend and fellow traveller Dr Tancred Robinfon, having mentioned to the Society the plant called the flar of the earth, as a remedy newly difcovered for the bite of a mad dog, Dr Sloane acequainted them that this virtue of the plant was to be found in a book called De Grey's Farriery; and that he knew a man who had cured with it twenty couple of dogs. This obfervation he made on the \(13^{\text {th }}\) of July, and on the 12 th of September following he embarked at Portfmouth for Jamaica with the duke of Albemarle, who had been appointed governor of that ifland. The docior attended his grace in quality of plyyfician, and arrived at Jamaica on the 19th of December following.

Here a new field was opened for frefh difcoveries in natural productions; but the world would have been deprived of the fruits of them, had not our author, by incredible application, converted, as we may fay, his minutes into hours. The duke of Albemarle died foon alter he landed, and the duchefs determined to return to England whenever an anfwer fheuld be received to the letter fhe had fent to court on that melancholy occafion. As Dr Sloane could not think of leaving her grace in her diftrefs, whilft the reft of her retinue were preparing for thcir departure he improved it in making collections of natural curiofities; fo that though his whole ftay at Jamaica was not above fifteen months, he brought together fuch a prodigious number of plants, that on his return to England Mr Ray was aftonifhed that one man could procure in one ifland, and in fo fhort a fpace, fo vaft a variety.

On his arrival in London he applied himfelf to the practice of his profeffion ; and foon hocame fo eminent, that he was chofen phyfician to Chrifl's Hofpital on the 17 th of October 1694 : and this office he held till the year 1730 , when, on account of his great age and infirmities, he found it neceffary to refign. It is fomewhat fingular, and redounds much to the Doctor's honour, that though he received the emoluments of his office punctually, becaufe he would not lay down a precedent which might hurt his fucceffors, yet lee conftantky applied the money to the relief of thofe who were the greateft objects of conlpaffion in the hofpital, that it might never be faid he enriched bimfelf by giving
health to the poor. He had been elected fecretary to the Royal Society on the 3 cth of November 1693 ; and upon this eccafion he revived the publication of the Philofophical Tranfactions, which had been omitted for fome time. He continued to be the editor of this work till the year 1712; and the volumes which appeared during that period are monuments of his in. dultry and ingenuity, many of the pieces contained in them being written by himfelf.

In the mean time he publifhed Catalogus Plantarum que in Infula Famaica fponte proveniunt, \&c. Seu Prodromi Hiforia Naturalis pars prima, which he dedicacated to the Royal Society and College of Phyficians. About the fame time he formed the plan of a difpenfary, where the poor might be furnifhed at prime coft with fuch medicines as their feveral maladies might require ; which he afterwards carried into execution, with the affiftance of the prefident and other members of the college of phyficians.

Our author's thirf for natural knowled fe feems to have been born with him, fo that his cabinet of curiofities may be faid to have commenced with his being. He was continually enriching and enlarging it ; and the fame which, in the courfe of a few years, it had acquired, brought every thing that was curious in art or nature to be firft offered to him for purchafe. Thefe acquifitions, however, increafed it but very flowly in comparifon of the augmentation it received in 1701 by the death of William Courten, Efq; a gentleman who had employed all his time, and the greater part of his fortune, in collecting rarities, and who bequeathed the whole to Dr Sloane, on condition of his paying certain debts and legacies with which he had clarged it. Thefe terms our author accepted, and he executed the will of the donor with the moft fcrupulous exactnefs; on which account fome people have faid, that he pur chafed Mr Courteli's curiofities at a dear rate.

In 1707 the firt volume of Dr Sloane's Natural Hiftory of Jamaica appeared in folio, though the publication of the fecond was delayed till \(s 725\). By this very ufeful as well as magnificent work the materia medica was enriched with a great number of excellent drugs not before known. In 1708 the Doctor was clected a foreign member of the Royal Academy of Sciences at Paris, in the room of Mr Tfchirnaus; an honour fo much the greater, as we were then at war with France, and the queen's exprefs confent was neceffary before he could accept it. In proportion as his credit rofe among the lcarned, his practice increafed among the people of rank: Queen Anne herfelf frequently confulted him, and in her laft illnefs was blooded by him.

On the advancement of George I to the throne, that prince, on the 3 d of April 1716 , created the Doctor a baronet, an hereditary title of honour to whicle no Englifl phyfician had before attained ; and at the fame time made him phyfician general to the army, in which fation he continued till 1727 , when he was appointed phyfician in ordinary to George II. He attended the royal family till his ceath ; and was particularly favoured by Queen Caroline, who placed the greateft confidence in his prefcriptions. In the mean time he had been unanimotifly chofen one of the clects of the college of phylicians June 1. 1716, and he was elected prefident of the fame body on September 30. 1719, an office which he held for fixteen years. Du3 Y 2
ring
ring that period he not only gave the higheft proofs of his zeal and affiduity in the difcharge of lis duty, but in 1721 made a prefent to that fociety of L. 100 ; and fo far remitted a very confiderable debt, which the corporation owed him, as to accept it in fuch fmall fums as were leaft inconvenient to the flate of their affairs. Sir Hans was no lefs liberal to other learned bodies. He had no fooner purchafed the manor of Chelfea, than he gave the company of apothecaries the entire freehold of their botanical garden there, upon concition only that they fhould prefent yearly to the Royal Society fifty new plants, till the number fhould amount to 2000 ( A ). He gave befides feveral other confiderable donations for the improvement of this garden; the fituation of which, on the banks of the Thames, and in the neighbourhood of the capital, was fuch as to render it ufeful in two refpects: Firf, by producing the moft rare medicinal plants; and, fecondly, by ferving as an excellent fchool for young botanifts; an advantage which he himfelf had derived from it in the early part of his life.
'The death of Sir Ifaac Newton, which happened in 1727, made way for the advancement of Sir Hans to the prefidency of the Royal Society. He had been vice-prefrdent, and frequently fat in the chair for that great man; and by his long connection with this learned body he had contracted fo ftrong an affection for it, that he made them a prefent of an humdred guineas, caufed a curious bult of King Charles II. its founder, to be erected in the great hall where it met, and, as is faid, was very inftrumental in procuring Sir Godfrey Copley's benefaction of a medal of the value of five gumeas, to be annually given as an honorary mark of diftinction to the perfon who communicates the beft experiments to the Society.

On his being raifed to the chair, Sir Hans laid afide all thoughts of further promotion, and applied himfelf wholly to the faithful difcharge of the duties of the of. fices which lie enjoyed. In this laudable occupation he employed his time from 1727 to 1740 , when, at the age of fourfcore, he formed a refolution of quitting the fervice of the public, and of living for himfelf. With this view he refigned the prefidency of the Royal Society much againft the inclination of that refpectable body, who clrofe Martin Folkes, Efq; to fucceed him, and in a public affembly thanked him for the great and eminent fervices he had rendered them. In the month of January \({ }^{1741}\), he began to remove his library, and his cabinet of rarities, from lris houfe in Bloomßury to that at Chelfea; and on the 12 th of March following, having fettled all his affairs, he retired thither himfelf, to enjoy in peaceful tranquillity the remains of a well-fpent
life. He did not, however, bury himfelf in that folitude which excludes men from fociety. He received at Chelfea, as he had done in London, the vifits of people of diftinction, of all learned foreigners, and of the royal family, who fometimes did hin the honour to wait on him; but, what was ftill more to his praife, he never refufed admittance or advice to rich or poor who came to confult him concerning their health. Not cona tented with this contracted method of doing good, he now, during his retreat, prefented to the public fuch ufeful remedies as fuccefs had warranted, during the courfe of a long continued practice. Among thefe is the efficacions redeipt for diftempers in the eyes, and his remedy for the bite of a mad dog.
During the whole courfe of his life, Sir Hans had lived with fo much temperance, as had preferved him from feeling the infirmities of old age; but in his goth year he began to complain of pains, and to be fenfible of an univerfal decay. He was often heard to fay, that the approach of death brought no terrors along with it ; that he had long expected the ftroke ; and that he was prepared to receive it whenever the great Author of his being fhould think fit. After a fhort illnefs of three days, he died on the IIth of January 1752, and was interred on the 18 th at Chelfea, in the fame vault with his lady, the folemnity being attended with the greateft concourfe of people, of all ranks and conditions, that had ever been feen before on the like occafion.

Sir Hans being extremely folicitous left his cabinet of curiofities, which he had taken fo much pains to collect, fhould be again diffipated at his death, and being at the fame time unwilling that fo large a portion of his fortune fhould be loft to his children, he bequeathed it to the public, on condition that L. 20,000 fhould be made good by parliament to his family. This fum, though large in appearance, was fcarcely more than theintrinfic value of the gold and filver medals, the ores and precious ftones that were found in it; for in his laft will he declares, that the firft coft of the whole amounted at leaft to L. 50,000 . Befides his library, confifting of more than 50,000 volumes, 347 of which were illuftrated with cuts firely engraven and coloured from nature, there were \(35^{\circ} 0\) manufcripts, and an infis nite number of rare and curious works of every kind. The parliament accepted the legacy, and fulfilled the conditions.

SLOANEA, in botany: A genus of plants belonging to the clafs of polyandria, and order of monogynia; and in the natural fyftem ranging under the 50 th order, Amentacea. The corolla is pentapetalous; the calyx pentaphyllous and deciduous; the ftigma is
perforated;
(A) This garden was firf eftablifhed by the company in 1673; and having after that period been focked by them with a great variety of plants, for the improvement of botany, Sir Hans, in order to encourage fo ferviceable an undertaking, granted to the company the inheritance of it, being part of his eftate and manor of Chelfea, on condition that it fhould be for ever preferved as a phyfic garden. As a proof of its being fo maintained, he obliged the company, in confideration of the faid grant, to prefent yearly to the Royal Society, in one of their weekly meetings, fifty fpecimens of plants that had grown in the garden the preceding year, and which were all to be fpecifically diftinct from each other, until the number of two thoufand fhould be completed. This number was completed in the year 1761. In 1733 the company erected a marble ftatue of Sir Hans, executed by Ryforac, which is placed upon a pedeftal in the centre of the garden, with a Latin infcription, expreffing his donation, and the defign and advantages of it.

\section*{S L U [ 541\(] \quad \mathrm{S}\) M A}
perforated; the berry is corticofe, echinated, polyfpermous, and gaping. There are two fpecies, the dentata and emarginata.

\section*{Sloe. See Prunus.}

SLOOP, a fmall veffel furnifhed with one maft, the mainfail of which is attached to a gaff above, or to the maft on its foremoft edge, and to a long boom below, by which it is occalionally fhifted to either quarter. See SHIP.

SLoop of War, a name given to the fralleft veffels of war except cutters. They are either rigged as fhips or fnows.

SLOT, in the fportfman's language, a term ufed to exprefs the mark of the foot of a ftag or other animal proper for the chace in the clay or earth, by which they are able to guefs when the animal paffed, and which way he went. The flot, or treading of the ftag, is very nicely ftudied on this occafion; if the flot be large, deep printed in the ground, and with an open cleft, and, added to thefe marks, there is a large fpace between mark and mark, it is certain that the ftag is an eld one. If there be obferved the fóts or treadings of two, the one long and the other round, and both of one fize, the long flot is always that of the larger animal. There is alfo another way of knowing the old ones from the young ones by the treading; which is, that the hinder feet of the old ones ucver reach to their fore feet, whereas thofe of the young ones do.

\section*{sloth, in zoology. See Bradypus.}

SLOUGH, a deep muddy place. The caft fkin of a fnake, the damp of a coal pit, and the fcar of a wound, are alfo called by the fame appellation. The flough of a wild boar is the bed, foil, or mire, wherein he wallows, or in which he lies in the day-time.

SLUCZK, a large and populous town in Poland, in Lithuania, and capital of a duchy of the fame name; famous for three batiles gazined here by Conftantine duke of Oftrog over the Tartars, in the reign of Sigifmund I. It is feated on the river Sluczk, 72 miles fouth-eart of Minkki, and 70 fouth of Novogrodecik. E. Long. 27. 44. N. Lat. 53. 2.

SLUG, in zoology. See Limax.
SLUICE, a frame of timber, flone, or other matter, ferving to retain and raife the water of a river, \&c. and on occation to let it pars.

Such is the fluice of a mill, which ftops and collects the water of a rivulet, \&c. to let it fall at length in the greater plenty upon the mill wheel: fuch alfo are thofe ufed as vents or drains to difcharge water off land. And fuch are the nuices of Flanders, \&c. which ferve to prevent the waters of thc fea from overflowing the lower lands.

Sometimes there is a kind of canal inclofed between two gates or fuices, in artificial navigations, to fave the water, and render the paffage of boats equally eafy and fafe, upwards and downwards; as in the fluices of Briare in France, which are a kind of maffive walls built parallel to each other, at the diftance of 20 or 24 feet, clofed with ftrong gates at each end, between which is a kind of canal or chamber, confiderably longer than broad; wherein a veffel being inclofed, the water is let out at the firtt gate, by whtch the veffel is raifed 15 or 16 feet, and paffed out of this canal into another much ligher. By fuch means a boat is conveyed ont of the

Loire into the Seine, though the ground between them rife above 150 feet higher than either of thofe rivers \(\ddagger\).

Sluices are made different ways, according to the ufe for which they are intended: when they ferve for navi- \(\ddagger\) See Can gation, they are fhut with two gates, prefenting an nal. angle towards the flream ; when they are made near the fea, two pair of gates are made, the one to keep the water out and the other in, as occafion requires : in this cafe, the gates towards the fea prefent an angle that way, and the others the contrary way; and the fpace inclofed by thofe gates is called the chamber. When fluices are made in the ditches of a fortrefs, to keep up the water in fome parts, inflead of gates, fhutters are made fo as to flide up and down in grooves; and when they are nade to raife an inundation, they are then fhut by means of fquare timbers let down in cullifes, fo as to lie clofe and firm,

The word Juice is formed of the French efclufe, which Menage derives from the Latin exclufa, found in the Salic law in the fame fenfe. But this is to be reftrained to the flnices of mills, \&c. for as to thofe ferving to raife veffels, they were wholly unknown to the ancients.

SLUR, in mufic, a mark like the arch of a circle, drawn from one note to another, comprehendiug two or more notes in the fame or different degrees. If the notes are in different degrees, it fignifies that they are all to be fung to one fyllable; for wind inftruments, that they are to be made in one continued breath; and for ftringed inftruments that are ftruck with a bow, as a violin, \&c. that they are made with one ftroke. If the notes are in the farne degree, it f:gnifies that it is all one note, to be made as long as the whole notes fo connected; and this happens moft frequently betwixt the laft note of one line and the firt of the next ; which is particularly called /jncopation.

SLUYS, a town of Dutch Flanders, oppofite the iffand of Cadfand, with a good harbour, 10 miles north of Bruges. E. Long. 3. 25 . N. Lat. 51. 19.

SMACK, a fmall veffel, commonly rigged as a floop or hoy, ufed in the coafting or filhing trade, or as a tender in the king's fervice.

SMALAND, or East Gothland, a province of Sweden, which makes part of Gothland; and is bounded on the north by Oftrogothia or Eaft Gothland, on the ealt by the Baltic Sea, on the fouth by Schonen and Bleckingia, and on the weft by Weftrogothia or Weft Gothland. It is about 112 miles in length, and \({ }^{4}\) 62 fm breadth. Calmar is the capital town.

SMALKALD, a town of Germany, in Franconia, and in the county of Henneberg: famous for the confederacy entered into by the German Proteftants againft the emperor, commonly called the lengue of Smalkald. The defign of it was to defend their religion and liberties. It is feated on the river Werra, 25 miles fouthweft of Erford, and 50 north.weft of Bamberg. E, Long. 10.53. N. Lat. 50.49. It is fubject to the prince of Heffe. Caffel.

SMALLAGE, in botany. See Apium.
SMALT, a kind of glafs of a dark blue colour, which when levigated appears of a mof beautiful colour ; and if it could be made fufficiently fine, would be an excellent fuccedaneum for ultramarine, as not only: refifting all kinds of weathir, but even the inott violent fires. It is prepared by melting one part of calcined cobalt with two of fint powder, and one of pot-afh,

\section*{S M E}

Smaraglue, At the bottoms of the crucibles in which the fmalt is Snaton. manufactured we generally find a regulus of a whitifh
colour inclining to red, and extremely brittle. This is melted afrefh, and when cold feparates into two parts; that at the bottom is the cobaltic regulus, which is employed to make more of the fmalt ; the other is bifmuth.

SMARAGDUS, in natural hiftory. See Emerald.

SMEATON (John), an eminent civil engineer, was born the 28th of May I 724 , O. S. at Authorpe, near Leeds, in a houfe built by his grandfather, and where his family have refided ever fince.

The ftrength of his underftanding and the originality of his genius appeared at an early age; his playthings were not the playthings of children, but the tools which men employ; and he appeared to have greater entertainment in feeing the men in the neighbourhood wark, and afking them queftions, than in any thing elfe. One day lie was feen (to the diftrefs of his family) on the top of his father's barn, "fixing up fomething like a windnill ; another time, he attended fome men fixing a pump at a neighbouring village, and obferving them cut off a piece of bored pipe, he was fo lucky as to procure it, and he actually made with it a working pump that raifed water. Thefe anecdotes refer to circumftances that happened while he was in petticoats, and moft likely before he attained his fixth year.

About his 14 th and 15 th year, he had made for himfelf an engine for turning, and made feveral prefents to his friends of boxes in ivory or wood , very neatly turned. He forged his iron and fteel, and melted his metal; lie had tools of every fort for working in wood, ivory, and metals. He had made a lathe, by which he liad cut a perpetual ferew in brats, a thing little known at that day, which was the invention of Mr Henry Hindley of York; with whom Mr Smeaton foon became acquainted, and they fpent many 2 night at Mr Hindley's houfe till day-light, converfing on thofe fubjects.

Thus had Mr Smeaton, by the ftrength of his genius and indefatigable induftry, acquired, at the age of 18, an extenfive fet of tools, and the art of working in moft of the mechanical trades, without the affittance of any mafter. A part of every day was generally occupied in forming fome ingenious piece of mecha. nifm.

Mr Smeaton's father was an attorney, and defirous of bringing him up to the fame profcffion, Mr Sinea. ton therefore came up to Loncon in 1742, and attended the courts in Weftminfter hall; but finding (as his common expreffion was) that the law did not fuit the bent of his genins, he wrote a ftrong memorial to his father on that fubject; whofe good fenfe from that moment left Mr Smeaton to purfue the bent of his genius in his own way.

In 1751 he began a courle of experiments to try a machine of his invention to meafure a fhip's way at fea, and alfo made two voyages in company with Dr Knight to try it, and a compais of his own invention and making, which was made magnetical by Dr Knight's artificial magnets: the fecond royage was made in the Fortune floop of war, commanded at that time by Captain Alexander Campbell.

In 1753 he was elected member of the Royal So-
ciety; the number of papers publifhed in their Tranfo Smeat actions will how the univerfality of his genius and knowledge. In 1759 he was honoured by an unanimous vote with their gold medal for his paper intitled "An Experimental Inquiry concerning the Natural Powers of Water and Wind to turn Mills, and other Machines depending on a Circular Motion."

This paper, he fays, was the refult of experiments made on working models in the years 1752 and 1753 , but not communicated to the Society till 1759 ; before which time he had an opportunity of putting the effect of thefe experiments into real practice, in a variety of cafes, and for various purpofes, fo as to affure the Society he had found them to anfwer.

In December 1755, the Eddyftone lighthoufe was burnt down: Mr Wefton, the chief proprietor, and the others, being defirous of rebuilding it in the moft fubftantial manner, inquired of the earl of Macclesfield (then prefident of the Royal Society) whom he thought the moft proper to rebuild it; his Lordfhip recommended Mr Smeaton.

Mr Smeaton undertook the work, and completed it in the fummer of 1759. Of this Mr Smeaton gives an ample defcription in the volume he publifhed in 1791: that edition has been fold fome time ago, and a fecond is now in the prefs, under the revifal of his much efteemed friend Mr Aubert, F. R. S. and governor of the London affurance corporation.

Though Mr Smeaton completed the building of the Eddyftone lighthoufe in 1759 (a work that does him fo much credit), yet it appears he did not foon "get into full bufinefs as a civil engineer; for in 1764 , while in Yorkfhire, he offered himfelf a candidate for one of the receivers of the Derwentwater eftate; and on the 3 Ift of December in that year, he was appointed at a full board of Greenwich lofpital, in a manner highly ftattering to himfelf; when two other perfons ftrongly recommended and powerfully fupported were candidates for the employment. In this appointment he was very happy, by the affiftance and abilities of his partner Mr Walton one of the receivers, who taking upon himfelf the management and accounts, left Mr Smeaton leifure and opportunity to exert his abilities on public works, as well as to make many improvements in the mills and in the eftates of Greenwich hofpital. By the year 1775 he had fo much bufinefs as a civil engineer, that he wifhed to refign this appointment; and would have done it then, had not his friends the late Mr Stuart the hofpital furveyor, and Mr Ibbetfon their fecretary, prevailed upon him to continue in the office about two years longer.

Mt Smeaton having now got into full bulinefs as a civil engineer, performed many works of general utility. He made the river Calder navigable; a work that required great fkill and judgment, owing to the very impetuous floods in that river: He planned and attended the execution of the great canal in Scotland for conveying the trade of the country either to the Atlantic or German ocean; and having brought it to the place originally intended, he declined a handfome yearly falary, in order that he might attend to the multiplicity of his other bufinefs.

On the opening of the great arch at London bridge, the excavation around and under the fterlings was \(f_{0}\) confiderable, that the bridge was thought to be in

\section*{S M E}
tor. great danger of falling. He was then in Yorkfhire, and was fent for by exprefs, and arrived with the utmoft difpatch: "I think (fays Mr Holmes, the author of his life) it was on a Saturday morning, when the apprehenfion of the bridge was fo general that few would pafs over or under it. He applied himfelf immediately to examine it, and to found about the fterlings as minutcly as he could; and the committee being called together, adopted his advice, which was to repurchafe the ftones that had been taken from the middle pier, then lying in Moorfields, and to throw them into the river to guard the fterlings." Nothing fhows the apprehenfions concerning the falling of the bridge more rhan the alacrity with which this advice was purfued; the ftones were repurchafed that day, horfes, carts, and barges, were got rcady, and they began the work on Sunday morning. Thus Mr Smeaton, in all human probability, faved London-bridge from falling, and fecured it till more effectual methods could be taken.
'I'he valt variety of mills which Mr Smeaton conftructed, fo greatly to the fatisfaction and advantage of the owners, will fhow the great ufe which he made of his experiments in 1752 and 1753 ; for he never trufted to theory in any cafe where he could have an opportunity to invefticrate it by experiment. He built a fteam engine at Aufthorpe, and made experiments thereon, purpofely to afcertain the power of Newcomen's fteam engine, which he improved and brought to a far greater degree of perfection, both in its conftruction and powers, than it was before.

Mr Smeaton during many years of his life was a frequent attendant on parliament, his opinion being continually called for ; and here his Atrength of judgment and perfpicuity of expreffion had its full difplay : it was his conftant cuftom, when applied to, to plan or fupport any meafurc, to make himfelf fully acquainted with it, to fee its merits before he would engage in it : by this caution, added to the clearnefs of his defeription and the integrity of his heart, he feldon failed to obtain for the bill which he fupported an act of parliament. No one was heard with more attention, nor had any one ever more confidence placed in his teftimony. In the courts of law he had feveral compliments paid him from the bench by Lord Mansfield and others, for the new light which he threw on difficult fubjects.

About the year \({ }^{7} 795 \mathrm{Mr}\) Smeaton's health began to decline; and he then took the refolution to endeavour to avoid all the bufincfs he could, fo that he might have leifure to pablifh an account of his inventions and works, which was certainly the firft wifh of his heart ; for he has often been heard to fay, that "he thought he could not render fo much fervice to his country as by doing that." He got only his account of the Eddyftone lighthoufe completed, and fome preparations to his intended Treatife on Mills; for he could not refit the folicitations of his friends in various works : and Mr Aubert, whom he greatly loved and refpected, being chofen chairman of Ramfgate harbour, prevailed upon him to accept the place of engineer to that harbour; and to their joint efforts the public is chiefly indebted for the improvements that have been made there within thefe few years, which fully appears in a seport that Mr Smeaton gave in to the board of truftees in 1791, which they immediately publifhed.

Mr Smeaton being at Aufthorpe, walking in his
garden on the 16 th of September 1792, was ftuck with Smeation the palfy, and died the 28th of October. "In his illnefs (fays Mr Holmes) I had feveral letters from him, Sm- ling. figned with his name, but written and figned by another's pen ; the diction of them fhowed the ftrength of his mind had not left him. In one written the 26 th of September, after minutely defcribing his health and: feclings, he fays, ' in confequence of the foregoing, I conclude myfelf nine-tenths dead ; and the greateft favour the Almighty can do me (as I think), will be to complete the other part ; but as it is likely to be a lingering illnefs, it is only in His power to fay when that is likely to happen."

Mr Smeaton had a warmth of expreffion that might appear to thofe who did not know him well to border on harfhnefs ; but thofe more intimately acquainted with him, knew it arofe from the intenfe application of his mind, which was always in the purfuit of truth, or engaged in inveftigating difficult fubjects. He would fometimes break out haftily, when any thing was faid that did not tally with his ideas; and he would not give up any thing he argued for, till his mind was convinced by found reafoning.

In all the focial duties of life he was exemplary ; he was a molt affectionate hufband, a good father, a warm, zealous, and finccre friend, always ready to affift thofe he refpected, and often before it was poinied out to him in what way he could ferve them. He was a lover and encourager of merit wherever he found it; and many men are in a rreat meafure indebted to his affiftance and advice for their prefent fituation. As a companion, he was always entertaining and inftuctive; and none could fpend any time in his company withous: improvement.

SMELL, ODOUR, with regard to the organ, is an: impreffion made on the nofe by little particles continually exhaling from odorous bodies: With regard to the object, it is the figure and difpofition of odorous effluvia, which, fticking on the organ, cxcite the fenfe of fmelling: And with regard to the foul; it is the perception of the impreffion of the object on the organ, or the affection in the foul refulting therefrom. See Anatomy, \({ }^{\circ}\) I40; and Metaphysics.

SNELLING, the act whereby we perceive fmells, or whereby we become fenfible of odorous bodies, by means of certain effluvia thereof; which, ftriking on the olfactory organ, brifkly enough to have their impulfe propagated to the brain, excite a fenfation in the fonl. The principal organs of fmelling are the noftrils and the olfactory nerves; the minute ramifications of which latter are diffributed throughout the whole concave of the former. For their defcriptions, fee AnatoMY.

Smelling is performed by drawing into the noftrils the odorous efluvia floating in the air in infpiration, which flrike with fuch force againft the fibrillæ of the olfactory nerves, which the figure of the nofe, and the fituation of the little bones, render oppofitc thereto, as to thake them, and give them a vibratory motion; which action, being communicated lience to the common fenfory, occafions an idea of a fweet, or fetid, or four, or an aromatic, or a putrefied object, \&c. The matter in animals, vegetables, foffils, \&c. which chiefly affects the fenfe of fmelling, Boerhaave obferves, is that fubtile fubitance, inherent in their oily parts,

\section*{S M E}

Smelling called Birits: becaufe, when this is taken away from the moft fragrant bodies, what remains hes farce any fmell at all; but this, poured on the moft inodorous bodies, gives them a fragrancy.

Willis obferves, that brutes have generally the fenfe of fmelling in much greater perfection than man : by this alone they diftinguifh the qualities of bodies, which could not otherwife be known; hunt out their food at a great diftance, as hounds and birds of prey; or hid among other fubtances, as ducks, \&c. Man, having other means of judging of his food, \&c. did not need fo much fagacity in his nofe; yet have we inftances of a great deal even in man. In the Hifoire des Antilles, we are affured there are negroes who, by the fmell alone, can diftinguifh between the footfteps of a Frenchman and a negro. It is found, that the laminæ, wherewith the upper part of the noftrils is fenced, and which ferve to receive the divarications of the olfactory nerves, are always longer, and folded up together in greater numbers, as the animal has this fenfe more acute: the various windings and turnings of thefe laminre detaining the odoriferous particles.

The fenfe of fmelling may be diminifhed or deftroyed by difeafes ; as by the moifture, drynefs, inflammation, or fuppuration of the olfactory membrane, the compreffion of the nerves which fupply it, or fome fault in the brain itfelf at their origin. A defect, or too great a degree of folidity of the fmall fpengy bones of the upper jaw, the caverns of the forehead, \&c. may likewife impair this fenfe; and it may be alfo injured by a collection of fetid matter in thefe caverns, which is continually exhaling from them, and alfo by immoderate ufe of fnuff. When the nofe abounds with moifture, after gentle evacuations, fuch things as tend to take off irritation and coagulate the thin fharp ferum may be applied; as the oil of anife mixed with fine flour, camphor diffolved in oil of almonds, \&c. the vapours of amber, frankincenfe, gum-maftic, and benjamin, may likewife be received into the nofe and mouth. For moittening the mucus when it is too dry, fome recommend fnuff made of the leaves of marjoram, mixed with oil of amber, marjoram, and anifeed; or a tternutatory of calcined white vitriol, twelve grains of which may be mixed with two ounces of marjoram water and filtrated. The fteam of vinegar upon hot iron, and received up the noftrils, is alfo of ufe for foftening the mucus, removing ob?tructions, \&c. If there be an ulcer in the nofe, it ought to be dreffed with fome emollient ointment, to which, if the pain be very great, a little laudanum may be added. If it be a venereal ulcer, 12 grains of corrofive fublimate may be diffolved in a pint and a half of brandy, a table fpoonful of which may be taken twice a day. The ulcer ought likewife to be wathed with it, and the fumes of cimnabar may be received up the noftrils.

If there be reafon to fufpect that the nerves which fupply the organs of fmelling are inert, or want fimulating, volatile falts, or ftrong fnuffs, and other things which occafion fneezing, may be applied to the nofe; the forchead may likewife be anointed with balfam of Peru, to which may be added a little oil of amber.

SMELT, in ichthyolo y. See Salmo.
SMELITING, in metallurgy, the fufion or melting of the ores of metals, in order to feparate the metalline
part from the earthy, fony, and other parts. See Metallurgy, Part III.

SMEW, in ornithology. See Mergus.
SMILAX, rough bindweed, in botany : A genus of plants belonging to the clats of diactia and order of bexandria; and in the natural fyftem ranging under the 1 th order, Sarmentacea. The male calyx is hexaphyllous, and there is no corolla; the female calyx is alfo hexaphyllous, without any corolla : there are three ftyles, a trilocular berry, and two feeds. There are is fpecies; the afpera, excelfa, zeilanica, farfaparilla, china, rotundifulia, laurifulia, tannoiges, caduca, bona nox, herbacea, tetragona, lanceolata, and pfeudochina. Of thefe, the fmilax farfaparilla, which affords the farfaparilla root, is the moft valuable. This is well defcribed in the London Medical Journal by Dr Wright, who, during a long refidence in Jamaica, made botany his peculiar Atudy.
"This fpecies (fays he) has ftems of the thicknefs of a man's finger : they are jointed, triangular, and befet with crooked fpines. The leaves are alternate, fmooth and hining on the upper fide ; on the other fide are three nerves or coftr, with fundry fmall crooked fpines. The flower is yellow, mixed with red. The fruit is'a black berry, containing feveral brown feeds.
"Sarfaparilla delights in low moitt grounds and near the banks of rivers. The roots run fuperficially under the furface of the ground. The gatherers have only to loofen the foil a little, and to draw out the long fibres with a wooden hook. In this manner they proceed till the whole root is got out. It is then cleared of the mud, dried, and made into bundles.
" The fenfible qualities of farfaparilla are mucilaginous and farinaceous, with a flight degree of acrimony. The latter, however, is fo flight as not to be perceived by many; and I am apt to believe that its medicinal powers may fairly be afcribed to its demulcent and farinaceous qualities.
"Since the publication of Sir William Fordyce's paper on Sarfaparilla in the Medical Obfervations and Inquiries, Vol. I. farlaparilla has been in more general ufe than formerly. The planters in Jamaica fupply their eftates with great quantities of it ; and its exhibition has been attended with very happy confequences in the yawsand in venereal affections; as nodes, tophi, and exoftofis; pains of the bones, and carious or cancerous ulcers.
"Sir William Fordyce feems to think farfaparilla a fpecific in all ftages of lues; but from an attentive and careful obfervation of its cffects in fome thoufands of cafes, I muft declare I could place no dependence on farfaparilla alone. But if mercury had formerly been tried, or was ufed along with farfaparilla, a cure was foon effected. Where the patients had been reduced by pain, diforder, and mercury, I prefcribed a decoction of farfaparilla, and a table-fpoonful of the powder of the fame, twice a day, with the greateft fuccefs, in the moft deplorable cafes of lues, ill-cured yaws, and carious or ill-difpofed fores or cance"s."

The china, or oriental fpecies of china root, has roundifh prickly ftalks and red berries, and is a native of China and Japan. The pfeudo china, or occidental fpecies, has rounder fmooth flalks and black berries, grows wild in Jamaica and Virginia, and bears the colds of our own climate.

Thefe

\section*{S M I [ 545.] S M I}

Thefe roots have fcarce any fmell or particular tafte: when frefh, they are faid to be fomewhat acrid, hut as brought to us they difcover, even when long. chewed, no other than a light unctuofity in the mouth. Boiled in water, they impart a reddifh colour, and a kind of vapid foftnefs: the decoction when infpiffated yields an unctuons, farinaceous, alnoft infipid mafs, amounting to upwards of half the weiglit of the root. They give a gold yellow tincture to rectified fpirit, but make no fenfible alteration in its tafte : on drawing off the firit from the filtered liquor, there remains an orange-coloured extraet, nearly as infipid as that obtained by water, but fcarcely in half its quantity.

China root is generally fuppofed to promote perfpiration and urine, and by its foft unetuous quality to bluut acrimonious lumours. It was firft introduced into Europe about the year 1535 , with the character of a Specific againt venereal diforders: the patient was kept warm, a weak decoction of china root was ufed for common drink, and a flronger decoction taken twice a day in bed to promote a fweat. Such a reginen is coubtlefs a good auxiliary to mercurial alteratives: but whatever may be its effects in the warmer climates, it is found in this to be of itfelf greatly infufficient. At prefent the china root is very rarely made ufe of, having, for fome time given place to farfaparilla, which is fuppofed to be more effectual. Profper Alpinus informs us, that this root is in freat efteem among the Egyptian women for procuring fatnefs and plumpnefs.

SMI'1'H (Sir Thomas), was born at Walden in Er. fex in 1512 . At 14 he was fent to Queen's college Cambridge, where he diftinguifhed himfelf fo much, that he was made Henry VIII.'s fcholar together with John Cheke. He was chofen a fellow of his college in 153 I , and appointed two years after to read the public Greek lecture. The common mode of reading Greek at that time was very faulty; the fame found being given to the letters and diphthongs \(i, n, v, u, 0, v\). Mr Smith and Mr Cheke had been for fome time fenfible that this pronunciation was wrong: and after a good deal of confultation and refearch, they agreed to introduce that' mode of reading which prevails at prefent. Mr Smith was lecturing on Arifotle de Republica in Greek. At firlt he dropped a word or two at intervals in the new pronunciation, and fometimes he would ftop as if he had committed a miftake and correct him. felf. No notice was taken of this for two or three days; but as he repeated more frequently, his audience began to wonder at the unufual founds, and at laft fome of his friends mentioned to him what they had remarked. He owned that fomething was in agitation, but that it was not yet fufficiently digefted to be made public. They entreated him earnefly to difcover his project: he did fo; and in a fhort time great numbers reforted to him for information. The now pronunciation was adopted with enthufiafm, and foon became univerfal at Cambridge. It was afterwards oppofed by biflop Gardiner the chancellor; but its fuperiority to the old mode was fo vifible, that in a few years it fpread over all England.
in 1539 he travelled into foreign countries, and ftu. died for fome time in the univerfities of France and Itasy. On his return he was made regins profeffor of ciwill law at Cambridge. About this time he publifhed a Vol. XVII. Part II.
treatife on the mode of pronouncing Englifh. He was ufeful likewife in promoting the reformation. Having gone into the family of the duke of Someriet, the protector during the minority of Edivard VI. he was employed by that nobleman in public affairs; and in 1548 was made fecretary of ftate, and received the honour of knighthood. While that nobleman continued in office, he was fent ambaffador, firft to Bruffets and afterwards to France.

Upon Mary's acceffion he loft all his places, but was fortunate enough to preferve the friendhip of Gardiner and Borner. He was exempted from perfecution, and was allowed, probably by their influence, a penfion of L. 100. During Elizabeth's reign he was employed in public affairs, and was fent three times by that princefs as her ambaffador to France. He died in 1577. His abilities were excellent, and his attainments uncommonly great: He was a philofopher, a phyfician, a chemit, mathematician, linguift, hiftorian, and architect. He wrote, 1. A treatife called the Englif Commonwealth. 2. A letter De Recia et Emendata Lingua Gracie Pronunciatione. 3. De Moribus Turcarum. 4. De Drui* dum Moribus.

Smith (Edinund), a diftinguifhed Englifh poet, the only fon of Mr Neale an eminent merchant, by a daugh . ter of baron Lechmere, was born in 1668 . By his father's death he was left young to the care of Mr Smith, who had married his father's fitter, and who treated him with fo much tendernefs, that at the death of his generous guardian he affumed his name. His writings are not many, and thofe are fcattered about in mifcellanies and collections: his celebrated tragedy of Phædra and Hippolitus was acted in r707; and being introduced at a time when the Italian opera fo much engroffed the polite world, gave Mr Addifon, who wrote the prologue, an opportunity to rally the vitiated tafte of the public. However, netwithftanding the efteem it has always been held in, it is perhaps rather to be confidered as a fine poem than as a good play. This tragedy, with a Poem to the memory of Mr John Philips, three or four Odes, with a Latin oration fpoken at Oxford in loudem Thoome Bodleii, were publifhed as his works by his friend Mr Oldifworth. Mr Smith died in 1710, funk into indolence and intemperance by poverty and difappointments; the lard fate of many a man of genius.

Smith (John), an excellent mezzotinter, flourifhed about 1700; but neither the time of his birth nor death are accurately known. He united foftnefs with ftrength, and finifhed with freedom. He ferved his time with one Tillict a painter in Moorfields; and as foon as he became lis own matter, learned from Becket the fecret of mezzotinto, and being farther inftructed by Van der Vaart, was taken to work in Sir Godfrey Kneller's houfe ; and as he was to be the publifher of that mafter's works, doubtlefs received confiderable hints from him, which he amply repaid. "To pofterity perhaps his prints (fays Mr Walpole) will carry an idea of Walpole's fomething burlefque; perukes of an enormous length Catalogue flowing over fuits of armour, compofe wonderful habits. of EngraIt is equally ftrange that fafhion could introduce the vers. one, and ellablifh the practice of reprefenting the other, when it was out of fathion. Smith excelled in exhibiting both, as he found them in the portraits of Knel-

3 Z

\section*{S M I [ 546 ] S M I} mour. In the Kit-cat club he has poured full bottoms chiefly over night-gowns. If thofe ftreams of hair were incommode in a battle, I know nothing (he adds) they were adapted to that can be cone in a night-gown. Smith compofed two large volumes, with proofs of his own plates, for which he afked L. 50 . His fineft works are duke Schomberg on horfeback; that duke's fon and fuccelfor Maynhard; the earls of Pembroke, Dorfet, and Albemarle; three plates with two figures in each, of young perfons or chitdren, in which be fhone; William Cowper; Gibbons and hiṣ wife; Queen Anue; the duke of Gloucefter, a whole length, with a flowerpot; a very curious one of Queen Mary, in a high head, fan, and gloves; the earl of Godolphin ; the d:ichefs of Ormond, a whole length, with a black; Sir George Rooke, \&ic There is a print by him of James II. with an anchor, but no infeription; which not being finiked when the king went away, is fo fearce that it is fometimes fold for above a guinea. Smith alfo performed many hiftoric pieces ; as the loves of the gods, from Titian, at Blenlieim, in ten plates; Venus ftanding in a fhell, from a picture by Correggio, and many more, of which perhaps the moft delicate is the holy family with angels, after Carlo Maratti."

SMITH (Dr Adam), the celebrated author of the Pbilofopkical Tranfictions Inquiry into the Nature and Caufes of the Wealth of of the thoyal Nations, was the only fon of Adam Smith comptroller Society of Edinburgh, vo!, ii. of the cuftoms at Kirkaldy, and of Margaret Douglas daughter of Mr Douglas of Strathenry. He was born
at Kirkaldy on the 5 th June 1723 , a few morths after the death of his father. His conftitution during his infancy was infirm and fickly, and required all the care of his furviving parent. When only three years old he was carried by his mother to Strathenry on a vifit to his uncle Mr Douglas; and happening one day to be amuing himfelf alone at the door of the houfe, he was ftolen by a party of thofe vagrants who in Scotland are called tinkers. Luckily he was miffed immediately, and the vagrants purfued and overtaken in Leflie wood; and thus Dr Smith was preferved to extend the bound's of fcience, and reform the commercial policy of Europe.

He received the rudiments of his education in the fchool of Kirkaldy under David Miller, a teacher of confiderable eminence, and whofe name deferves to be recorded on account of the great number of eminent men which that feminary produced while under his direction. Dr Smith, even while at fchool, attrakted notice by his paffionate attachment to books, and by the extraordinary powers of his memory; while his friendly and generous difpofition gained and fecured the affection of his fchoolfellows. Even then he was remarkable for thofe habits which remained with him through life, of fpeaking to himfelf when alone and of abfence in company. He was fent in 1737 to the univerfity of Glafrow, where he remained till 1740, when he went to Baliol collepe Oxford, as an exhibitioner on Snell's foundation. His favourite purfuits while at the univerfity were mathematics and natural philofophy. Af. ter his removal to England he frequently employed himfelf in tranlating, particularly from the French, with a view to the improvement of his own ftyle: a practice which he often recommended to all who wifhed to cul.
tivate the art of compofition. It was probatly then a' Amit fo that he applied hinfelf with the greateft care to the ftudy of lan ruages, of which, both ancient and modern, his knowledge was uncommonly extenfive and accurate.

After feven years refidence at Oxford he returned to Kirkaldy, and lived two years with his mother without any fixed plan for his future life. He had been defigned for the church of England; but difiiking the eccle. fiaftical profeffion, he refolved to abandon it alcogether, and to limpit his ambition to the profpect of obtaining fome of thofe preferments to which literaty attainments lead in Scotland. In 1748 he fixed his refidence in Edinburgh, and for three years read a courfe of lectures on rhetoric and belles lettres under the patronage of Lord Kames. In 17.5 r he was elected profeffor of lo. gic in the univerlity of Glafrow, and the year follow. ing was removed to the profefforfhip of moral phi. lofophy, vacant by the death of Mr Thomas Ciaigis the immediate fucceffor of Dr . Hutchefon. In this fituation he remained 13 years, a period he ufed frequently to look back to as the moft uffel part of his life. His lectures on moral philofophy were divided into four parts: - The firlt contained natural theology; in which he confidered the proofs of the being and attributes of God, and thofe truths on which relipion is founded : the fecond comprehended etlics, ftrictly fo called, and confifted chiefly of thofe doctrines which he afterwards publifhed in his theory of moral fentiments: in the third part he treated more at length of that part of morality called jufice; and which, being fufceprible of precife and accurate rules, is for that reafon capable of a full and accurate explanation: in the lait part of his. lectures he examined thofe political regulations which are founded, not upon the principle of jultice, but of expediency; and which are calculated to increale the riches, the power, and the profperity of a flate. Under this view he confidered the political inftitutions relating to commerce, to finances, to ecclefiaftical and military governments : this contained the fubftance of his Wealth of Nations. In deliverings his lectures he trufted almoft entirely to extemporary elocution: his manner was plain and unaffected, and he never failed to intereft his hearers. His reputation foon rofe very high, and many ftudents reforted to the univerfity merely up* on his account.

When his acquaintance with Mr Hume firlt commenced is uncertain, but it had ripened into friendftip before the year 1752 .

In 1759 he publifhed his Theory of Moral Sentiments; a work which defervedly extended his reputation: for, though feveral of its conclufions be illfounded, it muft be allowed by all to be a fingular effort of invention, ingenuity, and fubtilty. Befides, it contains a great mixture of important truth; and, tho' the author has fometimes been miffed, he has had the merit of directing the attention of philofophers to a view of human nature, which had formerly in a great meafure efcaped their notice. It abounds evcrywhere with the pureft and moft clevated maxims concerning the practical conduct of life; and when the fubject of his work leads him to addrefs the imagination and the heart, the variety and felicity of his illuftrations, the richnefs and fluency of his eloquence, and the fkill with

\section*{S M I [ 547 ] S M O}
ith. Which he wins the attention and commands the paffion of his readers, leave him among our Britih moralifts without a rival.

Towards the end of 1763 Dr Sinith received an invitation from Mr Charles Townfend to accompany the Duke of Buccleugh on his travels; and the liberal terms in which this propofal was made induced him to refign his office at Glafgow. He joined the Duke of Buccleugh at London early in the year 1764 , and fet out with him for the continent in the month of March following. After a ftay of about ten days at Paris, they proceeded to Thouloufe, where they fixed their refidence for about 18 months; thence they went by a pretty extenlive route through the fouth of France to Geneva, where they paffed two months. About Chriftmas 1765 they returned to Paris, and remained there till Oclober following. The fociety in which Dr Smith paffed thefe ten months may be conceived in confequence of the recommendation of Mr Hume. Turgot, Quefnai, Necker, D'Alembert, Helvetius, Marmontel, Madame Riccoboni, were among the number of his acquaintances; and fome of them he continued ever after to reckon among the number of his friends. In October 1766 the duke of Buccleugh returned to England.

Dr Smith fpent the next ten years of his life with lis mother at Kirkaldy, occupied habitually in intenfe ftudy, but unbending his mind at times in the company of fome of his old fchoolfellows, who ftill continued to refide near the place of their birth. In 1776 he publifhed his Inquiry into the Nature and Caufes of the Wealth of Nations; a book fo univerfally known, that any panegyric on it would be ufelefs. The variety, inportance, and (may we not add) novelty, of the infor mation which it contains ; the fill and comprehenfivenefs of mind difplayed in the arrangement; the admirable illuftrations with which it abounds; together with a plainnefs and perfpicuity which makes it intelligible to all-render it unqueftionably the moft perfect work which has yet appeared on the general principles of any branch of legiflation.

He fpent the next two years of his life in London, where he enjoyed the fociety of fome of the moft eminent men of the age : but he removed to Edinburgh in 1778 , in confequence of having been appointed, at the requeft of the duke of Bucclengl, one of the commiffioners of the cuifoms in Scotland. Here he fpent the laft twelve years of his life in an affluence which was more than equal to all his wants. But his ftudies feemed entirely fufpended till the infirmities of old age reminded him, when it was too late, of what he yet owed to the public and to his own fame The principal materials of the works which he had announced lad long ago been collected, and little probably was wanting but a few years of health and retirement to complete them. The death of his mother, who had accompanied him to Edinburgh in 1784, together with that of his coulin Mifs Douglas in 1788 , contributed to fruftrate thefe projects. They had been thee objects of his affection for more than 60 years, and in their Society he had enjoyed from his infancy all that he ever knew of the endearments of a family. He was now alone and helplefs; and though he bore his lofs with equanimity, and regained apparently his former cheerfulnefs, yet his bealth and itrength gradually declined till the period of
his death, which happened in July. 1790. Some days before his death he ordered all his papers to be burnt except a few effays, which have fince been publifhed.

Surith: 11 Of the originality and comprehenfivenefs of his views; the extent, the variety, and the correctnefs of his information ; the inexhauftible fertility of his invention-he has left behind him lafting monuments. To his private worth, the moft certain of all teftimonies may be found in that confidence, refpect, end attachment, which fol lowed him through all the various relations of life. He was habitually abfent in converfation, and was apt when he fpoke to deliver his ideas in the form of a lecture. He was rarely knowil to fart a new topic himfelf, or to appear unprepared upon thofe topics that were introduced by others. In his external form and appearance there was nothing uncommon. When perfectly at eafe, and when warmed with converfation, his geftures were animated and not ungraceful; and in the fociety of thofe he loved, his features were often brightened by a fmile of inexpreffible benignity. In the company of ftrangers, his tendency to ablence, and perhaps ftill more his confcioufnefs of that tendency, rendered his manners fomewhat embarraffed; an effect which was probably not a little heightened by thofe fpeculative ideas of propriety which his reclufe habits tended at once to perfect in his conception, and to diminifh his power of realizing.

SMITHIA, in botany : A genus of the decandria order, belonging to the diadelpbia clals of plants; and in the natural method ranking under the 32 d order, Papilionacea. The calyx is monophyllous and belabia* ted; the corolla winged; the legumen inclofed in the calyx, with three or four joints, and contain as inary feeds, which are fmooth, compreffed, and kidney-fhaped. There is only one fpecies, viz. the thonina.

SMITZ (Gafpar), who, from painting a great number of Magdalens, was called Mogdalen Smith, was a Dutch painter, who came to England foon after the Reftoration. For thefe portraits fat a woman that he kept, and called his wrife. A lady, whom he had taught to draw, took him with her to Ireland, where he painted fmall portraits in oil, had great bufinefs, and high prices. His flowers and fruit were fo much admired, that one bunch of grapes fold there for L. 40 . In his Magdalens he generally introduced a thiftle on the fore ground. He had feveral fcholars, particularly Maubert, and one Gawdy of Exeter. Yet, notwithftanding his fuccefs, he died poor in Ireland in 1707.

SMITHERY, a fmith's fhop; alfo the art of a fmith, by which iron is wrought into any fhape by means of fire, hammering, filing, \&c.
SMITING-L1NE, in a fhip, is a fmall rope faftened to the mizen-yard-arm, below at the deck, and is always furled up with the mizen-fail, even to the upper end of the yard, and thence it comes down to the poop. Its ufe is to loofe the mizen-fail without friking down the yard, which is eafily done, becaufe the mizen-fail is furled up only with rope-yarns; and therefore when this rope is pulled hard, it breaks all the rope-yarns, and fo the fail falls down of itfelf. The failor's phrafe is, \(f\) mite the mizen (whence this rope takes its name), that is, hale by this rope that the fail may fall down.

SMOKE, a denfe elaftic vapour, ariling from burning bodies. As this vapour is extremely difagreeable to the fenfes, and often prejudicial to the health, man-

\section*{S M O \(\quad\left[\begin{array}{ll}54^{8} & ]\end{array} \mathrm{S}\right.\) M O}
kind have fallen npon feveral contrivances to enjoy the benefit of fire, without being annoyed by fmoke. The moft univerfal of thefe contrivances is a tube leading from the chamber in which the fire is kindled to the top of the building, through which the fmoke afcends, and is difperfed into the atmofphere. Thele tubes are called chimmeys ; which, when conftructed in a proper manner, carry off the fmoke entirely; but, when improperly conftructed, they carry off the fmoke inperfectly, to the great amoyance of the inhabitants. As our maforis at prefent feem to have a very imperfect knowledge of the manner in which chimneys ought to be built, we can hardly perform a more acceptable fervice to the public than to point out the manner in which they ought to be conitructed, fo as to carry off the fmoke entirely; as well as to explain the caufes from which the defects fo often complained of generally proceed, and the method of removing them.
Thofe who would be acquainted with this fubject, fhould begin by confidering on what principle fmoke afcends in any chirnney. At firt many are apt to think that fmoke is in its nature, and of itfelf, fpecifically lighter than air, and rifes in it for the fame reafon that cork rifes in water. Thefe fee no caufe why fmoke fould not rife in the chimney though the room be ever fo clofe. Others think there is a power in chimneys to draze up the fmoke, and that there are different forms of chimneys which afford more or lefs of this power. Thefe amufe themfelves with fearching for the beft form. The equal dimenfions of a funnel in its whole length is not thought artificial enough, and it is made, for fancied reafons, fometimes tapering and narrowing from below upwards, and fometimes the contrary, \&c. \&c. A fimple experiment or two may ferve to give more correct ideas. Having lighted a pipe of tobacen, plunge the feni to the bottom of a decanter half filled with cold water; then putting a rag over the bowl, blow through it, and make the fmoke defcend in the ftem of the pipe, from the end of which it will rife in bubbles through the water; and being thus cooled, will not afterwards rife to go out through the neck of the decanter, but remain fpreading itfelf and refting on the furface of the water. This fhows that fmoke is reaily heavier than air, and that it is carried upwards only when attached to or acted upon by air that is heated, and thereby rarefied and rendered feccifically lighter than the air in its neighbourhood.

Smoke being rarely feen but in company with heated air, and its upward motion being vifible, though that of the sarefied air that drives it is not fo, has naturally given rife to the error. It is now well known that air is a fluid which has weight as well as others, though about 800 times lighter than water; that heat makes the particles of air recede from each other, and take up more fpace, fo that the fame weight of air heated will have more bulk than equal weights of cold air which may furround it, and in that cafe mult rife, being forced upwards by fuch colder and heavier air, which preffes to get under it and take its place. That air is fo rarefied or expanded by heat, may be proved to their comprehenfion by a lank blown bladder, which laid before a fire, will foon fwell, grow tight, and burf.

Another experiment may be to take a glafs tube about an inch in diameter, and 12 inches long, open at both ends, and fixed upright on legs fo that it need not
be handled, for the hands might warm it. At the end of a quill faften five or fix inches of the fucit light filament of filk, fo that it may be held either above the upper end of the tube or under the lower end, your warm hand being at a dittance by the length of the quill. If there were any motion of air through the tube, it wrould manifelt itfelf by its effect on the filk; but if the tube and the air in it are of the fame temperature with the furrounding air, there will be no fuch motion, whatever may be the form of the tube, whether crooked or ftraight, narrow below and widening upwards, or the contrary, the air in it will be quiefcent. Warm the tube, and you will find as long as it continues warm, a conftant current of air entering below and paffing up through it till difcharged at the top; becaufe the warmth of the tube being communicated to the air it contains, rarefies that air, and makes it lighter than the air wichout; which therefore preffes in below, forces it upwards, follows and takes its place, and is rarefied in its turn. And, without warming the tube, if you hold under it a knob of hot iron, the air thereby heated will rife and fill the tube, going out at its top; and this motion in the tube will continue as long as the knob remains hot, becaufe the air entering the tube below, is heated and rarefied by paffing near and over that knob.

That this motion is produced merely by the difference of fpecific gravity between the fluid withis and that without the tube, and not by any fancied form of the tube itfelf, may appear by plunging it into water contained in a glafs jar a foot deep, through which fuch motion might be feen, The water within and without the tube being of the fame fpecific gravity, balance each other, and both remain at reft. Mut take out the tube, fop its bottom with a firger, and fill it with olive oil, which is lighter than water; then ftopping the top, place it as before, its lower end under water, its top a very little above. As long as you keep the bottom ftopped the fluids remain at reft; but the moment it is unftopt, the heavier enters below, forces up the lighter, and takes its place: and the motion then. ceafes, merely becaufe the new fluid cannot be fucceffively made lighter, as air may be by a warm tube.

In fact, no form of the funnel of a chimney has any thare in its operation or effect refpecting fmoke except its height. 'The longer the funnel, if erect, the greater its force when filled with heated and rarefied air to draw in below and drive up the fmoke, if one may, in compliance with cuftom, ufe the expreffion draw, when in fact it is the fuperior weight of the furrounding atmofphere that preffes to enter the funnel below, and to drives up before it the fmoke and warm air it meets with in its paffage.

What is it then which makes a fmoky chimney, that is, a chimney which, inftead of conveying up all the fmoke, dilcharges a part of it into the room, offending the eyes and damaging the furniture?
'The caufes of this effect may be reduced to nine, differing from each other, and therefore requiring different. remedies.
1. Smoky chimneys in a new boufe are fuch frequently from mere zuant of air. The workmanhip of the rooms being all good, and juft out of the workman's hands, the joints of the boards of the flooring, and of the pannels of wainfotting, are all true and tight; the more fo as

\section*{S M O}
oke. the walls, perhaps not yet thoroughly dry, preferve a dampnefs in the air of the room which keeps the woodwork fwelled and clofe. The doors and the fafhes too, being worked with truth, fhut with exactnefs, fo that the room is as tight as a fnuff-box, no paffage being left open for air to enter except the key-hole, and even that is fometimes covered by a little dropping fhutter. Now if fmoke cannot rife but as connected with rarefied air, and a column of fuch air, fuppofe it filling the funnel, cannot rife unlefs other air be admitted to fup. ply its place; and if therefore no current of air enter the opening of the chimuey-there is nothing to prevent the fmoke from coming out into the room. If the motion upwards of the air in a chimney that is freely fupplied be obferved by the rifing of the fmoke or a feather in it, and it be conlidered that in the time fuch feather takes in rifing from the fire to the top of the chimney, a column of air equal to the content of the funnel muft be difcharged, and an equal quantity fupplied from the room below, it will appear abfolutely impoffible that this operation fhould go on if the tight room is kept thut; for were there any force capable of drawing conftantly fo much air out of it, it muft foon be exhaufted like the receiver of an air-pump, and no animal could live in it. Thofe therefore who ftop every crevice in a zoom to prevent the admiffion of frefh air, and yet would have their chimney carry up the fmoke, require inconfiftencies, and expect impoffibilities, Yet under this fituation it is not uncommon to fee the owner of a new houfe in defpair, and ready to fell it for much lefs than it coft ; conceiving it uninhabitable becaufe not a chimney in any one of its rooms will carry off the fmoke unlefs a door or window be left operr. Much expence has alfo been made to alter and amend new chimneys which had really no fault : in one houfe particularly which Dr Franklin knew that belonged to a nobleman in Weftminfter, that expence amounted to no lefs than L. 300, after his houfe had been, as he thought, finifhed and all charges paid. And after all, feveral of the alterations were ineffectual, for want of enderftanding the true principles.

Remedies. When you find on trial that opening the door or a window enables the chimney to carry up all. the fmoke, you niay be fure that want of air from without was the caufe of its fmoking. "I fay from with. out (adds Dr Franklin), to guard you againtt a common mittake of thofe who may tell yon the room is large, contains abundance of air fufficient to fupply any chimney, and therefore it cannot be that the chimney wants air. Thefe reafoners are ignorant that the largenefs of a room, if tight, is in this cafe of fmall import. ance, fince it cannot part with a chimney full of its air without occafioning fo much vacuum ; which it requires a great force to effect, and could not be borne if ef. fected."

It appearing plainly then, that fome of the outward air mult be adimitted, the queftion will be, how much is abfolutely neceffary? for you would avoid admitting more, as being contrary to one of your intentions in having a fire, viz. that of warming your room. To difcover this quantity, fhut the door gradually while amiddling fire is burning, till you find that before it is. guite fhut the fmoke begins to come out into the :oom; then open it a little till you perceive the fmoke comes out no longer. There hold the door, and abferve the
width of the open crevice between the edge of the door Smoke. and the rabbet it fhould fhut into. Suppofe the diftance to be half an inch, and the door eight feet high; you find thence that your room requires an entrance for air equal in area to 96 half inches, or 48 fquare inches, or a paffage of 6 inches by 8 . This, however, is a large fuppofition; there being few chimneys that, having a moderate opening and a tolerable height of funnel, will not be fatisfied with fuch a crevice of a quarter of an inch: Dr Franklin found a fquare of 6 by 6, or 36 fquare inches, to be a pretty good medium that will ferve for moft chimneys. High funnels with fmall and low openings may indeed be fupplied through a lefs fpace; becaufe, for reafons that will appear hereafter, the force of levity, if one may fo fpeak, being greater in fuch funnels, the cool air enters the room with greater velocity, and confequently more enters in the fame time. This, however, has its limits; for experience fhows, that no increafed velocity fo occafionedhas made the admiffion of air through the key-hole equal in quantity to that through an open door, though through the door the current moves flowly, and through the key-hole with great rapidity.

It remains then to be confidered, how and where this neceffary quantity of air from without is to be admitted fo as to be lealt inconvenient: for if at the door . left fo much open, the air thence proceeds directly tothe climney, and in its way comes cold to your back and heels as you fit before your fire. If you keep the door thut, and raife a little the fath of your window, you feel the fame inconverience. Various have been the contrivances to avoid this; fuch as bringing in frefh air through pipes in the jams of the chmmey, which pointing upwards fhould blow the fmoke up the funnel;opening paffages into the funnel above, to let in air for the fame purpofe. But thefe produce an effect contrasy to that intended: for as it is the conftant current of air pafing from the room through the opening of the chimney into the funnel which prevents the fmoke from coming out into the room, if you fupply the funnel: by other means or in other ways with the air which it wants, and efpecially if that air be cold, you diminifh the force of that current, and the fmoke in its efforts to enter the room finds lefs refiftance.

The wanted air muft then indifpenfably be admitted: into the room, to fupply what goes off through the opening of the chimney. M. Gauger, a very ingenious. and intelligent French writer on the fubject, propofes with judgment to admit it above the opening of the chimney; and to prevent inconvenience from its colelnefs, he directs that it may be fo made, that it fhall: pals in its entrance through winding cavities made behind the iron back and fides of the fire-place, and under the iron hearth-plate; in which cavities it will be warmed, and even heated, fo as to contribute much, inftead of cooling, to the warming of the room. This invention is excellent in itfelf, and may be ufed with: advantage in building new houfes; becaufe the chimneys may then be fo difpofed as to admit conveniently: the cold air to enter fuch paffages : but in houfes built without fuch views, the chimneys are often fo fituated as not to afford that convenience without great and expenfive alterations. Eafy and cheap methods, though: not quite fo perfect in themfelves, are of more general utility ; and fuch are the following.

\section*{S M O}

Smoke.
 warmed and rarefied before the chimney is continually charging place, and making room for other air that is to be warmed in its tum. Part of it enters and goes up the chimney, and the reft fifes and takes place near the ceiling. If the room be lofty, that warm air remains above our heads as long as it continues warm, and we are little benefited by it, becaufe it does not defend till it is cooler. Few can imagine the difference of climate between the upper and lower parts of fuchs a room, who have not tried it by the thermometer, or \(\mathrm{bft}_{\mathrm{f}}\) going up a ladder till their heads are near the ceiling. It is then among this warm air that the wanted quant. sty of outward air is beet admitted, with which being mixed, its coldnefs is abated, and its inconvenience diminified fo as to become farce obfervable. This may be eaflly done by drawing down about an inch the upper faith of a window; or, if not moveable, by cutting fuck a crevice through its frame; in both which cafes it will be well to place a thin Shelf of the length to conceal the opening, and floping upwards, to direct the entering air horizontally along and under the ceiling. In forme houfes the air nay be admitted by foch a crevice made in the wainscot, comice, or flattering, near the ceiling and over the opening of the chimney. This, if practicable, is to be chofen, because the entering cold air will there meet with the warmeft riling air from before the fire, and be fooneft tempered by the mixture. The fame kind of shelf should alfo be placed here. Another way, and not a very difficult one, is to take out an upper pane of glass in one of your fafhes, feet it in a tin frame, giving it two fringing angular fides, and then replacing it, with hinges below on which it may be turned to open more or le ls above. It will then have the appearance of an internal nsy-light. By drawing this pane in, more or less, yon may admit what air you find neceffary. Its pofition will naturally throw that air up and along the ceiling. 'This is what is called in France a Was if das? As this is a German queftion, the invention is probably of that nation, and takes its name from the frequent anking of that queftion when it frt appeared. In England fome have of late years. cut a round hole about five inches diameter in a pane of the fash and placed againft it a circular plate of tin hung on an axis, and cut into vanes; which, being feparately bent a little obliquely, are acted upon by the entering air, fo as to force the plate continually round like the vanes of a windmill. This admits the outward air, and by the continual whirling of the vanes, does in forme degree difperfe it. The noife only is a little inconvenient.
2. A fecond cause of the fmoking of chimneys is, their openings in the room being too large; that is, too wide, too high, or both. Architects in general have no other ideas of proportion in the opening of a chimney than what relate to fymmetry and beauty refpecting the dimenfions of the room; while its true proportion respecting its function and utility depends on quite other principles; and they might as -properly proporton the step in a ftaircafe to the height of the flory, inftead of the natural elevation of mans legs in mounting. The proportion then to be regarded, is what relutes to the height of the funnel. For as the funnels in the different stories of a house are neceffarily of diffevent heights or lengths, that from the loweft floor be.
ing the highest or longeft, and thole of the other floors shorter and Porter, till we we come to those in the garrets, which are of course the fhorteft ; and the force of draft being, as already fard, in proportion to the height of funnel filled with rarefied air, and a current of air from the room into the chimney, fufficient to fill the opening, being neceffary to oppofe and prevent the smoke from coming out into the room; it follows, that the openings of the longeft funnels may be larger, and that those of the fhorter funnels fhould be faller. For if there be a large opening to a chimney that does not draw ftrongly, the funnel may happen to be furnifhedwith the air which it demands by a partial current entering on one fide of the opening, and leaving the other fide free of any opposing current, may permit the moke to iffue there into the room. Much too of the force of draft in a funnel depends on the degree of rarefaction in the air it contains, and that depends on the nearnefs to the fire of its paffage in entering the funnel. If it can enter far from the fire on each fides, or far above the fire, in a wide or high opening, it receives little heat in paling by the fire, and the contents of the funnel are by there means leis cifferent in levity from the furrounding atmofphere, and its force in drawing confequently weaker. Hence if too large an opening be given to chamneys in upper rooms, thole rooms will be fmoky: On the other hand, if too mail openings be given to chimeneys in the lower rooms, the entering air operating too directly and violently on the fire, and afterwards strengthening the draft as it afcends the funnel, will confume the fuel too rapidly.

Remecty. Ass different circumftances frequently mix themfelves in the fe matters, it is difficult to give precife dimenfions for the openings of all chimneys. Our fathers made them generally much too large: we have lefiened them; but they are often fill of greater dimenfins than they should be, the human eye not being eafill reconciled to fulden and great changes. If you fufpeet that your chimney fmokes from the too great dimenfion of its opening, contract it by placing moveable boards fo as to lower and narrow it gradually till you find the fmoke nolonger iffues into the room. The proportion fo found will be that which is proper for that chimney, and you may employ the bricklayer or matron to reduce it accordingly. However, as in building new houfes fomething mut be fometimes hawarded, Dr Franklin propofes to make the openings in the lower rooms about 30 inches fare and i 8 deep, and thole in the upper only 18 inches fquare and not quite fo deep; the intermediate ones chiminfling in pro* portion as the height of the funnel is diminifhed. In the larger openings, billets of two feet long, or half the common length of cordwood, may be burnt conveniently; and for the faller, fuch wood may be fawed into thirds. Where coals are the fuel, the grates will be proportioned to the openings. The fame depth is nearly neceffary to all, the funnels being all made of a fize proper to admit a chimney-fweeper. If in large and elegant rooms cuftom or fancy fhould require the appearance of a larger chimney, it may be formed of expenfive marginal decorations, in marble, \&c. But in time perhaps, that which is fitteft in the nature of things may come to be thought handfomen.
3. Another cause of fmoky chimneys is too mort a funnel. This happens neceffarily in forme cafes, as where
a chimey is required in a low buidinx ; for, it the funnel be raifed high above the roof, in order to flrength. en its draft, it is then in danger of being blown down, and crufhing the roof in its fall.

Remerties. Contract the opening of the chimney, fo as to oblige all the entering air to pafs through or very near the fire ; wherehy it will be more heated and sarefied, the funnel itfelf be more warmed, and its contents have more of what may be called the force of levity, fo as to rife ftrongly and maintain a good draft at the opening.

Or you may in fome cales, to advantage, build additional Itories over the low building, which will fupport a high funnel.

If the low building be ufed as a kitchen, and a contraction of the opening therefore inconvenient, a larre one being neceffary, at leaft when there are great dinners, for the free management of fo many cooking utenfils; in fuch cafe the beft expedient perhaps would be to build two more funnels joining to the firt, and liaving three moderate openings, one to each funnel, in ftead of one large one. When there is occafion to ufe but one, the other two may be kept Cuut by fliding plates, hereafter to be defcribed; and two or all of them may be ufed together when wanted. This will indeed be an expence, but not an ufelels one, fince your cooks will work with more comfort, fee better thaplit a fmoky kitchen what they are about, your victuads will be cleaner dreffed and not tafte of fmoke, as is of ten the cafe; and to render the effect more certain, a flack of three funnels may be fafoly built higher above the roof than a fingle funnel.

The cafe of too fhort a funnel is more general than would be imagined, and often found where one would not expect it. For it is not uncommon, in ill-contrived buildings, inflead of having a funnel for each room or fire-place, to bend and turn the funvel of an upper room fo as to make it enter the fide of another funnel that comes from below. By thefe means the upper room funnel is made fhort of courfe, fince its length can only be reckoned from the place where it enters the lower room funnel; and that funnel is alfo fhortened by all the diftance between the entrance of the fecond funnel and the top of the ftack : for all that part being readily fupplied with air through the fecond furnel, adds no ftreng th to the draft, efpecially as that air is cold when there is no fire in the fecond chimney. The only eafy remedy here is, to keep the opening of that fumel fhut in which there is no fire.
4. A nother very common caufe of the fmoking of chimneys is, their orerpaverirg one anutber. For inflance, if there be two chimneys in one large room, and yon make fires in both of them, the doors and windows clofe fhut, you will find that the greater and flronger fire fhall overpower the weaker, from the funnel of which it will draw air down to fupply its own demand; which air defcending in the weaker funnel, will drive down its fmoke, and foree it iuto the room. If, inflead of being in one room, the two chimneys are in iwe different rooms, communicating by a door, the cafe is the fame whenever that door is open. In a very tight houfe, \(a^{a}\) kitchen chimney on the loweft floor, when it had a great fire in it, has been known to overpower any other chimney in the houfe, and draw air and fmoke
into its room as often as the door communicating with smoke. the ftai cale was opened.

Renoly. Take care that every room have the means of fupplying itfelf from without with the air which its chimnty may require, fo that no onc of them may be obliged to borrow from another, nor under the neceffity of lending. A variety of thefe means have becn already delcribed.
5. A nother caufe of fmoking is, when the tors of chiv. neys are commanded by bigher luillaings, or by a bill, fo that the wind blowing over fuch eminences falls like water ovar a dam, fometimes almoft perpendicularly on the tops of the chimneys that lie in its way, and beats down the finoke contained in them.

To illultrate this, let A (fir. 3.) reprefent a fmall building at the fide of a great rock B , and the wind coming in the direstion CD; when the current of air comes to the point D , being hurried forward with great velocity, it gees a littlc forward, but foon defcends downward, and gradu lly is reflected more and more in. ward, as reprefented by the dotted lines EE, \&ec. fo that, defcending downwards upon the top of the chimney A, the fmoke is beat back ayrain into the apartments.

It is evident that houfes fituated near high hills or thick woods will be in fome meafure expofed to the fame inconvenience; but it is likewife plain, that if a houfe be fituated upon the flope of a hill (as at F, fig. 3.), it will not be in any danzer of fmoke when the wind blows towards that dide of the hill upon which it is fituated; for the current of air coming over the houfc-top in the direction GH, is immediately chanced by the flope of the hill to the direction HC , which powerfully draws the fmoke upward from the top of the chimney. But it is alfo crident, that a houfe in this fituation will be liable to fmoke when the wind blows from the hill; for the current of air coming do wnward in the direction CH , will heat downward on the chimney \(F\), and prevent the fmoke from afcerding with freedom. The effect will be nutuch heightened if the dours and windows are chiefly in the lowermoft fide of the houre.

Remedy. That commonly applied to this cafe is a turncap made of tin or plate iron, covering the chimney above and on three fides, open on one fide, turning on a fininle; and which being guided or governed by a vane always prefeilts its back to the current. This may be generally effectual, though not certain, as there may be cafes in which it will not fuccced. Raifing your funnels if practicabie, fo as their tops may be hisher, or at leaft equal, with the commanding eminence, is more to be depended on. luat the turning cap, being eafier and cheaper, thould firft be tried. "If obliged to build in fuch a fituation, I wonld choofe (fays Dr Tranklin) to place iny doors on the fide next the hill, and the backs of my chimneys on the fartheft fide; for then the column of air falling over the eminence, and of courfe preffing on that below, and forcing it to enter the doors or was-if-dases on that fide, would tend to balance the preffure down the chimneys, and leave thic funnels more free in the exercife of their functions."
6. There is another cafe which is the reverfe of that last mentioned. It is where the commanding eminence

Snote. is farther from the wind than the chimery commanded. To explain this a figure may be neceflary. Suppofe then a buikding whofe fide \(A B 3\) happens to be expolea to the wind, and forms a kind of dam againt its progrefs. Suppofe the wind blowing in the direction FE. The air obftructed by this diam or building \(\Lambda B\) will like watcr prefs and fearch for paffages through it; but finding none, it is beat back with violence, and fpreads itfelf on every fide, as is reprefented by the curved lines \(e, e, e, e, e, e\). It will therefore force itfelf down the fmall chimney C , in ouder to get through by fome door or window open on the other fide of the, buildins. And if theere be a fire in fuch chinney, its fmoke is of courfe beat down, and fills the room.
Remedy. There ss but one remedy, which is to raife fuch a funnel higher than the roof, fupporting it if neceffary by iron bars. For a turncap in this cafe has no effec, the dammed up air prefing down through it in whatever pofition the wind may have placed its opening.

Dr Franklin mentions a city in which many houfes are rendered fmoky by this operation. For their kitchens being built behind, and connected by a paffage with the houfes, and the tops of the kitchen chimneys lower than the tops of the houfes, the whole fide of a ftreet when the wind blows againft its back forms fuch a dam as above defcribed; and the wind fo obftructed forces down thofe kitchen chimneys (efpecially when they have but weak fires in them) to pafs through the paffage and houfe into the itreet. Kitchen chimneys fo formed and fituated have another inconvenience. In fummer, if you open your upper room windows for air, a light breeze blowing over your kitchen chimney towards the houfe, though not frong enough to torce down its fmoke as aforefaid, is fufficient to waft it into your windows, and fill the rooms with it ; which, befides the difagreeablenefs, damares your fumiture.
7. Chimneys, otherwife drawing well, are fometimes made to fmoke by the improper and inconvenient. Ituation of. a door. When the door and chimney are on the fame fide of the room, if the door being in the corner is made to open againtt the wall, which is common, as being there, when open, more out of the way, it follows, that when the door is only opened in part, a current of air rufhing in paffes along the wall into and acrofs the opening of the chimney, and flirts fome of the finoke out into the room. This happens more certainly when the door is fhutting, for then the force of the current is augmented, and becomes very inconvenient to thofe who, warming themfelves by the fire, happen to fit in its way.

The remedies are obvious and eafy. Either put an intervening fcreen from the wall round great part of the fireplace; or, which is perhaps preferable, fhift the hinges of your door, fo as it may open the other way, and when open throw the air along the other wall.
8. A room that has no fire in its chimney is fome. tines filled with fmoke which is received at the top of its funnel, and defcends into the room. Funnels withont fires have an effect according to their degree of coldnefs or warmth on the air that happens to be contained in them. The furrounding atmofphere is frequently changing its temperature ; but ftacks of funnels covered from winds and fun by the houfe that contains them, retain a more eqqual temperaturc. If, after a warm feafon, the out-
ward air fuddeniy grows cold, the empty warm funnels begin to draw floongly upward; that is, they rarefy the air contained in them, which of couffe rifes, cooler air enters below to fupply its place, is rarefied in its turn, and rifes; and thi operation continues till the funnel. grows cooler, or the outward air warmer, or both, when the motion ceafes: On the other hand, if after a cold feafon the outward air fuddenly grows warm and of courfe lighter, the air contanied in the cool funnels being heavier defcends irto the room; and the warmer air which enters their tops being cooled in its turn, and made heavier, continues to defeend; and this operation goes on till the funnels are warmed by the paffing of warm air thro' them, or the air itfelf grows cooler. When the temperature of the air and of the funnels is nearly equal, the difference of warinth in the air between day and night is fufficient to produce thefe currents : the air will begin to afcend the funnels as the cool of the evening comes on, and this current will continue till perhaps nine or ten o'clock the next morning, when it begins to hefitate ; and as the heat of the day approaches, it fets downwards, and continues fo till towards evening, when it again hefitates for fome time, and then goes upwards conftantly during the night, as before mentioned. Now when fmoke iffuing from the tops of neighbonring funnels paffics over the tops of funnels which are at the time drawing downwards, as they often are in the middle part of the day, fuch fmoke is of necefity drawn into thefe funnels, and defcends with the air into the chamber.

The remedy is to have a fiding plate that will fhut perfectly the offending funnol. Dr Franklin has thus defcribed it: "The opening of the chimney is contrafted by brick-work faced with marble flabs to about two fect between the jams, and the breaft brought down to within about three feet of the hearth. An iron frame is placed juit under the brealt, and extending quite to the back of the chimney, fo that a plate of the fame metal may flide herizontally backwards and forwards in the grooves on each fide of the frame. This plate is jult fo large as to fill the whole fpace, and fhut the chimney entirely when tlruft quite in, which is convenient when there is no fire. Draw it out, fo as to leave between its further edge and the back a face of about two inches; this fpace is fufficient for the fmoke to pafs; and fo large a part of the funnel being flopt by the reft of the plate, the paffage of warm air out of the room, up the chimney, is obftructed and retarded ; and by thofe means much cold air is prevented from coming in through crevices, to fupply its place. 'This effeet is made manifeft three ways. 1. When the fire burns brifkly in cold weather, the howling or whiftling noife made by the wind, as it enters the room through the crevices, when the chimney is open as ufual, ceafes as foon as the plate is flid in to its proper diftance. 2. Opening the door of the room about lialf an inch, and holding your hand againit the opening, near the top of the door, you feel the cold air coming in araint your hand, but weakly, if the plate be in. Let another perfon fuddenly drav it out, fo as to let the air of the room go up the chimney, with its ufual freedom whete chimneys are open, and you immediately feel the cold air rufhing in ftrongly. 3. If fomething be fet againft the door, juft fufficient, when the plate is in, to keep the door neariy fhat, by refifing the preffure of the

\section*{S M O \(\quad\left[\begin{array}{lll}553\end{array}\right] \quad\) S M O}
moke, air that would force it open : then, when the plate is drawn out; the door will be forced open by the increafed preffure of the out ward cold air endeavouring to get in to fupply the place of the warm air that now paffes out of the room to go up the chimney. In our common open chimneys, half the fuel is wafted, and its effect loft; the air it has warmed being immediately drawn off."
9. Chimneys which generally draw well, do neverthelefs fometimes give fmoke into the rooms, it being driven dorun by frong awinds pafing over the tops of their funnels, though not defcending from any commanding eminence. This cafe is moft frequent where the funnel is thort and the opening turned from the wind. It is the more grievous, when it happens to be a cold wind that produces the effect, becaufe when you moft want your fire you are fometimes obliged to extinguifh it. To underftand this, it may be confidered that the rifing light air, to obtain a free iffue from the funnel, mutt pufh out of its way or oblige the air that is over it to rife. In a time of calm or of little wind this is done vifibly; for we fee the fmoke that is brought up by that air rife in a column above the chimney: but when a violent current of air, that is, a ftrong wind, paffes over the top of a chimney, its particles have received fo much force, which keeps them in a horizontal direction and follow each other fo rapidly, that the rifing light air las not ftrength fufficient to oblige them to quit that direction and move upwards to permit its iffue.

Remedies. In Venice, the cuftom is to open or widen the top of the flue rounding it in the true form of a funnel. In other places the contrary is practifed; the tops of the flues being narrowed inwards, fo as to, form a flit tor the iffue of the fmoke, long as the breadth of the funnel, and only four inches wide. This feems to have been contrived on a fuppofition that the entry of the wind would thereby be obftructed, and perlaps it might have been imagined, that the whole force of the rifing warm air being condenfed, as it were, in the narrow opening, would thereby be ftrengthened, fo as to overcome the refiftance of the wind. This, however, did not always fucceed; for when the wind was at north-eaft and blew frefh, the fmoke was forced down by fits into the room where Dr Franklin commonly fat, fo as to oblige him to fhift the fire into another. The pofition of the flit of this funnel was indeed north-eaft and fouth-weft. Perhaps if it had lain acrofs the wind, the effect might have been different. But on this we can give no certainty. It feems a matter proper to be referred to experiment. Poffibly a turncap might have been ferviceable, but it was not tried.

With all the fcience, however, that a man fhall fup. pofe himfelf poffeffed of in this article, he may fometimes meet with cafes that fhall puzzle him. "I once lodged (fays Dr Franklin) in a houfe at London, which in a little room had a fingle chimney and funnel. 'lhe opening was very fmall, yet it did not keep in the fmoke, and all attempts to have a fire in this room were fruitlefs. I could not imagine the reafon, till at length obferving that the chamber over it, which had no fireplace in it, was always filled with fmoke when a fire was kindled below, and that the fmoke came through the cracks and crevices of the wainfcot; I had the wainfcot taken down, and difcovered that the funnel which went up behind it had a crack many feet in length, and wide

Vob. XVII. Part II.
enough to admit my arm; a breach very dangerous with regard to fire, and occafioned probably by an apparent irregular fettling of one fide of the houfe. The air entering this breech frecly, deftroyed the drawing force of the funnel. The remedy would have been, filling up the breach, or rather rebuilding the funnel: but the landlord rather chofe to ftop up the chimney.
" Another puzzling cafe I met with at a friend's country houfe near London. His beft room had a chimney in which, he told me, he never could have a fire, for all the fmoke came out into the room. I flattered myfelf I could eafily find the caufe and prefcribe the cure. I had a fire made there, and found it as he faid. I opened the door, and perceived it was not want of air. I made a temporary contraction of the opening of the chimney, and found that it was not its being too large that caufed the fmoke to iffue. I went out and looked up at the top of the chimney: Its funnel was joined in the fame ftack with others; fome of them fhorter, that drew very well, and I faw nothing to prevent its doing the fame. In fine, after every other examination I could think of, I was obliged to own the infufficiency of my fkill. But my friend, who made no preteafion to fuch kind of knowledge, afterwards difcovered the caufe himfelf. He got to the top of the funnel by a ladder, and looking down found it filled with twigs and ftraw cemented by earth and lined with feathers. It feems the houfe, after being built, had ftood empty fome years before he occupied it ; and he concluded that fome large birds had taken the advantage of its retired fituation to make their neft there. The rubbifh, confiderable in quantity, being removed, and the funnel cleared, the chimney drew well, and gave fatisfaction."

Chimneys whofe funnels go up in the north wall of a houfe, and are expofed to the north winds, are not fo apt to draw well as thofe in a fouth wall; becaufe when rendered cold by thofe winds, they draw downwards.

Chimneys inclofed in the body of a houfe are better than thofe whofe funnels are expofed in cold walls.

Chimneys in ftacks are apt to draw better than feparate funnels, becaufe the funnels that have conftant fires in them warm the others in fome degree that have none.

Smore-Fack. This ingenious machine is of German extraction; and Meffinger, in his Collection of Mechanical Performances, fays it is very ancient, being reprefented in a painting at Nurenbergh, which is known to be older than the year 1350 .

Its conftruction is abundantly fimple. An upright iron fpindle GA (fig. \(5 \cdot\) ), placed in the narrow part of the kitchen chimney, turns round on two pivots H ccccexxt, and I. 'The upper one H paffes through an iron bar, which is built in acrofs the chimney ; and the lower pivot I is of tempered fteel, and is conical or pointed, refting in a conical bell-metal focket fixed on another crofs bar. On the upper end of the fpindle is a circu. lar fly \(G\), confifting of \(4,6,8\), or more thin iron plates, fet obliquely on the fpindle like the fails of a windmill, as we fhall defcribe more particularly by and by. Near the lower end of the findle is a pinion \(A\), which works in the teeth of a contrate or face wheel B , turning on a horizontal axis BC. One pivot of this axis turns in a cock fixed on the crofs bar, which fupports the lower end of the. upright findle HI, and the other pivot 4 A
turns

\section*{S M O}

Snitace-
turns in a cock fixed on the fide wall of the chimney; fo that this axle is parallel to the front of the chimuey. On the remote end of this horizontal axle there is a imall pulley C, having a deep angular groove. Over this pulley there paffes a chain CDE , in the lower bight of which hangs the larce pulley \(E\) of the fpit. This end of the fit turns loofely between the branches of the fork of the rack or raxe F , but without reftins on it. This is on the top of a moveable fland, which can be thifted nearer to or farther from the fire. The other end turns in one of the tootches of another rack. 'Fhe number of teeth in the pinion \(A\) and wheel \(B\), and the diameters of the puileys \(C\) and \(E\), are fo proportioned that the fly \(G\) makes from 12 to 20 turns for one turn of the fit.

The manner of operation of this ufeful machine is eafily underftood. The air which contributes to the burning of the fuel, and paffes through the midit of it, is greatly heated, and expanding prodigioufly in bulk, becomes lighter than the neighbouring air, and is therefore pufhed by it up the chimney. In like manner, all the air which comes near the fire is heated, expanded, becomes lighter, and is driven up the chimney. This is called the drauglbt or fuction, but would with greater propriety be termed the drift of the chimney. As the chimney gradually contracts in its dimenfions, and as the fame quantity of heated air paffes through every fection of it, it is plain that the rapidity of its afcent muft be greateft in the narroweft place. There the fly \(G\) flould be placel, becaufe it will there be expofed to the flongent current. This air, ftriking the fly vanes obliquely, puffres them afide, and thus turns them round with a confiderable force. If the joint of meat is exactly balanced on the fpit, it is plain that the only refiftance to the motion of the fy is what arifes from the friction of the pivots of the upright fpindle, the friction of the pirion and whicel, the friction of the pivots of the horizontal axis, the friction of the fmall end of the fpit, and the friction of the chain in the two pulleys. The whole of this is but a mere trille. But there is frequently a confrderable inequality in the weight of the meat on different fides of the fpit: there mult there-- fore be a fufficient overplus of force in the impulfe of the afcending air on the vanes of the fly, to overcome this want of equilibrium occafioned by the unfkilfulnefs or negligence of the cook. There is, however, commonly enough of power when the machine is properly conftrueted. The utility of this machine will, we hope, procure us the indulgence of fome of our readers, while we point out the circumftances on which its performance depends, and the maxims which fhould be followed in its conftruction.

The upward current of air is the moving power, and foould be increafed as much as poffible, and applied in the moit advantageous manner. Every thing will increafe the current which improves the draught of the chimney, and fecures it from fmoking. A fmoky chimney muft always have a weak current. For this particular, therefore, we refer to what has been delivered in the article Pneumatics, \(n^{\circ} 359\); and in the article Sмоке.

With refpect to the manner of applying this force, it is evident that the beft conftruction of a windmill fails will be nearly the bef conftruction for the fly. According to the ufual theory of the impulfe of fluids,
the greatelt effective impulfe (that is, in the direetion of the fly's motion) will be produced if the plane of the vane be inclined to the axis in an angle of 54 degrees 46 minutes. But, fince we have pronounced this the ory to be fo very defective, we had better take a determination founded on the cxperiments on the impulfe of fluids made by the academy of Paris. Thefe authorife us to fay, that \(49 \frac{1}{2}\) or 50 degrees will be the beft anyle to give the vane: but this muft be underftood only of that part of it which is clofe adjoining to the axis. The vane itfelf mult be twifted, or zucutb-red as the millwrights term it, and muft be much more oblique at its outer extremity. The exact pofition cannot be determined with any precifion; becaufe this depends on the proportion of the velocity of the vane to that of the current of heated air. This is fubject to no rule, being changed according to the load on the jack. We ima. gine that an obliquity of 65 degrees for the outer ends of the vanes will be a good pofition for the generality of cafes. IMeffinger defcribes an ingenious contrivance for changing this angle at pleafure, in order to vary the velocity of the motion. Each vane is made to turn round a midrib, which flands out like a radius from the fpindle, and the vane is moved by a fiff wire attached to one of the corncrs adjoining to the axle. Thefe wires are altached to a ring which flides on the findle like the fpreader of an umbrella; and it is fopped on any part of the fpindle by a pin thruft through a hole in the fpindle and ring. We mention this briefly, it being eafly underfood by any mechanic, and but of little confequence, becaufe the machine is not fufceptible of much precifion.

It is ealy to fee that an increafc of the furface of the vanes will increafe the power: therefore they fhould occupy the whole fpace of the circle, and not confift of four narrow arms like the fails of a windmill. It is better to make many narrow vanes than a few broad ones; as will appear plain to one well acquainted with the mode of impulfe of fluids aeting obliquely. We recommend 8 or 12 at leaft ; and each vane thould be fo broad, that when the whole is held perpendicular between the eye and the light, no light thall come through the fly, the vanes overlapping each other a very fimall matter. We alfo recommend the making them of fiff plate. Their weight contributes to the fleady motion, and enables the fly, which has acquired a confiderable velocity during a favourable pofition of things, to retain a momentum fufficient to pull round the fit while the heary fide of the mcat is rifing from its loweft pofition. In furch a fituation a light fly foon lofes its momentum, and the jack ftaggers under its load.

It is plain, from what has been faid, that the fly Thould occupy the whole of that fection of the vent where it is placed. The vent muft therefore be brought to a round form in that place, that none of the current may pafs ufelefsly by it.
It is an important quelion where the fly fhould be placed. If in a widc part of the vent, it will have a great furface, and act by a long lever ; but the current in that place is now, and its impulfe weak. This is a fit fubject of calculation. Suppoie that we have it in our choice to place it either as it is drawn in the figure, or farther up at \(g\), where its diameter muft be one half of what it is at ' \(G\). Since the fame quantity of heated air pafes through both fections, and the fection \(g\) has only one-

\section*{S M O \(\quad[55\)} fourth of the area of the fection \(G\), it is plain that the sit mut be moving four times fater, and that its impulfe is 16 times greater. 13 ut the furface on which it is act. ing is the fourth part of that of the fly G; the actual impulfe therefore is only four times greater, fuppofing both flies to be moving with the fame relative velo. city in refpect of the current; that is, the rim of each moving with the fame portion of the velocity of the current. This will be the cafe when the fmall fly turns cight times as often in a minute as the large fly: for the air is moving four times as quick at \(g\), and the diametcr of \(g\) is one-half of that of \(G\). Therefore, when the fmall fly is turning eight times as quick as the great one, there is a quadruple impulfe acting at half the diftance from the axis. The momentum ur energy therefore of the current is double. Therefore, fuppofing the pinion, wheel, and pulleys of both jacks to be the fame, the jack with the fmall Ay, placed in the narrow part of the vent, will be 16 times more powerful.

By this example, more eafily underfood than a ge. neral procefs, it appears that it is of particular importance to place the fly in an elevated part of the vent, where the area may be much contracted. In order ftill farther to increafe the power of the machine, it would be very proper to lengthen the fpincle fill more, and to put another fly on it at a confiderable diftance above the firt, and a third above this, \&c.

As the velocity of the current changes by every change of the fire, the motion of this jack mult be very unfteady. To render it as adjuftable as may be to the particular purpofe of the cook, the pulley E has feveral grooves of different diametèrs, and the fpit turns more or lefs flowly, by the fame motion of the fly, according as it hangs in the chain by a larger or fmaller pulley or groove.

Such is the conftruction of the fmoke jack in its moft fimple form. Some are more artificial and complicated, having, in place of the pulleys and connecting chain, a spindle coming down from the horizontal axis \(13 C\). On the upper end of this fpindle is a horizontal contrate wheel, driven by a pinion in place of the pulley C. On the lower end is a pinion, driving a contrate wheel in place of the pulley E. This conftruction is reprefented in fig. 6. Others are conftricted more fimply, in the manner reprefented in fig. 7. But our firft conitruction has great advantage in point of fimplicity, ond allows a more eafy adjuttment of the fpit, which may be brought neater to the fire or removed farther from it without any trouble; whereas, in the others, with a train of wheels and pinions, this cannotabe done without feveral changes of pins and fcrews. The only imperfection of the pulley is, that by long ufe the grooves become flippery, and an ill balanced joint is apt to bold back the fpit, while the chain flides in the grooves. This may be completely prevented by making the grooves flat inftead of angular (which greatly diminifhes the friction), and furnifhing them with fhort fluds or pins which take into every third or fourth link of the chain. If the chain be made of the fimpleit form, with flat links, and each link be made of an exact length (making them all on a mould), the motion will be as eafy as with any wheelwork, and without the lcaft chance of nipping.

It is always of importance to avoid this תlipping of Smokethe chain by balancing the loaded fpit. For this pur- Jack. pofe it will be extremely convenient to have what is called a balance-gerver. Let a part of the fit, immediately adjoining to the pulley, be made round, and let an arm be made to turn on it ftifly, fo that it may be made faft in any pofition by a ferew. Let a leaden ball be made to llide along this arm, with a fcrew to faften it at any diftance from the fpit. When the meat is fpitted, lay it on the racks, and the heavieft fide will immediately place itfelf undermoft. Now turn round the balance-nkewer, fo that it may point ftraight upwards, and make it faft in that pofition by the fcrew. Put the leaden ball on it, and flide it inwards or outwards till it exactly balances the heavy fide, which will appear by the fpit's remaining in any pofition in which it is put.

The greateft difficulty is to keep the machine in repair. The moft confequential part of it, the firf mover, the fly, and the pinion and wheel, by which its motion is tranfmitted to the reft of the machine, are fituated in a place of difficult accefs, and where they are expofed to violent heat and to the Imoke and foot. 'The whole weight of the fly, refting on the lower pivot I, muft exert a great preffure there, and occafion great friction, even when this pinion is reduced to the fmalleft fize that is compatible with the neceffary ftrength. The pivot mult be of hardened fteel, tapered like an obture cone, and muft turn in a conical focket, alfo of hardened ftecl or of bell-metal ; and this feat of preffure and friction muft be continually fupplied with oil, which it confumes very quickly. It is not fufficient that it be from time to time fmeared with an oiled feather; there mult be an iron cup formed round the focket, and kept filled with cil. It is furprifing how quickly it difappears : it foon becomes clanmy by evaporation, and by the foot which gathers about it. The continued rubbing of the pivot and focket wears them both very faft; and this is increafed by hard powders, fuch as fandy duft, that are hurried up by the rapid current every time that the cook firs the fire. 'Thefe, getting between the rubbing parts, caufe them to grind and wear each other prodigioully. It is a great improvement to invert thefe rubbing parts. Let the lower end of the fpindle be of a confiderable thicknefs, and have a conical hollow nicely drilled in its extremity. Let a blunt pointed conical pin rife up in the middle of the oil-cup, on which the conical hollow of the fpindle may reft. Here will be the fame fteady fupport, and the fame friction as in the other way; but no grinding duft can now lodge between the pivot and its focket: and if this upright pin be fcrewed up through the bottom of the cup, it may be fcrewed farther up in proportion as it wears; and thus the upper pivot \(g\) will never defert its hole, a thing which foon happens in the common way. We can fay from experience, that a jack conftucted in this way will not require the fifth part of the repairs of one done in the other way.

It is of importance that the whole be fo put together as to be eafily taken down, in order to fweep the vent, or to be repaired, \&c. For this purpofe, let the crofs bar which carries the lower end of the upripht fpindle be placed a little on one fide of the perpendicudar line from the upper pivot hole. Let the cock which

\section*{S M O [ 556}
dom, one of the moft entertaining novels in the Englifh
smoke
carries the oil-cup and the pivot of the horizontal axis \(13 C\) be fcrewed to one fide of this crofs bar, fo that the centre of the cup may be exactly under the upper pivot hole. Py this confluation we have only to unferew this cock, and then both axles come out of their places at once, and may be replaced without any trouble. We have fretched in fig. 8. the manner in which this may be cione, where M reprefents a fection of the lower crofs bar. BCDE is the cock, fixed to the bar by the pins which go through toth, with finger nuts \(a\) and \(b\) on the oppofite fide. \(F i\) is the hard fieel pin with the conical top \(i\), on which the lower end I of the upright fpindle AG refts, in the manner recommended as the beft and the moft durable. The pivot of the horizontal axis turns in a hole at \(\mathbf{E}\) the top of the cock.

After all, we mult acknowledge that the fmoke jack is inferior to the common jack that is moved by a weight. It is more expenfive at firf, and requires more frequent repairs; its motion is not fo much under command; it occafions foot to be thrown about the fire, to the great annoyance of the cook; and it is a great encumbrance when we would clean the vent.

SMOKE-Farthings. 'The pentecoftals or cuftomary oblations offered by the difperfed inhabitants within a diocefe when they made their proceffion to the mother or cathedral church, came by degrees into a fanding annual rent called fmoke-fartbings.

Smoke-Silver. Lands were holden in fome places by the payment of the fum of 6 d . yearly to the fheriff, called froke-filver (Par. 4. Edw. VI.) , Smoke-filver and fmoke-penny are to be paid to the minifters of divers parifhes as a modus in lieu of tithe-wood: and in fome manors formerly belonging to religious houfes, there is ftill paid, as appendant to the faid manors, the ancient Peter-pence, by the name of fnoke-money ( \(\mathcal{T}\) wifd. Hif. Vindicat. 77.)-The bifhop of London anno 1444 iffued out his commiffion, Ad levandum le fmoke-farthings, \&c.

SMOLENSKO, a large and ftrong city of Ruffia, and capital of a palatinate of the fame name, with a caftle feated on a mountain, and a bithop's fee. It is ftrong by its fituation, being in the middle of a wood, and furrounded by almoft inacceffible mountains. It has been taken and retaken feveral times by the Poles and Ruffians; but thefe laft have had poffeffion of it ever fince the year 1687 . It is feated on the river Nieper, near the frontiers of Lithuania, 188 miles fouth-weft of Mofcow. E. Long. 3 1. 22. N. Lat. 54. 30.

Smolensko, a duchy and palatinate of Ruffia, bounded on the north by Biela, on the eaft by the duchy of Mofow, on the fouth by that of Severia and the palatinate of Meiflaw, and or the weft by the fame palatinate and by that of Witepfls. It is full of forefts and mountains: and the capital is of the fame name.

SMOLLET (Dr Tobias), an auther whofe writings " will t!aufmit his name with honour to pofterity, was born in the year 1720 at a fmall village within two miles of Cameron, on the banks of the river Leven. He appears to have received a claffical education, and was bred to the practice of phyfic and furgery; and in the early part of his life ferved as a furgeon's mate in the navy.

The incidents that befel him during his continuance in this capacity ferved as a foundation for Roderic Ran-
tongue. He was prefent at the fiege of Carthagena; and in the before mertioned novel he has given a faithful, though not very pleafing, account of the management of that ill-conducted expedition, which he cenfures in the warmeft terms, and from circumitances which fell under his own particular obfervation.

His comection with the fea feems not to have been of long continuance; and it is probable that he wrote feveral pieces before he became known to the public by his capital productions. The firft piece we know of with certainty is a Satire in two parts, printed firf in the years 1746 and 1747, and reprinted in a Collection of his Plays and Poems in 1777. About this period, or fome time before, he wrote for Mr Rich an opera intitled Alcefte, which has never been performed nor printed.

At the age of 18 he wrote a tragedy intitled The Regicide, founded on the flory of the affaffination of James I. of Scotland. In the preface to this piece, publifhed by fubfcription in the year 1749, he bitterly exclaimed againft falfe patrons, and the duplicity of theatrical managers. The warmth ard impetuofity of his temper hurried him, on this occafion, into unjuft reflections againft the late George Lord Lyttleton and Mr Garrick: the character of the former he characterifed in the novel of Peregrine Pickle, and he added a burlefque of the Monody written by that nobleman on the death of his lady. Againt Mr Garrick he made illiberal ill-founded criticifms; and in his novel of Roderic Random gave a very unfair reprefentation of his treatment of him refpecting this tragedy. Of this conduct he afterwards repented, and acknowledged his errors; though in the fubfequent editions of the novel the paflages which were the hafty effufions of difappointment are not omitted.

However, in giving a fketch of the liberal arts in his Hiftory of England, he afterwards remarked, "the exhibitions of the flage were improved to the moft exquifite entertainment by the talents and management of Garrick, who greatly furpaffed all his predeceffors of this and perhaps every other nation, in his genius for acting, in the fweetnefs and variety of his tones, the irrefirtible magic of his eye, the fire and vivacity of his action, the cloquence of attitude, and the whole pathos of expreffion.
"Candidates for literary fame appeared even in the higher fphere of life, embellifhed by the nervous fenfe and extenfive erudition of a Corke; by the delicate tafte, the polifhed mufe, and the tender feelings, of a Lyttleton."

Not fatisfied with this public declaration, he wrote an a pology to Mr Garrick in fill ftronger terms. With thefe ample conceffions, Mr Garrick was completely fatisfied; fo that in 1757, when Dr Smollet's comedy of the Reprifals, an afterpiece of two acts, was performed at Drury Lane theatre, the latter acknowledged himfelf highly obliged for the friendly care of Mr Garıick exerted in preparing it for the ftage; and fill more for his acling the part of Lufignan in Zara for his benefit, on the fixth inftead of the ninth night, to which he was only intitled by the cuftom of the theatre.

The Adventures of Roderic Random, publifhedin 1748 , 2 vols 12 mo , a book which ftill continues to have a moft extenfive

\section*{S M O}
extenfive fale, firs eftablifhed the Doetor's reputation. All the firt volume and the beginning of the fecond appears to confift of real incident and character, tho' certainly a gooddeal heightened and difguifed. 'The Judge his grandfather, Crab and Potion the two apothecaries, and 'Squire Gawky, were characters well known in that part of the kingdom where the fcene was laid. Captains Oakhum and Whiftie, Doctors Mackmane and Morgan, were alfo faid to be real perfonaoes ; but their names we have either never learned or have now forgotten. A bookbinder and barber long eagerly contended for being fhadowed under the name of Strap. The Doftor feems to have enjoyed a peculiar felicity in defcribing fea-characters, particularly the officers and failors of the navy. His Trunnion, Hatchway, and Pipes, are highly finifhed originals; but what exceeds them all, and perhaps equals any character that has yet been painted by the happieft genius of ancient or modern times, is his Lieutenant Bowling. 'This is indeed nature itfelf; oripinal, unique, and fui generis.

By the publication of this work the Doctor had acquircd fo great a reputation, that henceforth a certain degree of fuccefs was infured to every thing known or fulpected to proceed from his hand. In the courfe of a few jears, the Adventures of Peregrine Piekle appeared; a work of great ingenuity and contrivance in the compofition, and in which an uncommon degree of erudition is difplayed, particularly in the defcription of the entertainment given by the Republican Doctor, after the manner of the ancients. Under this perfonage the late Dr Akenfide, anthor of The Pleafures of Ima. gination, is fuppofed to be typified; and it would be diffieult to determine whether profound learning or genuine humour predominate molt in this epifode. Another epifode of The Adventures of a Lady of Quality, likewife inferted in this work, contributed greatly to its fuccefs, and is indeed admirably executed; the materials, it is faid, the lady herfelf (the celcbrated lady Vane) furnifhed.

Thefe were not the only original compofitions of this Alamp with which the Doctor has favoured the public. Ferdinand Count Fathom, and Sir Launcelot Greaves, are ftill in the lift of what may be called reading novels, and have gone through feveral editions; but there is no injuftice in placing them in a rank far below the former. No doubt invention, character, compofition, and contrivance, are to be found in both; bu then-fituations are defcribed which are hardly poffible, and characters are painted which, if not altogether unexampled, are at leaft incompatible with modern manners; and which ought not to be, as the fcenes are laid in modern times.
The fatt work which we believe the Doctor publifhed was of much the fame fpecies, but caft into a different form-The Expedition of Humphrey Clinker. It confifts of a feries of letters, written by different perfons to their refpective correfpondents. He has here carefully avoided the faults which may be jufly charged to his two former productions. Here are no extravagant characters nor unnatural fituations. On the contrary, an admirable knowledge of life and manners is difplayed; and moft ufeful leffons are given applicable to interefting but to very common fituations.

We know not whether the remark has been made,
but there is certainly a very abvious fimilitude between Smollet. the characters of the three heroes of the Doctor's chief productions. Roderic Random, Peregrine Pickle, and Matthew Bramble, are all brothers of the fame family. The fame fatirical, cynical, difpofition, the fame generofity and benevolence, are the diftinguifhing and characteriftical features of all three; but they are far from being fervile copies or imitations of each other. They differ as much as the Ajax, Diomed, and Achilles of Hemer. 'This was undonbtedly a great effort of genius; and the Doctor feems to have defcribed his own character at the different ftages and fituations of lis life.

Before he took a houfe at Chelfea, he attempted to fettle as practitioner of phyfic at Bath; and with that view wrote a treatife on the waters; but was unfuccefs. ful, chiefly becaufe he could not render himfelf agreeable to the women, whofe favour is certainly of great confequence to all candidates for eminence, whether in medicine or divinity. This, however, was a little extraordinary; for thofe who remembered Dr Smollet at that time, cannot but acknowledge that he was as graceful and handfome a man as any of the age he lived in ; befides, there was a certain dignity in his air and manner which could not but infpire refpect wherever he appeared. Perhaps he was too foon difconraged; in all probability, had he perfevered, a man of his great learning, profound fagacity, and intenfe application, befides being endned with every other external as well as internal accomplifhment, muft have at laft fucceeded, and, had he attained to common old agre, been at the head of his profeffion.

A bandoning phyfic altogether as a profeffion, he fixed his refidence at Chelfea, and turned his thoughts entirely to writing. Yet, as an author, he was not near fo fuccefsful as his happy genius and acknowledged merit certainly deferved. He never acquired a patron among the great, who by his favour or benefieence relieved him from the neceffity of writing for a fubliftence. The truth is, Dr Smollet poffeffed a loftinefs and elevation of fentiment and character which appears to have difqualified him for paying court to thofe who were capable of conferring favours. It would be wrong to call this difpofition pride or haughinefs; for to his equals and inferiors he was ever polite, friendly, and generons. Bookfellers may therefore be faid to have been his only patrons; and from them he had conftant employment in tranflating, compiling, and reviewing. He tranflated Gil Blas and Don Quixote, both fo happily, that all the former tranflations of thefe excellent productions of genius have been almoft fuperfeded by his. His name likewife appears to a tranflation of Voltaire's Profe Works: but little of it was done by his own hand ; he only revifed it, and added a few notes. He was concerned in a great variety of compilations. His Hiftory of England was the principal work of that kind. It had a molt extenfive fale ; and the Doctor is faid to have received L. 2000 for writing it and the continuation.
In 1755 he fet on foot the Critical Revicw, and continued the principal manager of it till he wel: abroad for the firft time in the year 1763. He was perhaps too acrimonious fometimes in the conduct of that work; and at the fame time difplayed too much fenfibility when

Smoilt.
when any of the unfcrtunate authors attempted to retaliate whofe works he had perhaps jutly centured.

Among other controverfies in which his engazements in this publication involved him, the moft material in its confequences was that occafioned by lis remarks on a pamphlet publifhed by Admiral Knowles. That gentleman, in defence of his condnct on the expedition to Rochfort, publifhed a vindication of himfelf; which fal. ling under the Doctor's examination, produced fome very fevere frictures both on the performance and on the character of the writer. The admiral immediately commenced a profecution againft the printer; declaring at the fame time that he defired only to be informed who the writer was, that if he proved to be a gentleman he might obtain the fatisfaction of one from him. In this affair the Doctor behaved both with prudence and with fpirit. Defirous of compromifing the difpute with the admiral in an amicable manner, he applied to his friend Mr Wilkes to interpofe his good offices with his opponent. The admiral, however, was inflexible; and juft as fentence was going to be pronounced againit the printer, the Doctor came into court, avowed himSelf the author of the Strictures, and declared himfelf ready to give Mr Knowles any fatisfaction he chofe. The admizal immediately commenced a frefh action againft the Doctor, who was found guilty, fined L. 100, and condemned to three months imprifonment in the King's Bench. It is there he is faid to have written The Adventures of Sir Launcelot Greaves, in which he has defcribed fome remarkable characters, then his fellow-prifoners.

When Lord Bute was called to the chief adminiftration of affairs, he was prevailed upon to write in defence of that nobleman's meafures; which he did in a weekly paper called the Briton. This gave rife to the famous North Briten; wherein, according to the opinion of the public, he was rather baffled. 'The truth is, the Doctor did not feem to poffefs the talents neceffary for political altercation. He wanted temper and coolnefs; and his friends accufed his patron of having denied him the neceffary information, and even neglected the fullil. ling of fome of his other engagements with him. Be that as it will, the Doctor is faid not to have forgotten him in his fubfeqnent performances.

Befides the Briton, Dr Smollet is fuppofed to have written other pieces in fupport of the caufe he efpoufed. The Advencures of an Atom, in two volumes, are known to be his production.

His conftitution being at laft greatly impaired by a fedentary life and affiduous application to ftudy, he went abroad for his health in June 1763 , and continued in France and Italy two years. He wrote an account of his travels in a feries of letters to fome friends, which were afterwards publifhed in two volumes octavo, 1766. During all that time he appears to have laboured under a conftant fit of chagrin. A very night perufal of thefe letters will fufficiently evince that this obfervation is founded in faet, and is indeed a melancholy inftance of the infuence of bodily diftemper over the beft difpofition.

His relation of his travels is actually cynical; for which Sturne, in his Sentimental Journey, has animadrerted on him under the character of Smelfurgus. The Dodor lived to return to his native country: but his
health continuing to decline, and meeting with frem smol mortifications and difappointments, he went back to Snug Italy, where he died in October. 21, 1771. He was employed, during the laft years of his life, in abridging the Modern Univerfal Hiftory, great part of which he had originally written himfelf, particularly the hiftories of France, Italy, and Germany.

He certainly met with many mortifications and dif. appointments; which, in a letter to Mr Garrick, he thus feelingly expreffes: "I am old enough to have feen and obferved, that we are all playthings of For tune; and that it depends upon fornething as infignifio cant and precarious as the toffing up of a halfpenny, whether a man rifes to affluence and honours, or conti. nues to his dying day ftruggling with the difficulties and difgraces of life."

It would be needlefs to expatiate on the character of a man fo well known as Dr Smollet, who has, befides, given fo many frictures of his own character and man. ner of living in his writings, particularly in Humphrey Clinker; where he appears under the appellation of Mr Serle, and has an interview with Mr Bramble; and his manner of living is deferibed in another letter, where young Melford is fuppofed to dine with him at his honfe in Chelfea. No doubt he made money by his connections with the bookfellers; and had he been a rigid economilt, or endued with the gift of retention (an expreffionof his own), he might have lived and died very independent. However, to do juftice to his memory, his difficulties, whatever they were, proceeded not from extravagance or want of economy. He was hofpitabie, but not oftentatioufly fo; and his table was plentiful, but not extravagant. No doubt he had his failings; but ftill it would be diffcult to name a man who was fo refpectable for the qualities of his head, or more ami. able for the virtues of his leart.

Since lis death a munument has been erected to his memory near Leghown, on which is infcribed an epitaph written in Latin by lis friend Dr Armitrong, author of 'Jhe Art of Preferving. Health, and many other excellent pieces. An infcription written in Latin was likewife iufcribed on a pillar crected to his memory on the banks of the Leven, by one of his relations.

To thefe memoirs we are extremely forry to add, that folate as 1785 the widow of Dr Smollet was re. fiding in indigent circumftances at Leghorn. On this account the tragedy of Venice Preferved was acted for her beuefit at Edinburgh on the 5 th of March, and an excellent prologive fooken on that oscafion.

The pieces inferted in the pothumous collection of Dr Smollet's plays and poems are, The Regicide, a tragedy: The Reprifal, a comedy; Advice and Re. proof, two fatires; The Tears of scotland; Verfes on a Young Lady; a Love Elegy, in imitation of Tibullus; two Songs; a Burlefque Ode; Odes to Mirth, to Sleep, to Leeven Water, to Blue-ey'd Ann, and to Independence.

SNUUGGLERS, perfons who import or export prohibited goods without paying the duties appointed by the law.

The duties of cuftoms, it is faid, were originally in fituted, in order to enable the king to afford protec. tion to trade againit pirates: they have fince been continued as a branch of the public reveaue. As duties

\section*{S M U [ 559 ] S M Y}
impofed upon the inportation of goods neceffarily raifes their price above what they might otherwife have been fold lor, a temptation is prefented to import the commodity clandeftinely and to evade the duty. Many perfons, prompted by the hopes of gain, and confdering the violation of a pofitive law of this nature as in no refpect criminal (an idea in which they have been encollaged by a great part of the community, who make no fcruple to purchafe fmurgoled goods), have engaged in this illicit trade. It was impoffible that government could permit this practice, which is highly injurious to the fair trader, as the fmugoler is enabled to underfell him, while at the fame time he inpairs the national revenue, and thus wholly deftroys the end fur which thefe duties were appeinted. Such penalities are therefore infliced as it was thought would prevent fmug gling.

Many laws have been made with this view. If any goods be fhipped or landed without warrent ant prefence of an officer, the veffel fhall be forleitec, and the wharfinger fhall forfeit L. 100 , and the mafter or masiner of any fhip inward bound fhall forfeit the value of the goods : and any carman, poiter, or other affitimp, flall be committed *o gaol, till he find furety of the grond behaviour, or mutil he fhall be difcha:ged by the court of exchequer ( 1.3 \& 14 C. II. c. 11.) If goods be relawded after drawback, the veffel and goods, thall be forfeited; and every perfon concerned therein thall forfeit doulle the value of the drawback ( 8 An. c. 13.) Goods taken in at fea flall be forfeited, and alfo the velfel into wh ich they are taken; and every perfon concerned therein fhall forfeit treble value (9 G. II. c. 35.) A vefiel hovering near the coaft fhall be forfeited, if under 50 tons burden; and the goods hall alfo be forfeited, or the value thereof ( 5 G. III. c. 43.) Perfons seceiving or buying run goods fhall forfeit L. 20 ( 8 G . r. 18.) A concealer of run goods thall forfeit treble value ( \(8 \mathrm{G} . \mathrm{c} .18\). ) Offering rme goods to fale, the fame fhall be forfeited, and the perfon to whom they are offered may feize them; and the perfon offering then to fale fhall forfeit treble value (ir G. c. 30. ) A porter or other perfon carrying run goods fhall forfeit ireble value (9 G. H. c. 35.) Perfons armed or dif. grifed carrying run goods fhall be guilty of felony, and tranfpuited for feven years ( \(8 \mathrm{G} . \mathrm{c}\). 18 . 9 G. II. c. 35.\()\)

But the laft fatute, I9 G. II. c. 34. is for this purpofe inflar omniam; for it makes all forcible acts of finuggline, carried on in defiance of the laws, or even in diffuife to evade them, felony without benefit of clergy: enacting, that if three or more perfons fhall affemble, with fire-arms or other offenfive weapons, to affift in the illegal expurtation or importation of roods, or in refcuing the fame after feizure, or in refcuing offenders in cuiftody for fuch offences; or fhall pafs with fuch goods in difguife ; or fhall wound, fhoot at, or af. fault, any officers of the revenue when in the execution of their duty; fuch perfons flall be felons, without the bencfit of clergy.

When we confider the nature, and Atll more the hiftory, of mankind, we muft allow that the enasting of fevere penal laws is not the way to prevent crimes: It were indeed much to be wiffed that there were no fuch thing as a political crime; fcr the generality of men, but efpecially the lower orders, not difcersing the pro-
pricty or utility of fuch laws, confider then as oppref. Sanzglers five and tyrannical, and never hefitate to violate them when they can do it with impunity. Infead therefore

Smijrm? of punifuing fmurgitis, it world be much better to re. Snith's move the temptation. But the high duties which have \(W\) ealth of been impesed upon the impotation of many different Nations, forts of foreign goods, in order to difcoumge their con. vo!. iiio fumption in Great Britain, have in many cafes fersed orly to encourage fmuggling; and in all cafes have reduced the revenue of the cultoms below what more mo. derate duties would have afforded. 'I he faving of Dr Swift, that in the arithmetic of the cuftoms two and two, initcad of making lour, make fometimes only one, holds perfectly true with regard to fuch heavy duties, which never could have been impofed, had not the mercantile fyftem taught us, in many cafes, to employ taxation as an intrument, not of revenue, but of monopoly.

The bounties which are fometimes given upon the exportation of home produce and manufactures, and the drawbacks which are paid upon the reexportation of the greater part of foreign goods, have given occafion to many fiauds, and to a fpecies of fmuggling more deArvetive of the public revenue than any other. In order to obtain the bounty or drawback, the goods, it is well known, are fometimes fhipped and fent to fea, but foon afterwards clandeftinely relanded in fome other part of the country.
Heavy duties being impofed upon almoft all goods imported, our merchant importers fmuggle as much, and make entry of as little as they can. Our merchantexporters, on the contrary, make entry of more than? they export ; fometimes out of vanity, and to pafs for great dealers in goods wiich pay no duty ; and fome. times to gain a bounty or a drawback. Our exports, in confequence of thefe different frauds, appear upon the cuftomhoufe books greatly to overbalance our iniports; to the unferakable comfort of thofe politicians who meafure the national profperity by what they call the balance of trade.
SMUI, in hufbandry, a difeafe in corn, when the grains, inftead of being filled with flour, are full of a ftinking black powder. See IVheat.

SMYRNA, or IsMIR, at prefent the largeft and? richeft city of Afia Minor, is fituated in north latitude \(38^{\circ} 28^{\prime}\), and in E. Long. \(27^{\circ} 25^{\prime}\) from Greenwich, and about 183 miles weft by fouth of Conftantinople. 'The town extends along the fhore about half a mile on a gentle declivity. The houfes of the Englifh, French, and Dutch confuls are handfome ttructures; thefe, with moft of thofe occupied by the Chriftian merchants, are .walhed on one fide by the fea, forming a ftreet named Frank-freet, from its being folely inhabited by European Chriftians. In the year \()_{;} \sigma_{3}\) the whole of this quarter was confumed by fire : the lofs fuftained by this calamity in merchandife was eftimated at a million and a half of Turkifh dollars, or near L. 200,000 Sterling. The port is one of the fineft of the Levant, it bcing able to contain the largeft fleet; and indeed there are feldom in it fewer than 100 fhips of different nations.

A caftle ftands at its entrance, and commands all the payne's fhipping which fail in or out. There is likewife an old Geografboy. ruinous caftle, near a mile in circumference, which ftands in the upper part of the city, and, according to tracti-

Snyrna.
tion, was built by the emprefs Helena: and near it is an ancient fructure, faid to be the remains of a palace where the Greek council was held when Smyrna was the metropolis of Afia Minor. They alfo thow the ruins of an amphitheatre, where it is faid St Polycarp, the firlt bifhop, fought with lions.

This city is about four miles in circumference, and nearly of a triangular form; but the fide next the mountain is much longer than the other fides. 'I'he houfes are low, and moftly built with clay-walls, on account of the earthquakes to which the country is fubject ; but the caravanferas and fome other of the public buildings have an air of magnificence. The ftreets are wide, and almoft a continued bazar, in which a great part of the merchandize of Europe and Afia is expofed to fale, with plenty of provifions; though thefe are not fo cheap as in many other parts of Turkey, on account of the populoufnefs of the place, and the great refort of foreigners. It is faid to contain 15,000 Turks, 10,000 Greeks, 1800 Jews, 200 Armenians, and 200 Franks. The TIurks have I9 mofques; two churches belong to the Greeks; one to the Armenians; and the Jews have eight fynagogues. 'The Romanifts have three convents. There is alfo one of the fathers Della Terra Santa. Here refides an archbifhop of the Greek church; a Latin bifhop who lias a falary from Rome, with the title of bifhop of Smyrna in partibus infudelium; and the Englifh and Dutch factories have each their chaplain.

The walks about the town are extremely pleafant, particularly on the weft fide of Frank ftreet, where there are feveral little groves of orange and lemon trees, which being always clothcd with leaves, bloffoms, and fruit, regale feveral of the fenfes at the fame time. The vines which cover the little hills about Smyrna afford both a delightful profpect and plenty of grapes, of which good wine is made. Thefe hills are agreeably interfperfed with fertile plains, little forefts of olives and other fruit-trees, and many pleafure-houfes, to which the Franks ufually retire during the fummer. In the neighbourhood of Smyrna is great plenty of game and wild-fowl, and particularly deer and wild-hogs. The fea alfo abounds with a variety of good fifl. The European Chriftians are here allowed all imaginable liberties, and ufually clothe themfelves after the European manner.

The chief commerce of this city confifts in raw filk, filk-ftuffs, grograms, and cotton yarn.

However, the unhealthfulnefs of the fituation, and more efpecially the frequent carthquakes, from which, it is faid, they are fcarccly ever free for two years together, and which have been felt 40 days fucceffively, are an abatement of the pleafure that might otherwife be enjoyed here. A very dreadful one happened in June 1688, which overthrew a. great number 'of the houfes; and the rock opening where the caftle ftood, fwallowed it up, and no lefs than 5000 perfons perifhed on this occation.

In the year \(\mathbf{~} 758\), fo defolating a plague raged here, that fcarcely a fufficient number of the inhabitants furvived to gather in the fruits of the earth. In the year 1772, three-fourth parts of the city were confumed by fire; and fix years after it was vifited by the moft dreadful earthquakes, which continued from the 25 th of June
to the 5 th of July ; by which fucceffive calamities the Smy city has been fo much reduced, that its former confequence is never likely to be reftored.

The ladies here wear the oriental drefs, confinting of large trowfers or breeches, which reach to the ancle ; long vefts of rich filk or velvet, lined in winter with cottly furs; and round their waift an embroidcred zone with clafps of filver or gold. Their hair is plaited, and defcends down the back often in great profufion. The girls lave fometimes above twenty thick treffes, belides two or three encircling the head as a coronct, and fet off with flowers and plumes of feathers, pearls, or other jewels. They commonly ftain it of a chefnut colour, which is the moft defired. Their apparel and carriage are alike antique. It is remarkable that the trowfers are mentioned in a fragment of Sappho as part of the female drefs.

SMYRNIUM, Alexanders: A genus of plants belonging to the clafs of pentandria, and to the order of digynia; and in the natural fyftem ranging under the \(45^{\text {th }}\) order, Umbellate. The fruit is oblong and friated ; the petals have a fharp point, and are keel-fhaped. There are five fpecies: 1. The perfopliatum, or perfoliate alexanders, which is a native of Candia and Italy ; 2. The AEgyptiacum; 3. The aureum, or golden alexanders, which is a native of North America; 4. 'The integerrimum; 5. The olufatrum, common alexanders, a native of Britain ; the leaves of which are cauline, ternate, petiolated, and ferrated. It grows on the feacoaft at Dunglas on the borders of Berwickflire North Britain. Since the introduction of celery into the garden, the alexanders is almoft forgotton. It was formerly cultivated for falading, and the young fhoots or ftalks blanched were eaten either raw or ftewed. The leaves too were boiled in broths and foups. It is a warm comfortable plant to a cold weak fomach, and was in much efteem among the monks, as may be inferred by its ftill being found in great plenty by old abbey walls.

SNAFFLE, in the manege, is a very flender bitmouth without any branches, much uled in England; the true bridles being referved for war.

SNAIL, in zoology. See Helix and Limax.
SNAKE, in zoology. See Anguis and Serpens.
Method of Preferving SNARES. When the fnake is killed, it muft firf be warhed clean, and freed from all filth and naftinefs; then it is to be put into a glafs of a proper fize, the tail firt, and afterwards the reft of the body, winding it in fpiral afcending circlea, and difpofing the back, which is alway the moft beautiful, outwardly. A thread, connected with a fmall glafs bead, is, by the help of a needle, to be paffed through the upper jaw from within outwardly, and then through the cork of the bottle, where it muft be faftened ; by this means the head will be drawn into a natural pofture, and the mouth kept open by the bead, whereby the teeth, \&c. will be difcovered : the glafs is then to be filled with rum, and the cork fealed down to prevent its exhalation. A label, containing the name and properties of the fnake, is then to be affixed to the wax over the cork; and in this manner the fnake will make a beautiful appearance; and may be preferved a great number of years; nor will the firits impair or change the luttre of its colours.

\section*{S NH}

Snark-Stones, Ammonita, in natural hiftory, the name of a large genus of foffil fhells, very few if any of which are yet known in their recent fate, or living either on our own or any other-fhores; fo that it feems wonderful whence fó valt a number and variety of them fhould be brought into our fubterranean regions. They feem indeed difperfed in great plenty throughout the world, but nowhere are found in greater numbers, beauty, and variety, than in our ifland.

Mr Harenberg found prodigious numbers of them on the banks of a river in Germany. He traced this river through its feveral windings for many miles, and among a great variety of belemnitx, cornua ammonis, and cochlitæ, of various kinds; he found alfo great quantities of wood of recent petrifaction, which fill preferved plain marks of the axe by which it had been cut from the trees then growing on the fhore. 'I' I , water of this river he found in dry feafons, when its natural fprings were not diluted with rains, to be confiderably heavier than common water; and many experiments fhowed him that it contained ferruginous, as well as fony particles, in great quantity, whence the petrifactions in it appeared the lefs wonderful, though many of them of recent date.

Of the cornua ammonis, or ferpent-Atones, he there obferved more than 30 different fpecies. They lie immerfed in a bluifh foffil ltone, of a foft texture and fatty appearance, in prodigious numbers, and of a great variety of fizes, from the larger known forts down to fuch as could not be feen without very accuratc infpecrion or the affiftanee of a microfcope. Such as lie in the fofteft of thefe flones are foft like their matrix, and eafily crumble to pieces ; others are harder. In a piece of this ftone, of the bignefs of a finger, it is common to find 30 or more of thefe foffils; and often they are feen only in form of white fpecks, fo minute that their figure cannot be dilinguifhed till examined by the nicrofcope.

They all confift of feveral volutx, which are different in number in the different fpecies, and their ftrix alfo are extremely variqus; fome very deep with very high ridges between them, others very flight; fomé ftraight, others crooked; others undulated, and fome terminating in dots, tubercles, or cavities, towards the back, and others having tubercles in two or three places. They are all compofed of a great number of chambers or cells, in the manner of the nautilus Grecorum, each having a communication with the others, by means of a pipe or fiphunculus. There is a fmall white fhell fifh of Barbadoes, which feems truly a recent animal of this genus; and in the Eaft Indies there is another alfo, fmall and greyif; but the large and beantifully marked ones are found only foffil.

They are compofed of various fofill bodies, often of quarry ftone, fometimics of the matter of the common pyritcs, and of a great variety of other fubftances; and though they appear ufually mere flones, yet in fome the pearly part of the oricinal thell is preferved in all its beauty: Sometimes alfo, while the outer fubftance is of the matter of the pyrites, or other coarfe; ftony, or mineral matter, the inner cavity is filled with a pure white fpar of the common' plated texture. 'This gives a great beauty to the fpecinen. Yhe cornua ammonis, or fnake-ftones, are found in many parts of England, particularly in Yorkfhire, where they are very plentiful in the alum rocks of feveral fizes.

\] NUM.

SNEEZING, a convulfive motion of the mufcles of the breaft, whereby the air is expelled from the nofe with much vehemence and noife. It is caufed by the irritation of the upper mombrane of the nofe, occafioned by acrid fubftances floating in the air, or by medicines called Aernutatory.

This irritation is performed either externally, by ftrong fmells, as marjoram, rofes, exc. or by duft floating in the air, and taken in by infpiration; or by fharp pungent medicines, as crefles and other fternutatories, which vellicate the membrane of the nofe; or internaily, by the acrimony of the lympha or mucus, which naturally moiftens that membrane. The matters caft forth in fneezing come primarily from the nofe and throat ; the pituitary membrane continually exuding a mueus thither; and, fecondarily, from the breaft, the trachea, and the bronchia of the lungs.
The practice of faluting the perfori who fneezed exifted in Africa, among nations unknown to the Greeks and Romans. The accounts we have of Monomotapa inform us *, that when the puince fneezes, all his fuh. * Straia, jects in the capital are advertifed of it, that they may Prol. Acad. offer up prayers for his fafety. The author of the conqueft of Peru affures us, that the cacique of Guachoia having fneezed in prefence of the Spaniards, the Indians of his train fell proftrate before him, ftretched forth their hands, and difplayed to him the accuftomed marks of refpect, while they invoked the fun to enlighter him, to defend him, and to be his conflant guard.

Every body knows that the Romans faluted each other on thefe ocafions: and Pliny relates \(\dagger\), that I ibe + Plin, Hif, rius exacted thefe fiyns of homage when drawn in his Nat. li). iita chariot. Superflition, whofe influence can debafe eve. \({ }^{\text {cap. } 2 .}\) ry thing, had degraded this cultom for feveral ages, by attaching favourable or unfavourable omens to ineezing according to the hour of the day or night, according to the figns of the zodiac, according as a work was more or lels advanced, or according as one had fneezed to the right or to the left \(\ddagger\). If a inan fneezed at rifing from \(\ddagger\) Spond. table or from his bed, it was neceffary for him to fit or Homeri lie down again: You are ftruck with aftonifhment, faid Commento Timothcus to the Athenians, who wifhed to return into the harbour with their fleet \(\S\), becaufe he had fneezed; § Frontin. you are ftruck with aftonifliment, becaufe among 10,000 lib. i. there is one man whofe brain is moit.
Polydore Virgil pretends, that in the time of Gregory the Great, there reigned in Italy an epidemic diftemper, which carrried off by fneezing all thofe who were feized by it ; and that this pontiff ordered prayers to be made arraint it, accompanied by certain ligns of the crofs. But befides that, there are very few cafes in which fneezing can be confidercd as dangerous, and that it is frequently a favourable fymptom \|: it is evi- \| Hippocrato denf, that we ought not to date from the fixth century Halleri the origin of a cuftom which lofes itfelf in the obfcurity Pbys. of antiquity. Avicenna and Cardan fay, it is a fort of convultion, which gives occation to dread an epilepfy, and that this difeafe is endeavoured to be warded off by prayers. Clement of Alexandria confiders it as a mark of intemperance and effeminacy, which ought to be profcribed. And he inveighs bitterly againft thofe 4 B

fneczing, who endeavour to procure fneezing by external aid Montaigne, on the contrary, explains this fact in a tone Father cynical. It is fingular enough, that fo many ridiculous, contradictory, and fuperfitious opinions, have not abolifhed thofe cuftomary civilities which are ftill preferved equally among high and low; and which only the Anabaptifts and Quakers have rejected, becaufe they have renounced falutations in every cafe.

Anong the Greeks fneezing was almoft always a oood omen. It excited marks of tendernefs, of refpect, and attachment. The genius of Socrates informed him by
- Plutarcb de fent. Soarat.
\(\uparrow\) Arifenaes g, when it was neceffary to perform any action The young Parthenis, hurried on by her paffion, refolved to write to Sarpedon an avowal of her love \(\dagger\); the fneezes in the moft tender and impaffioned part of her letter: This is fufficient for her ; this incident fupplies the place of an anfwer, and perfuades her that Sarpedon is her lover. Penelope, haraffed by the vexatious courtfhip of her fuitors, begins to curfe them all, and to pour
\(\ddagger\) Homeri
dyy f .
lib. xvii.
§ Xenoph. Anab. forth vows for the return of Ulyfles末* Her fon 'I'elemachus interrupts her by a loud fneeze. She inftantly exults with joy, and regards this fign as an affurance of the approaching return of her hufband. Xenophon was haranguing his troops; a foldier fneezed in the moment when he was exlorting them to embrace a dangerous but neceffary refolution. The whole army, moved by this prefage, determine to purfue the project of their general ; and Xenophon orders facrifices to Jupiter the preferver \(\$\).

This religious reverence for fneezing, fo ancient and fo univerfal even in the times of Homer, always excited the curiofity of the Greek philofophers and of the rabbins. Thefe laft have fpread a tradition, that, after the creation of the world, God made a general law to this purport, that every living man fhould fneeze but once in his life, and that at the fame inftant he fhould render
\(\|\) Acad. des

is Prob.
up his foul into the hand of his Creator \(\|\), without any preceding indifpofition. Jacob obtained an exemption from the common law, and the favour of being informed of his laft hour: He fneezed and did not die; and this fign of death was changed into a fign of life. Notice of this was fent to all the princes of the earth; and they ordained, that in future fneezing fhould be accompanied with forms of bleffing, and vows for the perfons who fneezed.

Arifotle remounts likewife to the fources of natural religion. He obferves, that the brain is the origin of the nerves, of our fentiments, our fenfations, the feat of the foul, the image of the Divinity I ; that upon all thefe accounts, the fubftance of the brain has ever been held in honour ; that the firf men fwore by their head; that they durft not touch nor eat the brains of any animal ; that it was even a facred word which they dared not to pronounce. Filled with thefe ideas, it is not wonderful that they extended their reverence even to fneezing. Such is the opinion of the moft ancient and fagacious philofophers of Greece.

According to mythology, the firft fign of life Prometheus's artificial man gave was by fternutation. This fappofedicreator is faid to have ftolen a portion of the folar rays; and filling with them a phial, which he had made on purpofe, fealed it up hermetically. He inftantly flies back to his favourite automaton, and opening the phial holds it clofe to the ftatue; the rays ftill retaining all their activity, infinuate themfelves through
the pores, and fet the factitious man a fieezing. Pro. Snigy metheus, tranfported with the fuccefs of his machine, offers up a fervent prayer, with wifhes for the prefervation of fo fingular a being. His automaton obferved him, remembering his ejaculations, was very careful, on the like occafions, to offer thefe wifnes in behalf of his defcendants, who perpetuated it from father to fon in all their colonies.

SNIGGLING, a method of fifhing for ecls, chiefly ufed in the day-time, when they are found to hide themfelves near wears, mills, or flood-gates. It is performed thus: 'I'ake a ftrong line and hook, baited with a garden-worm, and obferving the holes where the eels lie hid, thruft your bait into them by the help of a tick; and if there be any, you thall be fure to liave a bite; and may, if your tackling hold, get the largeft eels.

SNIPE, in ornithology. See Scolopax and Shoot ing.

SNORING, in medicine, otherwife called fertor, is a found like that of the cerchnon, but greater and more manifeft.

Many confound thofe affections, and make them to differ only in place and magnitude, calling by the name of gertor that found or noife which is heard or fuppofed to be made in the paffage between the palate and the noftrils as in thofe who fleep; that boiling or bubbling noife, which in refpiration proceeds from the larynx, or or head, or orifice of the afpera arteria, they call cerchon; but if the found comes from the afpera arteria itfelf, they will have it called cerchnos, that is, as fome underftand it, a rattling, or as others a ftridulous or wheezing roughnefs of the afpera arteria. In dying perfons this affection is called by the Greeks pe \(\chi \times 0\), rhenchos, which is a fnoring or rattling kind of noife, proceeding as it were from a conflict between the breath and the humours in the afpera arteria.
This and fuch like affections are owing to a weaknefs of nature, as when the lungs are full of pus or humours: to which purpofe we read in the Prognoftics of Hippocrates, " it is a bad fign when there is no expec. toration, and no difcharge from the lungs, but a noife as from an ebullition is heard in the afpera arteria from a plenitude of humour." Expectoration is fuppreffed either by the vifcidity of the humour, which requires to be difcharged, and which adhering to the afpera arteria, and being there agitated by the breath, excites that bubbling noife or ftertor; or by an obftruction of the bronchia ; or, laftly, by a compreffion of the afpera: arteria and throat, whence the paffage is fraitened, in which the humours being agitated, excite fuch a kind of noife as before defcribed. Hence Galen calls thofe who are ftrait-breafted fertorous. That author affigns but two caules of this fymptom, which are either the ftraitnefs of the paffage of refpiration or redundance of humours, or both together ; but it is neceffary to add. a third, to wit, the weaknefs of the faculty, which is the caufe of the rhenchos in dying perfons, where nature is too weak to make difcharges.

From what has been faid we conclude, that this: fymptom, or this fort of fervour or ebullition in the, throat, is not always mortal, but: only, when nature is. oppreffed with the redundance of humour, in fuch a manner, that the lungs cannot difcharge.themfelves by: fpitting ; or the paffage appointed for the breath (being. the afpera arteria) is very much obftructed, upon which.
account

\section*{\(\mathrm{S} \mathrm{NO} \quad\left[\begin{array}{lll}\sigma_{3} & ]\end{array}\right.\) \\ S N O}
account many dying perfons labour under a ftertor with their mouths gaping.

SNOW, a well-known meteor, formed by the freezing of the vapours in the atmofphere. It differs from hail and hoar-froft, in being as it were crytallized, which they are not. This appears on examining a flake of fnow by a magnifying glafs; when the whole of it will appear to be compofed of fine fhining fpicula diverging like rays from a centre. As the flakes fall down through the armofphere, they are continually joined by more of thefe radiated fpicula, and thus increafe in bulk like the drops of rain or hailitones. Dr Grew, in a difcourfe of the nature of fnow, obferves, that many parts thereof are of a regular figure, for the moft part flars of fix points, and are as perfect and tranfparent ice as any we fee on a pond, \&c. Upon each of thefe points are other collateral points, fet at the fame angles as the main points themfelves: among which there are divers other irregular, which are chiefly broken points, and fragments of the regular ones. Others alfo, by various winds, feem to have been thawed and frozen again into irregular clufters ; fo that it feems as if the whole body of fnow were an infinite mafs of icicles irregularly figured. That is, a cloud of vapours being gathered into drops, the faid drops forthwith defcend; upon which defcent, meeting with a freezing air as they pafs through a colder region, each drop is immediately frozen into an icicle, hooting itfelf forth into feveral points; but thefe ftill continuing their defcent, and meeting with fome intermitting gales of warmer air, or in their continual waftage to and fro touching upon each other, fome of them are a little thawed, blunted, and again frozen into clufters, or intangled fo as to fall down in what we call fakes.

The lightnefs of fnow, although it is firm ice, is owing to the excefs of its furface, in comparifon to the matter contained under it; as gold itfelf may be extended in furface till it will ride upon the leaft breath of air.

The whitenefs of fnow is owing to the fmall particles into which it is divided; for ice, when pounded, will become equally white. An artificial fnow has been made by the following experiment. A tall phial of aquafortis being placed by the fire till it is warm, and filings of pure filver, a few at a time, being put into it; after a brifk ebullition, the filver will diffolve nowly. The phial being then placed in a cold window, as it cools the tilver particles will thoot into cryftals, feveral of which running together will form a flake of fnow, which will defcend to the bottom of the phial. While they are defcending, they reprefent perfectly a fhower of filver fnow, and the flakes will lie upon one another at the bottom like real fnow upon the ground.

According to Signior Beccaria, clouds of fnow differ in nothing from clouds of rain, but in the circumftance of cold that freezes them. Both the regular diffulion
of the fnow, and the regularity of the fructure of its parts (particularly fome figures of fnow or hail which fall about Turin, and which he calls rofette), fhow that clouds of fnow are acted upon by fome uniform caufe like electricity ; and he endeavours to fhow how electricity is capable of forming thefe figures. He was confirmed in his conjectures by obferving, that his apparatus for obferving the electricity of the atmofphere never failed to be electrified by fnow as well as rain. Profeffor Winthrop fometimes found his apparatus electrified by fnow when driven about by the wind, though it had not been affected by it when the fnow itfelf was falling. A more intenfe electricity, according to Beccaria, unites the particles of hail more clofely than the more moderate electricity does thofe of fnow, in the fame manner as we-fee that the drops of rain which fall from thunder-clouds are larger than thofe which fall from others, though the former defcend through a lefs fpace.

But we are not to confider fnow merely as a curious and beautiful phenomenon. The Great Difpenfer of univerfal bounty has fo ordered it, that it is eminently fubfervient, as well as all the works of creation, to his benevolent defigns. Were we to judge from appear. ances only, we might imagine, that fo far from being ufeful to the earth, the cold humidity of fnow would be detrimental to vegetation. But the experience of all ages afferts the contiary. Snow, particularly in thofe northern regions where the ground is covered with it for feveral months, fructifies the earth, by guarding the corn or other vegetables from the intenfer cold of the air, and efpecially from the cold piercing winds. It has been a vulgar opinion, very generally received, that fnow fertilizes the lands on which it falls more than rain, in confequence of the nitrous falts which it is fuppofed to acquire by freezing. But it appears from the experiments of \(\operatorname{Margraaf}(\mathrm{A})\) in the year 1751 , that the chem mical difference between rain and fnow-water is exceedingly fmall; that the latter is fomewhat lefs nitrous, and contains a fomewhat lefs proportion of earth than the former; but neither of them contain ein ther earth or any kind of falt in any quantity which can be fenfibly efficacious in promoting vegetation. AL lowing, therefore, that nitre is a fertilizer of lands, which many are upon good grounds difpofed utterly to deny, yet fo very fmall is the quantity of it contained in fnow, that it cannet be fuppofed to promote the vegetation of plants upon which the fnow has fallen. The peculiar agency of fnow, as a fertilizer in preference to rain, may admit of a very rational explanation, without recurring to nitrous falts fuppofed to be contained in it. It may be rationally afcribed to its furnifhing a covering to the roots of vegetables, by which they are guarded from the influence of the atmofpherical cold, and the internal heat of the earth is prevented from efcaping.

The internal parts of the earth, by fome principle 4 B 2 which
(A) Margraaf collected of the pureft fnow he could find as much as when melted afforded 100 meafures of water, each meafure containing 36 ounces. By diftilling this quantity he obtained 60 grains, not of nitre, but of calcareous earth, with fome grains of the acid of fea-falt, impregnated with a nitrous vapour. The fame quantity of rain-water collected in the winter months with equal attention, when diftilled yielded 100 grains of calcareous earth with fome grains of the acid of mitre and feafalt. The chemical difference therefore between rair and fnow is very fmall.

\section*{S N O \(\left[\begin{array}{lll}564\end{array}\right] \quad\) S N O}

Snow. which we do not underftand, is heated uniformly to the 48th degree of Fahrenheit's thermometer. This degree of heat is greater than that in which the watery juices of vegetables freeze, and it is propagated from the in. ward parts of the earth to the furface, on which the vegetables grow. The atmofphere being variably heated by the action of the fun in different climates, and in the fame climate at different feafons, communicates to the furface of the earth and to fome diflance below it the degree of heat or cold which prevails in itfelf. - Different vegetables are able to preferve life under different degrees of cold, but all of them perifh when the cold which reaches their roots is extreme. Providence has therefore, in the coldeft climates; provided a covering of fnow for the roots of vegetables, by which they are protected from the influence of the atmofpherical cold. The fnow keeps in the internal heat of the earth, which furrounds the roots of vegetables, and defends them from the cold of the atmofphere.

Snow or ice water is always deprived of its fixed air, which efcapes during the procefs of congelation. Accordingly, as fome of the inhabitants of the Alps who ufe it for tlreir conftant drink have enormous wens upon their throats, it has been afcribed to this circumftance. If this were the caufe of thefe wens, it would be eafy to remove it by expofing the fnow-water to the air for fome time. But feveral eminent phyfrcians have rejected the notion that fnow-water is the caufe of thefe wens; for in Greenland, where fno w-water is commonly ufed, the inhabitants are not affected with fuch fwellings : on the other hand, they are common in Sumatra where fnow is never feen. -

SNow, in fea-affairs, is generally the largeft of all twomafted veffels employed by Europeans, and the moft convenient for navigation.

The fails and rigging on the mainmaft and foremaft of a fnow are exacly fimilar to thofe on the fame mafts in a fhip; only that there is a fmall maft behind the mainmaft of the former, which carries a fail nearly refembling the mizen of a fhip. The foot of this maft is fixed on a block of wood on the quarter-deck abaft the mainmalt; and the head of it is attached to the aftertop of the maintop. The fail which is called the tryfail is extended from its maft towards the ftern of the veffel.

When the loops of war are rigged as fnows, they are furnifhed with a horfe, which anfwers the purpofe of the tryfail-maft, the fore-part of the fail being attached by rings to the faid horfe, in different places of its height.

SNow-Grotto, an excavation made by the waters on the fede of Mount Etna, by making their way under the layers of lava, and by carrrying away the bed of pozzolana below them. It occurred to the proprietor, that this place was very fuitable for a magazine of fnow: for in Sicily, at Naples, and particularly at Malta, they are obliged for want of ice to make ufe of fnow for cooling their wine, fherbet, and other liquors, and for making fweetmeats.

This grotto was hired or bought by the knights of Malta, who laving neither ice nor fnow on the burning rock which they inhabit, have hired feveral caverns on Etna, into which people whom they employ colleet and preferve quantities of fnow to be fent to Malta when needed. This grotto has therefore been repaired with-
in at the expence of that order; flights of fteps are cut into it, as well as two openings from above, by which they throw in the fnow, and through which the grotto is eulightened. Above the grotto they have alfo levelled a piece of ground of confiderable extent : this they have inclofed with thick and lofty walls, fo that when the winds, which at this elevation blow with great violence, carry the fnow from the higher parts of the mountain, and depofite it in this inclofure, it is retained and amaffed by the walls. The people then renove it into the grotto through the two openings; and it is there laid up, and prelerved in fuch a manner as to refift the force of the fummer heats; as the layers of lava with which the grotto is arched above prevent thens from making any imprefion.

When the feafon for exporting the fnow comes on, it is put into large bags, into which it is prefled as clofely as poffible; it is then carried by men out of the grotto, and laid upon mules, which convey it to the fhore, where fmall veffels are waiting to carry it away.
But before thofe lumps of fnow are put into bags, they are wrapped in frem leaves; fo that while they are conveyed from the grotto to the fhore, the leaves may prevent the rays of the fun from making any impreffion upon them.

The Sicilians carry on a confiderable trade in fnow, which affords employment to fome thoufands of mules, horfes, and men. They have magazines of it on the fummits of their loftieft mountains, from which they diftribute it through all their cities, towns, and houfes; for every perfou in the inland makes ufe of fnow. 'I'hey confider the practice of cooling their liquors as abfolutely neceffary for the prefervation of health; and in a climate the blat of which is conttantly relaxing the fibres, cooling liquors, by communicating a proper tone to the fibres of the flomach, mult greatly ftrengthen them for the performance of their functions.

In this climate a fcarcity of fnow is no lefs dreaded than a fcarcity of corn, wine, or oil. We are inform. ed by a gentleman who was at Syracufe in the year 1777, when there was a fcarcity of fnow, the people of the town learned that a fmall veffel loaded with that article was paffing the coaft : without a moment's deliberation they ran in a body to the fhore and demanded her cargo \(;\) which when the crew refufed to deliver up, the Syracufans attacked and took, though with the lofs of feveral men.

\section*{Snotr-Drop, in botany. See Chionanthus.}

SNOWDON-HiLl, the name of a mountain in Caernarvonfhire in Wales, generally thought to be the higheft in Britain; though fome have been of opinion that its height is equalled, or even exceeded, by mountains in the Highlands of Scotland. The mountain is furrounded by many others, called in the Welfh language Crib Coch, Crib y Difill, Lliweddy yr Arran, \&c.

According to Mr Pennant*, this mountainous tract yields fcarcely any corn. Its produce is cattle and fheep; which, during fummer, keep very high in the mountains, followed by their owners with their families, who refide during that feafon in bavodtys, or "fummer dairyhoufes," as the farmers in the Swifs Alps do in their fennes. Thefe houfes confift of a long low room, with a hole at one end to let out the fmoke from the fire which is made beneath. Their furniture is very fimple; ftones are fubitituted for ftools, and their beds are of
wdon- hay, ranged along the fides. They manufacture their own clothes, and dye them with the lichen omphaloides and lichen farititinus, moffes collected from the rocks. During fuminer the men pafs their time in tending their herds or in making hay, \&ic. and the women in milking or in making butter and cheefe. For their own ufe they milk both ewes and goats, and make cheefe of the milk. Their diet confilts of milk, eleefe, and butter: and their ordinary drink is whey; though they have, by way of referve, a few botles of very flrong beer, which they ufe as a cordial when fick. They are peepile of good undertanding, wary, and circumfpcet ; tall, thin, and of ftrony conffitutions. In the vintertime they defcend into the ber-dref, or " old dwelling," where they pafs their time in inactivity.
The view from the higheft peak of Snowdon is very extenfive. From it \(\mathrm{Mr}_{\mathrm{r}}\) Pennant faw the county of Chefter, the high hills of Yorkhire, part of the north of Enoland, Scotland, and Ireland; a plain view of the ifle of Man; and that of Anglefea appeared like a map extended under his feet, with every rivulet vifible. Our author took much pains to have this view to advantage; fat up at a farm on the weft till about 12, and walked up the whole way. The night was remarkably fine and ftarry; towards morning the flars faded away, leaving an interval of darknefs, which, however, was foon difpelled by the dawn of day. The body of the fun appeared moft diftinct, with the roundnefs of the moon, before, it appeared too brilliant to be looked at. The fea, which bounded the weftern part of the profpect, appeared gilt with the fun-beams, firft in flender ftreaks, and at length glowed with rednefs. The profpect was difclofed like the gradual drawing up of a curtain in a theatre ; till at laft the heat beeame fufficiently frong to raife mifts from the various lakes, which in a flight degree obfcured the profpect. The fhadow of the mountain extended many miles, and fhowed its bicapitated form ; the Wyddfa making one head, and Crib y Diftill the other. At this time he counted between 20 and 30 lakes either in Caernarvon or in Merionethhire. In making another vifit, the fky was obfcured very foon after he got up. A valt riit involved the whole circuit of the mountain, and the profpect down was horrible. It gave an idea of numbers of abyffes, concealed by a thick fmoke furioufly circulating around them. Very often a gutt of wind made an opening in the clouds, which gave a fine and diftinct vifta of lake and valley. Sometimes they opened in one place, at others in many at onee; exhibiting a moft ftrange and perplexing fight of water, fields, rocks, and chafms. They then elofed again, and every thing was involved in darknefs; in a few minutes they would feparate again, and repeat the above-mentioned facene with infinite variety. From this profpect our traveller defcended with great reluetance ; but before he had reached the place where his horfes were left, he was overtaken by a thunder ftorm. The rolling of the thunder-claps, being reiterated by the mountains, was inexpreffibly awful; and a'ter he had mounted, he was in great danger of being fwept away by the torrents whieh poured down in confequence of a very heavy rain.

It is very rare ( Mr Pennant oblerves) that the traveller gets a proper day to afcend this hill: it indeed often appears clear; but by the evident attraction of the
clouds by this lofty mountain, it becomes fuddenly and unexpectedly enveloped in mit, when the clouds have juft before appeared very high and very remote. At times he obferved then lower to hali their height ; and notwithftandin: they have been difperfed to the right and left, yet they have met from both fides, and united to involve the fummit in one great obfcurity.
The height of Snowidon was meafured, in 1682, by Mr Cafwell, with inftruments made by Flamftead : according to his menturation, the height is 3720 feet; but more modern computations make it only 3558 , reckoning from the quay at Caernarvon to the higheft peak. The ftone that compofes this mountain is exceffively hard. Large coarle cryftals, and frequently cubie pyrites, are found in the fiffures. An immenfe quantity of water rufhes down the fides of Snowdon and the neighbouring mountains, infomuch that Mr Pennant fuppofes, if collected into one ftream, they would exceed the waters of the Thames.

SNUFF, a powder chiefly made of tobacco, the ufe of which is too well known to need any defcription here.

Tobacco is ufually the bafis of fnuff; other matters being only added to give it a more agretable fcent, \&e. The kinds of fnuff, and their feveral names, are infinite, and new ones are daily invented; fo that it would be difficult, not to fay impoffible, to give a detail of them. We fhall ouly fay, that there are three principal forts: the firft granulated ; the fecond an impalpable powder ; and the third the bran, or coarfe part remaining after fifting the fecond fort.
"Every profeffed, inveterate, and incurable fiufftaker (fays Lord Stanhope), at a moderate compritation, takes one pinch in ten minutes. Every pinch, with the agreeable ceremony of blowing and wiping the nofe and other incidental circumftances, confumes a minute and a half. One minute and a half out of every ten, allowing 16 hours to a fnuff-taking day, amounts to two hours and 24 minutes out of every natural day, or one day out of every ten. One day out of every 10 amounts to 36 days and a half in a year. Hence if we fuppofe the practice to be perfited in 40 years, two entire years of the fnuff-takei's life will be dedicated to tickling his nofe, and two mere to blowing it. The expence of fnuff, fnuff-boxes, and handkerchiefs, will be the fubject of a fecond effay; in which it will appear, that this luxury encroaches as much on the income of the fnuff-taker as it does on his time; and that by a proper application of the time and money thus loft to the public, a fund might be conflituted for the difcharge of the national delt." See Nicotiana.

SNYDERS (Francis), a Flemifl. painter, born at Antwerp in 1579, and bred under his countryman Henry Van Balen. His genius firt difplayed ittelf in painting fruit : he afterwards attempted animals; huntings, \&c. in which he exceeded all his predeceffors. He alfo painted kitchens, \&c. and gave dignity to fubjects that feemed incapable of it. He was made painter to Ferdinand and Ifabella, archduke and duchefs, and became attached to the houfe of the cardinal infant of Spain. 'The king of Spatn and the elector Palatine adorned their palaces with huntings by this artif. Rubens, Jordaens, and Snyders, ufed to cu-operate in the enriching of each other's pictures according to their

Sruff, Snyders.

Soil- fin, feveral talents; and thus they became more valuable \(S\) rap.
in 1657

SOAL-fish, in ichthyology. See Pleuronectes.

SOAP, a compofition of cauftic, fixed alkaline falt, and oil, fometimes hard and dry, fometimes foft and liquid; much ufed in wafhing, whitening linens, and by dyers and fullers.-Soap may be made by feveral methods, which, however, all depend upon the fame principle. The foap which is ufed in medicine is made without heat. See Chemistry, \({ }^{\circ}\) ioz 6.

In manufactures where large quantities of it are prepared, foap is made with heat. A lixivium of quicklime and foda is made, but is lefs concentrated than that above referred to, and only fo much that it can fuftain a frefh egg. A part of this lixivium is to be even diluted and mixed with an equal weight of oil of olives. The mixture is to be put on a gentle fire, and agitated, that the union may be accelerated. When the mixture begins to unite well, the reft of the lixivium is to be added to it ; and the whole is to be digefted with a yery gentle heat, till the foap be completely made. A trial is to be made of it, to examine whether the juft proportion of oil and alkali has been obferved. Good foap of this kind ourht to be firm, and very white when cold ; not fubject to become moif by expofure to air, and entirely mifcible with pure water, to which it communicates a milky appearance, but without any drops of oil floating on the furface. When the foap lias not thefe qualities, the combination has not been well made, or the quantity of falt or of oil is too great, which faults muft be corrected.

In foft or liquid foaps, green or black foaps, cheaper oils are employed, as oil of nuts, of hemp, of fifh, \&c. Thefe foaps, excepting in confiftence, are not effentially different from white foap.

Fixed alkalis are much difpofed to unite with oils that are not volatile, both vegetable and animal, fince this union can be made even without heat. The compound refulting from this union partakes at the fame time of the properties of oil and of alkali; but thefe properties are modified and tempered by each other, according to the general rule of combinations. Alkali formed into foap has not nearly the fame acrimony as when it is pure; it is even deprived of almoft all its cauticity, and its other faline alkaline propertics are almof entirely abolifhed. The fame oil contained in foap is lefs combuttible than when pure, from its union with the alkali, which is an uninflammable body. It is mifcible, or even foluble, in water, to a certain degree, by means of the alkali. Soap is entirely foluble in fpirit of wine; and fill better in aquavitr fharpened by a little alkaline falt, according to an obfervation of Mr Geoffioy.

The manufacture of foap in London firf began in the year 1524 ; before which time this city was ferved with white foap from foreign countries, and with grey foap fpeckled with white from Brifol, which was fold for a penny a pound; and alfo with black foap, which fold for a halfpenny the pound.

The principal foaps of our own manufacture are the foft, the hard, and the ball foap. The foft foap is either white or green. The procefs of making each of thefe thall now be defcribed.

Green foft foap. The chief ingredients ufed in making this are lees drawn from pot-afh and lime, boiled up with tallow and oil. Firlt, the ley of a proper degree of ftrength (which muft be eftimated by the weight of the liquor), and tallow, are put into the copper to. gether, and as foon as they boil up the oil is added; the fire is then damped or fopped up, while the ingredients remain in the copper to unite; when they are united, the copper is again made to boil, being fed or filled with lees as it boils, till there be a fufficient quantity put into it; then it is boiled off and put into cafks. Whee this foap is firf made it appears uniform ; but in about a week's time the tallow feparates from the oil into thofe white grains which we fee in common foap. Soap thus made would appear yellow, but by a mixture of indigo added at the end of the boiling, it is rendered green, that being the colour which refulte from the mixture of yellow and blue.
White foap. Of this one fort is made after the fame manner as green foft foap, oil alone excepted, which is not ufed in white. The other fort of white foft foap is made from the lees of athes of lime boiled up two different times with tallow. Firft, a quantity of lees and tallow are put into the copper together, and kept boiling, being fed with lees as they boil, until the whole is boiled fufficiently ; then the lees are feparated or difcharged from the tallowifh part, which part is removed into a tub, and the lees are thrown away; this is called the firft balf-boil: then the copper is filled again with frefh tallow and lees, and the firf half-boil is put out of the tub into the copper a fecond time, where it is kept boiling with frefh lees and tallow till the foap is produced. It is then put out of the copper into the fame fort of cafks as are ufed for green foft foap. The common foft foap ufed about London, generally of a greenifh hue, with fome white lumps, is prepared chiefly with tallow: a blackifh fort, more common in fome other places, is faid to be made with whale oil.

Hard foap is made with lees from athes and tallow, and is moft commonly boiled twice : the firt, called the balf-boil, hath the fame operation as the firt half-boil of foft white foap. Then the copper is charged with frefh lees again, and the firt half boil put into it, where it is kept boiling, and fed withlees as it boils, till it grains or is boiled enotgh; then the ley is difcharged from it, and the foap put into a frame to cool and harden. Common falt is made ufe of for the purpofe of graining the foap; for when the oil or tallow has been united with the ley, after a little boiling, a quantity of falt is thrown into the mafs, which diffolving readily in water, but not in the oil or tallow, draws out the water in a confiderable degree, fo that the oil or tallow united with the falt of the ley fwims on the top. When the ley is of a proper ftrength, lefs falt is neceffary to raife the curd than wher it is too weak. It mult be obferved, that there is no certain time for bringing off a boiling of any of thefe forts of foap: it frequently takes up part of two days.

Ball foap, commonly ufed in the north, is made with lees from aines and tallow. The lees are put into the copper, and boiled till the watery part is quite gone, and there remains nothing in the copper but a fort of faline matter (the very frength or effence of the ley); to this the tallow is put, and the copper is kept boilo ing and ftirring for above half an hour, in which time

\section*{S. O A}
the foap is made; and then it is put out of the cop. per into tubs or bafkets with Cheets in them, and immediately (whilft foft) made into balls. It requires near 24 hours in this procefs to boil away the watery part of the ley.

When oil unites with alkali in the formation of foap, it is little altered in the connection of its principles; for it may be feparated from the alkali by decompofing foap with any acid, and may be-obtained nearly in its original fate.

Concerning the decompofition of foap by means of acids, we muift obferve, firt, that all acids, even the weakeft vegetable acids, may occafion this decompori. tion, becaufe every one of them has a greater affinity than oil with fixed alkali. Secondly, thefe acids, even when muited with any bafis, excepting fixed alkali, are capable of occafioning the fame decompofition; whence all ammoniacal falts, all falts with bafis of earth, and all thofe with metallic bafes, are capable of decompofing foap, in the fame manner as difengaged acids are; with this difference, that the oil feparated from the fixed alkali, by the acid of thefe falts, may unite more or lefs intimately with the fubltance which was the bafis of the neutral falt employed for the decompofition.

Soap may alfo be decompered by diftillation, as Lemery has done. When firtt expofed to fire, it yields a phlegm called by him a fpirit; which neverthelefs is neither acid nor alkaline, but fome water which enters into the compofition of foap. It becomes more and more coloured and empyreumatic as the fire is increafed, which fhows that it contains the moft fubtle part of the oil. It feems even to raife along with it, by help of the oil and action of the fire, a frisall part of the alkali of the foap: for, as the fame chemift obferves, it occafions a precipitate in a folution of corrofive fublimate. After this phlegm the oil rifes altered, precifely as if it had been dititled from quicklime, that is, empyreumatic, foluble in fpirit of wine, at firt fuff ciently fubtle and afterwards thicker. An alkaline refiduous coal remains in the retort, confifting chiefly of the mineral alkali contained in the foap, and which may be difengaged from the coal by calcination in an open fire, and obtained in its pure flate.

Alkaline foaps are very ufeful in many arts and trades, and alfo in chemittry and medicine. 'Their principal utility confifts in a deterfive quality that they receive from their alkali, which, although it is in fome meafure faturated with oil, is yet capable of acting upon oily matters, and of rendering them faponaceous and mifcible with water. Hence foap is very ufeful to cleanfe any fubflances from all fat matters with which they happen to be foiled. Soap is therefore daily ufed for the wafhing and whitening of linen, for the cleanfing of woollencloths from oil, and for whitening firk and freeing it from the refinous varnifh with which it is naturally covered. Pure alkaline lixiviums being capable of diffolving oils more effectually than foap, might be employed. for the fame purpofes; but when this activity is notmitigated by oil, as it is in foap, they are capable of al. tering, and even of deftroying entirely by their caufticity, moft fubtances, efpeciahly animal matters, as filk, wool, and others: whereas foap cleanfes from oil almot: as effectually as pure alkali, without danger of altering or deftroying ; which renders it very ufeful.

Soap. was imperfectly known to the ancients. It is

\section*{567 S O A}
mentioned by Pliny as made of fat and affes, and as an invention of the Gauls. Aretrus and others inform us, that the Greeks obtained their knowledge of its medi- Woodville cal ufe from the Romans. Its virtues, according to Botary, Bergius, arc detergent, refolvent, and aperient, and its P. 390. ufe recommended in jaundice, gout, calculous complaints, and in obftructions of the vifcera. The efficacy of foap in the firtt of thefc difeafes was experienced by Sylvius, and fince recommended very generally by various authors who have written on this complaint; and it has. alfo been thought of ufe in fupplying the place of bile in the primæ vix. The utility of this medicine in ieterical cafes was inferred chiefly from its fuppofed power of diffolving biliary concretions ; but this medicine has. loft much of its reputation in jaundice, fince it is now known that gall-ftones have been found in many after death who had been daily taking foap for feveral noonths and even years. Of its good efficets in urinary calcu。 lous affections, we have the teftimony of feveral, efpe. cially when diflolved in lime-water, by which its efficacy is confiderably increafed; for it thus becomes a power. ful folvent of mucus, which an ingenious modern author fuppofes to be the cliief agent in the formation of calculi : it is, however, only in the incipient flate of the difeafe that thefe remedies promife effectual benefit; though they generally abate the more violent fymptoms. where they cannot remove the caufe. With Boerhaave foap was a general medicine: for as he attributed moft complaints to vifcidity of the fluids, he, and moft of the Boerhaavian fchool, prefcribed it in conjunction with different refinous and other fubftances, in gout, rheumatifm, and various vifceral complaints. Soap is alfo externally employed as a refolvent, and gives name to feveral officinal preparations.

From the properties of foap we may know that it mult be a very effectual and convenient anti-acid. It abforbs acids as powerfully as pure alkalis and abforo. bent earths, without having the caufticity of the former, and without oppreffing the ftomach by its weight like the latter.
Laftly, we may perceive that foap nuuft be one of the beft of all antidotes to fop quickly, and with the leaft inconvenience, the bad effects of acid corrolive poifons, as aquafortis, corrofive fublimate, \&c.

Soap imported is fubject by 10. Ann. cap. 19. to a duty of 2 d . a pound (over and above.former duties); and by 12 Ann..ftat. 2. cap. 9. to the farther fum of i.d. a pound. And by the fame acts, the duty on foap made in the kingdom is \(1 \frac{1}{2}\) d. a pound. By 17 G. III. cap. 52 . no perfon within the limits of the head office: of excife in London fhall be permitted to make any foap unlefs he occupy a tenement of 101 a year, be affeffed, and pay the parifh rates; or ellewhere, unlefs he be affeffed, and pay to church and poor. Places of making are to be entered on pain of 501. and covers and locks to be provided under a forfeiture of 1001 . ; the furnace-door of every utenfil ufed in the manufacture of foap fhall be locked by the excife officer, as foon as the fire is damped or drawn out, and faftenings provided, under the penalty of 501 .; and opening or damaging fuch fartening incurs a penalty of 100 1. Officers are required to enter and furvey at all. times, by day or night, and the penalty of obftrusting. is 201 . and they may unlock and examine every copper, \&c. between the hours of five in the morning and ele-

8

\section*{\(\mathrm{S} O \mathrm{C}\) [ 568\(] \quad \mathrm{S} O \quad \mathrm{C}\)}
ven in the evening, and the penalty of obrlugting is 1001 . Every maker of foap before he begins any making, if within the bills of mortality, fhall give 12 hours, if elfewhere 24 hours, notice in writing to the officer, of the time when he intends to begin, on pain of sol. No maker fhall remove any foap unfurveyed on pain of 201 . without miving proper notice of his intention. And if any maker fhall conceal any foap or materials, he fhall forfeit the fame, and alfo 5001 . Every barrel of foap fhall contain 256 lb . avoirdıpois, half barrel 128 lb . firkin 64 lb . half-firkin 32 lb . befides the weight or tare of each cafk: and all foap, excepting hard cake foap and ball foap, fhall be put into fuch cafks and no other, on pain of forfeiture, and \(\varsigma 1\). The maker fhall wreekly enter in writing at the next office the foap made by him in each week, with the weight and quantity at each boiling, on pain of 501 ; and within one week after entry clear off the duties, on pain of double duty. See, belides the ftatutes above cited, 5 Geo. III. cap. 43 . 12 Geo. III. cap. 46. 1 I Geo. cap. 30. I Geo. ftar. 2. cap. \(3^{66}\).

SOC (Sax.), fignifies power or liberty to minitter juftice or execute laws: alfo the circuit or territory wherein fuch power is exercifed. Whence our lawLatin word focca is ufed for a feigniory or lordhip enfranchifed by the king, with the liberty of holding or keeping a court of his fockmen: And this kind of liberty continues in divers parts of England to this day, and is known by the names of foke and foken.

SOCAGE, in its moft general and extenfive fignification, feems to denote a tenure by any certain and determinate fervice. And in this fenfe it is by our ancient writers conflantly put in oppofition to chivalry or knight-fervice, where the render was precarious and uncertain. The fervice muft therefore be certain, in order to denominate it focage ; as to hold by fealty and 20 s. rent ; or, by homage, fealty, and 20 s. rent ; or, by homage and fealty without rent ; or, by fealty and certain corporal fervice, as ploughing the lord's land for three days; or, by fealty only without any other fervice: for all thefe are tenures in focage.

Socage is of two forts: free-focage, where the fervices are not only certain but honourable; and villeinfocage, where the fervices, though certain, are of a bafer nature (fee Vileenage). Such as hold by the former tenure are called, in Glanvil and other fubfequent anthors, by the name of liberi fokemanni, or tenants in freefocage. The word is derived from the Saxon appellation foc, which fignifies liberty or privilege; and, being joined to an ufual termination, is called focages in La: tin focugium; fignifying thereby a free or privileged tenure.

It feems probable that the focage-tenures were the relics of Saxon liberty; retained by fuch perfons as had neither, forfeited them to the king, nor been olliged to exchange their tenure for the more honomable, as it was called, but at the fame time more burthenfome, te-
nure of knight-fervice. This is peculiarly semarkable in the tenure which prevails in Kent, called gavelkind, which is generally acknowledged to be a fpecies of fo-cage-tenure ; the prefervation whereof inviolate from the innovations of the Norman conqueror is a fact univerfally known. And thofe who thus preferved their liberties were faid to hold in free and common focape.
As therefore the grand criterion and difinguifhing mark of this fpecies of tenure are the having its renders or fervices afcertained, it will include under it alt other methods of holding free lands by certain and invariable rents and duties; and in particular, Petit Seryeantr, Tenure in Burgage, and Gavelinind. See thefe articles.
SOCIETY, a number of rational and meral be. ings, united for their common prelervation and happinefs.

There are fhoals of fifhes, herds of quadrupeds, and flocks of birds. But till obfervation enable us to de. brutes termine with greater certainty, how far the inferior ani- capable mals are able to look through a feries of means to the fate. end which thefe are calculated to produce, how far their conduet may be influenced by the hope of reward and the fear of punifhment, and whether they are at all capable of moral diftinetions-we cannot with propriety apply to them the term Society. We call crows, and beavers, and feveral other fpecies of animals, gregarious ; but it is hardly good Englifh to fay that they are forial.

It is only human fociety, then, that can become the fubject of our prefent inveftigation. The phenomena the or : which it prefents are highly worthy of our notice.

Such are the advantages which each individual evi. dently derives from living in a focial ftate; and fo helpleís does any human being appear in a folitary flate, that we are naturally led to conclude, that if there ever a that period could not be of long duration s for theis averfion to folitude and love of fociety would for their duce them to enter into focial union. Such is the opinion which we are led to conceive, when we compare our own condition as members of civilized and enlightened fociety with that of the brutes around us, or with that of favages in the carlier and ruder periods of focial life. When we hear of Indians wandering naked through the woods, deffitute of arts, unfkilled in agriculture, fcarce capable of moral diftinctions, void of all religious fentiments, or poffeffed with the moft abfurd notions concerning fuperior powers, and procuring means of fubfiftence in a manner equally precarious with that of the beatt of prey-we look down with pity on their condition, or turn from it with horror. When we view the order of cultivated fociety, and confider our inftitutions, arts, and manners-we rejoice over our fuperior wifdom and happinefs.
Man in a civilized ftate appears a being of a fuperior order to man in a favage ftate; yet fome philofophers tell us, that it is only he who, having been educated in fociety, has been taught to depend upon others, that can be helplefs or miferable when placed in a folitary Rate. They view the fayage who exerts hinifelf with intrepidity to fupply his wants, or bears them with fortitude, as the greateft hero, and pofiffing the greateft happinefs. And therefore if we agree with them, that the propenfities of nature may liave prompted men to

\section*{S O C : \(\quad[569] \quad \mathrm{S} \mathrm{O} \mathrm{C}\)}
icty. enter into fncial union, though they may hawe hoped to enjoy fuperior fecurity and happinefs by engaging to protect and fupport each othér, we mult conclude that the Author of the univerfe has deftined man to attain greater dignity and happinefs in a favage and folitary than in a focial ftate; and therefore that thofe dífpofitions and views which lead us to fociety are fallacious and inimical to our real intereft.

Whatever be the fuppofed advantages of a folitary ftate, certain it is that mankind, at the earlieft periods, were united in fociety. Various theories have been formed concerning the circumtances and principles which gave rife to this union: but we have elfewhere fhown, that the greater part of them are founded in error; that they fluppofe the original fate of man to have been that of favages; and that fuch a fuppofition is contradicted by the moft authentic records of antiquity. For though the records of the earlier ages are generally obfcure, fabulous, and imperfect; yet happily there is one free from the imperfections of the reft, and of undoubted authenticity, to which we may fafely have -recourfet. This record is the Pentateuch of Mofes, of prefents us with a genuine account of the origin man and of fociety, perfectly confonant to what we have laid down in the article referred to (fee Savage). According to Mofes, the firlt fociety was that of a huband and wife united in the bouds of marriage : the firft government that of a father and huband, the mafter of his family. Men lived together under the patriarchal form of government while they employed themfelves chiefly in tending flocks and herds. Children in fuch circumftances cannot foon rife to an equality with their parents, where a man's importance depends on his property, not on his abilities. When flocks and herds are the chief articles of property, the fon can only obtain thefe from his father; in general therefore the fon mult be entirely dependent on the father for the means of fubliftence If the parent during his life beftow on his children any part of his property, he may do it on fuch conditions as fhall make their dependence upon him continue till the period of his death. When the community are by this event deprived of their head, inftead of continuing in a fate of union, and felecting fome one from among theinfelves whom they may inveft with the authority of a parent, they feparate into fo many diftinct tribes, each fubjected to the authority of a different lord, the mafter of the family, and the proprietor of all the flocks and herds belonging to it. Such was the ftate of the firft focieties which the narrative of Mofes exhibits to our attention.
. Thofe philofophers who have made fociety, in its various ftages between rudenefs and refinement, the fubject of their fectuations, have generally confidered mankind, in whatever region of the globe, and under whatever climate, as proceeding uniformly through certain regular gradations from one extreme to the other. They regard them, firft, as gaining a precarious fubfiftence by gathering the fpontaneous fuits of the earth, preying on the inhabitants of the waters, if placed on the fea fhore, or along the banks of large rivers; or hunting wild beafts, if in a fituation where thefe are to be found in abundance, without forefight or induftry to provide for future wants when the prefent call of appetite is gratified. Next, they fay, man rifes to the fhepherd flate, and next to that of hufbandmen, when they tuen their , Vol. XVIL. Part IT.
attention from the management of hocks to the cultio vation of the ground. Next, thefe hubandmen improve their powers, and better their condition, by becoming artizans and merchants; and the begiuning of this period is the boundary between barbarity and civilization.
Thefe are the flages through which they who have employed themfelves on the natural hifory of fociety have generally conducted mankind in their progrefs from rudenefs to refinement : but they feem to have overlooked the manner in which mankind were at firft eftablifhed on this earth; for the circumftances in which the parents of the human race were originally placed; for the degree of knowledge communicated to them; and for the inftruction which they muft have been capable of communicating to their pofterity. They rather appear to confider the inhabitants of every different region of the glove as aborigines, fpringing at firft from the ground, or dropped on the fpot which they inlabit; no lefs ignorant than infarts of the nature and relations of the objects around them, and of the purpofes which they may accomplifh by the exercife of their organs and facultics.

The abfurdity of this theory has been fully demon- Are fancin. ftrated in another place: and if we agree to receive thefulo Mofaic account of the original eftablifhment of mankind, we fhall be led to view the phenomena of focial life in a light very different. We mult firft allow, that though many of the rudeft tribes are found in the ftate of bunters or fifbers; yet the hunting or fifhing ftate cannot have been invariably the primary form of fociety. Notwithftanding the powers with which we are endowed, we are in a great meafure the creatures of circumftances. Phylical caufes exert, though indirectly, a mighty influence in forming the character and directing the exertions of the human race. From the information of Mofes we gather, that the firlt focieties of men lived under the patriarchal form of government, and employed themfelves in the cultivation of the ground and the management of flocks: Ard as we know that mankind, being fubjected to the influence both of phyfical and moral caufes, are no lefs liable to degeneracy than capable of improvement; we may eafily conceive, that though defcending all from the fame original pair, and though enlightened with much traditionary knowledge relative to the arts of life, the order of fociety, moral diftinctions, and religious obligations; yet as they were gradually, and by varions accidents, difperfed over the earth, being removed to fituations in which the arts with which they were acquainted could but little avail them, where induftry was overpowered, or indolence encouraged by the feverity or the profufion of nature, they might degenerate and fall into a condition almoft as humble and precarious as that of the brutal tribes. Other moral caufes might alfo concur to debafe or elevate the human character in that early period. The particular character of the original fettlers in any region, the manner in which they were connected with one another, and the arts which they were beft qualified to exercife, with various other caufes of a fimilar nature, would have confiderable influence in determining the character of the fociety.

When laying afide the fpirit of theory and fyftem, we fet ourfelves, with due humility, to trace facts, and to liten to evideace, though our difcoveries may be
fewer fewer than we fhould otherwife fancy them; yet the knowledge which we thus acquire will be more ufeful and folid, and our fpeculations more confiftent with the fpirit of true philofoply. Here, though we learn from the information of the facred writinge, that the firf family of mankind was not cruelly expofed in this world, as children whom the inhumanity of their parents induces them to defert; yet we are not, in confequence of admitting this fact, laid under any neccflity of denying or explaining away any of the other phenomena which occur to our obfervation when tracing the natu. ral hittory of fociety. Tradition may be corrupted; arts and fciences may be loft ; the fubliment religious doctrines may be debafed into abfurdity.

If then we are defirous of furveying focisty in ics rudeft form, we muft look, not to the earlieft period of its exiftence, but to thofe diftricts of the globe where external circumftances concur to drive them into a fate of flupidity and wretchednefs. Thus in many places of the happy clime of Afid, which a variety of ancient records concur with the facred writings in reprefentin:s as the firt peopled quarter of the globe, we cannot trace the form of fociety backwards beyond the fhepherd ftate. In that flate indeed the bonds which connect fociety extend not to a wide range of individuals, and men remain for a long period in diftinct families; but happinefs, and to virtuc. Again, the torrid and the frozen regions of the earth, thoursh probably peopled at a later pcriod, and by tribes fprung from the fame ftock with the fhepherds of Afia, have yet exhibited mankind in a much lower ftate. It is in the parched deferts of Africa and the wilds of America that human beings have been found in a condition approaching the neareft to that of the brutes.

We may therefore with fome propriety defert the order of time, and take a view of the different ftages through which philolophers have coufidered mankind as advancing, beginning with that of rudenefs, though we have fhown that it cannot have been the firft in the progrefs.
Rudeñ fate or firft flage of Society.

Where the human fpecies are found in the loweft and rudeft ftate, their rational and moral powers are very faintly difplayed; but their external fenfes are acute, and their bodily organs active and vigorons. Hunting and fifting are then their chief employments on which they depend for fupport. During that portion of their time which is not fpent in thefe purfuits, they are funk in littles indolence. Deftitute of forefight, they are roufed to active exertion only by the preffure of immediate neceffity or the urgent calls of appetite. Accuftomed to endure the feverity of the elements, and but feantily provided with the means of fubfiftence, they acquire habits of refignation and fortitude, which are beheld with aftonifhment by thofe who enjoy the plenty and indulgence of cultivated life. But in this ftate of want and depreffion, when the powers and poffeffions of every individual are fcarce fufficient for his own fup. port, when even the calls of appetite are reprefled becaufe they camot always be gratified, and the more re. fined paftions, which either originate from fuch as are merely animal, or are intimately connected with them, have not yet been felt-in this fate all the milder affections are unknown; or if the breaft is at all fenfible to their impulfe, it is estremely feeble. Hubband and

\section*{701 \\ Soc}
wife, parent and child, brother and brother, are united by the weakeft ties. Want and misfortune are not pitied. Why indeed fhould they, where they cannot be relieved? It is impoffible to determine how far beiugs in this condition can be capable of moral diftinc. tions. One thing certain is, that in no fate are the human race entirely incapable of thefe. If we liften, however, to the relations of refpectable travellers; we nult admit that human beings have fometimes been found in that abje of fate where no proper ideas of fub. ordination, government, or diftiuction of ranks, could be formed. No diftir Ct notions of Deity can be here entertained. Beings in fo humble a condition cannot look through the order of the univerfe and the harmony of nature to that Eternal Wifdom and Goodnefs which contrived, and that Almighty Power which brought into exiftence, the fyltem of things. Of arts they muft be almof totally deftitute. They may ufe fome inftruments for fifnins or the chace; but thefe mult be extramely rude and fimple. If they be acquainted with any means to fhelter them from the inclemency of the elements, both their houfes and clothing will be aukward and inconvenient.

But human beings have net been often found in fo rude a ftate as this. Even thofe tribes which we denominate favage, are for the moft part farther removed from mere animal life. -They generally appear united is under fome fpecies of government, exercifing the powers of reafon, capable of morality, though that inorality be not always very refincd ; difplaying fome degree of focial virtues, and acting under the inftuence of religious fentimcuts. Thofe who may be confidered as but one degree higher in the fcale than the ftupid and wretched beings whofe condition we have furveycd, are to befound fill in the hunting and fifhing ftate; but they are farther advanced towards focial life, and are become more fenfible to the impulfe of focial affection. By unavoidable intercourfe in their employments, a few individual hunters or fithers contract a certain degree of fondnefs for each other's company, and are led to take fome part in each other's joys and forrows; and whea the focial affections thus generated (fee Passion) begin to exert themfelves, all the other powers of the mind are at the fame time called forth, and the circumftances of the little fociety are immediately improved. We behold its members in a more comfurtable condition, and find reafon to view the hmman character with more complacency and refpect. Huts are now built, more commodious clothes are fafhioned, intruments for the annoyance of wild beafts and even of enemies are contrived; in fhort, arts, and fcience, and focial order, and religious fentiments, and ceremonies, now make their appearance in the rifing fociety, and ferve to characterize it by the particular form which diftinguifhes each of them. But though focial order is no longer unknown nor unobferved, yet the form of government is ftill extromely fimple, and its ties are but loofe and fceble. It will perhaps bear fome refemblance to the patriarchat ; only all its members are on a mure equal footing, and at the fame time lefs clofely connected than in the fhepherd ftate, to which that form of government feems almoft peculiar. The old men are treated with veneration; but the young are not entirely fubject to them. They may liften refpectfully to their advice; but they do not fubmit to their arbitraty
commands.

\section*{SO C [ 571 ] SO C}
commands. Where mankind are in the fate of hunter and fifhers, where the means of fubfiftence are prescarioufly acquired, and prudent forefight does not prompt to accumulate much provifion for the future, no individual can acquire comparative wealth. As foo as the fol is grown up, he cafes to be dependent on his father, as well as on the fociety in general. Differance of experience cherefore constitutes the only diftinction between the -young and the old; and if the old have experience, the young lave ftrength and astivity. Here, then, neither age nor property can give rife to any ftriking diftinction of ranks. All who have attained to manhood, and are not difabled by unusual deficiency of frength or agility, or by the infirmities of old age, are on an equal footing; or if any one poffefs a pre-eminence over the reft, he owes it to fuperior addrefs or fortitude. The whole tribe deliberate; the old give their advice ; each individual of the affembly receives or rejects it at his pleafure (for the whole body think not of exercifing any compulfatory power over the will of individuals); and the warrior who is mont diftinguifhed for ftrength, addrefs, and valour, leads out the youth of the tribe to the chace or against the enemy. War, which in the former fage did not prevail, as they who were Arrangers to focial fentiments were, at the fame time, farce capable of being enemies, now firth begins to depopulate the thinly inhabited regions where thole hunters and fifhers purfue their prey. They are Scattered, poffibly in Scanty and Separate tribes, over an immenfe tract of country; but they know no mediam between the affection which brethren of the fame tribe bear to each other and the hatred of enemies. Though thinly feattered over the earth, yet the hunting parties of different tribes will fometimes meet as they range the forests; and when they meet, they will naturally view each other with a jealous eye; for the fuccefs of the one party in the chase may cause the other to be unfuccefsful; and while the one fnatches the prey, the other muff return home to all the pangs of famine. Inveterate hoftility will therefore long perevail among neighbouring tribes in the hunting fate.

If we find them not incapable of focial order, we may naturally expect that their conduct will be influenced by come fentiments of religion. They have at this period ideas of fuperior beings. They alfo pracfife certain ceremonies to recommend them to thole beins; but both their fentiments and ceremonies are furperftitious and absurd.
We have elfewhere flown (fee Polytheism) how Savage tribes have probably degenerated from the pure worfhip of the one true God to the adoration of a multitude of imaginary divinities in heaven, earth, and hell. We have traced this idolatrous worfhip from that of the heavenly bodies, through all the gradations of dæmon-worfhip, hero-worfhip, and fatue-worfhip, to that wonderful inftance of absurd fupertition which induce the inhabitants of come countries to fall prostrate in adoration before the vilest reptiles. But though we are convinced that the heavenly bodies lave by all idodaters been confidered as their first and greatelt gods, we pretend not that the progress through the other stages of polytheifm has been everywhere in the very fame order. It is indeed impoffble to exhibit under one general view an account of arts, manners, and religious fentiments, which may apply to forme certain pe.
rood in the hiltory of every nation, The characters and Society. circumstances of nations are farce lefs various and ann. malous than thole of individuals. Among many of the American tribes among the ancient inhabitants of the forests of Germany, whole manners have been fo accurately delineated by the mafterly pen of Tacitus, and in forme of the iflands flattered over the fouthern ocean, religion, arts, and government, have been found in that fate which we have defcribed as characterizing the fecord ftage of focial life. But neither can we pretend that all thole fimple and rude focieties have been defcribed by hiftorians and travellers as agreeing precifely in their arts, manners, and religious fentiments; or that the difference of circumstances always enables us to account in a fatisfactory manner for the diftinction of their characters. There is a variety of facts in the hiftory of the early periods of fociety, which no ingenuity, no induftry however painful, can reduce under general heads. Here, as well as when we attempt to philofophize on the phenomena of the material world, we find reafon to confers that our powers are weak, and our oblervation confined within a narrow Sphere.

But we may now carry our views a little forward, Third plage and furvey human life as approaching fomewhat nearer in the proto a civilized and enlightened fate. As property is ac-grefs of fo. quires, inequality and fubordination of ranks neceffarily piety, in follow: and when men are 110 longer equal, the many of property are foo fubjected to the will of the few. But what and inequagives rife to thee new phenomena is, that after having lity of often fuffered from the precarioufnefs of the hunting ranks ap. and firing fate, men begin to extend their cares be- pear yon the prefent moment, and to think of providing lome fupply for future wants. When they are enabled to provide foch a fupply, either by purfuing lie chase with new eagernefs and perfeverance, by gathering the spontaneous fruits of the earth, or by breeding tame animals-thefe acquifitions are at first the property of the whole fociety, and diftributed from a common tore to each individual according to his wants: But as various reafons will foo concur to convince the cominunity, that by this mode of diftribution, industry and activity are treated with injultice, while negligence and indolence receive more than their due, each individual will in a fort time become his own fteward, and a community of goods will be abolifhed. As foo as ditinct ideas of property are formed, it mut be unequally diftributect ; and as foo as property is unequally diftributed, there arifes an inequality of ranks. Here we have the origin of the depreffion of the female fox in rude ages, of the tyrannical authority exercifed by parents over their children, and perhaps of livery. The women cannot difplay the fame perfeverance, or activity, or address, as the men in purling the chace. They are therefore left at home; and from that moment are no longer equals, but flaves and dependants, who mit fulfil by the bounty of the males, and mut therefore fubinit with implicit obedience to all their capricious commands. Even before the era of property, the female fax were viewed as inferiors; but till that period they were not reduced to a fate of abject flavery.

In this period of fociety new notions are formed of the relative duties. Men now become citizens, matters, and fervants; hufbands, parents, \&c. It is impoffible to enumerate all the various modes of government which take place among the tribes who have advanced

\section*{S O C [ 572 ] S O C}

Socie'r. to this ftage; but one thing certain \(i\) a, that the authority of the few over the many is now finf eftablinhed, and that the rife of property firlt introduces inequality of ranks. In one place, we fhall perhaps find the community fubjected during this period to the will of a fingle perfon; in another, power may be lodged in the bands of a number of chiefs; and in a third, every individual may have a voicc in creating public officcrs, and in enacting, laws for the fupport of public order. But ins no code of laws is formed during this period, juftice is not very impatially adminiftered, nor are the rights of individuals very faithfully guarded. Many actions, which will afterwards be condidered as heinoufly immoral, are now confidered as praife-worthy or inditferent. This is the age of hero-worthip, and of houfehold and tutelary gods; for it is in this flage of fociety that the invention of arts, which gave rise to that worfhip, contributes moft confpicuoufly to the public grood. War, two, which we confidered as beginning firt to ravage the earth during the former period, and which is another caufe of the deifcation of dead men, will thill prevail in this age, and be carried on with no lefs ferocity than before, though in a more fyftematic form.

The prevalence of war, and the means by which fubfiftence is procured, cinnot but have confiderable influence on the charafer and fentiments of focieties and individuals.' The hunter and the warrior are, characters in many refpects different from the fheplerd and the hußandman. Such, in point of govermment, arts, and manners, religious and moral fentiments, were feveral of the German tribes defcribed by 'Tacitus; and the Britons whofe character has been fletched by the pen of Cxiar: fuch, ton, were the Romans in the early period of their iiflory; fuch too the inhabitants of A fia Minor about the time of the fege of Troy, as well as the Greeks whom Homer celebrates as' the deflroyers of the Trojan ftate: the northern tribes alfo, who poured thro' Afia, A frica, and Furepe, and overthrew the Roman empire, appear to have been of a nearly fimilar character. It feems to be a zencial opinion among thofe who have dirceted their attencion to the hiftory of fociety, that, in the fcale afconding from the loweit condition of human beings to the moft civilized and enlightened fate of fociety, the fhepherd fate is the next in order above the lunting; and that as mankind inaprove in knowledge and in moral fentiments, and as the forefts are gracually depopulated of their inhabitants, inftead of deftroying the interio animals, men become their guardians and protectors. But we cannot unrefervedly fublcribe to this opinion: we believe, that in the thepherd itate focieties have been fometimes found fuperior to the molt polifted tribes of hunters; but upon viewing the annals of mankind in early ages, we obferve that there is often no inconfiderable refemblance even between hunters and fhepherds in point of the improvement of the rational faculties and the moral fenfe; and we are therefore led to think, that thefe two ftates are fonetimes parallel : for inflance, feveral of the Asnerican tribes, who ftill procure their fubfiftence by hunting, appear to be nearly in the fate which vee have defcribed as the third flage in the progrefs of fociety; and the ancient Thepherds of Afia do not appear to have. been much more cultivated and refined. We even believe that men have fometimes turned their attention from hunting to agriculture without paffing through
any intermediate ftate. Let us remember, that much depends upon local circumfances, and fomewhat un. doubtedly on original infpiration and traditionary inftruction. In this period of fociety the flate of the arts well deferves our attention. We fhall find, that the fhepherds and the hunters are in that refpect on a pretty equal footing. Whether we examine the records of ancient hiftory, or view the iflands fcattered through the South Sca, or range the wilds of America, or furvey the fnowy waftes of Lapland and the frozen coaft of Greenland--ftill we find the uffful arts in this period, though known and cultivated, in a very rude fate; and the fine arts, or fuch as are cultivated merely to pleafe the fancy or to gratify caprice, difplaying an odd and fantaftic, not a true or natural, tafte ; yet this is the period in which eloquence fhines with the trueft luftre: all is metaphor or glowing fentiment. Languares are not yet copious; and therefore fpeech is fgurative, expreffive, and forcible. 'The tones and geftures of nature, not being yet laid afide, as they generally are, from regard to decorum, in more polifhed ages, give a degree of force and expreffion to the harangues of the ruffic or favage orator, which the mott laborious ftudy of the rules of rhetoric and elocution could not enable, even a more polifhed orator to difplay.

But let us advance a little farther, and contemplate Fourth our fpecies in a new light, where they will appear with fape; greater dignity and amiablenefs of character. Let us view them as hurbandmen, artizans, and legiflators. cultares, Whatever circumftances might turn the attention of arts are any people from hunting to agriculture, or caufe the fubdivi herdiman to yoke his oxen for the cultivation of the \({ }_{\text {and re }}^{\text {comme }}\) ground, certain it is that this change in the occupation govern would produce an happy change on the character and ment a circumitances of men; it would oblige them to exertiitredu a more regular and perfevering induftry. The hunter is like one of thofe birds that are defcribed as paffing the winter in a torpid ftate. The Mepherd's life is extremely indolcnt. Neither of thefe is very favourable to refinement. But different is the condition of the hufandman. His labours fucceed each other in regue lar rotation through the year. Each feafon with him has its proper employments: he therefore muit exert active perfevering induftry; and in this ftate wc often find the virtues of rude and polifhed ages united. This is the period where barbarifm ends and civilization bezins. Nations have exilted for ages in the hunting or the fhepherd ftate, fixed as by a kind of flagrustion, without advancihg farther. But fcarce any inftances occur in the hiftory of mankind of thofe who once reached the flate of lufbandinen, remaining long: in that condition without rifin. to a more civilized and polifhed ftate. Where a people turn their attention in any confiderable degree to the objects of agriculture, a diftinction of occupations naturally arifes annong them. The hufbandman is fo clofely employed thro' the feveral feafons of the year in the labours of the field, that he has no longer leifure to exercife all the rude arts knowir among his countrymen. He has not time to fafhion the inftruments of hufbandry; to prepare his clothes, to build his houfe, to manufacture honfehold utenfils, or to tend thofe:tame animals which he continues to rear. Thofe different departments therefore now begin to employ different perfons; each of whom
dedicates

\section*{S O C}
eiety.
dedicates his whole time and attention to his own occupation. The manufacture of cloth is for a confiderable time managed exclutively by the women; but fniths and joiners arife from among the men. Metals begin now to be confidered as valuable materials. The intercourfe of mankind is now placed on a new footing. Before, every individual practifed all the arts that were known, as far as was neceffary for fupplying himfelf with the conveniences of life. Now he confines himfelf to one or to a few of them; and, in order to obtain a neceffary fupply of the productions of thole arts which he does not cultivate himfelf, he gives in exchange a part of the productions of his own labours. Here we have the origin of commerce.

After continuing perhaps for fome time in this fate, as arts and diftinctions multiply in fociety, the exchange of one commodity for another is found troublefore and inconvenient. It is ingenioully contrived to adopt a medium of commerce, which being eftimated not by its intrinfic value, but by a certain nominal value which it receives from the agreement of the fociety among whom it is ufed, ferves to render the exchange of property, which is fo neceffary for the purpofés of focial life, eafy and expeditious. Wherever metals have been known, they appear to have been adopted as the medium of commerce almoft as foon as fuch a medium began to be ufed: and this is one important purpofe for which they ferve; but they have ftill more important ufes. Almoft all the neceffary arts depend on them. Where the metals are known, agriculture practifed, and the neceffary arts diftributed among diffe. rent orders of artifans-civilization and refinement, if not obftructed by fome accidental circumftances, advance witli a rapid progrefs. With regard to the firlt applying of the precious metals as the inedium of commerce, we may ebferve, that this was probably not accomplifhed by means of a formal contract. They inight be firlt ufed as -ornaments; and the love of ornament, which prevails among rude as much as anong civilized nations, would render every one willing to receive them in exchange for fuch articles as he could spare. Such might be the change produced on fociety with regard to the neceflary arts by the origin of agriculture. As foon as ornament and amufement are thought of, the fine arts begin to be cultivated. In their origin therefore they are not long pofterior to the neceffary and ufeful arts. They appear long before men reach the comfortable and refpectable condition of huf. bandmen; but fo rude is their character at their firf origin, that our Dilettanti would probably view their productions of that period with unfpeakable contempt and difgnft. But in the period of fociety which we now confider, they have afpired to an ligher character; yet poetry is now perlaps lefs generally cultivated than during the fhepherd ftate. Agriculture, confidered by itfelf, is not directly favourable either to refinement of manners or to the fine arts. The converfation of thepherds is generally fuppofed to be far more elegant than that of hubbandmen; but though the direct and immediate effects of this condition of life be not favourable to the fine arts, yet indire Qly it has a ftrong tendency to promote their improvement. Its immediate influence is extremely favourable to the neceffary and ufeful arts; and thefe are :20 lefs favourable to the fine arts.

One of the nobleft changes which the introduction of Society. the arts by agriculture produces on the form and circumftances of fociety, is the introduction of regular government and laws. In tracing the hiftory of ancient nations, we fcarce ever find laws introduced at an earlier period. Minos, Solon, and Lycurgus, do not appear to have formed codes of wifdom and juftice for regulating the manners of their countrymen, till after the Cretans, the Athenians, and even the Lacedemonians, had made fome progrefs in agriculture and the ufful arts.

Religion, under all its various forms, has in every ftage of fociety a mighty influence on the fentiments and conduct of men (fee Rexigion) ; and the arts culs tivated in fociety have on the other hand fome influe ence on the fyftem of religious belief. One happy effect which will refult from the invention of arts, though perhaps not immediately, will be, to render the character of the deities nore benevolent and amiable, and the rites of their worfhip more mild and humane.

The female fex in this period generally find the yoke of their flavery fomewhat lightened. Men now become eafier in their circumflances; the focial affections affume ftronger influence over the mind; plenty, and fecurity, and eafe, at once communicate both delicacy and keen: nefs to the fenfual defires. All thefe circumftances concur to make men relax in fome degree that tyrannic fway by which they before depreffed the fofter fex. The foundation of that empire, where beauty triumphs over both wifdom and ftrength, now begins to be laid. Such are the effects which hitory warrants us to attribute to agriculture and the arts; and fuch the outlines of the characier of that which we reckon the fourth ftage in the progrefs of fociety from rudenefs to refinement.

Let us advance one Atep farther. We have not yet Fifth trage furveyed mankind in their molt polifhed and cultivated in the proftate. Society is rude at the period when the arts firt grefs of begin to flow themfelves, in comparifon of that fate which lito which it is raifed by the indultrious cultivation cfterature, them. The neighbouring commonwealths of Athens arts, and and Lacedemon afford us a happy opportunity of com- fciences, paring this with the former ftage in the prowrefs of fo-cultivated, ciety. The chief effeet produced by the inftitutions of and religions: Lycurgus feems to have been, to fix the manners of his affuines a countrymen for a confiderable period in that fate to mild and which they had attained in his days. Spartan virtue anpect. has been admired and extolled in the language of enthufiafm ; but in the fame manner has the character and the condition of the favage inhabitants of the wilds of America, been preferred by forne philofophers, to the virtues and the enjoyments of focial life in the moft polifhed and enlieghtened itate. 'The Spartans in the days of Lycurgus had begun to cultivate the ground, and were not unacquainted with the ufeful arts. They muft foon have advanced farther had not Lycurgus arifen, and by effecting the eftablifhment of a code of laws, the tendency of which appears to have been in many particulars directly oppofite to the defigns of nature; retarded their progrefs towards complete civilization and refinement. The hiftory of the Lacedemonians, therefore, while the laws of Lycurgus continued in force, exhibits the manners and character of a people in that which we have denominated the fourth ftage in the progrefs of fociety. But if we turn our eyes to theirs

\section*{S O C [ 574\(] \quad\) S O C}
\(\qquad\) neighbours the Athenians, we behold in their hiftory the fiatural progrefs of opinions, arts, and manners. The ufeful arts are firf cultivated with fuch fteady in: duftry, as to raife the community to opulence, and to furnifh them with articles for commerce with foreign nations. The ufeful arts cannot be raifed to this height of improvement without leading men to the purfuit of fcience. Commerce with foreign nations, flill in the ufeful arts, and a tafte for fcience, mutually aid each other, and confpire to promote the improvement of the fine arts. Hence magnificent buildings, noble ftatues, paintings expreffive of life, action, and paffion; and poems in which imagination adds new grace and fublimity to nature, and gives the appearances of focial life more irrefiftible power over the affections of the heart. Hence are moral diftinctions more carefully ftudied, and the rights of every individual and every order in fociety better underfood and more accurately defined. Moral fcience is generally the firft fcientific purfuit which ftrongly attracts the attention of men. Lawgivers appear before geometricians and aftronomers. Some particular circumftances may caufe thefe fciences to be cultivated at a very early period. In Egypt the overflowing of the Nile caufed geometry to be early cultivated. Caufes no lefs favourable to the ftudy of aftronomy; concurred to recommend that fcience to the attention of the Chaldeans long before they had attained the heiglit of refiuement. But, in general, we find, that the laws of morality are undenftood, and the principles of morals inquired into, before men make any confiderable progref 6 in phyfical fcience, or even profecute it with any degree of keenuefs. Accordingly, when we view the fate of literature in this period (for it is now become an object of fo much importance as to force itfelf on our atten. tion), we perceive that poetry, hiftory, and morals, are the branches chiefly cultivated. Arts are generally cafual inventions, and long practifed before rules and principles on which they are formded affume the form of fcience. But morality, if confidered as an art, is that art which men have fooneft and moft conftantly occafion to practife. Befides, we are fo conftituted by the wifdom of nature, that human actions, and the events which befal human beings, have more powerful influence than any other object to engage and fix our attention. Hence we are enabled to explain why morality, and thofe branchen of literature more immediately connected with it, are almoft always cultivated in preference to phyfical fcience. 'Though poetry, hiftory, and morals, be puifued with no fmall eagernefs and fuccefs in that period of fociety which we now confider, we need not therefore be greatly furprifed that natirral philofophy is neither very generally nor very fuccefsfully cultivated. Were we to confider each particular in that happy change which is now produced on the circumftances of mankind, we fhould be led into a too minute and perhaps unimportant detail. This is the period when human virtue and human abilities fhine with moft fplendour. Rudenefs, ferocity, and barbarifm, are now banifhed. Luxury lias made her appearance ; but as yet the is the friend and the benefactrefs of fociety. Commerce has ftimulated and rewarded induftry, but has not yet contracted the heart and debafed the character. Wealth is not yet become the fole object of purfuit. The charms of focial intercourfe are known and rehfhed; but domellic duties are not yet deferted
for public amufements. The female fex acquire new influence, and contribute much to refine aud polifh the nanners of their lords. Religion now affumes a milder and more pleafing form ; fplendid rites, magnificent temples, pompous facrifices, and gay feftivals, give even fuperftition an influence favourable to the happinefs of mankind. The glonny notions and barbarous rites of former periods fall into difufe. The fyitem of theology produced in formet ages fill remains : but only the mild and amiable qualities of the deities are celebrated; and none but the gay, humane, and laughing divinities, are worfhipped. Philofophy alfo teaches men to difcard fuch parts of their religion as are unfriendly to good morals, and have any tendency to call forth or cherifh unfocial fentiments in the heart. War (for in this peried of fociety enough of caufes will arite to arın one nation againft another) -war, however, no longer retains its former ferocity; nations no longer ftrive to extirpate one another ; to procure redrefs tor real or imaginary injuries; to humble, not to deftroy, is now its object. Prifoness are no longer murdered in cold blood, fub. jected to horrid and excruciating tortures, or condemned to hopelefs flavery. They are ranfomed or exchanged ; they return to their country, and again fight under its banners. In this peiriod the arts of government are likewife better underftood, and practifed fo as to contribute moft to the interelts of fociety. Whether monarchy, or democracy, or ariftocracy, be the eftablifhed form, the rights of individuals and of fociety are in general refpected. The interefts of fociety are fo well underfood, that the few, in order to preferve their influence over the many, find it neceffary to act rather as the faithful fervants than the imperious lords of the public. Though the liberties of a nation in this fate be not accurately defined by law, nor their property guaranteed to them by any legal infitutions, yet their governors dare not violate their liberties, nor deprive them wantonly of their properties. This is truly the 徣olden age of fociety : every trace of barbarifm is entirely effaced ; and vicious luxury has not yet begun to fap the virtue ard the happinefs of the community. Men live not in liftlefs indolence ; but the induftry in which they are engaged is not of luch a nature as to overpower their ftrength or exliauft their fpirits. The focial affections have now the ftrongett influence on mens fentiments and conduct.

But human affairs are fcarce ever ftationary. The Degene circumftauces of mankind are almoft always changing, and deo either growing better or worfe. Their manners are ever of focien in the fame fluctuating ftate. They either advance towards perfection or degenerate. Scarce have they attained that happy period in which we have juft contemplated them, when they begin to decline till they perhaps fall back into a ftate nearly as low as that from which we tuppofe them to have emerged. Inftances of this uuhappy degeneracy occur more than once in the hiftory of mankind; and we may finith this fhort fketch of the hiftory of fociety by mentioning in what manner this degeneracy takes place. Perhaps, fticetly fpeaking, every thing but the fimple neceffaries of life may be denominated luxury: For a long time, how. ever, the welfare of fociety is beft promoted, while its members afpire after lomething more than the mere neceffaries of life. As long as thefe fuperfuities are to be obtained only by aclive and honelt exertion; as long

\section*{575 ] S O C}
as they only ennage the leifure hours, without beco. ming the chief objects of purfuit-the employment which they give to the faculties is favourable both to the virtue and the happinels of the human race.

The period arrives, however, when luxury is no longer ferviceable to the interefts of nations; when the is no longer a graceful, elegant, active form, but a languid, overgrown, and bloated carcafe. It is the love of luxury, which contributed fo much to the civilization of fociety, that now brings on its decline. Arts are cultivated and improved, and commerce extended, till enormous opulence be acquired: the effect of opulence is to awake the fancy, to conccive ideas of new and capricious wants, and to inflame the breaft with new defires. Here we have the origin of that felfiflnefs which, operating in conjunction with caprice and the violence of unbridled paffions, contributes fo much to the corruption of virtuous manners. Selfifhnefs, caprice, indolence, effeminacy, all join to loofen the bonds of fociety, to bring on the degeneracy both of the ufeful and the fine arts, to banifh at once the mild and the auftere virtues, to deftroy civil order and fubordination, and to introduce in their room anarchy or defpotifin.

Scarce could we have found an example of the bcautiful form of fociety which we laft attempted to defcribe. Never, at lcaft, has any nation continued long to enjoy fuch happy circumftances, or to difplay fo amiable and refpectable a character. But when we fpeak of the declining fate of fociety, we have no difficulty in finding inftances to which we may refer. Hiftory tells of the Affyrians, the Egyptians, and the Perfians, all of them oncc flourifhing nations, but brought low by luxury and an unhappy corruption of manners. The Greeks, the Romans, and the Arabians, owed their fall to the fame canfes; and we know not if a finilar fate docs not now threaten many-of thofe nations who have long made a diftinguifhed figure in the fyftem of Europe. The Portuguefe, the Venetians, and the Spaniards, have already fallen; and what is the prefent ftate of our neighbours the French ? They have long been a people deftitute of religion, corrupted in morals, unfteady in conduct, and flaves to pleafure and public amufements. Among them luxury had arrived at its highent pitch; and the confequence has been, that after capricionly fhaking off the yoke of defpotifm, they have eftablihed, or rather fet up (for eftablifhed it cannot be), a motely kind of government, which, in the courfe of a few years, has exhibited fcenes of tyranny and oppreffion, to which we doubt if the annals of the world can furnifh any parallel. Yet this is the people whofe manners the other nations of Europe were ambitious to imitate. May thofe uations take warning in time, and avoid the rocks upon which they have fplit.

Thus have we viewed the feveral ftages in which fociety appears in its progrefs from rudenefs to refinement and decay. The intelligent reader will perceive, that the various. and anomalous phenomena which occur in the natural hiftoiy of fociety, cannot ealily be folved ; becaufe the neceffary information cannot be obtained. Others have been well accounted for by the refearches of curious philofophical inquirers. Local circumftances, the infuence of climate, the intercourfe of nations in different ftates of civilization, have been taken notice of, as caufer ferving to accelerate or retard
the progrefs of arts and manners. But our proper bu. Societies, finefs here was merely to mark the gradations between barbarifm and refinement : and as the painter who is to exhibit a feries of portraits reprefenting the human form in infancy, puerility, youth, and manhood, will not think of delineating all that variety of fizures and faces which each of thofe periods of life affords, and will find himfelf unable to reprefent in ariy fingle figure all diverfities of form and features; fo we have not once thought of defcribing particularly under this article, all the various national characters reducible to any one of thofe divifions under which we have viewed the progrefs of fociety, nor llave found it poffible tocomprehend under one confiftent view, all the particulars which may be gathered from the remains of antiquity, from the relations of later travellers, and the general records of hiftory conccrning the progreffive character of mankind in various regions, and under the influence of various accidents and circimftances. This indeed would have even been improper, as all that in. formation appears under other articles in this Work.

SOCIE'TIES, affociations voluntarily formed by a number of individuals for promoting knowledge, induftry, or virtue. They may therefore be divided into three claffes; focieties for promoting fcience and literature, focieties for encouraging and plomoting arts and manufactures, and focieties for diffufing religion and morality and relieving diftrefs. Societies belonsing to the firtt clafs extend their attention to all the fciences and literature in general, or devote it to one particular fcience. The lame obfervation may be applied to thofe which are inftituted for improving arts and manufactures. Thofe of the third class, are eftablifhed; either with a view to prevent, crimes, ás the Philanthropic Socicty; for the diffution of the Chriftian relicrion among unenlightened nations, as the Society for the Propagation of the Gofpel in Foreign Parts; or for introducing arts and civiliza. tion; along with a knowledge of the Chriftian religion, as the Sierra Leona company.

The honour of planning and inftituting focieties for thofe valuable purpoles is due to modern times. A literary affociation is faid to have been formed in the reign of Charlemagne (fee Academy); but the plan feems to have been rude and defective. Several others were inftituted in Italy in the 16 th century ; but from the accounts which we have feen of them, they feem tohave been far inferior to thofe which are moft flourifhing. at prefent. The moft enlarged idea of literary focietiesfeems to have originated with the great Lord Bacon, the father of modern philofophy, who recommended to the reigning prince to inftitute focieties of learned men, who fhould give to the world from time to time a regular account of their refearches and difcoveries. It was the idea of this great philofopher, that the learned world fhould be united, as it were, into one immenfe republic; which, though confifting of many detached ftates, fhould hold a frict union and preferve a mutual intelligence with each other, in every thing that regards the conn-. mon intcreft. The want of this union and intelli, ence he laments as one of the chief obftacles to the advance. ment of fcience; and, juitly confidering the inftitution of public focietics, in the different countries of Europe, under the aufpices of the fovertign, to be the befl remedy for that defect, he has given, in his fanciful work, the New Atlantie, the delineation of a philofophical 2
fuciety

\section*{S O C [ 576 ] S O C}

Scrietie, fociety on the moft cxtended plan, for the imorovernent of a.ll arts and fciences; a work which, though written in the language, and tinctured with the colouring of romance, is full of the nobleft philofophic views. The plan of Lord Bacon, which met with little attention from the age in which he lived, was deftined to produce its effect in a period not very diftant. The fcheme of a philofophical collcere by Cowley is acknowledged to have had a powerful influence in procuring the eftablifhment of the Royal Society of London by charter from
§. Sprat's
Hifory of the Royal Society, 2d edit. p. 59. Charles II. \(\delta\); and Cowley's plan is manifeftly copied in almoft all its parts from that in the New Atlantis. The inflitution of the Roval Society of London was foon followed by the eftablifhment of the Royal Academy of Sciences at Paris; and thefe two have ferved as models to the philofophical academies of higheft reputation in the other kingdoms of Europe.
The experience of ages has fhown, that improvements of a public nature are bect carried on by focieties of liberal and ingenious men, uniting their labours without regard to nation, feet, or party, in one grand purfuit alike interefting to all, whereby mutual prejudices are worn off, and a humane philofophical fpirit is cherifhed. Men united together, and frequently meeting for the parpofe of advancing the fciences, the arts, agriculture, manufactures, and commerce, may oftentimes fuggeft fuch hints to one another as may be improved to important ends: and fuch focieties, by being the repofito. ries of the obfervations and difcoveries of the learned and ingenious, may from time to time furnifh the world with ufeful publications which miglit otherwife be loft: for men of ingenuity and modefty may not choofe to rifk their reputation, by fending abroad unpatronized what a learned fociety might judge richly worthy the public eye; or perhaps their circumflances being ftraitened, they may not be able to defray the expence of publication. Societies inflituted for promoting knowledge may alfo be of eminent fervice, by exciting a fipirit of emulation, and by enkindling thofe fparks of genius which otherwife might for ever have been concealed; and if, when poffeffed of funds fufficient for the purpofe, they reward the exertions of the induftrious and enterprifing with pecuniary premiums or honorary medals, many important experiments and ufeful difcoveries will be made, from which the public may reap the higheft advantages.
Eminent inflances of the beneficial effects of fuch inflitutions we have in the Royal Academy of Sciences at Paris, the Royal Society, and the Society inflituted for the Encouragement of Arts, Manufactures, and Commerce, in London, and many others of a fimilar kind. Hereby a fpirit of difcovery and improvement has been excited among the ingenious in almoft every nation knowledge of various kinds, and grcatly ufeful to mankind, has taken place of the dry and uninterefting fpeculations of fchoolmen ; and bold and crroneous lyypothefis has been obliged to give way to demonftrative experiment. In fhort, fince the eftablifhment of thefe focieties, folid learning and philofophy have more increafed than they had done for many centuries before.
As to thofe focieties eftablifhed for promoting induftry, religion and morality, and relieving difterfs, the defign is laudable and excellent, and prefents a beauriful picture of the philanthropy of modern times. We are chappy to knd, from the minutes of fome of thefe fo-
cieties, that their beneficial effects are already confpicu. ous.

We will now give fome account of the moft eminent focieties; arranging them under the three claffes into which we have divided them : 1. Religious and Humane Societies. II. Societies for Promoting Science and Literature. III. Societies for Encouraging Arts, Manufaciures, \&c.

\section*{I. Religious and Humane Societies.}
I. Society for the Propagation of the Gofpel in Foreign Payts, was inftithted by King William III. in 170r, in order to fecure a maintenance for an orthodox clergy, and to make other provifions for propagating the gofpel in the plantations, colonics, and factories beyond the feas. 'To that end he incorporated the archbifhops, feveral of the bifhops, and others of the nobility, gentry, and clergy, to the number of 90 , into one body, which, by the name of The Society for the Propagation of the Gofpel in Foreign Parts, was to plead and be impleaded; to have perpetual fucceffion, with privilege to purchafe I. 2000 a-year inheritance, and eftates for lives or years, with other goods and chattels to any value. By its charter the fociety is authorifed to ufe a commons feal; and to meet annually on the third Friday in Fe bruary for the purpofe of choofing a prelident, viceprcfident, and officers for the year enfuing ; and on the third Friday in every month, or oftener if there fhould be occafion, to tranfact bufinefs, and to depite perfons to take fubicriptions, and collect money contributed for the purpofes aforefaid; and of all moneys received and laid out, it is obliged to give account yearly to the lord-chancellor or keeper, the lord chief-juitice of the King's-bench, the lord-chief.juftice of the Commonpleas, or to any two of thefe magittrates. Of this fociety there is a ftanding committee at St Paul's chap-ter-houle, to prepare matters for the monthly mecting, which is held at St Martin's library.

Before the incorporation of the fociety for the propagation of the gofpel in foreign parts, there had been formed, for the promoting of Chrittian knowledge both at home and in the colonies, a voluntary affociation of perfons of rauk and refpectability, who in March 1699 began to hold ftated meetings in London for that purpofe, regulating themfelves by the laws of the land and the canons of the church; and when the new fociety was formed, they had already tranfmitted to America and the Weft Indies L. 800 worth of Bibles, Books of Common Prayer, and treatifes of practical religion, befides fecuring a tolerable maintenance to feveral clergyman on that continent. This affociation fill fubfints under the denomination of The Society for Promoting Chrifian Knowledgr, and has been productive of much good in the cities of London and Weftminfter ; but upon the formation of the new fociety, into which all its original members were incorporated by name, the care which the voluntary affociation had taken of the colonies devolved of courfe upon the incorporated fociety ; of which incorporation we believe the object has been fometimes miftaken, and the labours of its miffionaries grofsly mifreprefented. It has by many bcen fuppofed that the fociety was incorporated for the fole purpofe of converting the favage Americans; and it has been much blamed for fending miffionaries into provinces where, in the defpicable cant of the complainers, a gofpel-miniflry was already eftablified. But an ingartial view of the

\section*{S O. C [ 577 ] S O C}
hous rife and progrefs of the American provinces, now become independent ftates, will fhow the folly and injuftice of thofe complaints.
The Englifh colonies in North America were in the laft century formed and firf peopled by religious men ; who, made uneafy at home by their intolerant brethren, left the old world to enjoy in peace that firt and chief preregative of man, the free zoor/hip of God according to bis ozun confcience. At one time Puritans were driven acrofs the Atlantic by the epifcopal church; at another, CHURCHMEN were forced away by the prefbyterians juft as the revolutions of fate threw the civil power into the hands of the one or the other party; and not a few members of the church of Rome were chafed to the wilds of America by the united exertions of both. It has been often obferved, that people perfecuted for their religion become for the moft part enthufiaftically attached to it; and the conduct of thofe colonifts was in perfect harmony with this obfervation. Their zeal, inflamed by their violent removal to the other hemifphere, kept religion alive and active among themfelves; but their poverty difabled them from fupplying fuel to the flame, by making provifion for a miniftry to inftruct their offspring. The confequence was, that the new Chritian commonwealth, without the kindly affitance of its mother-country, would have been, in the words of the Roman hiftorian; Res unius atatis. Againft this danger a timely aid was to be provided by the fociety; which, as it confifted not of fanatical members, would not intruft the important bufinefs of the miffion to fanatical preachers, who, though always ready for fuch firitual enterptifes, are never qualifed to carry them on with fuccefs.

It was therefore thought fit to affign a decent maintenance for clergymen of the church of England, who might preacli the gofpel to their brethren in America: and though thofe miffionaries in general carefully avoided the conduct of thofe of Rome, whofe principal aim is to reduce all churches under fubmiffion to the papal tyrarny ; yet fo lately as 1765 , did fome of the colonies, in which the puritanic fpirit of the laft century characterifed the church eftablifhed by law, raife a hideous outcry againft the fociety for fending a miffion into their quarters, though only for the fervice of the difperfed members of the Epifcopal church refiding among them, and for the converfion of thofe men whom their rigid fanaticifm had prejudiced againft Chriftianity itfelf.

Indeed the commodity called freethinking, as Bifhop Warburton expreffes it, was at an early period imported by the opulent and fathionable colonifs. The celebrated Berkeley, who had refided fome years in Rhode Ifland, and at his return was called upon to preach the anniverfary fermon before the fociety, informs us, that the ifland where he lived was inhabited by an Englifh colnny, confifting chiefly of fectaries of many different denominations; that feveral of the better fort of the inhabitants of towns were accultomed to affemble themfelves regularly on the Lord's day for the performance of divine worfhip; but that moft of thofe who were difperfed through the colony rivalled fome well bred people of other countries, in a thorough indifference for all that is facred, being equally carelefs of outward worhip and of inward principles. He adds, that the miffionaries had done, and were continuing to

Vol. XVII. Part II.
do, good fervice in bringing thofe planters to a ferious Relirions fenfe of religion. "I fpeak it knowingly (fays he), and Huthat the minifters of the gofpel, in thofe provinccs which go by the name of New England, fent and fupported at the expence of the fociety, have, by their fobriety of manners, difcreet behaviour, and a competent degree of ufeful knowledge, fhown themfelves worthy of the choice of thofe who fent them." We have the honour to be acquainted with fome of the miffionaries fent at a later period, and have reafon to believe that, down to the era of the American revolution, they had the fame virtues, and were doing the fame good fervices, which procured to their predeceffors this honourable teftimony from one of the greateft and the beft of men. Surely fuch a miffion deferved not to be evil fpoken of by fectarifts of any denomination who believe in Chrift ; efpecially as the very charter of incorporation affigns as a reafon for miffonaries being fent to the colonies, " that by reafon of their poverty thofe colonies were deftitute and unprovided of a maintenance for minifters and the public worfhip of God."

The fociety, however, was incorporated for other purpofes than this. It was obliged by its charter to attempt the converfion of the native Americans and the negro flaves; and we have reafon to believe, that, as foon as the firitual wants of the colonits were decently fupplied, it was not inattentive to thefe glorious objects. Its fuccefs indeed in either purfuit has not been fo great as could be wifhed; but it would be rafh and unfair to attribute this failure to the prefident, viceprefident, or other officers of the corporation at home. An erroneous notion, that the being baptized is inconfiftent with a ftate of flavery, rendered the felfifh colonits for a long time averfe from the converfion of their negroes, and made thém throw every obftacle in the way of all who made the attempt ; while the difficulties of the Indian miffion are fuch as hardly any clergyman educated in a Proteftant country can be fuppofed able to furmount.

He who hopes fuccefsfully to preach the gofpel among a tribe of favage wanderers, mult have an ardent zeal and unwearied diligence ; appetites fubdued to all the diftreffes of want; and a mind fuperior to all the terrors of mortality. Thefe qualities and habits may be acquired in the church of Rome by him who from infancy has been trained up in the feverities of fome of the monaftic orders, and afterwards fent to the college de propaganda fide to be inftructed in the languages, and inured to the manners and cuftoms of the barbarous nations whofe converfion he is deftined to attempt. But in the reformed churches of Britain there are no monaftic orders, nor any college de propaganda fide; and yet without the resular preparation, which is to be looked for in fuch inftitutions alone, it is not in nature, whatever grace may effect, for any man cheerfully, and at the fame time foberly, to undergo all the accu. mulated diffreffes ever ready to overtake a faithful miffionary among favage idolaters. A fanatic zealot will indeed undertake it, though he is totally unqualified for every fober and important work; and a man of ruined fortunes may be preffed into the fervice, though the impotency of his mind has Mown him unable to bear either poverty or riches. The failure of the fociety thencfore in its attempts to convert the American Indians may be attributed, we think, in the firf ino
\(4 D\)
ftance,

\section*{S O C [ \(\left.577^{8}\right] \quad\) S O C}

Re'iginus ftance, to the want of a college de propaganda for trainand Hu mane So. cieties. ing up youns, men for the American miffion.
Perhaps another caufe of this failure may be found in the conduct of the miffionaries, who, it is to be prefumed, have not always employed in a proper manner even the fcanty qualifications which they actually porfeffed. The gofpel, plain and fimple as it is, and fitted in its nature for what it was ordained to effect, cannot be apprehended but by an intellect fomewhat raifed above that of a favage. Such of the miffionaries therefore as began their work with preaching to favage and brutal men, certainly fet out at the wrong end; for to make the gofpel underftood, and much more to propagate and eftablifh it, thofe favares fhould have been firft taught the neceffary arts of civil life, which, while they improve every bodily accommodation, tend at the fame time to enlarge and enlighten the undertanding. For want of this previous culture, we doubt not, it hath happened that fuch of the favages as have been baptized into the faith have fo feldom perfevered themfelves, or been able in any degree to propagate among their tribes the Chriftianity which they had been taught, and that fucceffive miffions have always found it neceffary to begin anew the work of converfion.

To one or other of thefe caufes, or to both, may juftly be attributed the little progrefs which reformed Chriftianity has made among the Indians of North A. merica; and not to any want of zeal, attention, or liberality, in the directors of the focicty at home. During the dependence of the United States on the mothercountry, great part of the fociety's funds was properly expended in keeping alive a juft fenfe of religion among the Clriftian colonifts from Europe, who had furely the firft claims upon this beft of charitics; but now that America has feparated herelf from Great Britain, and fhown that fhe is able to maintain her independence, and to make ample provifion for a regnlar clergy of her own, the members of the corporation mult feel themlelves at liberty to beftow greater attention, and to expend more money than they could formerly do, on the converfion of fuch Indians as have any intercourfe with the fettlements which we ftill poffefs. To a body fo refpectable, we prefume not to offer advice; but we cannot help thinking, with Bifhop Berkeley, that the moft fuccefsful miffionaries would be children of Indians, educated in a confiderable number together from the age of ten or twelve in a college de propaganda fide, where they fhould be in no danger of lofing their mo-ther-tongue while they were acquiring a competent knowledge of religion, morality, hiftory, practical ma-
7 ropofal for thematics, and agticulture. "If there were a yearly tbe better
Supplying of

Cburches in
our Foreign Plantations, \&c. fupply (fays he) of a dozen fuch miffionaries fent abroad into their refpective countries, after they had received the degree of mafter of arts, and been admitted into holy orders, it is hardly to be doubted but that in a little time the world would fee good and great effects of their miffion."
2. Sociely in Scotland for Propagating Cbrilian Knowv-
ledge, was intituted in the beginning of the prefent cent-
tury. At that period the condition of the Scotch Hish. landers was truly deplorable. Shut up in defolate ifland by tempeftuous feas, or difperfed over a wide extent of cotintry, interfected by high mountains, rapid rivers, and arms of the fea, without bridges or highways, by which any communication could be kept open either with remote or neighbouring diftricts, they lived int fmall detached companies in hamlets or folitary huts. Being thus fecluded from intercourfe with the more civilized part of the ifland, they could not enjoy the advantages of trade and manufactures. As their foil was barren and their climate fevere, in agriculture no progrefs was to be expected: and as they were acquainted with no language but Gatlic, in whicln no books were then written, to poffefs knowledge was impofible. Their parifhes being of great extent, often 30 or 40 miles long and of a proportionable breadth, and fometimes confifting of feveral inlands feparated by feas, which are often impaffable, a confiderable number of the inhabitants was entirely deprived of religious inftruction or fell a prey to Popifh emiffaries. A fingle fchool in fuch extenfive parifhes could be of little benefit; yet many parifhes were entirely deftitute even of this refource: and where fchools were eftablifhed, the want of books prevented them from producing the ufeful effects otherwife to have been expected from them (A). To all this we muft add, that they lived in a ftate of the great* eft oppreffion: For though the Highlands formed a part of the Britifh empire, the bleffings of the Britifl conftitution had not reached them. The feudal lyftem reigned in its utmoft rigour; the chieftains exercifin: the moll defpotic fway over the inferior Highlanders, whom at their pleafure they deprived of their lives or property ( B ).

Thus the Highlanders were ignorant, oppreffed, and uncivilized ; flaves rather than fubjects; and either entirely deftitute of the advantages of the Chriftian relim gion, or unqualified to improve them. Hitherto they had been unhappy and ufelefs to themfelves and dangerous to the ftate; for they were ready at the call of their chieftains to iffue from their mountains, and to turi their arms againft their lawful king and his loyal fubjects. 'This character, however, arofe from their frtuation. It was therefore impoffible for benevolent minds to contemplate this unhappy fituation of their countrymen without feeling a defire to raife them to the dignity of rational beings, and to render them ufeful as citizens.

Accordingly, in the year 1701, fome private gentlemen of the city of Edinburgh, who had formed themfelves into a fociety for the reformation of manners, directed their attention to the Highlands of Scotland, and endeavoured to devife fome plan for alleviating the diftreffes of the inhabitants. The remedy which prow mifed to be moft efficacious was, to eftablih charity fchools in different places. But as the exigency was great, it was no ealy matter to raife a fufficient fund for this
(A) Even fo late as the year 1758 , no fewer than 175 parifhes, within the bounds of 39 prefbyteries, had nor parochial fchool. We are forry to add, that even in the prefent enlightened and benevolcnt age the complaint is not entirely remaved.
(s) The feudal lyftem was at length abolifhed in the year 1748 by the jurifdiction act.

\section*{S O C [ 579\(] \quad\) S O C}
isurs this pirpole. They began therefore with what voluntary fubfrciptions they could procure, hoping afterwards to increafe their capital by vacant ftipends and public contributions. A memorial with this view was prefented to the General Affembly in 1704, which received their approbation; and they accordingly paffed an act, recommending a general contribution. In 1706 the General Affembly appointed fome of their number to inquire more carefully into the fate of the Highlands, and the year following appointed a felect committee to confer with the gentlemen who had fuggefted the plan. The refult of thefe conferences was the publication of propofals "for propagating Chriftian knowkedge in the Fighlands and inaunds of Scotland, and in fnreign parts of the world." Copies of thefe propofals, with fubfription papers, were diftributed through the kingdom; and the contributions having foon amounted to L. 1000, her majelty Queen Anne encouraged this infant fociety by her royal proclamation, and at the fame time iffued letters patent under the great feal of Scotland for erecting certain of the fubfrribers into a corporation ; the firt nomination of whom was lodged with the lords of council and feffion.

This corporation held its firft meeting on Thurfday 3 November 1709. It was attended by feveral of the nobility, fourteen of the lords of feffion, many gentlemen of rank, together with moft of the minifters of the city of Edinburgh and neighbourhood. A prefident, fecretary, and treafurer, with a committee of fifteen directors, were appointed for the difpatch of bufinefs. At their fecond meeting in January 1710 , a fcheme of management was formed and approved; in which it was propofed, r. To erect and maiutain fchools in fuch places of Scotland, particularly in the Highlands and Iflands, as flould be found to need them mott; in which fchools all :perfons whatfoever fhould be taught by fit and well qualified fchoolmafters, appointed by the fociety, to read the Holy Scriptures and other pious books; as allo to write, and to underftand the common rules of arithmetic, with fuch other things as fhould be thought tuitable to their circumflances. 2. That the fchoolmafters fhould be particularly careful to inftruct their fcholars in the principles of the Chriftian reformed religion; and for that end fhould be obliged to catechife them at leaft twice a week, and to pray publicly with them twice a-day. 3. That not only fuch as were unable to pay fhould be taught gratis, but that thofe whofe circumftances required it, fhould have fuch farther encouragement as the fociety fhould think fit in a confiltency with their patent. 4. To name fome prudent perfons, minitters and others, to be overfeers of thofe fchools, who fhould take care that the fchoolmarters do their duty, and that the inftructions to be given from time to time by the fociety or their committee be punctually obferved; which overfeers fhould make their report to the fociety quarterly or half-yearly at fartheft. 5. To give fnitable encouragement to fuch minifters or catechits as fhould be willing to contribute their affitance towards the farther infruction of the fcholars remote from church, by not only catechifing, but preaching to them; which minifters or catechifts fhould take the fame care of the other inhabitants as of the fcholars. 6. 'To extend their endeavours for the advancement of the Chriftian seligion to heathen na-
tions; and for that . \(d\) to give encourajement to minifters to preach the gofpel among them.
Having thus formed a plan, they immediately pro* ceeded to eftablifh fchools in the moft ufeful and economical manner ; and as the capital continued to accumulate, the intereft was faithfully applied, and the utility of the inflitution was more extenfively diffured.
Until the year 1738 the attention of the fociety had been wholly directed to the eftablifhment of feliools; but their capital being then confiderably augmented, they began to extend their views of utility much farther. The grand object of all public affociations ought certainly to be the promoting of religion and morality. It mult, however, be evident to every man of reflection, that thefe can neither be propagated nor preferved among a people without agriculture, unaccuftomed to commerce and manufactures, and confequently without labour or exertion. Languor and debility of mind nuut always be the companions of idlenefs. While the Highlanders roved about with arms in their hands, the latent vigour of their minds muft often have been called forth into action; but when their arms were taken away, and themfelves confined to a domeftic life, where there was nothing to roufe their minds, they muft have funk into indolence and inactivity. All attempts therefore to inftruct them in religion and morality, without introducing among them fome of the neceffary arts of life, would probably have been unavailing. The fociety accordingly refolved to adopt what appeared to then the molt effectual methods of introducing indultry among the Highlanders. But as their patent did not extend far enough, they applied to his majefty George 1I. for an enlargement of their powers; and accordingly ob.tained a fecond patent, by which they are empowered, " befides fulfilling the purpofes of their original patent, to caufe fuch of the children as they fhall think fit to be bred to hufbandry and houfewifery, to trades and manufactures, or in fuch manual occupations as the fociety fhall think proper."

The objects of this fecond patent the fociety have not failed to purfue; and though many obftacles and difcouragements to their efforts occurred among a rude and barbarous people, yet their perfeverance, and the obvious utility of their plans, at length fo far overcame the reluctance of the inhabitants, that no lefs than 94 fchools of induftry in various parts of the Highlands and iflands are now upon their eftablifhment, at which are educated 2360 fcholars.

The fociety, while anxioufly endeavouring to diffure a fpirit of induftry through the Highlands, were ftill equally folicitous to promote the knowledge of the Chritian religion. As the Englifh language had been the only channel by which knowledge was conveyed to them (a language which, being not ufed in converfation, was in all refpects foreign to them), it was judged requifite that they fhould have the Scriptures in their vernacular tongue. The fociety therefore firt appointed a tranflation of the New Teflament to be made into Gaelic : A trandlation was accordingly undertaken by the Rev. Mr Stewart minifter of Killin in Perth fhire, and printed in 1767 , which is faid to be executed with much fidelity. Of this work many thoufand copies have been diftributed in the Higllands. The great--er part of the Old T'eftament has alfo been tranflated 4 D 2

\section*{S O C [ 580 ] O C}

Religious by the Rev. Dr Smith of Campbelton and others, but and Humane Societice: chiefly by the Rev. Dr Stewart of Lufs, by the appointment and at the expence of the fociety : and as foon as the remaining part can be got ready, the whole will be fold at fo low a price as the poor may without difficulty afford. 'IThis plan the fociety have judiciounty chofen, in order to prevent difcontent and murmuring ; ef. fects which the diffufion of the Scriptures ought never to produce; but which could not poffibly have been prevented, had the diftribution been gratuitous, and of courfe partial.

For fome years paft the funds of the fociety have rapidly accumulated, from the very liberal donations of feveral individuals.
\[

\text { Mifs Gray of Teaffes } & -\ldots & 3,500
\end{array}
\]

In confequence of thefe great additions to their flock, infinuations have been thrown out that the fociety have become fo wealthy as to be at a lofs for proper objects on which to beftow their increafed revenue. If fuch an opinion be ferioufly entertained by any one, we muft beg him to remember, that the fociety have erected and endued no lefs than 323 fchools for religion, the firft principles of literature and induftry, at the annual ex. pence of L. \(3214,10 \mathrm{~s}\). Sterling; and that at thefe feminaries are educated from 14,000 to 15,000 children; who, but for the means of inftruction thus obtained, would in all probability be bred up in ignorance and idlenefs: That they employ 12 miffionary minifters and catechifts in remote parts of the Highlands and iflands, or among the ignorant Highlanders fettled in the great towns of Scotland, at the annual expence of L. 296 : That they beftow a burfary or penfion of L. I 5 per annum on each of fix ftudents of divinity ha. ving the Gaelic language : That they employ two miffionary minifters and one fchoolmafter among the Oneida and Stockbridge Indians of North America (being the deftination of certain legacies bequeathed to them for that purpofe), at the annual expence of L. 140. Such is their fixed fcheme of annual expenditure, amounting in all to L. 3740, 10 s. Sterling-a fum it will be acknowledged of veryconfiderable magnitude. The wholeof their incidental expences arifing from the Gaelic tranflation of the Scriptures of the Old Teftament; from annuities which they have to pay, in confequence of fums left them as refiduary legatees; from land and houfe-taxes; from enabling candidates for the office of fchoolmafter to come to Edinburgh for examination; from furnifhing books to poor fcholars in their various fchools; and from removing fchoolmafters from one flation to another, is generally about L. 875 , which added to the former fum makes the whole annual expence amount to L. \(4615,10 \mathrm{~s}\).

If it be inquired at what expence, in the management of it, this extenfive and complicated charity is annually conducted, we are authorifed to fay, that the treafurer,
bookholder, and clerk, are allowed each L. 25 fer annum, the fame falaries which were annexed to thefe of fices from the commencement of the fociety. The beadle or officer is allowed L. 12 per annum. No falary whatever is enjoyed by any of the other officers of the fociety. The fecretary, comptroller, accountant, and librarian, although fubjected, fome of them efpe. cially, to no fmall expence of time and labour, have no pecuniary recompenfe or emolument. Theirs are labours of love, for which they feek and expect no other reward than the confcioufnefs of endeavouring to promote the beft interefts of mankind. The whole amount of the expence of managing the bufinefs of the focity, including the above falaries, and coals, candle, ftationary ware, poftages, and other incidents, exceeds not at an average L. 115 per annum. From this ftatement it appears, that hitherto at leaft the directors have been at no lofs for important objects within the proper fiphere of their inftitution on which to beftow their increafed funds. They have, it is true, the difpofal of very confiderable fums for promoting the objects of the inftitution; but they are fo far from accumulating wealth, that every year their expenditure, notwithftanding the late increafe of their capital, exceeds rather than falls fhort of their income. They have depended upon a kind Providence and a generous public to refund thefe anticipations of their revenue, and hithesto they have never been difappointed.

Thus has the Society forPropagating Chriftian Know. ledge proceeded for almoft a century. It was founded by the pious exertions of a few private individuals, whofe names are unknown to the world; and its funds, by faithful and judicious management, as well as by generous contributions, have now become of fuch magnitude, as to excite the hope that they will be productive of the moft valuable effects. The benefits arifing from public focieties, it is well known, depend entirely upon the management of their directors. If fo, the advantages which have accrued from this fociety intitle it to the praife and gratitude of the nation. While eager to increafe the number of fchools, the fociety have not been inattentive to their profperity. In the year 1771 Mr Lewis Drummond, a gentleman in whom they placed great confidence, was commiffioned by them to vifit their fchools, and to make an exact report of their ftate and circumitances. Again, in the year 1790, a commiffion was granted to the Rev. Dr Kemp, one of the minifters of Edinburgl and fecretary to the fociety, to vifit all the fchools on their eftablifhment. This laborious and gratuitous tafk he accomplifhed in the courfe of four fummers with much ability and care, and highly to the fatisfaction of the fociety. At his return he communicated a variety of important information refpecting the ftate of the Highlands and iflands, and the means neceffary for their improvement in religion, literature, and induftry ; an abftract of which was publifhed by the fociety in appendixes to the anniverfary fermons preached before them in the years \(1789,90,91\), and 92 (c).
'l'he
(c) It is well known, that the number of Roman Catholics in the Highlands is confiderable; but it muft give much pleafure to the Proteftant reader to be informed, that the ancient malignant firit of Popery has in. that diftrict given place to mildnefs and liberality. This is chiefly owing to the gentleman who fuperintends the priefs in that quarter, whofe mind is enlightened by fcience and learning. So far from being hodtile to the

\section*{S O C}

The following table will cxhibit at a glance the funds, eftablifhment, and expenditure, of the fociety, from a few years after its commencement to the prefent time. Where the number of fcholars is not mentioned, the defeet may be fupplied by taking an average from thofe years where a computation has been made. Where the capital is not mentioned, it may eafily be made out by confidering the falaries as the intereft.

Hitherto we have taken no notice of the correfponding board which was eftablifhed at London fo early as the year 1729 , to receive fubferiptions and lay out fums. That board indeed remained long inactive; but in 1773 its members began to co-operate more cordially with their brethren in Scotland. Since that period an annual fermon has been preached in recommendation of the charity ; and the preacher is now felected without any regard to the religions denomination to which he belongs ; fometimes from the church of England, fometimes from the church of Scotland, and fometimes from fectaries of different perfuafions. The meetings of the correfpondent board have been attended by many of the nobility and gentry, who have made great exertions to promote the views of the fociety. From its prefent flouriming flate therefore, from the incefatigable exertion and laudable zeal of the managers, and from the countenance and fupport which they have received from perfons of the firt rank and refpectability in the nation, the benevolent mind may look forward with much conficence and fatisfaction to a period not very diftant, when its beneficial effects fhall be felt act only in the Highlands, but fhall be communicated to the roft of the nation. We have been thus particular in our account of the Society for Propagating Chriftian Knowledge, bccaufe we have had accefs to the moft authentic fources of information, and becaufe we know it to be an inftitution calculated to enlighten and improve a confiderable part of the Britifh nation.
3. Society of the Sons of the Clergy, was incorporated by King Charles I1. in 1678 , by the name of The Governors of the Charity for Relief of the Poor Widows and Children of Clergymen. This fociety is under the direction and management of a prefident and vice-prefident, three treafurers, and a court of affiftants compofed of forty members. Several hundreds of widows and chil
dren of the clergy have annually received confiderable relief from this ufeful charity.
4. Society for the Sons of the Clergy of the Eftablifhed Church of Scolland, was intituted at Edinburgh in Fe bruary 1790 , and was conftituted a body corporate by his majelty's royal charter in \(\mathbf{1 7 9 2}\). The fociety, after feveral meetings, are of opinion, that the period in which the families of clergymen feel moft urgently the need both of friends and of pecuniary aid, is that which commences with the introduction of the fons either to an univerfity or to bufinefs, and terminates with their eftablifhment in their refpective profeffions; that many of the minifters of this church, living at great diflances from the feats either of univerfities or of bufinefs, poffefs incomes which, in the prefent flate of the country, are inadequate to the purpofes of procuring for their fons cither the literary or profeffional education which might enable them to come forward with credit and fuccefs in the world; that the fons of clergymen, from domeftic tuition and example, have in genetal very advantageous means of receiving in their early years the impreffions of virtue and honour, together with the rudiments of liberal knowledge; and that of courfe the public intereft may be promoted, by enabling this clafs. of young men to obtain their fhare in the refpectable fituations of life. The views of the fociety have been limited to the fons only of clergymen ; as they are of opinion, that within the limits which they have fixed, the field of beneficence will be ftill very extenfive, and the claims for aid as many and as great as their funds can be fuppofed able to anfwer, at leaft for many years to come. If the fociety fhall ever be in a fituation to undertake more than the aids which will be neceffary in bringing forward the fons of the clergy, it may then be confidered in what manner the daughters alfo may become fharers in its bounty.
5. Royal Humane Society, was inftituted in London in 1574 , for the recovery of perfons drowned or otherwife fuffocated. We have already given fome account of focieties inttituted in other countries with the fame views, and have alfo copied the directions of this fociety for the recovery of life, for which fee the article Drowning. We have therefore only to ftate, that the plan of this fociety is fo adverfe to any private interefted views, that it acquits its founders of all fordid motives. For the medical practitioners accept no pecuniary recompenfe for the time which they devote to a difficult and tedious procefs; for the anxiety which they feel while the event is doubtful; for the mortification which they too often undergo, when death, in fpite of all their efforts, at laft carries off his prey; nor for the infults to which they willingly expofe themfelves from vulgar incredulity. Their fole reward is in the holy joy of doing good. Of an inftitution thus free in its origin from the fufpicion of ambitious views, and in its plan renouncing felf-intereft in every fhape, philanthropy mult be the only bafis. The good intention therefore of the fociety is proved: by its conflitution;
views of the fociety, he recommended to his clergy to promote them. 'They accordingly received' the fecretary with much politenefs ; exhorted the people to fead their children to the Proteftant fchools to be inftructed in literature, to be taught to read the Scriptures in their own language, and to be made acquainted with thofe great principles of religion in which all Chriftians are agreed. What a bleffed reformation!.

\section*{S O C}

Reiligious and Humane Soeietics.
the widdom and utility of the undertaking are proved by its fuccefs: not lefs than 3000 fellow-creatures ha* ving fince its commencement been (1794) reftored to the community by its timely and indefatigable exertions. For it is to be obferved, that the benefit of this fociety is by no means confined to the two cales of drowning and fufpenfion. Its timely fuccours have roufed the lethargy of opium taken in immoderate and repeated dofes; they lave refcued the wretched victims of intoxication; rekindled the life extinguifhed by the fueden Itroke of lightning ; recovered the apoplectic; reftored life to the infant that had loft it in the birth; they have proved efficacious in cafes of accidental fmothering and of fuffocation by noxious damps; in inftances in which the tendernefs of the infant body or the debility of old age greatly leffered the previous probability of fuccefs; infomuch that no fpecies of death feems to be placed beyond the reach of this fociety's affiftance, where the mifchief had gone no farther than an obttruction of the movements of the animal machine without any damage of the organs themfelves. In confequence of every neceffary affiftance afforded by this fociety, fimilar inftitutions have been eftablifhed at Algiers, Lifbon, Philadelphia, Bofton, Jamaica, Dublin, Leith, Glafgow, Aberdeen, Birmingham, Gloucetter, Shropflhire, Northamptonfhire, Lancafter, Briftol, Whitehaven, Norwich, Exeter, Kent, and Newcaftle. The fociety has publifhed an 8 vo volume with plates, confift. ing of cafes, correfpondence, and a variety of interefting matter relating to the object of this benevolent inititution.
6. The Philanthropic Society, was inftituted in September 1788. It aims at the prevention of crimes, by removing out of the way of evil counfel, and evil company, thofe children who are, in the prefent flate of things, deftined to ruin. It propofes to educate and inftruct in fome ufeful trade or occupation the children of convicts or other infant poor who are engaged in vagrant or crimirial courfes; thus to break the clain of thofe pernicious confederacies, deprive the wicked of fucceffors, the gaols of inhabitants, juftice of its victims, and by all thete means add citizens to fociety. This inftitution is not only calculated to decreafe vice and infamy, but to increafe ufeful induftry; fo that thofe children who would otherwife fucceed to their parents hereditary crimes, and become the next race of beggars and thieves, will now be taught to fupply by honeft means their own wants and the wants of others.

To carry into effect thefe defirable purpofes, it is the firft bufinefs of the fociety to felect from prifons, and from the haunts of vice, profligacy, and beggary, fuch objects as appear moft likely to become obnoxious to the laws, or prejudicial to the community ; and, in the execution of this duty, the affiftance of the magiftrates, the clergy, and all who are interefted in the promotion of good morals and good government, is moft earnefly requefted. For the employment of the children, feveral houfes are fupported, at Cambridge Heath, near Hackney, in each of which a mafter-workman is placed for the purpofe of teaching the children fome ufeful trade. The trades already eftablifhed are thofe of a printer, carpenter, fhoemaker, and taylor. The girls are at prefent educated as menial fervants.

In the year 1791 no lefs than 70 children were un-
der the protection of this fociety, among whom were ma-Socisecie ny who have been guilty of various felonies, burglaries, Promut and other crimes. Yet, fingular as it may appear, in science lefs than two years thofe very children became no lefs remarkable for induftry, activity, decency, and obedience, than they formerly were for the contrary vices. Such are the grounds on which the Philanthropic Society now claims the attention and folicits the patronage of the public. If we regard humanity and religion, this inftitution opens an afylum to the moft forlorn and abject of the human race; it befriends the moft friendlefs; it faves from the certain and fatal confequences of infamy and vicious courfes orplians and deferted chil. dren. If we regard national profperity and the public welfare, it is calculated to increafe induftry ; and it directs that induftry into the moft ufeful and neceffary channels. If we regard felf-intereft, its immediate object is to protect our perfons from affault and murder, our property from depredation, and our peaceful habitations from the defperate fury of midnight incendiaries.

One guinea per annum conftitutes a member of the fociety; and L. 10 at one payment a member for life. A life-fubfcription, or an annual payment of at leaft two guineas, is a neceffary qualification for being elected into the committee.

\section*{II. Societies for Promoting Science and Literature.}
1. The Royal Society of London is an academy or body of perfons of eminent learning, inftituted by Charles II. for the prometing of natural knowledge. The origin of this fociety is traced by Dr Sprat, its earlieft hilto. rian, no farther back than to "Some fpace after the end of the civil wars" in the laft century. The fcene of the firft mettings of the learned men who laid the foundation of it, is by him fixed in the univerfity of Oxford at the lodgings of Dr Wilkins warden of Wadham college. But Dr Birch, on the authority of Dr Wallis, one of its earlieft and moft confiderable members, affigns it an earlier origin. According to him, certair worthy perfons, refiding in London about the year 1645 , being "inquifitive into natural and the new and experimental philofophy, agreed to meet weekly on a certain day, to difcourfe upon fuch fubjects, and were known by the title of The Invijble or Pb:lofophical Caln lege." In the years \(16+8\) and \(16+9\), the company who formed thefe meetings were divided, part retiring to \(O x-\) ford and part remaining in London ; but they continued the fame purfuits as when united, correfponding with each other, and giving a mutual account of their refpective difcoveries. About the year 1659 the greater part of the Oxford fociety returned to London, and again uniting with their fellow-labourers, met once, if not twice, a-week at Grefham college, during term time, till they were fattered by the public diftractions of that year, and the place of their meeting made 2 quarter for foldiers. On the reftoration 1660 their meetings were revived, and attended by a greater con. courfe of men eminent for their rank and learning. They were at laft taken notice of by the king, who having himfelf a confiderable tafte for phyfical fcience, was pleafed to grant them an ample charter, dated the 15 th of July 1662 , and afterwards a fecond dated 15 th April 1763 , by which they were erected into a corpo

\section*{S O C}
tesfor ration, confifting of a prefident, council, and fellows, for joting promoting natural knowledge; and to give their inveftice and
ature. gations, a a gainft which ftrange prejudices were entertained, every poffible fupport, he fometimes honoured their meetings with his prefence.

Their manner of electing fellows is by balloting. Their council are in number 2 I , including the prefident, vice prefident, treafurer, and two fecretaries ; it of which are continued for the next year, and 10 more added to them; all chofen on Se A ndrew's day. Each member at his admiffion fubfribes an engagemept that he will endeavour to promote the good of the fociety; from which he may be freed at any time, by fignifying to the prefident that he defires to withdraw. The charges have been different at different times, and were at firlt irregularly paid; but they are now five guineas paid to the treafurer at admiffion; and 13 s . per quarter fo long as the perfon continues a member: or, in lieu of the annual fubfription, a compofition of \(2 ;\) guineas iu one payment.

Their defign is, to " make faithful records of all the works of nature or art which come within their reach; fo that the prefent as well as future ages may be enabled to put a mark on errors which have been frengthened by long prefcription ; to reftore truths that have been neglected; to pufh thofe already known to more various ufes; to make the way more paffable to what remains unrevealed," \&c. To this purpofe they have made a gieat number of experiments and obfervations on moft of the works of nature ; and alfo numbers of fhort hiftories of nature, arts, manufactures, ufeful engines, contrivances, \&c. The fervices which they have rendered to the public are very great. They have inproved naval, civil, and military architecture ; advanced the fecurity and perfection of navigation; improved agriculture ; and put not only this kingdom, but alfo Ireland, the plantations, \&c. upon planting. They have regithered experiments, liiftories, relations, obfervations, \&c. and reduced them into one common tlock; and have, from time to time, publifhed thofe which they reckoned moft ufeful, under the title of Pbilofophical Tranfaciions, \&c. and laid the reft up in public regitters, to be nakedly tranfmitted to pofterity, as a folid groundwork for future fyftems.

They have a library adapted to their inftitution; towards which Mr Henry Howard, afterwards duke of Norfolk. contributed the Norfolcian library, and which is, at this time, greatly increafed by a continual feries of benefactions. The mufeum or repofitory of natural and artificial rarities, given them by Daniel Colwal, Efq; and fince enriched by many others, is now removed to the Britifh mufeum, and makes a part of that great repofitory. 'Their motto is Nullius in verba; and their place of affembling is Somerfet-houfe in the Strand. Sir Godfrey Copley, baronet, left five guineas to be given annually to the perfon who fhould write the beft paper in the year, under the head of experimental philofophy. This reward, which is now changed to a gold medal, is the higheft honour the fociety can befow. It is conferred on St Andrew's day:
8. The Royal Sociity of Edinturgh, was incorporated by foyal charter on the 29 th of March 1783 , and has for its objeet the curtivation of every branch of fcience, erudition, and tafte. Its rife and progrefs towards its prefent ftate was as follows: In the year 1718 a literary
lociety was eftablifhed in Edinburgh by the learned Societies fue Ruddiman and others, which in-1731 was fucceeded by Sciencenting and a fociety inftituted for the improvement of medical 1 itierature, knowledge. In the year 1739 the clebrated-Maclaurin conceived the idea of enlarging the plan of this fociety, by extending it to fubjects of philofophy and literature. The inflitution was accordingly new-modelled by a printed fet of laws and regulations, the number of members was increafed, and they were diftinguifhed from that time by the title of The Society for Improving Arts and Sciences, or more generally by the title of The Pbilofopbical Society of Edinburgh. Its meetings, however, were foon interrupted by the diforders of the country during the rebellion in 1745 ; and they were not renewed till the year 1752 . Soon after this period the firt volume of the Tranfactions of the Philofophical Society of Edinburgh was publifhed, under the title of Effays and Obfervations, Pbyyfal and Literary, and was followed by other volumes of ackriowledged merit. About the end of the year 1782, in a meeting of the profeffors of the univerlity of Edinburgh, many of whom were likewife members of the Philofophical Society, and warmly attached to its interelts,. a fcheme was propofed by the Rev. Dr Robertfon, principal of the univerfity, for the eftablifhment of a new fociety on a more extended plan, and after the model of fome of the foreign academies. It appeared an expedient meafure to folicit the royal patronage to an inftitution of this nature, which promifed to be of national importance, and to requeft an eftablifhment by charter from the crown. The plan was approved and adopted; and the Philofophical Society, joining its inflizence as a body in feconding the application from the univerfity, his majefty, as we have already obferved, "was moft gracioully pleafed to incorporate The Royab Society of Edinburgh by charter.

Thlis fociety confits of ordinary and honorary mem. bers; and the honorary places are reltricted to perfons refiding out of Great Britain and Ireland. The election of new members is appointed to be made at two ftated general meetings, which are to be held on the fourth Monday of January and the fourth Monday of June. A candidate for the place of an ordinary member muft fignify by a letter, addreffed to one of the members, his wifh to be received into the foo citty. He mult then be publicly propofed at leaft a month before the day of election. If the propofal be feconded by two of the members prefent, his name is to be inferted in the lift of candidates, and hung up in the ordinary place of meeting. The election is made by ballot, and is determined in favour of a candidate, if he f:all have the vetes of two thirds of thofe prefent, in a meet ny confifing of at leaft 21 meinbers. The general bufinefs of the fociety is managed by a prefident, two vice-prefidents, with a council of 12, a general fecretary, and a treafurer. Thefe officers are chofen by ballot annually on the laft Monday of November. All public deeds, whether of a civil or of a literary nature, are tranfacted by this board, and proceed in the name of the prefident or vice-prefident.
As it was thought that the members would have a greater inducement to punctual attendance on the meetings of the fociety, if they had fome general intimation of the nature of the fubjects which were to be confio dered, and made the topics of converfation, it was there-

Socictie for fore refolved to divide the fociety into two claffes, Promoting which fhould meet and deliberate feparately. One of Literature. thefe claffes is denominated the Phyfal Clafs, and has \(\underbrace{\text { Literature. }}\) for its department the fciences of mathematic6, natural philofophy, chemiftry, medicine, natural hiftory, and whatever relates to the inprovement of arts and manufactures. The other is denominated the Literary Clafs, and has for its department litcrature, philology, hitory, antiquities, and fpeculative philofophy. Every member is defired at his admiffion to intimate which of thofe claffes he wifhes to be more particularly affociated with; but he is at the fame time intitled to attend the meetings of the other clafs, and to take part in all its proceedings. Each of the claffes has four prefidents and two fecretaries, who officiate by turns. The meetings of the phyfical clafs are held on the firft Mondays of January, February, March, April, July, Auguft, November, and December; and the meetings of the Literary clafs are held on the third Mondays of January, February, March, April, June, July, November, and December, at 7 o'clock afternoon.

At thefe meetings the written eflays and obfervations of the members of the fociety, or their correfpondents, are read publicly, and become the fubjects of converfation. The fubjects of thefe effays and obfervations are announced at a previous meeting, in order to engage the attendance of thofe members who may be particularly interefted in them. The author of each differtation is likewife defired to furnifh the fociety with an abftract of it, to be read at the next enfuing meeting, when the converfation is renewed with increafed advantage, from the knowledge previoufly acquired of the fubject. At the fame meetings are exhibited fuch fpecimens of natural or artificial curiofities, fuch remains of antiquity, and fuch experiments, as are thought worthy of the attention of the fociety. All objects of natural hiftory prefented to the fociety, are ordered by the charter of the inftitution to be depofited, on receipt, in the mufeum of the univerfity of E. dinburgh; and all remains of antiquity, public records, or ancient manufcripts, in the library belonging to the faculty of advocates at Edinburgh.

The ordinary members, whofe ufual refidence is in the city of Edinburgh or its immediate neighbourhood, are expected to attend_regularly the monthly meetings'; and are required to defray, by an annual contribution, the current expences of the inftitution. The members who refide at fuch a diftance from Edinburgh, that they cannot enjoy the advantages arifing from a regular attendance on the meetings of the fociety, are not fubjected to any contribution for defraying its expences, but have a right to attend thofe meetings when occ:fionally in Edinburgh, and to take part in all their proceedings.

Three volumes of the Tranfactions of the fociety have been publifhed, which bear ample teftimony to the learning and acutenefs of their various authors.
3. Medical Society of London, inftituted in the year 3752, on the plan recommended by Lord Bacon ( \(D e\) Augm. Scient. lib. iv. cap. 2.), to revive the Hippecratic method of compofing narratives of particular cafes, in which the nature of the difeafe, the manner of treating it, and the confequences, are to be fpecified; to attempt the cure of thofe difeafes which, in his opinion, bave been too boldly pronounced incurable; and, laft.
ly, to extend their inquiries after the powers of par- Societ ticular medicines in the cure of particular cafes ; the brome collections of this fociety have been already publifhed, , iniencera under the title of Medical Obfervations and Inquiries, in feveral volumes.
4. The Medical Society of Edinburgh was incorporated by royal charter in 1778 ; but there appears to have been in that city a yoluntary affociation of the fame name from the firft eftablifhment of a regular fchool of phyfic in the univerfity. To the voluntary fociety the public is indebted for fix volumes of currious and ufeful eflays, collected principally by the late Dr Monro from June 173 I to June 1736; but in the year 1739 that fociety was united to another, as we have already obferved in a former article. The ordinary members of the prefent medical fociety are elected by bal. Int, and three diffentient exclude a candidate ; an ordinary member may alfo be elected an honorary mem. ber, who enjoys the privileges of the others, and receives a diploma, but is freed from the obligation of attendance, delivering papers in rotation, \&cc. to which the ordinary members are fubject; but in this cafe the votes mult be unanimous. The meetings of this fociety are held every Saturday evening in their own hall, during the winter feafon, when papers on medical fubjects are delivered by the feveral members in rotation; and four of thefe are annually elected to fill the chair in rotation, with the title of annual prefidents.
5. The Royal Medical Society of Paris was inftituted in 1776. The members are divided into affociates ordinary, limited to 30 , honorary to 12 , extraordinary to 60 , and foreign to 60 , and correfpondents. This fociety has publifhed feveral volumes of Memoirs in 4 to.
6. Afratic Society, an inflitution planned by the late illuttrious Sir William Jones, and actually formed at Calcutta on the 15 th of January 1784 , for the purpofe of tracing the hiftory, antiquities, arts, fciences, and literature, of the immenfe continent of \(A\) fia. \(A \varepsilon\) it was refolved to follow as nearly as poffible the plan of the Royal Society of London, of which the king is patron, the patronage of the Afiatic Society was offered to the governor-general and council, as the executive power in the territories of the company. By their acceptance of this offer, Mr Haftings, as governor-general, appeared among the patrons of the new fociety ; "but he feemed in his private ftation as the firft liberal promoter of ufeful knowledge in Bengal, and efpecially as the great encourager of Perfian and Shanferit litera. ture, to deferve a particular mark of diftinction:" he was requefted, therefore, to accept the honorary title of prefident. This was handfomely declined in a letter from Mr Haftings, in which he requefted "to yield his pretenfions to the gentleman whofe genius planned the inftitution, and was moft capable of conducting it to the attainment of the great and fplendid purpofes of its formation." On the receipt of this letter, Sir William Jones was nominated prefident of the fociety ; and we cannot give the reader a view of the object of the inftitution in clearer language than that which he employed in his firt difcourfe from the clair.
"It is your defign, I conceive (faid the prefident), to take an ample face for your learned inveftigations, bounding them only by the geographical limits of A fia; fo that, confidering Hindoftan as a centre, and turning your eyes in idea to the north, you have on your right

\section*{S O C \\ \(\left[\begin{array}{lll}58 & \text { ] }\end{array}\right.\) \\ \(S\) O C}
fisfor many important kingdoms in the eaftern peninfula, the tingy ancient and wonderful empire of Clina with all her 'Tar ce aund tarian dependencies, and that of Japan, with the cluiter
ature of precious iflands, in which many fingular curiofities have too long been concealed: before you lies that prodigious chain of mountains, which formerly perhaps were a barrier againt the violence of the fea, and beyond them the very interefting country of Tibet, and the vaft regions of Tartary, from which, as from the Trojan horfe of the poets, have iffued fo many confummate warriors, whofe domain has extended at leaft from the banks of the Ilyflus to the mouths of the Ganges: on your left are the beautiful and celebrated provinces of Iran or Perfia, the unmeafured and perhaps unmeafurable deferts of Arabia, and the ouce flourifhing kingdom of Yemen, with the pleafant ifleg that the Arabs have fubdued or colonized; and farther weftward, the Afiatic dominions of the Turkifh fultans, whofe moon feems approaching rapidly to its wane. By this great circumference the field of your ufeful refearches will be inclofed; but fince Egypt had unqueftionably an old cernection with this country, if not with China, fince the language and literature of the A byffinians bear a manifett affinity to thofe of Afia, fince the Arabian arms prevailed along the African coaft of the Mediterranean, and even erected a powerful dynatty on the continent of Europe, you may not be difpleafed occafionally to follow the ftreams of Afiatic learning a little beyond its natural boundary; and, if it be neceffary or convenient that a fhort name or epithet be given to our fociety, in order to diftinguifh it in the world, that of Afatic appears both claffical and proper, whether we confider the place or the object of the intitution, and preferable to Oriental, which is in truth a word merely relative, and thourh commonly ufed in Europe, conveys no very diftinct, idea.
"If now it be afked, What are the intended objects of our inquiries within thefe fpacious limits? we anfiver, Man and Nature; whatever is performed by the one or produced by the other. Human knowledge has been elegantly analy fed according to the three great faculties of the mind, memory, reafon, and imagination, which we conftantly find employed in arranging and retaining, comparing and diftinguifhing, combining and diverfifying, the ideas, which we receive through our fenfes, or acquire by reflection : hence the three main branches of learning are, bifory, fcience, and art; the firlt comprehends either an account of natural productions, or the genuine records of empires and ftates; the fecond embraces the whole circle of pure and mixed mathematics, together with ethics and law, as far as they depend on the reafoning faculty; and the third includes all the beauties of imagery and the charms of invention, dif played in modulated language, or reprefented by colour, figure, or found.
" Agreeably to this analyfis, you will inveltigate whatever is rare in the ftupendous fabric of nature, will correct the geography of Afia by new obfervations and difcoveries ; will trace the annals and even traditions of thofe nations who from time to time have peopled or defolated it ; and will bring to light their various forms of government, with their inffitutions civil and religious; you will examine their improvements and methods in arithmetic and geometry; in trigonometry, menfuration, mechanics, optics, aftronomy, and general phy-

Vol, XVII. Part II.
fics ; their fyftems of morality, grammar, rhetoric, and Sucieties for dialectic; their Akill in chirurgery and medicite; and Pronoting their advancement, whatever it may be, in anatomy and Science and chemitry. To this you will add refearches into their iterature. agriculture, manufactures, trade ; and whilft you inquire with pleafure into their mufic, architecture, painting, and poetry, will not neglect' thofe inferior arts by which the comforts and even elegancies of focial life are fupplied or improved. You may obferve, that I have omitted their languages, the diverfity and difficulty of which are a fad obftacle to the progrefs of ufeful knowledge; but I have ever corifidered languages as the mere inftruments of real learning, and think them improperly confounded with learning itfelf: the attainment of them is, however, indifpenfably neceffary ; and if to the Perfian, Armenian, Turkifh, and Arabic, could be added not only the Shanfcrit, the treafures of which we may now hope to fee unlocked, but even the Chinefé, Tartarian, Japanefe, and the various infular dialects, an immenfe mine would then be open, in which we might labour with equal delight and advantage."

Of this fociety three volumes of the Tranfactions have been publifhed, which are replete with information in a high degree curious and important; and we hope that the European world fhall foon be favoured with another. 'I'he much-to be lamented death of the accomplifhed prefident may indeed danıp the fpirit of inveftigation among the members; for to conquer difficulties fo great as they mult meet with, a portion feems to be neceffary of that enthufiafm which accompanied all the purfuits of Sir William Jones; but his fucceffor is a man of great worth and learning, and we truft will ufe his utmoft endeavours to have the plan completed of which Sir William gave the outlines.
5. The Anerican Pbilofophical Society, held at Philadelphia, was formed in January 1769 by the union of two focieties which had formerly fubfited in that city. This fociety extends its attention to geography, mathematics, natural philofophy, and aftronomy; medicine and anatomy; natural hiftory and chemiftry; trade and commerce ; mechanics and architecture ; hufbandry and American improvements. Its officers are a patron, prefident, three vice-prefidents, one treafurer, four fecretaries, and three curators, who are annually chofen by ballot. The duty of the prefident, vice-prefidents, treafurer, and fecretaries, is the fame as in other focieties. 'The bufinefs of the curators is to take the charge of all fpecimens of natural productions, whether of the animal, vegetable, or foffil kingdom; all models of machines and inftruments; and all other matters belonging to the fociety which fhall be intrufted to them. The ordinary meetings are held on the firlt and third Fridays of every month from October to May inclufive. This fociety was incorporated by charter 15 th March 1780; and has publifhed three volumes of its Tranfactions, containing many ingenious papers on general literature and the fciences, as well as refpecting thofe fubjects peculiar to America. It is a delightful profpect to the philofopher to confider, that A fia, Europe, and America, though far feparated and divided into a variety of political itates, are all three combined to promote the caufe of knowledge and truth.
6. A Literary and Pbilofopbical Society of cofiderable reputation has been lately eftablifhed at Manchefter, under the direction of two prefidents, four vice-prefi-
dents,

Bncietiesfor cents, and two fecretaries. The number of members is Mroniotiny Yimited to so; befides whom there are feveral honorary tiretature members, all of whom are elected by ballot; and the nerue offecrs are chofen annually in April. Four volumes of *aluable effays have been already publifhed by this fociety. \%. Sociely fur Promoting the Difcuvery of the Interior \(\$\) arts of fifrica. This focrety or affociation for explo. Fing the internal difricts of Africa, of which fo little is at prefent known, was formed in London by fome opukent individuals in 1788 ; who, ftrongly impreffed with a conviction of the practicability and utility of thus en4irging the fund of hmman knowledge, determined if polfible to refcue the age from that fligma which attaches to its ignorance of fo large and fo near a portion of zlie globe. The founders of this fociety refolved to admit-no man a member for a fhorter period than three years, during which lye muft pay annually into the public fund five guineas. After three years, any member, upon giving a year's notiec, may withdraw himfelf from the affociation. During the firf 12 months each of the members was allowed to recommend for the appprobation of the fociety fuch of his friends as he might think proper to be admitted into it ; but fince that period we believe all additional members have been elected: by a ballot of the affociation at large. A comnittee wias chofen by ballot to manage the funds of the fociety, to choofe proper perfíns to be fent on the difcovery of the interior parts of Africa, and to carry on the fociety's correfpondence, with exprefs injunctions to difelofe no intelligence received from their agents but to the fow viety at large. But a filler account of the nature of *his eftablifhment, and the very happy efforts they have made, may be feen in the fuperb edition of their prow ceedings printed in 1790, 4t0, for their own ufe; or in the 8 vo edition fince made public. They foon found Iwo gentleman, Mr Lucas aird Mr Ledyard, who were fingularly well qualified for the important miffion. The information they have acquired will be found in the above work; with a new map by Mr Rennel, exhibitsing the geographical knowledge collected by the African affociation. Mr Ledyard very unfortunately died during his refearchies at Cairo.
3. The Society of Antiquaries of London, was founded -bout the year 1572 by Archbiftop Parker, a munifieent patron of learned men. For the face of 20 years it affembled in the houfe of Sir Robet Cotton; in 3589 they refolved to apply to Queen Elizabeth for a chatter and a public building where they might hold their meetings; but it is uncertam whether any fuch application was ever made. In the mean time, the reputation of the fociety giadually increafed, and at length it excited the jealoufy of James I. who was afraid leit it thould prefume to canvafs the fecrer tranfactions of his government. He accordingly diffolved it. But in the beginning of the prefent century, the Antiquarian Society began to revive; and a number of gentlemen, minent for their affection to this fcience, had weekly meetings, in which they examined the antiquities and hiftory of Great Britain preeeding the reign of James I. but without excluding any other semarkable antiquities that might be offered to them. From this time the fociety grew in importance; and in 1750 they unanimoufly refolved to petition the king for a charter of incorporation. This they obtained the year following, by
the influence of the celebrated carl of Hardwicke, then Socie lord chancellor, and Martin Folkes, Efq; who was then Pron their prefident. The king declared himfelf their foun- Scien der and patron, and empowered them to have a body of liter ftatutes, and a common feal, and to hold in perpetuity latids, \&ac: to the yearly value of L. Ioco.

The chief object of the inquiries and refearches of the fociety are Britifh antiquities and hiftory; not, however, wholly excluding thofe of other countries. It muft be acknowledged, that the fludy of antiquity offers to the curious and inquifitive a large field for refearch and amufement. The inquirer in this branch furnifhes the hiftorian with his beft materials, while he difinguihhes from truth the fictions of a bold invention, and ateertains the credibility of facts; and to the philofopher he prefents a frutitul fource of ingenious fuectrIation, while he points out to him the way of thinking, and the manners of men, under all the varieties of afpeet in which they have appeared.

An antiquarian ought to be a man of folid judgment, poffeffed of learning and fcience, that he may not be an enthufiaftic admirer of every thing that is ancient mere. ly becanfe it is ancient ; but he qualified to diftinguifh between thofe refearches which are valuable and important, and thofe which are trifling and ufelefs. It is from the want of thefe qualifications that fome men have contracted fuch a blind paffion for every thing that is ancient, that they have expofed themfelves to ridicule, and their ftudy to contempt. But if a regard to utility were always to regulate the purfuits of the antiqua. rian, the fhafts of fatire would no longer be levelled at him; but he would be refpected as the man who labours to reftore or to preferve fuch ancient productions as are fuited to illuminate religion, philofophy, and hiftory, or to improve the arts of life.

We by no means intend to apply thefe obfervations to any particular fociety of antiquarians; but we throw them out, becaufe we know that an affidnous ftudy of antiquity is apt, like the ardent purfuit of money, to lofe fight of its original object, and to degenerate into a paffion which miftakes the mean for the end, and confiders poffeffion without a regard to utility as enjoy: ment.

An affociation fimilar to that of the Antiquarian Society of London was founded in Edinburgh in 9780 , and received the royal charter in 1783 .

Befides thefe literary focieties here mentioned, there are a great number more in different parts of Europe, fome of which are neticed under the article Academy. Thofe which are omitted are not omitted on acconnt of any idea of their merior importance; but either becaufe we have had no accefs to authentic information, or becaufe they refemble the focieties already deforibed fo clofely, that we could have given nothing but their names.

\section*{III. Societies for Encouraging and Promoting} Arts, Manufactures, Ȩc.
1. Iondon Socisty for the Encouragement of Arts, Mamufuctures, and Conmerce, was inftituted in the year 1754 by Lord Folkflone, Iord Romney, Dr Steplien Hales, and a few private gentlemen; but the merit of this intitution chieny belonged to Mr William Shipley, 5

\section*{S O C}
[ 587 ]
S O C
ice for at ingenious mechanic ; who, though doriving no ad. ura- vantages from learning, by unwearied peifonal attendand ance found means to engage a few perfons of rank and fortune to meet:'at Peele's coffechoufe in Fleetfreet, and to adopt a plan for promoting arts and manufactures.
The office-bearers of this, fociety are a prefident, 12 vice-prefidents, a fecretary, and regifter. Their proceedings are regulated by a body of sules and orders eftablifhed by the whole fociety, and printed for the ufe Qf the members. All queftions, and debates are determined by the holding up of hands, or by ballot if required; and no matter can be confirmed without the affent of a majority at two meetings. They invite all the world to propofe fubjects for encouragement ; and whatever is deemed deferving attention, is referred to the confideration of a committee, which, after due inquiry and deliberation, make their report to the whole fociety, where it is approved, rejected, or altered. A lift is printed and publifhed every year of the matters for which they propofe to give premiums, 5 which premiums are either fums of money, and thofe fometimes very confiderable ones; or the fociety's medal in gold or filver, which they confider as the greateft honour they ean beftow. All poffible care is taken to prevent partiality in the diftribution of thei premiums, by defiring the claimants names to be concealed, and by appoint. ing comanittees (who when they find occafion call to their affiftance the moft fiilful artifs) for the ftrict examination of the real merit of all matters and things brought before them, in confequence of their premiums.

The chief objects of the attention of the Society for the Encourayement of Arts, Manufactures, and Commerce, in the application of their rewards, are ingenuity in the feveral branches of the polite and liberal arts, ufeful difcoveries and improvements in agriculture, manufaetures, mechanics, and chemittry, or the laying open of any fuch to the public ; and, in general, all fuch ufeful inventions, difcoverics, or improvements (though not mentioned in the book of premiums), as may appear to. baye a tendency to the advantage of trade and coma merce.
The following are fome of the mont important regufations of this fociety. It is required that the matters for which premiums are offered be delivered in without names, or any intimation to whom they belong; that each particulan thing be marked in what manner each claimant thinks. fit, fuch claimant fending with it a paper fealed up, having on the outide a correfponding mark, and on the infide the claimant's name and ad-. drefs; and all cardidates are to take notice, that no claim for a premium will be attended to, unlefs. the conditions of the advertifement are fully complied with. No papers fhall be opened but fuch as flalll. gain premiums, unlefs where it appears. to the fociety abfofuteky neceffary for the determination of the claim : all the reft flall be returned unopened, with the matters to which they, belong, if inquired after by the marks with. in two years; ; after: which time, if not demanded, they fhall be publicly burnt: unopened at fome meeting of the fociety. All the premiums of this fociety are defigned for that part of Great Britain called Encland, the dominion of Wales, and the town of Berwick upon Tweed, unlefs, expreflay. mentioned to the cantrayy.

No perfon fhall receive aby premium, bounty, or encon- Societice for ragement, from the fociety for any matter for which Encourahe has obtained or propofes to obtain a patent. No ging and member of this fociety fhall be a candidate for or in. Arrs, \(A \rightarrow 2\). titled to receive any premium, bounty, or reward what-nufactures, foever, except the honorary medal of the fociety.
The refpectability of the members who compofe it may be feen by perufing the litt which generally accompanies their Tranfactions. In the laft volume (vol. xii.) it occupies no lefs than 43 pages. Some idea may be formed of the wealth of this fociety, by obferving that the lift of their premiums fills 96 parges, and amounts. to 250 in number. Thefe confift of gold medals worth from 30 to 50 , and in a few inflances to 100 , guineas; and filver medals valued at 10 guineas.

This fociety is, one of the moft important in Great Britain. Much money has been expended by it, and many are the valuable effects of which it has been pros duetive. Among thefe we reckon not only the difcoveries which it has excited, but the inftitution of other focieties on the fame principles to which it has given birth; and we do not hefitate to conclude, that future ages will confider the founding of this fociety as one of the mof remarkable epochs in the hitory of the arts. We contemplate with pleafure the beneficial effects which muft refult to this nation and to mankind by the diffufion of fuch inftitutions; and rejoice in the hope that the active minds of the people of Great Britain, inftead of being employed as formerly in controverfies about religion, which engender ftrife, or in dilícuffions conecrning the theory of politics, which lead to the adoption of fchemes inconfiftent with the nature and condition of man, will foon be more generally united into affociations for promoting ufeful knowledge and folid improvement, and for alleviating the diftreffes of their fellow-creatures.
2. Society infituted at Bath for the Encouragement of Agriculture, Arts, Manufaaures, and Commerce. It was founded in the year \(17 \% 7\) by feveral gentlemen who met at the city of Bath. This fcheme met with a. very favourable keception both from the wealthy and learned. The wealthy, fubfreribed very liberally, and the learned communicated many important papers. On application to the London and provincial focieties inftituted for the like purpofes, they very politely offered their affitance. Seven volumes of their tranfactions have' already been publifhed, containing very valuable experiments and ob-m fervations, particularly refpeeting agriculture, wlich well deferve the attention of all farmers in the kingdom. We have confulted them with much fatisfaction on feveral occafions, and have frequently referred to them in the courfe of this. work; and therefore, with pleafure, embrace the prefent opportunity of repeating our oblin gations. We owe the fame acknowledgments to the Society for the Improvement of Arts, \& c: of London.
3. Society for Working Mines, an affociation lately formed on the continent of Europe. This inftitution arole from the accidental meeting of feveral mineralogilts at Skleno near Schemnitz in Hungary, who were colleeted in order to examine a new method of amalgamation. Struck with the fhackles impofed on mincra: logy. by monopolizers of new and ufeful proceffies, they thought no method fo. effectual to. break them, as forming a fociety, whofe common labours fhould be directed to fix: mining on its.fureft. principles; and whofe memoirs,

Societiesfor foread over all Europe, might offer to cvery adventurer Encoura- the refult of the refearches, of which they are the obging and Promot ng

\section*{Airs, Ma-}
nufactures, \&c. ject. By thefe means they fuppofed, that there would be a mafs of information collected ; the interefts of individuals would be loft in the general intereft; and the one would materially affift the other. Impofture and
quackery would, by the fame means, be banifhed from a fcience, which muft be improved by philofophy and experience; and the fociety, they fuppofed, would find, in the confidence which they infpired, the reward and the encouragement of their labours. They defign, that the memoirs which they publifh finall be fhort and clear; truth mult be their bafis, and every idle difcuffion, every foreign digreffion, muft be banifhed; ;politics and finance mult be avoided, though the differtations may feem to lead towards them; and they oblige themfelves to oppofe the affectation of brilliancies, and the oftentation of empty fpeculation, when compared with plain, fimple, and ufeful facts.

The object of the fociety is phyfical geography ; mineralogy founded on clemiftry; the management of ore in the different operations which it undergoes; fubterraneous geometry; the hiftory of mining; founderies, and the proceffes for the extraction of metals from the ores, either by fufion or amalgamation, in every inftance applied to practice. The end of this inftitution is to collect, in the moft extenfive fenfe, every thing that can affift the cperations of the miner, and to communicate it to the different members, that rhey may employ it for the public good, in their refpective countries. Each member mult confider himfelf as bound to fend to the fociety every thing which will contribute to the end of its inflitution ; to point out, with precifion, the feveral facts and obfervations; to communicate every experiment which occurs, even the unfuccefsful ones, if the relation may feem to be advantageous to the public; to communicate to the fociety their examination of fchemes, and their opinions on quettions propofed by it ; and to pay annually two ducats (about 18 s .6 d .) to the direction every Eafter. The fociety, on the other hand, is bound to publifh every novelty that fhall be communicated to it ; to communicate to each member, at the member's expence, the memoirs, lefigns, models, productions, and every thing connected with the inftitution; to anfwer all the neceffary demands made, relating in any refpect to mining ; and to give its opinion on every plan or project communicated through the medium of an honorary member.

The great centre of all intelligence is to be at Zellerfield in Hartz, Brunfwick : but the fociety is not fixed to any one fpot ; for every particular ftate fome practical mineralogit is nominated as director. Among thefe are the names of Baron Born, M. Pallas, M. Charpentier, M. Prebra, and M. Henkel. Their office is to propofe the members; to take care that the views of the fociety are purfurd in the different countries where they refide; to anfwer the requefts of the members of their country who are qualified to make them ; in cafe of the death of a director, to choofe another ; and the majority is to determine where the archives and the ftrong box is to be placed.

All the eminent mineralogits in Europe are members of this fociety. It is erected on fo liberal and fo extenfive a plan, that we entertain the higheft hopes of its fuccefs; and have only to add, that we wifh much
to fee the fludy of feveral other feiences purfurd in the Sneietie fame manner.
4. The Society for the Improvement of Naval Architec. ging a ture, was founded in 1791. The object of it is to en- Arts, A courage every ufeful invention and difcevery relating to nufactu naval architecture as far as thall be in their power, both by honorary and pecuniary rewards. They have in view particularly to improve the theories of floating bodies and of the refiftance of fluids; to procure draughts and models of different veffels, together with calculations of their capacity, centre of gravity, tonnage, \&c. ; to make obfervations and experiments themfelves, and to point out fuch obfervations and experiments as appear beft calculated to further their defigns, and moft deferving thofe premiums which the fociety can beftow. But though the improvement of naval architecture in all its branches be certainly the principal object of this inftitution, yet the fociety do not by any means intend to confine themfelves merely to the form and ftructure of veffels. Every fubordinate and collateral purfuit will claim a fhare of the attention of the fociety in proportion to its merits; and whatever may have any tendency to render navigation more fafe, falutary, and even pleafant, will not be neglected.

This inftitution owes its exiftence to the patriotic difpofition and extraordinary attention of Mr Sewel a private citizen of London, who (though engaged in a line of bufinefs totally oppofite to all concerns of this kind) has been led, by mere accident, to take fuch occular notice of, and make fuch obfervations on, the actual ftate of naval architecture in this country, as naturally occurred to a man of plain underftanding, zealous for the honour and intereft of his country, and willing to beftow a portion of that time for the public good, which men of a different defcription would rather have devoted to their own private advantage. His attention. was the more ferioufly excited, by finding that it was the opinion of fome private fhip-builders, who, in a debate on the failure of one of our naval engagements, pronounced, that fuch " would ever be the cafe while that bufinefs (the conftruction of our fhips of war) was not ftudied as a fcience, but carried on merely by precedent ; that there had not been one improvement in ous navy that did not originate with the French, who had naval fchools and feminaries for the ftudy of it ; and that our fhips were not a match for thofe of that nation either fingly or in a fleet, \&c. \&c."

In a thort time the fociety were enabled to offer very confiderable premiums for particular improvements in the conftruction of our Mipping, \&c. \&c. and alfo to encourage our philofophers, mathematicians, and mechanics, to make fatisfactory experiments, tending to afcertain the laws of refiftance of water to folids of different forms, in all varieties of circumitance. On this head the reward is not lefs than L. 100 pounds or a gold medal. Other premiums of 50,30 , and 20 guineas, according to the importance or difficulty of the particular fubject or point of inveftigation, are likewife offered, for different difcoveries, inventions, or improvements. 'The terms of admiffion into the fociety are a fubfcription of two guineas annually, or twenty guineas for life.
5. Society of Artifs of Great Britain, which confifts of directors and fellows, was incorporated by charter in 1765 , and empowered to purchafe and hold lands, not
exoeeding

\section*{S OC}
\(\left[\begin{array}{ll}589\end{array}\right]\)
enter for exceeding I. 1000 a year. The directors of this fo-doura- ciety, annually elected, are to confine of 24 persons, inclouding the preficent, vice-prefident, treafurer, and fecretary ; and it is required that they be either painters, sculptors, architects, or engravers by profeffion.
6. Britifh Society for Extending the Fif/teries and ITproving the Sea-Cooffs of this Kingdom, was inflituted in 1786. The end and defign of this fociety will bert appear from their charter, of which we prefent an abtract.

The preamble fates, "the great want of improvemont in fifheries, agriculture, and manufactures, in the Highlands and iflands of North Britain; the prevalence of emigration from the want of employment in thole parts; the prospect of a new nurfery of feamen, by the eftablifhment of firing towns and villages in that quarter. The aet therefore declares, that the perfons there. in named, and every other perfon or perfons who hall thereafter become proprietors of the joint flock mentoned therein, foal be a dittinct and feparate body politic and corporate, by the name of The Britijb Society for Extending the Fijheries and Improving the Sea.coofls of this King dom : 'That the fair fociety may raise a capital joint flock not exceeding L. 150,000 , to be applied to purchaling or otherwife acquiring lands and tenements in perpetuity, for the building thereon, and on no other land whatever, free towns, villages, and fifhing ftations: That the joint flock fall be divided into flares of L. yo each : That no one perron fall in his or her name poffefs more than ten hares, or L. 500 : That the fociety fall not borrow any fum or fums of money whatfoever: That the fums to be advanced for this undertaking, and the profits arifing therefrom, hall be divided proportionably to the furn fubfcribed; and that no perron foal be liable for a larger fum than he or the foal have respectively fubleribed: 'That one or two hares shall intitule to one vote and no more, in perfor or by proxy, at all meetings of proprietors; three or four flares to two votes; five, fix, or feven flares, to three votes; eight or nine flares to four votes; and ten flares to five votes and no more : That more perfons than one inclining to hold in their joint names one or more flares fall be intitled to vote, by one of fuch perfons, according to the priority of their names, or by proxy : That bodies corporate fall vote by proxy under their feal : That all perfons holding proxies fall be proprietors, and that no one perron Shall hold more than five votes by proxy : That the affairs of the fociety hall be managed by a governor, deputy governor, and \(\mathbf{I}_{3}\) other directors, to be elected annually on the 25 th of March, from among the proprietors of the fociety, holding at leapt one full flare, by finned lifts of their names to be transmitted by the proprietors to the fecretary of the fociety : that five proprietors, not being governor, director, or other officer, foal be in like manner ansully elected to audit the accounts of the fociety : That there foal be one general meeting of the proprietors annually on the 25 th of March : That occafional general meetings hall be called on the requeft of nine or more proprietors: That the general meetings of the proprietors fall make all bye laws and conititutions for the government of the fociety, and for the good and orderly carrying on of the bufinefs of the fame: That no transfer fall be made of the flock of the fociety for three years from the roth of August 1786: That
the cath of the fociety fall be lodged in the bank of Societio for
England, bank of Scotland or the royal bat England, bank of Scotland, or the royal bank of Scot. Encouraland: That no director, proprietor, agent, or officer of priming and the fociety, fall retain any fum or films of money in his Arts, Mahands beyond the face of 30 days, on any account nufactures, whatsoever: That all payments by the fociety fall be made by drafts on the fad banks, under the hands of the governor or deputy-goveruor, counterfirned by the fecretary or his deputy, and two or more directors : And that the books in which the accounts of the lociety flail be kept fall be open to all the proprietors."

The institution of this public-fpirited fociety was irs a great meafure owing to the exertions of the patriotic Johu-Knox; who, in the coulee of 23 years, traverfed and explored the Highlands of Scotland no less than is times, and expended feveral thoufand pounds of his own fortune in pursuing his patriotic deigns.
7. Britijfo Wool Society. See Britij) Wool Society.

Society Ifles, a clutter of ines, fo named by Captain Cook in 1769. They are fituated between the latitudes of 16. 10. and 16. 55. fouth, and between the longio tubes of 150.57 . and 152 , weft. They are eight ir number; namely, Otaheite, Huahine, Ulietea, Otaha, Bolabola, Maurua, Toobouai, and Tabooyamanoo or Saunders's Inland. 'The foil, productions, people, their language, religion, cuftoms, and manners, are fo nearly the fame as at OTAHEITE, that little need be added here on that fubject. Nature has been equally bountiful in uncultivated plenty, and the inhabitants are as luxurious and as indolent. A plantain branch is the emblem of peace, and exchanging names the greateft token of friendfhip. Their dances are more elegant, their dramatic entertainments have something of plot and confiftency, and they exhibit temporary occurrences as the objects of praife or fatire ; fo that the origin of ancent comedy may be already difcerned among them. The people of Hyaline are in general flouter and fairer than thole of Otaheite, and this inland is remarkable for its populoufnefs and fertility. Thole of Ulietea, on the contrary, are faller and blacker, and much lees order1y. Captain Cook put on fore a Cape ewe at Bolabola, where a ram had been left by the Spaniards ; and aldo an Englifh boar and Sow, with two goats, at Ulietea. If the valuable animals which have been traulported thethe from Europe fhould be fuffered to multiply, no part of the world will equal thee ilfands in variety and abundance of refreshments for future navigators:
SOCINIANS, in church-hiftory, a feet of Christian heretics, fo called from their founder Fauftus Socinus. (fee Socinus). They maintain, "That Jefus Christ was a mere man, who had no exittence before he was conceived by the Virgin Mary ; that the Holy Glroit is no diftinct perion, but that the Father is truly and properly God. They own, that the name of God is given in the Holy Scriptures to Jesus Chit ; but contend, that it is only a deputed title, which, however, inverts him with an absolute fovereignty over all created beings, and renders him an object of worlhip to men and angels. They deny the doctrines of fatistactimon and imputed righteoufnefo; and fay that Thrift only preached the truth to mankind, feet before them in himself an example of heroic virtue, and fealed his doctrines with his blood. Original fin and absolute presdeftination they efteem fcholaftic chimeras. They like-

Bzthiane Sucinus. comes infenfible at death, and is raifed ayain with the body at the refurrection, when the good fhall be eftablithed in the poffeffion of eternal felicity, white the wicked fhall be configned to a fire that will not torment them eternally, but for a certain duration proportioned to their demerits."

This fect has long been indignant at being fyled Socinians. They difclaim every human leader; and profefing to be guided folely by the word of God and the deductions of reafon, they call themfelves Unitarians, and affect to confider all other Chrittians, even their friends the Arians, as Polytheiffs. Modern Unitarianifm, as taught by Dr Priefley, is, however, a very different thing from Socinianifm, as we find it in the Racovian catechifm and other ftandard works of the feet. This far-famed philofopher has difcovered what efcaped the fagacity of all the fratres poloni, that Jefus Chrift was the fon of Jofeph as well as Mary ; that the evangelifts miftook the meaning of Ifaiah's prophecy, that "a virgin fhould conceive and bear a fon;" that the applying of this prophecy to the birth of our Saviour, led them to conclude that his conception was miracu-- lous; and that we are not to wonder at this miltake, as the apoftles were not always infpired, and were in general inconclufive reafoners. The modetty of the writer in claiming the merit of fuch difooveries will appear in its proper colours to all our readers: the truth of his doct rime fhiall be confidered in another place. See Theology.

SOCINUS (Exlius), the firt author of the fect of the Socinians, was born at Siemna in Tufcany in 1525 . Being defigued by his father for the law, he began very early to fearch for the foundation of that fcience in the Werd of God; and by that ftudy difcovered that the Romifh religion taught many things contrary to revelation; when, being defirous of penetrating farther into the true fenfe of the Scriptures, he ftudied Greek, Hebrew, and even Arabic. In 1547 he left Italy, to go and converfe with the Proteftants; and fpent four years in travelling thro' France, England, the Netherlands, Germany, and Po. land, and at length fettled at Zurich. He by this means became acquainted with the moft learned men of his time, who teftified by their letters the efteem they had for him: but as he difcovered to them his doubts, he was greatly fufpected of herefy. He, however, conducted himfelf with fuch addrefs, that he lived among the capital enemies of his opinions, without recciving the leaft injury. He met with fome difciples, who heard his initructions with refpect ; thefe were Italians who left their native country on account of religion, and swandered about in1 Germany and Poland. He communicated likewife his fentiments to his relations by his writings, which he caufed to be conveyed to thein at Sienna. He died at Zurich in 1562 . Thofe who were of fentiments oppofite to his, and were perfonally acquainted with him, confefs that his outward behaviour was blamelefs. He wrote a laraphrafe on the firft chapter of St John; and other works are. afcribed to hin.

Socinus (Fauftus), nephew of the preceding, and principal founder of the Socinian fect, was born at sienna in 1539. The letters which his uncle Lzolius wrote to his relations, and which infufed into them many feeds of herefy, made an impreffion upon him; \{o that,
knowing himfeif not innocent, he fled as well as the reft when the inquifition began to perfecute that family. He was at Lyons when he heard of his uncle's death, and departed immediately to take poffeffion of his writings. IJe returned to Tufcany; and ınade himfelf fo agreeable to the grand duke, that the charms which he found in that court, and the honourable putts he filled there, hindered him for twelve years from remembering that he had been confidered as the perfon who was to put the laft hand to the fyftem of famofatenian divinity, of which his uncle Lælius bad made a rough draught. At lait he went into Germany in 1574, and paid no regard to the grand duke's advices to return. He flaid three years at llafl, and fludied divinity-there; and having adopted a fet of principles very different from the fyftem of Proteftants, he refolved to maintain and propagate them; for which purpofe be wrote a treatife De Yefu Chrifto: Servatore. In 157.9 Socinus retired into Poland, and defred to be admitted into the com+ munion of the Unitarians; but as he differed from them in fome points, on which he refufed to be filent, he met with a repulfe. However, he did not ceafe to write in defence of their churches againft thote who attacked them. At length his book againft James Paleologus furnifhed his enemies with a pretence to exafperate the king of Poland againft him ; but though the mere read. ing of it was fufficient to refute his accufers, Socinus thought proper to leave Cracow, after having refided there four years. He then lived under the protections of feveral Polifh lords, and married a lady of a good family : but her death, which happened in 158 , fo deeply afllicted him as to injure his health; and to complete his forrow, he was deprived of his patrimony by the death of Francis de Medicia great duke of Florence. The confolation he found in feeing his fentiments at laft approved by feveral minifters, was greatly interrupt. ed in 1598 ; for he met with a thoufand infults at Cracow, and was with great difficulty faved from the hands of the rabble. His houfe was plundered, and he loft bis goods; but this lofs was not fo uneafy to him as that of fome manufcripts, which he extremely regretted. To deliver himfelf from fuch dangers, he retired to a village abont nine miles diftant from Cracow, where he fpent the remainder of his days at the houfe of Abras ham Blonfki, a Polifh grentleman, and died there in 1604. All Fauftus Socinus'a works are contained in the two firlt volumes of the Bibliotheca. Fratrum. Polom norum.

SOCMANS, Sokemanis, or Socmen (Socmanni), are fuch tenants as hold their lands and tenementa by focage tenure. See Socage.
SOCOTORA, an ifland lying between A fia and \(A\) rabia Felix; about 50 miles in length, and 2.2 in breadth. It is particularly noted. for its fine aloes, known by the name of Socotrine Aloes. The religion of the natives is a mixture of Mahometanifn and Paganifm; but they are civil to frangers who call there in their paffage to the Eaft Indies. It abounds in fruit and cattle; and they have a king of their own, who is dependent on Arabia.
SOCRATES, the greateft of the ancient philofophers, was born at Alopece, a village near Athens, is the fourth year of the 77 th olympiad. His parents were of low rank; his father Sophronifcus being a ftatuary, and his mother. Phænareta a midwites. Sophro-

\section*{S. 0}
nifcus brought up his fon, contrary to his inclination, in his own manual employment ; in which Socrates, though his mind was continually afpiring after higher objects, was not unfuccefsful; for whillt he was a young man, he is faid to have formed fatues of the habited graces, which were allowed a place in the citadel of Athens. Upon the death of his father he was left in fuel ftraitened circumitances as laid him under the neceffity of exercifing that art to procure the means of fubfiftevice, though he devoted, at the fame time, all the lcifure which the could command to the fudy of philofophy. His ditrefs, however, was foon relieved by Crito, a wealthy Athenian ; who, remarking his ftrong propenfity to fludy, and admiring his ingenuous difpofition and difinguifhed abilities, rencrouny took him under his patronage, aml intrufted him with the inftuction of his children. The opportunities which Socyates by this means enjoyed of attending the public lectures of the mof eminert philofophers, fo far increafed his thirft after wifdom, that he determined to relinquifh his occupation, and every profpect of emolument which that might afford, in order to devote himfelf extirely to his favourite purfuits. Under Anaxagoras and Archelaus he profecuted the fludy of nature in the ufual manner of the philofophers of the age, and became well acquainted with their doctrines. Prodicus the fophift was his preceptor in eloquence, Evenas in poetry, Theodorus in geometry, and Damo in mufec. Afpafia, a woman no lefs celebrated for her intellectual than her perfonal accomplifhments, whofe honfe was frequented by the moil celebrated characters, had alfo fome fhare in the education of Socrates. Under fuch preceptors it camot reafonably tre doubted but that the became maiter of evcry kind of learning which the age in which the lived could afford; and being blefed with very uncommon talents by nature, he appeared in Athens, under the refpectable characters of a good citizen and a true philofopher Being called upon by his country to take arms in the long and fevere flruggle between Athens and Sparta, he fignalized himfelf at the fiege of Poticłe, both by his valour and by the hardinefs with which he endured fatigue. During the feverity of a Thracian swinter, whilt others were clad in furs, he wore only his ufual clothing, and walked barefoot upon the ice. In an engagement in which he faw \(A_{1 .-}\) cibiades falling down wounded, he advanced to defend him, and faved both him and his anms: and though the prize of valour was on this occofion unquetlionably due to Socrates, he seneroufly gave his vote that it might be teftowed upon Alcibiades, to encourage his rifing werit. He ferved in other campaigns with dittingiifhed bravery, and had the happinefs on ore occafion to fave the life of Xenophon, by bearinet him, when covered with wounds, out of the reach of the enemy.

It was not till Socrates was upwards of 60 years of age that he undertook to lerve his commtry in any civil office, when he was chofen to reprefent his own diftict, sin the fenate of five hundred. In this office, though he at frift expofed himfelf to fome deoree of ridicule from the want of experience in the forms of bufircfs, be foon convinced his colleagues that he was fuperior to them all in wildom and integrity. Whilit they, intinidated by the clamours of the populace, paffed an unjult fentence of condemnation upon the commanders, who, after the engagement at the Arginulian ifands, had

\section*{591 J \\ 50 C}
been prevented by a form from paying funeral honours to the dead, Socrates flood forth fingly in their defence, and to the laft refuled to give his futfrage aygainft them, declaring that no force fhould compel him to act contrary to juftice and the laws. Under the fubfequent tyranny he never ceafed to condemn the oppreflive and eruel proceedings of the thirty tyrants; and when his boldnels provoked their referitiment, fo that his life was in hazard, fearing neither treachery nor violence, he Atill continued to fupport with undaunted firmnefs the rights of his fellow-citizens.

Having given thefe proofs of public virtue both in a military and civil cavacity, he wifhed to do thll more for his country. Obferving with regret how much the opimichs of the Athenian youth were mithed, and theipinciples and tafte corrupted by philofophers who fpent all their time in refined fpeculations upon nature and the origin of things, and by fophits who taught in their fchools the arts of falle eloquence and deceitful reafoning ; Socrates formed tive wife and senerous defign of inflitnting a new and more ufeful method of infruction. He juftly conceived the true end of philo. fophy to be, not to make an oftentations difplay of fuperior learnine and ability in fubtle difpatations or in. genious conjectures, But to free mankind from the do. minion of pernicious prejudices; to correct their vices; to infpire them with the love of virtue; and thus conduct them in the path of wifdorn to true felicity. He therefore affumed the character of a moral philufopher; and, looking upon the whole city of Athens as his fichool, and all who were difpofed to lend him their attention as his pupils, he feized every occafion of communicating moral wifdom to his fellow citizens. He paffed tlre greater part of his time in public; and the method of inftruction of which he chiefly made ufe was, to propofe a ferious of queftions to the perfon with whom he converfed, in order to lead him to fome inforefeen conclufion. He firt gained the confent of his refpondent to fome obvious truths, and then obliged him to admit others from their relation or refemblance to thofe to which he had alreacy affected. Without making ufe of any dired argument or perfuafion, he chofe to lead the perfon he meant to inftruct, to deduce the truths of which he wifled to convince him, as a neceffary confe. quence from his own concefions. He commonly conducted thefe conferences with fuch addrefs, as to conceal his defign till the refpondent had advanced too fat to recede. On foine occafions he made ufe of ironical language, that vain men might be caught in their own replies, and be obliged to confefs their ignorance. He never affumed the air of a morofe and rigid preceptor, but communicated ufeful initruction with all the eafe and pleafantry of polite converfation. Though emimently furnifhed with every'kind of learning, he preferred moral to fpeculative wirdom. Convinced that philofophy is valuable, not as it furnifhes queftions for the fchools, but as it provides men with a law of life, he cenfured his predeceffors for fpending all their time in abfrufe refearches into nature, and taking no pains to render themfelves ufefnl to mankind. His favourite maxim was, Whatever is above us doth not coricem us. He eftimated the value of knowledge by its utility, and recommended tlie ftudy of geometry, aftronomy, and other fciences, only fo far as they admit of a practical spplication to the purpofes of human life. His great
object

\section*{S O C [ 50}

Socrates. object in all his conferences and difcourfes was, to lead men into an acquaintance with themfelves; to convince them of their follies and vices; to infpire them with the love of virtue; and to furnifh them with ufeful moral inftructions. Cicero might therefore very juflly fay of Socratcs, that he was the firf who called down philofoplyy from heaven to earth, and introduced her into the public walks and domeftic retirements of men, that fhe might inftruet them concerning life and manners.

Through his whole life this good man difcovered a mind fuperior to the attractions of wealth and power. Contrary to the general practice of the preceptors of lis time, he inftructed his pupils without receiving from them any gratuity. He frequently refufed rich prefents, which were offered him by Alcibiades and ethers, though importunately urged to accept them by his wife. The chief men of Athens were his ftewards: they fent him in provifions, as they apprehended he wanted them; he took what his prefent wants required, and returned the reft. Obferving the numerous articles of luxury which were expofed to fale in Athens, he exclaimcd, "How many things are there which I do not want !" With Socrates, moderation fupplied the place of wealth. In his clothing and food, he confulted only the demands of nature. He commonly appeared in a neat but plain clock, with his feet uncovered. 'Though his table was only fupplied with fimple fare, he did not fcruple to invite men of fuperior rank to partake of his meals; and when his wife, upon fome fuch occafion, expreffed her diffatisfaction on being no better provided, he defired her to give herfelf no concern ; for if his guefts were wife men, they would be contented with whatever they found at his table; if otherwife, they were unworthy of notice. Whilft others, fays he, live so eat, wife men eat to live.:

Though Socrates was exceedingly unfortunate in his domeftic connection, he converted this infelicity into an occafion of excrcifing his virtues. Xantippe, concerning whofe ill humour ancient writers relate many amu. fing tales, was certainly a woman of a high and unmanageable fpirit. But Socrates, while he endeavoured to curb the violence of her temper, improved his own. When Alcibiades expreffed his furprife that his friend could bear to live in the fame houfe with fo perverfe and quarrelfome a companion, Socrates replied, that being daily inured to ill humour at home, he was the better prepared to encounter perverfenefs and injury abroad.

In the midft of domeftic vexations and public diforders, Socrates retaincd fuch an unruflled ferenity, that he was never feen either to leave his own houfe or to return home with a difturbed countenance. In acquiring this entire dominion over his paffions and appetites, he had the greater merit, as it. was not effected without a violent ftruggle againft his natural propenfities. Zopyrus, an eminent phyfiognomift, declared, that he difcovered in the features of the philofopher evident traces of many vicious inclinations. The friends of Socrates who were prefent ridiculed the ignorance of this pretender to extraordinary fagacity. But Socrates himfelf ingenuouny acknowledred his penetration, and confeffed that he was in his natural difpofition prone to vice, but that he had fubdued his inclinations by the power of reafon and philofophy.

Through the whole of his life Socrates gave himfelf
up to the guldance of unbiaffed reafon, which is fuppofed by fome to be all that he meant by the genius or demon from which he profeffed to receive inftruction. But this opinion is inconfiftent with the accounts given by his followers of that dæmon, and even with the language in whiclı he fpoke of it himfelf. Plato fometimes calls it his guardian, and Apuleius his god; ; and as Xenophon attefts that it was the belief of his matter that the gods occafionaily communicate to men the knowledge of future events, it is by no means impro. bable that Socrates admitted, with the gencrality of his countrymen, the exiftence of thofe intermediate beings called clamons, of one of which he might fancy himfelf the peculiar care.

It was one of the maxims of Socrates, "That a wife man will worfhip the grods according to the inftitutions of the ftate to which he belongs." Convinced of the weaknefs of the human underftanding, and perceiving that the pride of philofophy had led his predeceffors into futile fpeculations on the nature and origin of things, he judged it moft conlifent with true wifdom to fpeak with caution and reverence concerning the divine nature.

The wifdom and the virtues of this great man, whilft they procured him many followers, created him alfo many eriemies. 'The Sophifts \(\oint\), whofe knavery and ig- \(\$\) See norance he took every opportunity of expofing to pub-pbij. lic contempt, became inveterate in their enmity againft fo bold a reformer, and devifed an expedient, by which they hoped to check the current of his popularity. They engaged Arifophanes, the firft buffoon of the age, to write a comedy, in which Socrates fhould be the principal character. Arifophanes, pleafed with fo promifing an occafion of difplaying his low and malig. nant wit, undertook the tafk, and produced the comedy of The Clouds, fill extant in his works. In this piece, Socrates is introduced hanging in a bafket in the air; and thence pouring forth abfurdity and prophanenefs. But the philofopher, fhowing in a crouded theatre that he was wholly unmoved by this ribaldry, the fatire failed of its cffect; and when Ariftophanes attempted the year following to renew the piece with alterations and additions, the reprefentation was fo much difcouraged, that he was obliged to difcontinue it.

From this time Socrates continued for many years to purfue without interruption his laudable defign of inAructing and reforming his fellow-citizenj. At lensth, however, when the inflexible integrity with which he had difcharged the duty of a fenator, and the firmnefs with which he had oppofed every kind of political corruption and oppreffion, had greatly increafed the number of his enenies, clandeltine arts were employed to raife a general prejucice againft him. The people were induftriounly reminded, that Critias, who had been one of the moft cruel of the thirty tyrants, and Alcibiades, who had infulted religion, by defacing the public ftatues of Mercury, and performing a mock reprefentation of the Eleufinian mytteries, had in their youth been difciples of Socrates; and the minds of the populace being thus prcpared, a direct accufation was preferred againft him before the fupreme court of judicature. His, accufers were Anytus a leather-dreffer, who had long entertained a perfonal enmity againft Socrates, for reprelending his avarice, in depriving his fons of the benefits of learning, that they might purfue the gains of 6

\section*{30 C [ 5 \\ rrade; Melitus, a young rhetorician, who was capable} of undertaking any thing for the fake of gain; and Lycon, who was glad of any opportunity of difplaying his talents. The accufation, which was delivered to the fenate under the name of Melitus, was this: "Melitus, fon of Melitus, of the trive of Pythos, accufeth Socrates, fon of Sophronifcus, of the tribe of Alopece. Socrates violates the laws, in not acknowledeing the gods which the ftate acknowledges, and by introducing new divinities. He alfo violates the laws by corrupting the youth. Be his punifhment dearh."

This charge was delivered upon oath to the fenate; and Crito a friend of Socrates became furety for his appearance on the day of trial. Anytus foon afterwards fent a private meffage to Socrates, affuring him that if he would defift from cenfuring his conduct, he would withdraw his acculation. But Socrates refufed to comply with fo degrading a condition; and with his ufual fpirit replied, "Whilft I live I will never difguife the truth, nor fpeak otherwife than my duty requires." The interval between the accufation and the trial he fpent in philofophical converfations with his friends, choofing to difcourfe upen any other fubject rather than his own fituation.

When the day of trial arrived, his aceufers appeared in the fenate, and attempted to fupport their charge in three diftinct fpeeches, which ftrongly marked their refpective characters. Plato, who was a youing man, and a zealous follower of Socrates, then tofe up to addrefs the judges in defence of his mafter; but whilft he was attempting to apologife for his youth, he was abruptly commanded by the court to fit down. Socrates, however needed no advocate. Afcending the chair with all the ferenity of confcious innocence, and with all the dignity of fuperior merit, he delivered, in a firm and manly tore, an unpremeditated defence of himfelf, which filenced his opponents, and ought to have convinced his judges. After tracing the progrefs of the confpiracy which had been raifed againft him to its true fource, the jealouly and refentment of men whofe ignorance he had expofed, and whofe vices he had ridiculed and reproved, he diftinctly replied to the feveral charges brought again't him by Melitus. To prove that he had not been guilty of impiety towards the gods of his comintry, he appealcd to his frequent practice of attending the public.religious feftivals. The crime of introducing new divinities, with which he was charged, chiefly as it feems on the ground of the admonitions which he profeffed to have received from an invifible power, he difclaimed, by pleading that it was no new thing for men to confult the gods and receive inftructions from them. ' \(o\) refute the charge of his having been a corrupter of youth, he urged the example which he had t tniformly exhibited of juttice, moderation, and tempe. rance; the moral fpirit and tendency of his difcourfes; and the effect which had actually been produced by his doctrine upon the manners of the young. Then, difdaining to folicit the mercy of his judges, he called upon them for that juftice which their office and their oath obliged them to adminifter; and profeffing his faith and confidence in God, refigned himfelf to their pleafure.

The judges, whofe prejudices would not fuffer them to pay dae attention to this apology, or to examine Yol. XVII. l'art II.
with impartiality the menits of the caufe, immediately declared him guilty of the crimes of which he flood accufed. Socrates, in this ftage of the trial, had a right to enter his plea againft the punifhment which the accufers demanded, and inftead of the fentence of death, to propofe fome pecuniary amercement. But he at filt peremptorily refufed to make any propofal of this kind, imagining that it might. be conftrued into an acknow ledgiment of guilt ; and afferted, that his conduct merited from the ftate reward rather than punifhment. At length, however, he was prevailed upon by his friends to offer upon their credit a fine of thirty mina. The judges, notwithftanding, ftill remained inexorable: they proceeded, without farther delay, to pronounce fentence upon hime, and he was condemned to be put to death by the poifon of hemlock.

The fentence being paffed, he was fent to prifon: which, fays Seneca, he entered with the fame relolution and firmnefs with which he had oppofed the thity tyrants; and took away all ignominy from the place, which could not be a prifon while he was there. He lay in fetters 30 days; and was conftantly vifited by Crito, Plato, and other friends, with whom he paffed the time in difpute after his ufual manacr. Anxious to fave fo valuable a life, they urged him to attempt his efcape, or at leaft to permit them to convey him away; and Crito went fo far, as to affure him that, by his intereft with the jailor, it might be eafily accomplifhed, and to offer him a retreat in Theffaly ; but Socrates rejected the propofal, as a criminal violation of the laws; and afked them, whether there was any place out of Attica which death could not reach.

At length the day arrived when the officers to whofe care he was committed delivered to Socrates early in the morning the final order for his execution, and inmediately, according to the law, fet him at liberty from his bonds. His friends, who came thus early to the prifon that they might have an opportunity of converfing with their mafler through the day, found his wife fitting by him with a child in her arms. Socrates, that the tranquillity of his laft moments might not be difturbed by her unavailing lamentations, requefted that fhe might be conducted home. With the moft frantic cxpreffions of grief the left the prifon. An interefting converfation then paffed between Socrates and his friends, which chiefly turned upon the immortality of the foul. In the courfe of this converfation, he exp:effed his difapprobation of the practice of fuicide, and affured his friends that his chief fupport in his prefent fituation was an expectation, though not unmixed with doubts, of a happy exiftence after death, "It would be inexcufable in me (faid he) to defpife death, if I were not perfuaded that it will conduct me into the prefence of the gods, who are the moft righteous governors, and into the fociety of juft and good men: but I derive confidence from the hope that fomething of man remains after death, and that the condition of good men will then be much better than that of the bad." Crito afterwards anking him, in what manner he wifhed to be buried? Socrates replied, with a finile, "As you pleafe, provided I do not efcape out of your hands." Then, turning to the reft of his friends, he faid, "Is it not ftrange, after all that I have faid to convince you that I am going to the fociety of the haps

\section*{\(S\) O C \(\quad[594] \quad\) S O D}
secrates. py, that Crito fill thinks that this body, which will foon be a lifelefs corpfe, is Socrates? Let him difpofe of my body as he pleafes, but let him not at its interment mourn over it as if it were Socrates."
- Towards the clofe of the day he retired into an adjoining apartment to bathe; his friends, in the mean time, exprefling to one another their grief at the profpect of loling fo excellent a father, and being left to pafs the relt of their days in the folitary ftatc of orphans. After a flort interval, during which he gave fome neceffary inftructions to his domeftics, and took his laft leave of his children, the attendant of the prifon informed him, that the time for drinking the poifon was come. - The cxecutioner, though accuftomed to fuch feenes, fhed tears as he prefented the fatal cup. Socrates received it without change of countenance or the leaft appearance of perturbation : then offering up a prayer to the gods that they would grant him a profperous pafface into the invifible world, with perfect compofure he fwallowed the poifonous draught. His friends around him burft into tears. Socrates alone remained unmeved. He upbraided their pufillanimity, and entreated them to exercife a manly conftancy worthy of the friends of virtue. He continued walking till the chilling operation of the hemlock oblized him to lie down upon his bed. After remaining for a fhort time filent, he requelted Crito (probably in order to refute a calumny which might prove injurious to his friends after his deceafe) not to neglect the offering of a cock which he had vowed to Efculapius. Then, covering himfelf with his cloak, he expired. Such was the fatc of the virtuous Socrates! A ftory, fays Cicero, which I neyer read without tears.

The friends and difciples of this illullrious teacher of wifdom were deeply afflicted by his death, and attended his funeral with every expreffion of grief. Apprehenfive, however, for their own fafety, they foon afterwards privately withdrew from the city, and took up their refidence in diftant places. Several of them vifited the philofopher Enclid of Megara, 'by whom they wenc kindly rcceived. No fooner was the unjuft condemnation of Socrates known through Greece, than a gencral indignation was kindled in the minds of good men, who univerfalty regretted that fo diftinguifhed an advocate for virtue fhould have fallen a facritice to jealoufy and envy. The Athenians themfelves, fo remarkable for their caprice, who never knew the value of their great men till after thcir death, foon became fenfible of the folly as well as criminality of putting to death the man who had been the chief ornament of their city and of the age, and turned their indignation againft his accufers. Melitus was condemned to death; and Anytus, to efcape a fimilar fatc, went into voluntary exile. To give a farther proof of the fincerity of their regret, the Athenians for a while interrupted public bufinefs; decreed a general mourning; recalled the exiled friends of Socrates; and erected a flatuc to his memory in one of the moft frequented parts of the city. His death happened in the firft year of the 96 th olympiad, and in the 70th.year of his age.

Socrates left behind him nothing in writing ; but his illuftrious pupils Xenophon and Plato have in fome meafure fupplied this defect. The Memoirs of Socrates, written by Xenophon, afford, however, a much
merc accurate idea of the opinions of socrates, and of his manner of teaching, than the Dialogues of Plato, who everywhere mixes his own conceptions and diction with the ideas and language of his matter. It is related, that when Socrates heard Plato recite his Lyfis, he faid, "How much does this yonng man make me fay which I never conccived!"

His diftinguifhing character was that of a moral phi. lofopher; and his dotrine concernin \(y\) God and refigion was rather pracical than fpeculative. But he did not neglect to buikd the ftructure of religious faith upon the firm foundation of an appeal to natural appearances: He taught, that the Supreme Being, though inviable, is clearly fen in his works; which at once demonitmate his cxiftence and his wife and benevolent providence. He admitted, befides the one Supreme Deity, the exittence of beings who poffefs a middle ftation between God and man, to whofe immediate agency lic afcribed the ordinary phenomena of naturc, and whom he fuppofed to be particularly concerned in the manargement of human affairs. Hence he declared it to be the dnty of every,one, in the performance of relirious rites, to follow the cuftoms of his country. At the fame time, he taught, that the merit of all religious offerings depends upon the character of the wormipper, and that the gods take pleafure in the facrifices of none but the truly pious.

Concerning the human foul, the opinion of Socrates, according to Xenophon, was, that it is allied to the Divine Being, not by a participation of effence, but by a fimilarity of nature; that man excels all other animals in the faculty of reafon; and that the exiftence of good men will be continued after death in a flate in which they will receive the reward of their virtue. Although it appears that on this latter topic he was not wholly free from uncertainty, the confolation which he proferfel to derive from this fource in the immediate profpect of death, leaves little room to doubt that he entertaincd a real expectation of immortality : and there is reafon to believe that he was the only philofopher of ancient Grecce whofe principles admitted of fuch an expectation (fee Metaphysics, Part III. Chap iv.) Of his moral fyttem, which was in a high dcgree pure, and founded oin the fureft balis, the reader will find a fhort view in our article Moral Philosophy, \(\mathrm{n}^{\circ} 4\).

Socrates was alfo the name of an ecclefiaftical hiftorian of the 5 th century, born at Conftantinople in the beginning of the reign of Theodofius: he profefled the law and pleaded at the bar, whence he obtained the name of Scholaficus. He wrote an ecclefiaftical hiftory from the year 309, where Eufebius ended, down to 440 ; and wrote with great exactnefs and judgment. An edition of Eufebius and Socrates, in Greek and Latin, with notes by Reading, was publihhed at London in 1720.

SODA, the name given by the French chemifts to the mineral alkali, which is found native in many parts of the world : it is obtained alfo from common falt, and from the afhes of the kali, a fpecies of falfola. See \(A_{L}\). kali, no 7. and Chemistry-Index.

Soda is alfo a name for a heat in the fomach or heart-burn. See Medicine, \(11^{\circ} 275\).

SODOM, formerly a town of Paleftine in Afia, famous in Scripture for the wickednefs of its inhabitants, and their deftruction by fire from heaven on account of

\section*{S O D [ 505 ] S O F}
that wickednefs. The place where it flood is now covered by the waters of the Dead Sea, or the Lake Af. phaltites. See Asphaltites.

SODOMY, an unnatural crime, fo called from the city of Sodom, which was deftroyed by fire for the fame. The Levitical law adjudged thofe guilty of this execrable crime to death ; and the civil law affigns the frame punilhment to it. The law of England makes it felony. There is no ftatute in Scotland againft Sodomy ; the libel of the crime is therefore founded on the divine law, and practice makes its punifhment to be burned alive.

SODOR, a name always conjoined with Man, in mentioning the bifhop of Man's diocefe. Concerning the origin and application of this word, very different opinions have been formed by the learned. Buchanan (lib. i. cap. 34.) fays, that before his time the name of Sodor was given to a town in the ifle of Man. In Gough's edition of Camden's Britannia (vol. iii. p. 701.) it is faid, that after the ifle of Man was annexed to the crown of England, this appellation was given to a fmall ifland within mufket-fhot of Man, in which the cathe dral ftands, called by the Norwegians the Holm, and by the inhabitants the Peel. In fupport of this opinion a charter is quoted A. D. I 505 , in which Thomas earl of Derby and lord of Man confirms to Huan Hefketh bifhop of Sodor all the lands, \& c. anciently belonging to the bifhops of Man. "Ecclefiam cathedralem fancti Germani in Holm Sodor vel Pele vocatam, ecclefiam fancti Patricii ibidem, et locum prefatum in quo ecclefiæ præfatæ fitæ funt." The truth of either, or perhaps of both, thefe accounts might be allowed; but neither of them are fufficient to account for the conftant conjunction of Sodor and Man, in charters, regifters, and hiftories. If Sodor was a fmall town or infand belonging to Man, it cannot be conceived why it is always mentioned before it, or rather why it fhould be mentioned at all in fpeaking of a bifhop's diocefe. To fpeak of the bifhopric of Sodor and Man in this cafe would be as improper as it would be to call the biMopric of Durham the bihopric of Holy Ifland and Durham, or the bifhopric of Darlington and Durham; the former being a fmall ifland and the latter a town belonging to the county and diocefe of Durham. Neither of thefe accounts, therefore, give a fatisfactory account of the original conjunction of Sodor and Man.

Thé ifland of Iona was the place where the bifhop of the ifles refided, the cathedral church of which, it is faid, was dedicated to our Saviour, in Greek Soter, hence Sotorenfes, which niight be corrupted into Sodo. renfes, a name frequently given by Danifh writers to the weftern ifles of Scotland. That we may be the more difpofed to accede to this Grecian etymolngy, the advocates for this opinion tell us, that the name Icelumkill, which is often applied to this ifland, is alfo of Greck extraction, being derived from columba, "a pigeon;" a meaning that exactly correfponds to the Celtic word : olum and the Hebrew word Iona. We mult confefs, however, that we have very little faith in the conjectures of etymologifts, and think that upon no occafion they alone can eftablifh any tact, though when concurring with facts they certainly tend to confirm and explain them. It is only from hiftorical facts that we can know to what Sodor was applied.

It appears from the hiftory of the Orkneys, compiled
by an old Inlandic writer, tranflated and enlarged by Torfæus, that the \(\ldots b u d æ\) or Weftern inles of Scotland were divided into two clufters, Norduress and Sudereys. The Nordureys, which were feparated from the Sudereys by the point of Ardnamurchan, a promontory in Argyleíhire, confifted of Muck, Egg, Rum, Canna, Sky, Rafay, Barra, South Uift, North Uif, Benbecu• la, and Lewis, including Harris, with a great number of fmall ifles. The Sudereys were, Man, Arran, Bute, Cumra, Avon, Gid, Ila, Colonfay, Jura, Scarba, Mull, Iona, Tiree, Coll, Ulva, and other fmall inands. All thefe, when joined torether, and fubject to the fame prince, made up the kingdom of Man and the inles. In the Norwegian lanruage Suder and Norder, fignifying fouthern and northern, and ey or ay an ifland. When the 不budx were under one monarch, the feat of empire was fixed in the Sudereys, and the Nordureys were governed by deputies; hence the former are much of tener mentioned in hiftory than the latter ; hence, too, the Sudereys often comprehend the Nordureys, as in our days Scotland is fometimes comprehended under England. Sudereys, or Suder, when anglicifed, became Sodor; and all the weftern ifles of Scotland being included in one diocefe under the Norwegian princes, the bifhop appointed to fuperintend them was called the bifhop of Man and the ifles, or the bifhop of Sodor and Man. Since Man was conquered by Edward III, it has been feparated from the other ines, and its bifhops have exercifed no jurideliction over them. Should it now be afked, why then is the bifhop of Man flill called the bifhop of Sodor and Man? we reply, that we have been able to difcover no reafon; but fuppofe the appellation to be continued in the fame way, as the title king of France, has been kept up by the kings of Great Britain, for feveral centuries after the Englifh were entirely expelled from France.

SOFA, in the eaft, a kind of alcove raifed half a foot above the floor of a chamber or other apartment ; and ufed as the place of flate, where vifitors of diftinction are received. Among the Furks the whole floor of their ftate-rooms is covered with a kind of tapeftry, and on the window-fide is raifed a fofa or fopha, laid with a kind of matrafs, covered with a carpet much richer than the other. On this carpet the 'Turks are feated, both merı and women, like the taylors in England, crofs-legged, leaning againft the wall, which is bolftered with velvet, fattin, or other fuff fuitable to the feafon. Here they eat their meals; only laying a Akin over the carpet to ferve as a table-cloth, and a round wooden board over all, covered with plates, \&c.
sofala, or Cefala, a kingdom of Africa, lying on the coaft of Mofambique, near Zanguebar. It is briunded on the north by Monomotapa; on the eait by the Mofambique Sea; on the fouth by the kingdom of Sabia ; and on the weft by that of Manica. It contains mines of gold and iron, and a great number of elephants. It is governed by a king, tributary to the Portuguefe, who built a fort at the principal town, which is of the fame name, and of great importance for their trade to the Eaft Indies. It is feated in a fmall illand, near the mouth of a river. E. Long. 35.40. S. Lat. 20. 20.

SOFFITA, or Soffit, in architecture, any timber ceiling formed of crofs beams of flying cornices, the fquare compartiments or pannels of which are enriched

\section*{\(\mathrm{S} O \mathrm{H}\)}
with fculpture, painting, or gilding ; fuch are thofe in the palaces of Italy, and in the apartments of Luxembourg at Paris.

Soffita, or Soffit, is alio ufed for the, underlide or face of an architrave; and more particularly for that of the corona or larmier, which the ancients called lacunar, the French plafond, and we ufually the drip. It is enriched with compartments of rofes ; and in the Doric order has 18 drops, difpofed in three ranks, fix in each, placed to the right of the guttæ, at the bottom of the triglyphs.
SOFI, or Soph1. See Soph 1 ,
SOF SENING, in painting, the mixing and diluting of colours with the brufh or pencil.

SOHO , the name of a fet of works, or manufactory of a variety of hard-wares, belonging to Mr Boulton, fituated on the borders of Stafordhire, within two miles of Birmiuigham ; now fo jufly celebrated as to deferve a thort hiftorical detail.
About 30 years ago the premifes confifted of a fmall mill and a few obfcure dwellings. Mr Boulton, in conjunction with Mr Fothergill, then his partner, at an expence of L.9000, erected a handfome and extenfive edifice, with a view of manufacturing metallic toys. 'Ihe firft productions conlitted of buttons, buckles, watch-chains, trinkets, and fuch other articles as were peculiar to Birmingham. Novelty, tafte, and vailety, were, however, always confpicuous; and plated wares, known by the name of Sheffield plate, comprifing a great variety of ufeful and ornamental articles, became another permanent fubject of manufacture.

To open channels for the confumption of thefe commodities, all the northern part of Europe was explored by the mercantile partner Mr Fothergill. A wide and extenfive correfpondence was thus eftablifhed, the undertaking became well known, and the manufacturer, by becoming his own merchant, eventually enjoyed a duouble profit.

Impelled by an ardent attachment to the arts, and by the patriotic ambition of forming his favourite Soho into a fruitful feminary of artilks, the proprietor extended lis views; and men of tafte ard talents were now fought for, and liberally patronifed. A fuccefsful imitation of the French or moulie ornaments, confifting of vafes, tripods, candelabra, \&c. \&c. extended the celebrity of the works. Services of plate and other works in filver, both maffive and airy, wêre added, and an affay office was eftablifhed in Birmingham.
Mr Watt, the ingenious improver of the feam-engine, is now in partnerfhip with Mr Boulton; and they carry on at Soho a manufactory of fteam-engines, not lefs beneficial to the public than lucrative to themfelves. This valuable machine, the nature and excellences of which are defcribed in another place (fee STBAM-Engine), Mr Boulton propofed to apply to the operation of coining, and fuitable apparatus was erected at a great expence, in the hope of being employed by government to make a new copper-coinage for the kingdom. Artits of merit were engaged, and Specimens of exquifite delicacy were exhibited; but as no national coinage has taken place, the works are employed upon high
finithed medals and private coins. To enumerate all the productions of this manufactory would be tedious (A).
In a national view, Mr Boulton's undertakings are highly valuable and important. By collecting around hin artifts of various defcriptions, rival talents have been called forth, and by. fincceflive competition have been multiplied to an extent highly beneficial to the public. The manual arts partook of the benefit, and became proportionably improved.

A barren heath has been covered with plenty and population ; and Mr Boulton's works, which in their infancy were little known and attended to, now cover feveral acres, give employment to more than 600 per. fons, and are faid to be the firlt of their kind in Europe.
SOIL, the mould covering the furface of the eartl, in which vegetables grow. It ferves as a fupport for vegetables, and as a refervoir for recciving and communicating their nourifhment.

Soils are commonly double or triple compounds of the feveral reputed primitive earths, except the barytic (fee Earths). The magnefian likewife faringly occurs. The more fertile loils afford alfo a finall proportion of coally fubitance arifing from putrefaction, and fome traces of marine acid and gypfum. The vulgar divifion into clay, chalk, fand, and gravel, is well underftood. Loam denotes any foil moderately adhefive; and, according to the ingredient that predominates, it receives the epithets of clayey, chalky, fandy, or gravelly. The intimate mixture of clay with the oxydes of iron is called till, and is of a hard confiftence and a dark reddifh colour. Soils are found by analyfis to contain their earthy ingredients in very different proportions. According 10 M . Giobert, fertile mould in the vicinity of Turin, where the fall of rain amounts yearly to 40 inches, affords for each roo parts, from 77 to 79 of filex, from 8 to 14 of argill, and from 5 to 12 of calx ; befides about one-half of carbonic matter, and nearly an equal weight of gas, partly carbonic and partly hydrocarbonic. The fame experimenter reprefents the compofition of barren foils in fimilar fituations to be from 42 to 88 per cent. of filex, from 20 to 30 of argill, and from 4 to 20 of calx. The celebrated Bergman found rich foils in the valleys of Sweden, where the annual quantity of rain is 24 inches, to contain, for each 100 parts, 56 of filiceous fand, 54 of argill, and 30 of calx. In the climate of Paris, where the average fall of rain is 20 inches, fertile mixtures, ac. cording to M. Tillet, vary from 46 to 52 per cent. of filex, and from 11 to 17 of argill, with 37 of calx. Hence it appears that in dry countries rich earths are of a clofer texture, and contain more of the calcareous ingredient, with lefs of the filiceous. Mr Arthur Young has difcovered, that the value of fertile lands is nearly proportioned to the quantities of gas which equal weights of their foil afford by diftillation. See Agriculture, \(\mathrm{n}^{\circ} 24\). and in 8.
SOISSONS, an ancient, large, and confiderable city of France, in the department of Aifne and late province of Soiffonnois. It was the capital of a kingdom of the fame name, under the firt 1 ace of the French monarchs. It contains about 12,000 inhabitants, and is a bifhop's.

\section*{S O L [ 507 ] S O L}
fee. The environs are charming, but the flreets are uarrow, and the houfes ill-built. The fire cathedral has one of the molt confiderable chapters in the kingdom; and the bifhop, when the archbifhop of Rheinis was abfent, liad a right to crown the king. The caftle, though ancient, is not that in which the kings of the firlt race relided. Soifons is feated in a very pleafant and fertile valley, on the river Aifne, 30 miles weft by north of Rheims, and 60 north ealt of Paris. E. Long. 3. 24. N. Lat. 49.23.

SOKE, or Sok. See Socage.
- SOKEMANS. See Soc and Socage.

SOL, in muffc, the fifth note of the gamut, \(u t, r e\), \(m i, f a, f o l, l a\). See Gamut.
Sol, or Sou, a French coin made up of copper mixed with a little filver, and is worth upwards of an Englifi halfpenny, or the 23d part of an Englifh fhilling. The fol when firft fruck was equal in value to 12 deniers Tonrnois, whence it was alfo called douzain, a name it Alll retains, tho' its ancient value be changed; the fol having been fince auginented by three deniers, and ftruck with a puncheon of a fleur-de-lis, to make it current for 15 deniers. Soon after the old fols were coined over again, and both old and new were indifferently made current for 15 deniers. In 1709 , the value of the fame fols was raifed to 18 deniers. Towards the latter end of the reign of Louis XIV. the fol of 18 deniers was again lowered to 15 ; and by the late king it was reduce? to the original value of 12 . What it is at prefent pofterity may perhaps difcover.

The Dutch have alfo two kinds of fols: the one of filver, called fols de gros, and likewife fobelling; the other of copper, called alfo the fuyver.

Sol, the Sun, in aftronomy, aftrology, \&c. See Astronomy, pinflim.

Sol, in chemiftry, is gold ; thus called from an opinion that this metal is in a particular manner under the influence of the fun.

Sol, in heraldry, denotes Or, the golden colour in the arms of fovereign princes.

SOLEEUS, or SoleUs, in anatomy, one \(n f\) the extenfor mufcles of the foot, rifitur from the upper and hinder parts of the tibia and fibula.
sOLAN-goose, in ornithology. See Pelicanus.
SOL:INDRA, in botany: A genus of plants belonging to the clafs of monodelphia, and to the order of polyandria; and in the natural fyftem arranged under the 38th order, Tricociea. The calyx is finmple; the capfule oblong, wreathed, and five-celled ; the feeds are many, difpofed in cells in a double order. The valves after maturity are divaricated, even to the bafe, and winged inwards by the partition. "The only fpecies is the Lobata. This genus was firft named Solandra, in honour of Dr Solander, by Murray in the \(14^{\text {th }}\) edition of the Syfema Vegetabilium.

SOLANUM, in botany: A genus of the monogynia order, belonging to the pentandria clafs of plants; and in the natural method ranking under the 28 th order, Luride. The calyx is inferior; the corolla is rotate, and generally monophyllous; the fruit a berry, bilocular, and containing many fmall and flat feeds. Of this genus there are 66 fpecies, mof of them natives of the Eaft and Weft Indies. The moft remarkable of which are the following.
1. The Dulcamara, a native of Britain and of Africa
is a flender climbing plant, rifing to fix or more feet in Solanam, height. The leaves are generally oval, pointed, and of a deep green colour; the flowers hang in loofe clufters, of a purple colour, and divided into five pointed fegments. The calyx is purple, perfiftent, and divided into five. The five filaments are fhort, black, and inferted into the tube of the corolla. The anthere yellow, crect, and united in a point as ufual in this genus. The ftyle is long, and terminates in an obtule ftigma. 'The berry, when ripe, is rec, and contains many flat yellowifh feeds. It grows in hedges well fupplied with water, and flowers about the end of June. On chewing the roots, we firft feel a bitter, then a fweet, tafte; hence the name. The berries are faid to be poifonous, and may eafily be miftaken by children for currants. The fipites or younger branches are directed for ufe, and may be employed either frefh or dried: they fhould be gathered in the autumn. This plant is generally given in decostion or infufion. Razou directs the following: '「ake dried dulcamara twigs half a dram, and pour upon it 16 ounces of fpring water, which muft be boiled down to 8 ounces; then flrain it Three or four tea foonfuls to be taken every four hours, diluted with milk to prevent its exciting a naufea. Several authors take notice, that the dulcamara partakes of the milder powers of the nighthade, joined to a refolvent and faponaceous quality ; hence it promotes the fecretions of urine, fweat, the menfes, and lochia. It is recommended in a variety of diforders ; but particularly in rheumatifms, obitructed menfes, and lochia, alfo in fome obłtinate cutaneous difeafes.
2. The Nigrum, common in many places in Britain about dunghills and wafte places. It rifes to about two feet in height. The ftalk herbacenus, the leaves alternate, irregularly oval, indented, and clothed with foft, hairs. The flowers are white; the berries black and flining. It appears to poffefs the deleterious quàlities of the other nightfhades in a very high degree, and everi the fincll of the plant is faid to caufe fleep. 'The berries are equally poifonous with the leaves ; caufing cardialgia, and delirium, and violent dittortions of the limbs in children. Mr Getaker in 1757 recommended irs internal ufe in old forcs, in fcrofulons and cancerous ulcers, cutaneous eruptions, and in dropfies. He fays, that one grain infufed in an ounce of water fometimes produced a confiderable effect; that in the dole of two or three grains it feldom failed to evacuate the firft paffages, to increafe very fenfibly the difcharges by the flain and kidneys, and fometimes to occafion headach, drowfinefs, gid. dinefs, and dimnefs of fight. Mr Broomield declares, that in cafes in which he tried this folanum, they were much aggravated by it; and that in one cafe in the dofe of one grain it proved mortal to one of his pa. tients; therefore he contends its ufe is prejudicial. This. opinion feems tacitly to be confirmed, as it is now never given internally. In ancient times it was employed externally as a difcutient-and anodyne in fome cutaneous affections, tumefactions of the glands, ulcers, and diforders of the eyes. The folanum nigrum \& rubrum, a native of the Weft Indies, is called guma by the negroes. It is fo far from laving any deleterious quality, that it is daily ferved up at table as greens or fpinnage. It has an agreeable bitter talte.
3. Lycoperficum, the love-apple, or tomato, cultivates in gardens in the warmer parts of Europe and in all tro-

\section*{S O L}

\section*{[ 598 ]}

\section*{S O L}

Solatum pical countries. The ftalk is herbaceous, the leaves pinnated, oval, pointed, and deeply divided. The flowers are on fimple racemi : they are fmall and yellow. The berry is of the fize of a plum; they are fmooth, fhining, foft ; and are either of a yellow or reddifh colour. The tomato is in daily ufe; being either boiled in foups or broths, or ferved up boiled as garnifhes to flefh-meats.
4. Melongena, the eqg-plant, or vegetable egg. This is alfo cultivated in gardens, particularly in Jamaica. It feldom rifes above a foot in height. The ftalk is herbaceous and fmooth; the leaves oval and downy; the flowers are large and blue; the fruit is as big, and very like, the egg of a goofe. It is often ufed boiled as a vegetable along, with animal food or butter, and fuppofed to be aphrodifiac and to cure fterility.
5. Longum. This plant is alfo herbaceous, but grows much ranker than the foregoing. 'l'he flowers are blue; and the fruit is fix or eight inches long, and proportionally thick. It is boiled and eaten at table as the egg-plant.
6. Tuberofum, the common potato. Sce Potato.

SOLAR, fomething belonging to the Sun.
Solar-Spots. See Astronomy-Inden.
SOLDAN. See Sultan.
SOLDANELLA, in botany: A genus of plants belonging to the clafs of pentandria, and order of monogynia; and in the natural fyltem arranged under the 21 ft order, Precia. The corolla is campanulated; the border being very finely cut into a preat many fegments. The capfule is unilocular, and its apex polydentate.

SOLDER, Sodder, or Soder, a metallic or mineral compofition ufed in foldering or joining together other metals.

Solders are made of gold, filver, copper, tin, bifmuth, and lead; ufually obferving, that in the compofition there be fome of the metal that is to be foldered mixed with fome hightr and finer metals., Goldfmiths ufually make four kinds of folder, viz. folder of eight, where to feven parts of filver there is one of brafs or copper ; folder of fix, where only a fixth part is copper; folder of tour, and folder of three. It is the mixture of copper in the folder that makes raifed plate come always cheaper than flat.

As mixtures of gold with a little copper are found to melt with lefs. heat than pure gold itfelf, thefe mixtures ferve as folders for gold : two pieces of fine gold are foldered by gold that has a fmall admixture of copper; and gold alloyed with copper is foldered by fuch as is alloyed with more copper: the workmen add a little filver as well as copper, and vary the proportions of the two to one another, fo as to make the colour of the folder correfpond as nearly as may be to that of the piece. A mixture of gold and copper is alfo a folder for fine copper as well as for fine gold. Gold being particularly difpofed to unite with iron, proves an excellent folder for the finer kinds of irôn and fteel inftru. ments.

The folder ufed by plumbers is made of two pounds of lead to one of block-tin. Its goodnefs is tried by melting it, and pouring the bignels of a crown piecc on a table; for, if good, there will arife little bright mining ftars therein. The folder for copper is made like that of the plumbers; only with copper and tin; and for
very nice works, inftead of tin, they fometimes ufe a Sold quantity of filver. Solder for tin is made of two-thirds of tin and one of lead, or of equal parts of each; but where the work is any thing delicate, as in organ ; pipes, where the juncture is fcarce difcernible, it is made of one part of bifmuth and three parts of pewter. The pewterers ufe a kind of folder made with two parts of tin and one of bifmuth ; this compofition melts with the leaft heat of any of the folders.

Silver folder is that which is made of two parts of filver and one of brafs, and ufed in foldering thofe metals. Spelter folder is made of one part of brafs and two of fpelter or zinc, and is ufed by the braziers and copperfmiths for \{oldering brafs, copper, and iron. This folder is improved by adding to each ounce of it one pennyweight of filver; but as it does not melt without a confiderable degree of heat, it cannot be ufed when it is inconvenient to heat the work red hot ; in which cafe copper and brafs are foldered with filver.

Though fpelter folder be much cheaper than filver. folder, yet workmen in many cafes prefer the latter. And Mr Boyle informs us, that he has found it to run with fo moderate a heat, as not much to endanger the melting of the delicate parts of the work to be foldered; and if well made, this filver folder will lie even upon the ordinary kind itfelf; and fo fill up thofe little cavities that may chance to be left in the fift operation, which is not eafily done without a folder more eafily fufible than the firft made ufe of. As to iron, it is fufficient that it be heated to a white heat, and the two extremities, in this ftate, be hammered together; by which means they become incorporated one with the other.

SOLI)ERING, the joining and faftening together of two pieces of the fame metal, or of two different metals, by the fufion and application of fome metallic compofition on the extremities of the metals to be joined.

To folder upon filver, brafs, or iron: Take filver, five pennyweights; bràfs, four pennyweights; melt them to ether for foft folder, which runs fooneft. 'Take filver, five pennyweights ; copper, three pennyweighte; melt them together for hard folder. Beat the folder thin, and lay it on the place to be foldered, which muft be firft fitted and bound togetler with wire as occafion requires ; then take borax in powder, and temper it like pap, and lay it upon the folder, letting it dry ; then cover it with live coals, and blow, and it will run immediately ; take it prefently out of the fire, and it is done. It is to be obferved, that if any thing is to be foldered in two places, which cannot well be done at one time, you muft firft folder with the harder folder, and then with the foft ; for it it be firft done with the foft, it will unfolder again before the other is fattened. Let it be obferved, that if you would not have your folder run about the piece that is to be foldered, you muft rub fuch places over with chalk-In the foldering either of gold, lilver, copper, or either of the metals above mentioned, there is generally ufed borax in powder, and fometimes rofin. As to iron, ic is fufficient. that it be heated red-hot, and the two extremitics thus hammered together, by which means they will become incorporated with each other. For the finer kinds of iron and fteel irftruments, however, gold proves an excellent folder. This metal will diffolve twice or thrice its weight of iron in a degree of heat very far lefs than that in which iron itfelf melts; hence if a fmall plate of

\section*{50 L}
as the creature is nourithed by means of falt-water; but it is very evident, that if a little falt be ftrewed upon thefe pipes in a fifl taken out of its habitation, it will corrode the joinings of the rings, and often make one or more joints drop off: the creature, to avoid this mifchief, arifes out of its hole, and throws off the falt, and then retires back again. The ufe of thefe pipes to the animal is the fame with that of many other pipes of a like kiud in other fhell-filh ; they all ferve to take irn water: they are only a continuation of the outer membrane of the fifh, and ferve indifferently "For taking in and throwing out the water, one receivin 5 , and the other difcharging it, and either anfiwering equally well to thcir purpofe. See Animal Motion.

This tihh was ufcd as food by the ancients; and Athenæus, from Sophron, fpeaks of it as a-grcat delicacy, and particularly grateful to widows. It is ofte:a ufed as food at prefent, and is brought up to table fried in ergs.

SOLEURE, a canton of Swifferland,- which holds the 1 Ith rank in the Helvetic confedcracy, into which it was admitted in the year 148 r . It ftretches partly through the pain, and partly along the chains of the Jura, and contains about 50,000 inhabitants. It is 35 miles in length from north to fouth, and 35 in breadtlifrom ealt to wclt. The foil for the moft part is exceedingly fertile in corn; and the diftricts within the Jura abound in excellent paftures. The trade both of the town and canton is of little value, although they are very commodioully fituated for an extenfivc commerce, It is divided into I r bailiwicks, the inhabitants of which. arc all Roman Catholics except thofe of the bailiwick of Buckegberg, who profefs the reformed religion.- The fovereign power refides in the great council, which, comprifing the fenate or little council of 36 , confifts of 102 members, chofen by the fenate in equal proportions from the II tribes or conpanies into which the ancient burghers are diftributed; and, owing to the diftinction between the ancient and the new burghers (the former confiling of only 85 fanilies) the goverument is a complete ariftocracy.

Soleure, an ancient and extremely neat town of. Sivifferland, capital of the canton of the fame name. It contains about 4000 inhabitants, and is pleafantly feated on the Aar, which here expands into a noble river: A nong the molt remarkable objects of curiofity in this town is the new church of St Urs, which was bcgun in 1762 and finifhed in 1772 . It is a noble edifice of a whitifh grey flone, drawn from the neighbouring quarries, which admits a poliih, and is a fpecies of rude marble. The lower part of the building is of the Corin. thian, the upper of the Compofite order. The façade, which confifts of a portico, furmounted by an elegant tower, prefents itfelf: finely at the extremity of the prino cipal ftreet. It coft at leaft L. 80,000 , a confiderable fum for fuch a fmall republic, whofe revenue fcarcely exceeds L. 12,000 a year. Soleure is furrounded by regular fone fortifications, and is 20 miles north northeaft of Bern, 27 fouth fouth-weft of Bafle, and 45 weft of Zurich.' E. Long. 7.20. N. Lat. 47. 15.

SOLFAING, in mufic, the naming or pronouncing the feveral notes of a fong by the fyllables \(u t, r e, m i, f a\), fol, \&c. in learning to fing it.

Of the feven notes in the French `cale \(u t, r e, m i, f a\), fol, \(l a, \sqrt{2}\), only four are ufed among us in finging, as

\section*{S O L}

Bolfaing, Solfatera
\(m i, f a, f o l, l a:\) their office is principally, in finsing, that by applying them to every note of the fcale, it may not only be pronounced with more eafe, Lut chiefly that by them the tones and femitones of the natural fcale may be better marked out and diftinguilhed. This defign is obtained by the four fyllables \(j a, f o l, l a, ~ m i . ~\) Thus from \(f a\) to fol is a tone, alio from fol to \(l a\), and from la to mi, without diltinguifhing the greater or lefs tone ; but from la to fa, alfo from mi to \(f a\), is ouly a femitone. If then thefe be applied in this order, fa, fol, \(l a\), \(f a, f o l, l a, m i, f a\). \&c. they exprefs the natural feries from C ; and if that be repeated to a fecond or third octave, we fee by them how to exprefs all the different orders of tones and femitones in the diatonic fcale ; and ftill above mi will ftand \(f a, f o l, l a\), and below it the fame inverted \(l a, f o l, f a\), and one \(m i\) is always diftant from another an octave; which cannot be faid of any of the reft, becaufe after \(m i\) afcending come always \(f a\), \(\int o l\), \(l a\), which are repeated invertedly defcending.

To conceive the ufe of this, it is to be remembered, that the firt thing in learning to fing, is to make one raife a feale of notes by tones and femitones to an octave, and defcend ayain by the fame; and then to rife and fall by greater intervals at a leap, as thirds and fourths, \&c. and to do all this by beginning at notes of different pitch. Then thofe notes are reprefented by lines and fpaces, to which thefe fyllables are applied, and the learners taught to name each line and fpace thereby, which makes what we call folfaing; the ufe whereof is, that while they are learning to tune the de. grees and intervals of found expreffed by notes on a line or fpace, or learning a fong to which no words are applied, they may not only do it the better by means of articulate founds, but chiefly that by knowing the degrees and intervals expreffed by thoie fyllables, they may more readily know the places of the femitones, and the true diftance of the notes. Sce the article Singing.
SOLFATERRA, a mountain of Italy in the king. dom of Naples, and Terra di Lavoro. This mountain appears evidently to have been a volcano in ancient times; and the foil is yet fo hot, that the workmen employed there in making alum need nothing elfe befides the heat of the ground for evaporating their liquids. Of this mountain we have the following account by Sir William Hamilton. "Near Aftruni (another mountain, formerly a volcano likewife) rifes the Solfaterra, which not only retains its cone and crater, but much of its former heat. In the plain within the crater, fmoke iffues from many parts, as alfo from its fides: here, by means of ftones and tiles heaped over the crevices, through which the fmoke paffes, they collect in an aukward manner what they call fale armoniaco; and from the fand of the plain they extract fulphur and alum. This fpot, well attended to, might certainly produce a good revenue, whereas I doubt it they have thitherto ever cleared L. 200 a-year by it. The hollow
found produced by throwing a heavy ftone on the plain of the crater of the solfaterra, feems to indicate that it is fupported by a fort of arched natural vault ;' and one is induced to think that there-is a pool of water beneath this vault (which boils by the heat of a fubterraneous fire ftill deeper), by the very moit flean that iffues from the cracks in the plain of the Solfaterra, which, like that of boiling water, runs ofl a fword or knite, prefented to it, in great drops. On the ontfide, and at the foot of the cone of the Solfaterra, towards the lake of Agnane, water ruthes out of the, rocks fo hot as to raite the quickfilver in Falirenheit's thermometer to the degree of boiling water (A) ; a fact of which I was myielf an eye-witnefs. This place, well worthy the obfervation of the curious, has been taken little notice of; it is called the Pifciarelli. The common people of Naples have great faith iir the efficacy of this water ; and make much of it in all cutaneous diforders, as well as for another diforder that prevails here. It feems to be impregnated chielly with fulphur and alum. When you approach your ear to the rocks of the Pifciarelli, from whence this water ouzes, you hear a horrid boiling noife, which feems to proceed from the huge cauldron that may be fuppofed to be under the plain of the Soifaterra. On the other fide of the Solfaterra, next the fea, there is a rock which has communicated with the fea, till part of it was cut away to make the road to Puzzole; this was undoubredly a confiderable lava, that ran from the Solfaterra when it was an active volcano. Under this rock of lava, which is more than 70 feet high, there is a tratum of pumice and ante3. This ancient lava is about a quarter of a mile broad; you mect with it abruptly before you come in fight of Puzzole, and it finithes as abruptly within about 100 paces of the town. The ancient name of the Solfaterra was Forum Vulcani; a ftrong proof of its* origin from fubterraneous fire. The degree of heat that the Solfaterra has preferved for fo many ages, feems to have calcined the ftones upon its cone and in its crater, as they are very white and crumble eafily iii the horteft parts. See Chemistry, n \({ }^{2} 656\).

SOLICITOR, a perfon employed to take care of and manage fuits depending in the courts of law or equity. Solicitors are within the flatute to be fworn, and admitted by the judges, before they are allowed to practife in our courts, in like manner as attorneys.

There is alfo a great officer of the law, next to the atto:ney-general, who is ftyled the king's folicitor-general ; who holds his office by patent during the king's pleature, has the care and cuncern of managing the king's affairs, and lias fees for pleading, befides other fees arifing by patents, \&c. He attends on the privycouncil; and the attorney-general and he were anciently reckoned among the officers of the exchequer; they have their audience, and come within the bar in all other courts.

SOLID, in philofophy, a body whofe parts are fo firmly
(A) "I have remarked, that after a great fall of rain, the degree of heat in this water is mueh lefs; which will account for what Padre Torre fays (in his book, intitled Hiftoire et Phenomenes dui Vejuve), that when he tried it in company with 'Monfieur de la Condamine, the degree of heat, upon Reaumur's. thermometer, was \(68^{\circ}\).

\section*{S O L}
firmly conneited together, as not eafily to give way or Ilip froin each other; in which fenfe folid ftands oppofed to fuid.

Geometricians define a folid to be the third fpecics of magnitude, or that which has three dimenfions, viz. length, breadth, and thicknefs or depth.

Solids are commonly divided into regular and irregutar. The regular folids are thofe terminated by regular and equal planes, and are only five in number, viz. the tetrahedron, which courfifts of four equal triangles ; the cube or hexahedron, of fix equal fquares; the octahedron, of eight equal triangles ; the dodecahedron, of twelve; and the icofihedron, of twenty equal triangles.

The irregular folids are almof infinite, comprehending all fuch as do not come under the definition of regular folids; as the fphere, cylinder, cone, parallelogram, prifm, parallelopiped, \&cc.

Solids, in anatomy, are the bones, ligamerts, membranes, mufcles, nerves and veffels, \&c.

The folid parts of the body, though equally compofed of veffels, are different with regard to their confiitence ; fome being hard and others foft. The hard, as the bones and cartilages, give firmuefs and attitude to the body, and furtain the other parts : the foft parts, either alone or together with the hard, ferve to execute the animal functions. See Anatomy.

SOLIDAGO, in botany: A genus of plants belonging to the clafs of fyngenefia, and to the order of polygamia fuperfua; and in the natural fyltem ranging under the \(49^{\text {th }}\) order, Compofta. The receptacle is naked; the pappus fimple ; the radii are commonly five; the fcales of the calyx are imbricated and curved inward. There are 14 fpecies; fempervirens, canadenfis, altifffma, laterifora, bicolor, lanceolata, ceffia, mexicana, flexicaulis, latifolia, virgaurea, minuta, rigida, noveboracen. fis. Among thefe there is only one fpecies, which is a native of Britain, the virggurea, or golden rod, which grows frequently in rough mountainous paftures and woods. The ftems are branched, and vary from fix inches to five feet high, but their common height is about a yard. The leaves are a little hard and rough to the touch; the lower ones oval-lanceolate, generally a little ferrated and fupported on footftalks; thofe on the flalks are elliptical; the flowers are yellow, and grow in fiikes from the alx of the leaves; the fcales of the calyx are lanceolate, of unequal length, and of a pale green colour; the female florets in the rays are from five to eight in number; the hermaphrodite flowers in the difc from ten to twelve. There is a variety of this fpecies called cambrica to be found on rocks from fix inches to a foot high.

SOLIDITY, that property of matter, or body, by which it excludes all other bodies from the place which itfelf poffeffes; 'and as it would be abfurd to fuppofe that two bodies could poffefs one and the fame place at the fame time, it follows, that the fofteft bodies are equally folid with the hardef. See Metaphysics, \(n^{\circ} 44\). 173 . \& Cc .

Among geometricians, the folidity of a body denotes the quantity or fpace contained in it, and is called alfo gits folid content.

The folidity of a cube, prifm, cylinder, or parallelopiped, is kad by multiplying its bafis into its height. The folidity of a pyramid or cone is had by mulVez. XVII. Part II.
tiplying either the whole bafe into a third part of Solilequys the height, or the whole height into a third part of the bafe.

SOLILOQUY, a reafoning or difcourfe which a man holds with himfelf; or, more properly, according to lapias, it is a difcourfe by of anfwer to a queftion that a man propofes to himfelf.

Soliloquies are become very common on the modern ftage; yet nothing can be more inartificial, or more unnatural, than an actor's making long feeches to himfelf, to convey his intentions to the audience. Where fuch difcoveries are neceffary to be made, the poet fhould rather take care to give the dramatic perfons fuch confidants as may neceffarily fhare their iumoft thoughts; by whicl means they will be more naturally conveyed to the audience; yet even this is a fhift which an accurate poet would not have occafion for. The following lines of the duke of Buckingham concerning the ufe and abufe of foliloquies deferve attention :

Soliloquies had need be very few, Extremely fhort, and fpoke in paffion too. Onr lovers talking to themfelves, for want Of others, make the pit their confidant : Nor is the matter mended yet, if thus They truft a friend, only to tell it us.
SOLIMAN II. emperor of the Turks, furnamed the Magnificent, was the only fon of Selim I. whom he fucceeded in \(\mathbf{1 5 2 0}\). He was educated in a manner very different from the Ottoman princes in general; for he was inftructed in the maxims of politics and the fecrets of government. He began his reiga by reftoring thofe perfons their poffeffions whom his father had unjuftly plundered. He re-eflablifhed the authority of the tribunals, which was almoft annihilated, and beftowed the government of provinces upon none but perforis of wealth and probity: "I would have my viceroys (he ufed to fay) refemble thofe rivers that fertilize the fields through which they pafs, not thofe torrents which fweep every thing before them."

After concluding a'truce with Ifmael Sophy of Perfia, and fubduing Gozeli Bey, who had raifed a rebel. lion in Syria, he turned his arms akainft Europe. Belgrade was taken in 1521, and Rhodes fell into his hands the year following, after an obftinate and enthufiaftic defence. In 1526 he defeated and new the king of Hungary in the famous battle of Mohatz. Three years after he conquered Buda, and immediately laid fiege to Vienna itfelf. But after continuing 20 days before that city, and affaulting it 20 times, he was obliged to retreat with the lofs of \(80,000 \mathrm{men}\). Some time after he was defeated by the Perfians, and difappointed in his hopes of taking Malta. He fucceeded, hewever, in difpoffeffing the Genoefe of Chio, an ifland which had belonged to that republic for more than 200 years.
He died at the age of 76 , while he was befieging Sigeth, a town in Hungary, on the 3 th Ausuft 1566.

He was a prince of the ftriteft probity, a lover of jufo tice, and vigorous in the execution of it ; but he tarnifhed all his glory by the cruelty of his difpofition. After the battle of Mohatz he ordered 1500 prifoners, muft of them gentlemen, to be ranged in a circle, and beheaded in prefence of his whole army.

Solipuga Solinan thought nothing impoffible which he commanded: A general having received orders to throw a bridge over the Drave, wrote him, that it was impoffible. The fultan fent him a long band of linen with thefe words written on it: "The emperor Soliman, thy mafter, orders thee to build a bridge over the Drave in fpite of the difficulties thou mayelt meet with. He informs thee at the fane time, that if the bridge be not finifhed upon his arrival, he will hang thee with the very linen which informs thee of his will."

SOLIPUGA, or Solifuga, in natural hiftory, the name given by the Rumans to a fmall venomous infect of the fpider-kind, called by the Greeks beliocentros; both words fignifying an animal which ftings moft in the country, and feafons where the fun is moft hot. Solinus makes this creature peculiar to Sardinia; but this is contrary to all the accounts given us by the ancients. It is common in Africa and fome parts of Europe. Almoft all the hot countries produce this venomous little creature. It lies under the fand to feize other infects as they go by ; and if it meet with any uncovered part of a man, produces a wound which proves very painful: it is faid that the bite is abfolutely mortal, but probably this is not true. Solinus writes the word folifuga, and fo do many others, erroneoully deriving the name from the notion that this animal flies from the fun's rays, and buries itfelf in the fand.

SOLIS (Antonio de), an ingenious Spanifh writer, of an ancient and illuftrious family, born at Placenza in Old Caftile, in 16ro. He was intended for the law ; but his inclination toward poetry prevailed, and he cultivated it with great fuccefs. Philip IV. of Spain made him one of his fecretaries; and after his death the queen-regent appointed him hiftoriographer of the Indies, a place of great profit and honour : his Hiffory of the Conqueft of Mexico fhows that the could not have named a fitter perfon. He is better known by this hiftory at leaft abroad, than by his poetry and dramatic writings, thuigh in thefe he was allo diftinguifhed. He turned prieft at 57 years of age, and died in 1686.

SOLTT RY, that which is remote from the company or commerce of others of the fame fecies.

SOLIT \(\because\) RIES, a denomination of nuns of St Peter of lenntara, inflituted in 1676, the defign of which was to imitate the fevere penitent life of that faint. Thus they are to keep a continual filence, never to open their mouths to a ftranger; to employ their time wholly in fpiritual exercifes, and leave their tempo. ral concerns to a number of maids, who have a particu lar fuperior in a feparate part of the monaftery : they always go bare-footed, without fandals; gird themfelves with a thick cord, and wear no linen.

SOLO in the Italian mufic, is frequently ufed in pieces confifting of feveral parts, to mark thofe that are to perform alone; as.fauio folo, violino folo. It is alfo ufed for fonatas compofed for one violin, one German flute, or other inftrument, and a bafs; thus we fay, Corelli's folos, Geminiani's lolos, \&c. When two or three parts play or fing feparately from the grand chorus, they are called a doi foli, a tre foli, \&c. Sulo is fomesimes denoted by \(S\).

SOLOMON, the fon of David kinf of Ifrael, renowned in Scripture for his wifdom, riches, and magnificent temple and other buildings. Towards the end of bis life he fullied ail his former glory by his apoftacy.
from God; from which caufe vengeance was denoun. ced againft his houfe and nation. He died about 975 B. C.

Solomon's Seal, in botany; a fpecies of Convalla. R1A.

SOLON, one of the feven wife men of Greece, was born at Salamis, of Athenian parents, who were defcended from Codrus. His father leaving little patrimony, he had recourfe to merchandife for his fubfitt ence. He had, however, a greater thirlt after knowledge and fame than after riches, and made his mercantile voyages fubfervient to the increafe of his intellectual treafures. He very early cultivated the art of poetry, and applied himfelf to the ftudy of moral and civil wifdom. When the Athenians, tired out with a long and troublefome war with the Megarenfians, for the recovery of the ifle of Salamis, prohibited any one, under pain of death, to propofe the renewal of their claim to that ifland, Solon thinking the prohibition difhonourable to the flate, and finding many of the younger citizens defirous to revive the war, feigned himfelf mad, and took care to have the report of his infanity fpread thro' the city. In the mean time he compofed an elegy adapted to the fate of public affairs, which he committed to memory. Every thing being thus prepared, he fallied forth into the market-place with the kind of cap on his head which was commonly worn by fick perfons, and, afcending the herald's fland, he delivered, to a numerous crowd, his lamentation for the defertion of Salamis. The verfes were heard with general applaufe ; and Pififtratus feconded his advice, and urged the people to renew the war. The decree was immediately repealed ; the claim to Salamis was refumed; and the conduet of the war was committed to Solon and Pififtratus, who, by means of a Atratagem, defeated the Megarenfians, and recovered Salamis.
His popularity was extended through Greece in confequence of a fuccessful alliance which he formed amongs the flates in defence of the temple at Delphos againft the Cirrhxans. When diffenfions had arifen at A thens between the rich creditors and their poor debtors, Solon was created archon, with the united powers of fupreme legiflator and magiftrate. He foon reflored harmony between the rich and poor: He cancelled the debts which had proved the occafion of fo much oppreffion; and ordained that in future no creditor fhould be allowed to feize the body of the debtor for his fecurity: He made a new diftribution of the people, inftituted new courts of judicature, and framed a judicious code of laws, which afterwards became the bafis of the laws of the twelve tables in Rome. Among his criminal laws are many wife and excellent regulations; but the code is neceffarily defective with refpect to thofe principles which muft be derived from the knowledge of the true God, and of pure morality, as the certain foundations of national happinefs. 'Two of them in particular were very exceptionable; the permiffion of a voluntary exile to perfons that had been guilty of premeditated murder, and the appointment of a lefs fevere punifhment for a rape than for feduction. Thofe who winh to fee accurately ftated the comparative excellence of the laws of Mofes, of Lycurgus, and Solon, may confult Prize Differtations relative to Natural and Revealed Religion by Tcyler's Theological Society, Vol. IX.

The interview which Solon is faid to have had with
Crefus.

\section*{S O M \(\quad\left[\begin{array}{lll}603 & ] & \mathrm{S}\end{array}\right] \quad \mathrm{M}\)}
tice Crofus king of Lydia, the folid remarks of the fage after furveying the monarch's wealth, the recollection of thofe remarks by Crofus when doomed to die, and the noble conduct of Cyrus on that occafion, are known to every fchoolboy. Solon died in the ifland of Cyprus, about the 80 th year of his age. Statues were erected to his memory both at Athens and Salamis. His thirft after knowledge continued to the laft: "I grow old (faid he) learning many things." Among the apothegms and precepts which have been alcribed to Solon, are the following: Laws are like cobwebs, that entan the weak, but are broken through by the ftrong. He who has learned to obey, will know how to command. In all things let reafon be your guide. Diligently contemplate excellent things. In every thing that you do, confider the end.

SOLSTICE, in aftronomy, that time when the fun is in one of the foltitial points ; that is, when he is at his greateft diftance from the equator; thus called becaufe he then appears to ftand ftill, and not to change his diftance from the equator for fome time; an appearance owing to the obliquity of our fphere, and which thofe living under the equator are ftrangers to.

The folftices are two in each year; the æftival or fummer folltice, and the hyemal or winter folftice. The fummer folltice is when the fun feems to defcribe the tropic of cancer, which is on June 22. when he makes the longeft day : the winter folltice is when the fun enters the firft degree, or feems to defcribe the tropic of capricorn, which is on December 22. when he makes the florteft day. This is to be underftood as in our nerthern hemifphere; for in the fouthern, the fun's entrance into capricorn makes the fummer folftice, and that into cancer the winter folftice. The two points of the ecliptic, wherein the fun's greateft afcent above the equator, and his defcent below it, are terminated, are called the folfitial points; and a circle, fuppofed to pafs through the poles of the world and thefe points, is called the folfitial colure. The fummer folftitial point is in the beginning of the firft degree of cancer, and is called the afival or fummer point; and the winter folftitial point is in the beginning of the firft degree of capricorn, and is called the winter point. Thefe two points are diametrically oppofite to each other.

SOLUTION, in chemiftry, denotes an intimate union of folid with fluid bodies, fo as to form a tranfparent liquor. See Dissolution, and Index to Chemistry.

Soluqion of Metals. See Metals (Solution of).
SOLVENT, that which diffolves a folid body into a tranfparent fluid.

SOLWAY moss. Sce Moving Móss.
SOMBRERO, the name of an uninhabited ifland in the Weft Indies in the form of an hat, whence the name is derived. It is alfe the name of one of the Nicobar iflands in the Eaft Indies.

Wonderful Plant of Sombrero, is a ftrange kind of fenfitive plant growing in the Eaft Indies, in fandy bays and in fhallow water. It appears like a flender ftraight ftick ; but when you attempt to touch it, immediately withdraws itfelf intn the fand. Mr Miller gives an acropbical count of it in his defeription of Sumatra. He fays,解cfions the Malays call it lolan lout, that is, fea grafs. He nelxyni. ver could obferve any tentacula; but, after many unfuc-
88 . cefsful attempts, drew out a broken piece about a foot
long. It was perfectly ftraight and uniform, and refembled a worm drawn over a knitting needle. When dry it appears like a coral.

SOMERS ( John), lord high chancellor of England, was born at Worcefter in 16.52 . He was educated at Oxford, and afterwards entered himfelf at the MiddleTemple, where he ftudied the law with great vigour. In 1688 he was one of the counfel for the \(\int\) even bifhops at their trial, and argued with great learning and eloquence againft the difpenfing power. In the convention which met by the prince of Orange's fummons, January 22. 1689, he reprefented Worcefter; and was one of the managers for the Houfe of Commons, at a conference with the Houfe of Lords upon the word abdicated. Soon after the acceffion of King William and Queen Mary to the throne, he was appointed folicitor-gerieral, and received the honour of knighthood. In 1692 he was made attorney general, and in 1693 advanced to the poft of lord keeper of the great feal of England. In 1695 he propofed an expedient to prevent the practice of clipping the coin. In 1697 he was created lord Somers, baron of Evefham, and made lord high chan. cellor of England. In the beginning of 1700 he was removed from his poft of lord chancellor, and the year after was impeached of high crimes and mifdemeanors by the Houfe of Commons, of which he was acquitted upon trial by the Houfe of Lords. He then retired to a ftudious courfe of life, and was chofen prefident of the Royal Society. In 1706 he propofed a bill for the regulation of the law; and the fame year was one of the principal managers for the union between England and Scotland. In 1708 he was made lord prefident of the council; from which poft he was removed in 1710 , upon the change of the miniftry: In the latter end of Queen Anne's reign his lordfhip grew very infirm in his health; which is fuppofed to be the reafon that he held no other poft than a feat at the council-table, after the acceffion of King George I. He died of an apoplectic fit in \(1716 . \mathrm{Mr}\) Addifon has drawn his character very beautifully in the Freeholder.

SOMERSETSHIRE, a county of England, taking its name from Somerton, once the capital, between \(50^{\circ}\) and \(5^{\circ} 27^{\prime}\) north latitude, and between \(1^{\circ} 25^{\prime}\) and \(2^{\circ} 59^{\prime}\) weft longitude. It is bounded on the weft by DevonMire, on the foutlf by Dorfetfhire, on the north by Briftol Channel or the Severn Sea, on the north-eaft by a fmall part of Gloucefterfhire, and on the eaft by Wiltfhire. It is one of the largeft counties in England, extending in length from eaft to weft about 68 miles; in breadth, where broadeft, from fouth to north, about 47 ; and 240 in circumference. It is divided into 42. hundreds, in which are 3 cities, 32 market towns, 1700 villages, 385 parifhes of which \(13^{2}\) are vicarages, containing more than \(1,000,000\) of acres, and about 300,000 fouls. It fends 18 members to Parliament, viz. two for the county, two for Briftol, two for Bath, two for Wells, two for Taunton, two for Bridgewater, two for Ilchefter, two for Milbourn-port, and two for Minehead.

The air of this county is very mild and wholefome, efpecially that of the hilly part. The foil in general is exceeding fich, fo that fingle acres very commonly produce forty or fifty bufhels of wheat, and there have been inftances of fome producing fixty of barley. As there is very fine pafture both for fheep and black catthe, it abounds in both, which are as large as thofe of

Snmers, omerfet hire.

\section*{30 N}

Samerfet- Lincolnfhire, and their flefh of a finer grais. In confe-
quence of this abundance of black cattle, great quantities of cheeie are made in it, of which that of Cheddar is thought equal to Parmefan. In the hilly parts are found coal, lead, copper, and lapis calaminaris. Wood thrives in it as well as in any county of the kingdom. It abounds alfo in peafe, beans, beer, cyder, fruit, wildfowl, and falmon; and its mineral waters are celebrated all over the world.

The riches of this county, both natural and acquired, exceed thofe of any other in the kingdom, Middlefex and Yorkfhire excepted. The woollen manufac. ture in all its branches is carried on to a very great extent ; and in fome parts of the county great quantities of linen are made. If to thefe the produce of various other commodities in which it abounds is added, the amount of the whole mult undoubtedly be very great. Its foreign trade mult alfo be allowed to be very extenfive, when it is confidered that it has a large trade for fea coal, and poffeffes, befides other ports, that of Briftol, a town of the greateft trade in England, next to London.

Befides fmall ftreams, it is well watered and fupplied with fifh by the rivers Severn, Avon, Parrel, Froome, Ax, Torre, and Tone. Its greateft hills are Mendip, Pouldon, and Quantock, of which the fir! abounds in coal, lead, \&c. The rivers Severn and Parrel breed very fine falmon. The chief town is Briftol.

SOMER 「ON, an ancient town in Somerfethire, fiom whence the county derives its name. It is 123 miles from London; it has five ftreets, containing 25 x houfer, which are mottly built of the blue ftone from the quarries in the ncighbourhood. It is governed by conftables, and has a hall for petty feffions. The market for corn is confiderable, and it has feveral fairs for cattle. The church has what is not very frequent, an ocfangular tower with fix bells. N. Lat. 5 t.4. W. Long. 3. 53.

SOMNAMBULI, perfons who walk in their neep. See Sleepmalkers.

SOMNER (William), an eminent Englifh antiquary, was born at Canterbury in 1 Ko6. His firft treatife was The Antiquities of Canterbury, which he dedicated to Archbifhop Laud. He then applied himfelf to the Itudy of the Saxon language; and having made himlelf mafter of it, he perceived that the old gloffary prefixed to Sir Roger Twifden's edition of the laws of King Henry I. printed in 1644, was faulty in many places; he therefore added to that edition notes and obfervations valuable for their learning, with a very ufeful gleffary. His Treatife of Gavelkind was finifhed about 1648, though not publifhed till 1660 . Our author was zealouny attached to King Charles I. and in 1648 he publifhed a poem on his fufferings and death. His fkill in the Saxon tongue led him to inquire into moft of the European languages ancient and modern. He affifted Dugdale and Dodiworth in compiling the Monaficon Anglicanum. His Saxon Dictionary was printed at Oxford in 1659 . He died in 1669.

SON, an appellation given to a male child confidered in the relation he bears to his parents. See Parent and Filial Pizty.

SONA'rA, in mufic, a piece or compofition, intend-
ed to be performed by inftruments only; in which fenfe it Itands oppofed to cantata, or a piece defigned for the veice. See Cantata.

The fonata then, is properly a grand, free, humorous compolition, diverfified with a great variety of motions and expreffions, extraordinary and bold ftrokes, fgures, \&cc. And all this purely according to the fanicy of the compofer; who, without confining himfelf to any general rules of counterpoint, or to any fixed num. ber or meafure, gives a loole to his genius, and runs from one mode, meafure, \&c. to another, as lie thinks fit. This fpecies of compofition had its rife about the middle of the 17 th century; thofe who have moft ex. celled in it were Baffani and Corelli. We have fonatas of \(1,2,3,4,5,6,7\), and even 8 parts, but ufually they are performed by a fingle violin, or with two vio: hins, and a thorough baifs for the harpfichord; and frequently a more figured bafs for the bafs viol, \&c.

There are a thoufand different fpecies of fonatas ; but the Italians ulually reduce them to two kinds. Suonate de chiefa, that is, fonatas proper for church mufic, which ufually begin with a grave folemn motion, fuitable to the dignity and fanctity of the place and the fervice, after which they ftrike into a briker, gayer, and richer manner. Thefe are what they mbre peculiarly call fonatas. Suonate de camera, or fonatas for the chamber, are properly feriefes of feveral little pieces, for dancing, only compofed to the fame tune. 'They ufually begin with a prelude or little fonata, ferving as an in. troduction to all the reft: afterwards come the allemand, pavane, courant, and other ferious dances ; then jigs, gavots, minuets, chacons, paffecailles, and other gayer airs : the whole compofed in the fame tune or mode.
SONCHUS, sow-THISTLE, in botany: A genus of plants belonging to the clafs of fyngenefia, and to the order of polygamia aqualis; and in the natural fyftem ranged under the 49th order, Compofita. The receptacle is naked; the calyx is imbricated, bellying and conical; the down of the feed is fimple, feffile, and very foft; the feed is oval and pointed. There are 13 fpecies; the maritimus, paluftris, fruticofus, arvenfis, oleraceus, tenerrimus, plumieri, alpinus, floridanus, fibiricus, tataricus, tuberofus, and canadentis. Four of thefe are natives of Britain. - I. Puluftris, marth fow-thistle. The ftem is erect, from fix to ten feet high, branched and hairy towards the top: the leaves are firm, broad, half pinnated, ferrated, and fharp-pointed; the lower ones fagittate at the bafe: the flowers are of a deep yellow, large, and difperfed on the tops of the branches: the calyx is rough. It is frequent in marihes, and flowers in July or Auguft. -2. Arvenfis, corn fow-thiftle. The leaves are alternate, runcinate, and heart-fhaped at the bafe; the root creeps under ground; the ftem is three or four feer high, and branched at the top. It grows in corn-fields, and flowers in Auguft.-3. Oleraceus, common fow-thiftle. The ftalk is fucculent, piftular, and a cubit high or more ; the leaves are broad, embracing the ftem, generally deeply finuated, fmooth or prickly at the edges; the flowers are of a pale yellow, numerous, in a kind of umbel, and terminal; the calyx is fmooth. It is frequent in wafte places and cultivated grounds. - 4. Alpinus, blue-flowered fow-thiftle. The ftem is erect, purplifh, branched, or fimple, from three to fix feet high : the leaves are large, fmooth, and finu.

\section*{S O N [ 605 ] S O N}
gh. ated ; the extreme fegment large and triangular : the flowers are blue, and grow on hairy vifcid pedicles, in lone fipikes: the calyx is brown. This fpecies is found in Northumberland.
sONG, in poetry, a little compofition, confiting of eafy and natural verfes, fet to a tune in orcher to be fung. See Poerry, \(\mathrm{n}^{\circ} 120\).

Sone, in muffic, is applied in general to a fingle piece of mufic, whether contrived for the voice or an inftrument. See Arr.

Song of Birds, is defined by the honourable Daines Barrington to be a fucceffion of three or more different motes, which are continued without interruption, during the fame interval,' with a mufical bar of four crotchets in an adagio movement, or whiltt a pendulum fiwings four feconds.
It is affirmed, that the notes of birds are no more innate than language in man, and that they depend upon imitation, as far as their organs will enable them to imitate the founds which they have frequent opportunities of hearing: and their adhering fo fleadily, even in a wild flate, to the fame fong, is owing to the neflings attending only to the inftruction of the "parent bird, whillt they difregard the notes of all others that may perhats be finging round them.
Birds in a wild ftate do not commonly fing above 10 weeks in the year, whereas birds that have plenty of food in a cage fing the greateft part of the year : and we may add, that the female of no \{pecies of birds ever fings. This is a wife provifion of nature, becaufe her fong would difcover her neft. In the fame manner, we may rationally account for her inferiority in plumage. The faculty of finging is confined to the cock birds; and accordingly Mr Hunter, in diffecting birds of feveral fpecies, found the mufcles of the larynx to be flronger in the nightingale than in any other bird of the fame fize ; and in all thofe initances, where he diffected both cock and hen, the fame mufcles were ftronger in the cock. To the fame purpofe, it is an obferva. tion as ancient as the time of Pliny, that a capon does not crow.

Some have afcribed the finging of the cock-bird in the fpring folely to the motive of pleafing his mate during incubation ; others, who allow that it is partly for this end, believe it is partly owing allo to another caufe, viz, the great abundance of plants and infects in the fpring, which, as well as feeds, are the proper food of finging birds at that time of the year.
Mr Barrington remarks, that there is no inflance of any finging bird which exceeds our blackbird in fize; and this, he fuppofes, may arife from the difficulty of its concealing itfelf, if it called the attention of its enemies, not only by its bulk, but by the proportionable loudnefs of its notes. This writer farther obfieves, that fome paffages, of the fong in a few kinds of birds correfpond with the intervals of our mufical fcale, of which the cuckoo is a flriking and known inftance; but the greater part of their fong cannot be reduced to a muafical fcale; partly, becaufe the rapidity is often fo
great, and it is allo fo uncertain when they may fop, that we cannot reduce the paffages to form a mufical bar in any time whatfoever; partly alfo, becaufe the pitch of moof birds is confiderably higher than the moft flrill notes of thofe inftruments which have the greateft compafs; and principally, becaufe the inter:vals ufed by birds are commonly fo minute, that we cannct judge of them from the more grofs intervals into which we divide our mufical octave. Thiswriter apprehends, that all birds fing in the fame key; and in order to difoover this key, he informs us, that the following notes have been obferved in different birds, \(\mathrm{A}, \mathrm{B}\) flat \(, \mathrm{C}, \mathrm{D}, \mathrm{F}\), and G ; and therefore E only is wanting to complete the fcale: now thefe intervals, he fays, can only be found in the key of \(F\) with a tharp third, or that of G with a flat third; and he fuppoféit to be the latter, becaufe, admitting that the firlt mufical notes were learned from birds, thofe of the cuckoo. which have been moft attended to, form a flat third, and moft of our compofitions are in a flat third, where mufic is fimple, and confirts merely of melody. As a farther evidence that birds fing always in the fame key, it has been found by attending to a nightingale, as well. as a robin which was educated under him, that the notes: reducible to our intervals of the octave were always precifely the fame.

Moft people, who have not attended to the notes of birds, fuppofe, that every fpecies fing exactly the fame notes and paffages: but this is by no means rrue; though it is admitted that there is a general refemblance. 'Thus the London bird-catchers prefer the fong of the Kentifh goldfinches, and Effex chaffinches; and fome of the nightin-gale-fanciers prefer a Surry bird to thofe of Middlefex.

Of all finging birds, the fong of the nightingale has. been moft univerfally admired: and its fuperiority (deduced from a caged bird) confifts in the following particulars ; its tone is much more mellow than that of any other bird, though at the fame time, by a proper exertion of its mufical powers, it can be very brilliait. Another point of fuperiority is its continuance of fong. without a paufe, which is fometimes no lefs than 20 feconds; and when refpiration becomes neceflary, it takes, it with as much judgment as an opera-finger. The fkylark in this particular, as well as in compals and variety, is only fecond to the nightingale. The nightingale alfo: fings (if the expreffion may be allowed) with fuperior judgment and tafte. Mr Barrington has obferved, thathis nightingale, which was a very capital bird, began foftly like the ancient orators; referving its breath to fwell certain notea, which by thefe means had a mult: aftonihing effect. This writer adds; that the notes of birds, which are annually imported from Afia, Africag. and America, both fingly and in concert, are not to be compared to thofe of European birds.

The following table, formed by Mr Barrington, agreeably to the idea of M. de Piles in eftimating the merits of painters, is defigned to exhibit the comparative merit of the Britifh finging birds; in which 20 is \({ }^{\text {s }}\) fuppofed to be the point of abfolute perfection.

SONNA, a book of Mahometan traditions, which all the orthodox muffulmen are required to believe.

SONNERATIA, in botany; a genus of plants belonging to the clafs of icofandria, and to the order of monogynia. The calyx is cut into fix fegments; the petals are fix.; the capfule is multilocular and fucculent; and the cells contain many feeds. The only fpecies is the ocida.

SONNET, in poetry, a compofition contained in I4 verfes, viz. two ftanzas or meafures of four verles each, and two of three, the eight firft verfes being all in three rhimes.

SONNITES, among the Mahometaris, an appellation given to the orthodox muffulmen or true believers; in oppofition to the feveral heretical fects, particularly the Shiites or followers of Ali.

SOOJU, or Soy. See Dolichos.
SOONTABURDAR, in the Eaft Indies; an attendant, who carries a filver bludgeon in his hand about two or three feet long, and runs before the palanquin. He is inferior to the Chubdar ; the propriety of an Indian newaury requiring two Soontaburdars for every Chubdar in the train. The Chubdar proclaims the approach of vifitors, \&c. He generally carries a large filver ftaff about five feet long in his hands: and among the Nabobs he proclaims their praifes aloud as he runs before their palanquins.

SOOT, a volatile matter arifing from wood and other fuel alony with the fmoke; or rather, it is the fmoke itfelf condenfed and gathered to the fides of the chimney. Tho' once volatile, however, foot cannot be again retolved into vapour; but, if diftilled by a ftrong fire, yiclds a volatile alkali and empyreumatic oil, a confiderable quantity of fixed matter remaining at the bottom of the diftilling veffel. If burnt in an open fire, it flames with a thick fmoke, whence other foot is produced. It is ufed as a material for making fal ammoniac, and as a manure. See Chemistry, \(n^{\circ} 796\).; and Agriculture, \(n^{\circ} 20\).

Soor-Black. See Colour-Making.
GOPHI, or SOFI, a title given to the emperor of

\section*{606 S O P}

Perfia; importing as much as wife, fage, or philofo. Sophis pher.

Sophify
The title is by fome faid to have taken its rife from a young fhepherd named Sophi, who attained to the crown of Perfia in 1370; others derive it from the fo. phoi or fages anciently called magi. Voffius gives a dif. ferent account of the word: fophi in Arabic, he obferves, fignifies wool; and he adds, that it was applied by the 'Turks out of derifion to the kings of Perfia ever fince 1 flımael's time ; becaufe, according to their fcheme of religion, he is to wear no other covering on his head but an ordinary red woollen fuff; whence the Perfians are alfo called bezelbafchs, q. d. red-beads. But Bochart affures us, that fophi in the original Perfian language, fignifies one that is pure in his religion, and who prefers the fervice of God in all things : and derives it from an order of religious called by the fame name. The fophis value themfelves on their illuftrious extraction. They are defcended in a right line from Houffein, fecond fon of Ali, Mahomet's coufin, and Fatima, Mahomet's daughter.

Sophis, or Sofees, a kind of order of religions among the Mahometans in Perfia, anfwering to what are other wife called dervifes, and among the Arabs and Indians faquirs. Some will have them called fophis from a kind of coarfe camblet which they wear called fouf, from the city Souf in Syria, where it is principally manufactured. The more eminent of thofe fophis are complimented with the title Schiek, that is, reverend, much as in Rominh countries the religious are called reverend fathers. Schiek foph, who laid the foundation of the grane deur of the royal houfe of Perfia, was the founder, or rather the reftorer of this order: Ifhmael, who conquered Perfia, was himfelf a fophi, and greatly valued him. felf on his being fo. He chofe all the guards of his perfon from among the religious of this order; and would have all the great lords of his court fophis. The king of Perfia is ftill grandmafter of the order; and the lords continue to enter into it, though it be now fallen under fome contempt.

SOPHISM, in logic, a fpecious argument having the appearance of truth, but leading to fallehood. Sophifms are reduced by Ariftotle into eight claffes, an arrangement fo juif and comprehenfive, that it is equally proper in prefent as in former times. I. Ignoratio elenchi, in which the fophift feems to determine the queftion, while he only does it in appearance. Thrus the queftion, "Whether excefs of wine be hurtful?" feems to be determined by proving, that wine revives the fpirits and gives a man courage: but the principal point is here kept out of fight; for ftill it may be hurtful to health, to fortune, and reputation. 2. Petitio principii, a begging of the queltion, or taking for granted that which remains to be proved, as if any one fhould undertake to prove that the foul is extended through all the parts of the body, becaule it refides in every member. This is affirming the fame thing in different words. 3. Reafoning in a circle; as when the Roman Catholics prove the Scriptures to be the word of God by the authority of the church, and the authority of the church from the Scriptures. 4. Non caufa pro caufu, or the affigning of a falfe caufe to any effect. Thus the fuppofed principle, that nature abhors a vacuum, was applied to ex. plain the rifing of water in a pump before Galileo difcovered that it was owing to the preffure of the

\section*{S O P [ 607 ] S O P}
iim atmolphere In this way the vulgar afcribe accidents to divine vengeance, and the herefies and infidelity of modern-times are faid to be owing to learning. 5. Fallacia accidentis, in which the fophift reprefents what is merely accidental as effential to the nature of the fubject. This is nearly allied to the former, and is committed by the Mahometans and Roman Catholics. The Mahometans forbid wine, becaufe it is fometimes the occafion of drunkennefs and quarrels ; and the Roman Catholics prohibit the reading of the Bible, becaufe it has fometimes promoted herefies. 6. By deducing an univerfal affertion from what is true only in particular circumftances, and the reverfe; thus fome men argue, " tranfcribers have committed many errors in copying the Scriptures, therefore they are not to be depended on." 7. By afferting any thing in a compound fenfe which is ouly true in a divided fenfe; fo when the Scriptufres affure us, that the worft of finners may be faved, it does not mean that they fhall be faved while they remain finners, but that if they repent they may be faved. 8. By an abufe of the ambiguity of words. Thus Mr Hume reafons in his Effay on Miracles: "Experience is our only guide in reafoning concerning matters of fact ; now we know from experience, that the laws of nature are fixed and invariable. On the other hand, teftimony is variable and often falfe; therefore fince our evidence for the reality of miracles refts folely on teftimony which is variable, and our evidence for the uniformity of the laws of nature is invariable, miracles are not to be believed." The fophiftry of this reafoning depends on the ambiguity of the word experience, which in the firft propofition fignifies the maxims which we form from our own obfervation and reflection; in the fecond it is confounded with teftimony ; for it is by the teftimony of others, as well as our own obfervation, that we learn whether the laws of nature are variable or invariable. The Effay on Miracles may be recommended to thofe who wifh to fee more examples of fophiftry; as we believe molt of the eight fpecies of fophifms which we have mentioned are well illuftrated by examples in that effay.

SOPHIST, an appellation affumed in the early periods of Grecian hiftory by thofe who devoted their time to the ftudy of fcience. This appellation appearing too arrogant to Pythagoras, he declined it, and wifhed to be called a philofopher; declaring that, though he could not confider himfelf as a wife man, he was indeed a lover of wifdom. True wifdom and modefty are generally united. 'The example of Pythagoras was followed by every man of eminence; while the name Sophifl was retained only by thofe who witha pomp of words made a magnificent difplay of wifdom upon a very flight foundation of knowledge. Thofe men taught an artificial ftructure of language, and a falfe method of reafoning, by which, in argument, the worfe might be made to appear the better reafon (fee Sophism). In Athens they were long held in high repute, and fupported, not only by contributions from their pupils, but by a regu. lar falary from the flate. They were among the bittereft enemies of the illuftrious Socrates, becaule he embraced every opportunity of expofing to contempt and ridicule their vain pretenfions to fuperior knowledge, and the pernicious influence of their doctrines upon the tafte and morals of the Athenian youth.
SOPHISTICATION, the mixing of any thing
with what is not genuine ; a practice too common in Sophocles. the making up of medicines for fale; as alro among vintners, diftillers, and others, who are accufed of fophifticating their wines, fpirits, oils, \&c. by mixing with them cheaper and coarfer materials; and in many cafes the cheat is carried on fo artfully as to deceive the beft judges.

SOPHOCLES, the celebrated Greek tragic poet, the fon of Sophilus an Athenian, was born at Colonn, and educated with great attention. Superior vigour and addrefs in the exercifes of the paleftra, and fkill in mufic, were the great accomplifhments of young: men in the ftates of Greece. In thefe, Sophocles excelled; nor was he lefs diftinguifhed by the beauty of his perfon. He was alfo inftructed in the nobleft of all fciences, civil polity and religion: from the firft of thefe lie derived an unthaken love of his country, which he ferved in fome embaffies, and in high military command with Pericles; from the latter he was impreffed with a pious reverence for the gods, manifefted by the inviolable integrity of his life. But his ftudies were early devoted to the tragic mufe ; the fpirit of Efchylus lent a fire to his genius; and excited that noble emulation which led him to contend with, and fometimes to bear away the prize from, his great mafter. He w rote 43 tragedies, of which 7 only have efcaped the ravages of time : and having teftified his love of his country by refufing to leave it, though invited by many kings; and having enjoyed the uninterrupted efteem and affection of his fellow-citizens, which neither the gallant actions and fublime genius of Efchylus, nor the tender fpirit and philofophic virtue of Euripides, could fecure to them, he died in the grft year of his age, about 406 years before Chrift. 'I'he burial-place of his anceftors was at Decelia, which the Lacedemonians had at that time feized and fortified; but Lyfander, the Spartan chief, permitted the Athenians to inter their deceafed poet; and they paid him all the honours due to his love of his country, integrity of life, and high poetic excellence. Efchylus had at once feized the higheff poft of honour in the field of poetry, the true fublime; to that eminence his claim could not be difputed. Sophocles had a noble elevation of mind, but tempered with fo fine a tafte, and fo chaftened a judgment, that he never paffed the bounds of propriety. Under lis conduet the tragic mufe appeared with the chafte dignity of fome noble matron at a religious folemnity ; harmony is in her voice, and grace in all her motions. From him the theatre received fome additional embellifhments; and the drama the introduction of a third feaker, which made it more active and more interefting: but his diftinguifhed excellence is in the judicious difpofition of the fable, and fo nice a comnection and dependence of thie parts on each other, that they all agree to make the event not only probable, but even neceffary. This is peculiarly admirable in his " Edipus Fing of Thebes;" and in this important point he is far fuperior to every other dranatic writer.

The ingratitude of the children of Sophocles is well known. They wifhed to become immediate mafters of their father's poffefions; and therefore tired of his long lite, they accufed him before the Areopagus of infanity. The only defence the poet made was to read his tragedy of CEdipus at Colonos, which he had lately. finifhed; and then he alked his judges, whetber the au-

\section*{S O R [608] S O R}
thor of fuch a performance could be taxed with infanity? The father upon this was acquitted, and the children returned home covered with fhame and confufion. The feven tragedies of Sophocles which ftill remain, together with the Greek Scholia which accompany them, have been tranflated into Latin by Johnfon, ard into Englifh by Dr Frauklin and Mr Potter.

SOPHORA, in botany: A genus of plants belong. ing to the clafs of decandria, and to the order of monoIynia; and in the natural fyftem arranged under the \(3^{2 \mathrm{~d}}\) order, Papilionacea. The calyx is quinquedentate :and gibbous above: the corolla is papilionaceous; the wings being of the fame length with the vcxillum: the feed is contained in a legumen. There are 16 fpecies; the tetraptera, microphylla, flavefcens, alopecuroides, to mentofa, occidentalis, capenfis, aurea, japonica, geniftoides, auftralis, tinctoria, alba, lupinoides, biflora, and hir futa

SOPORIFIC, or Soporfferous, a medicine that produces neep. Such are opium, laucanum, the feed of poppies, \&xc. The word is formed from the Latin fopor "fleep." The Greeks in place of it ufe the word bypnotic.

SORBONNE, or Sorbon, the houfe or college of the faculty of theology eftablifhed in the univerfity of Paris. It was founded in 1252 by St Louis, or rather by 1,7 obert de Sorbon his confeffor and almoner, firft canon of Cambray, and afterwards of the church of Paris; who gave his own name to it, which he himfelf took from the village of Sorbon or Serbon, near Sens, where he was born. The foundation was laid in 1250; queen Blanche, in the abfence of her hurband, furnifhing him with a houfe which had formerly been the palace of \(J u l i a n\) the apoftate, of which fome remains are fill feen. Afterwards the king gave him all the houfes he had in the fame place, in exchange for fome others. The college has been fince magnificeintly rebuilt by the cardinal de Richelieu. The defign of its inftitution was for the ufe of poor ftudents in divinity. There are lodgings in it for 36 doctors, who are faid to be of the fociety of the Sorbonne; thofe admitted into it without being doetors, are faid to be of the hofpitality of the Sorbonine. Six regent doctors formerly held lectures every day for an hour and a half each; three in the morning, and three in the afternoos.

Sorbonne, is alfo ufed in general for the whole faculty of theology at Paris; as the affemblies of the whole body are held in the houfe of the Sorbonne; and the bachelors of the other houfes of the faculty, as the houfe of Navarre, \&c. come hither to hold their forbonnique, or act for being admitted doctor in divinity.

SORBUS, service-tree, in botany; a genus of plants belonging to the clafs of ico \({ }^{\circ}\) andria, and to the order of trigynia. 'I'he calyx is quinquefid; the petals are five ; the berry is below the flower, foft and containing three feeds. There are three fpecies; the aucuparia, domettica, and hebrida.
1. The aucuparia, mountain-afh, quicken-tree, quickbeam, or roan-tree, rifes with a ftraight upright ftem and regular branching head, twenty or thirty feet high or more, covered with a fmootl greyifh brown bark; pinnated leaves of eight or ten pair of long, narrow, ferrated folioles, and an odd one, fmooth on both fides; and large umbellate clufters of white flowers at the fides
and ends of the branches, fucceeded by clufters of fine red Berries, ripe in autumn and winter. There is a variety with yellow ftriped leaves. 'I'his §pecies grows wild in many parts of this ifland in mountainous places, woods, and hedge-rows, often growing to the fize of timber; and is admitted into moft ornamental plantations, for the beauty of its growth, foliage, flowers, and fruit ; the latter, in particular, being produced in numerous red large bunches all over the tree, exhibit a fine appeatance in autumn and winter, till devoured by the birds, efpecially the blackbird and thrufh, which are fo allured by this fruit as to flock from all parts and feed on it voracioully. - In the illand of Jura the juice of the berries is employed as an acid for punch. It is probable that this tree was in high efteem with the Druids; for it is more abundant than any other tree in the neighbourhood of thofe Druidical circles of ftones, fo common in North Britain. It is ftill believed by fome perfons, that a branch of this tree can defend them from enchantment or witchcraft. Even the cattle are fuppofed to be preferved by it from danger. The dairy-maid drives them to the fummer paftures with a rod of the roan-tree, and drives them home again with the fame. In Strathfpey, we are told, a hoop is made of the wood of this tree on the Ift of May, and all the fheep and lambs are made to pafs through it.
2. The domefica, or cultivated fervice-tree, with eatable fruit, grows with an upright ftem, branching 30 or 40 feet high or more, having a brownifh bark, and the young fhoots in fummer covered with a mealy down; pinnated leaves of eight or ten pair of broadifh deeply ferrated lobes and an odd one, downy underneath, and large umbellate clufters of white flowers at the fides and ends of the branches, fucceeded by bunches of large, fle hy, edible red fruit, of various fhapes and fizes. This tree is a native of the fouthern warm parts of Europe, where its fruit is ufed at table as a defert, and it is cultivated here in many of our gardens, both as a fruit-tree and as an ornament to diverfify hardy plantations.
3. The bebrida, or mongrel fervice tree of Gothland, grows twenty or thirty feet high; it has half-pinnated leaves, very downy underneath; and clulters of white flowers, fucceeded by bunches of round reddifh berries in autumn.

SORCERY, or MAGIC; the power which fome perfons were formerly fuppofed to poffefs of commanding the devil and the infernal fpirits by fkill in charms and invocations, and of foothing them by fumigations. Sorcery is therefore to be diftinguifhed from witcheraft ; an art which was fuppofed to be practifed, not by commanding evil spirits, but by compact with the devil. As an inftance of the power of bad fmells over demons or evil fpirits, we may mention the flight of the evil fpirit mentioned in Tobit into the remote parts of Egypt, produced, it is faid, by the fmell of the burnt liver of a fifh. Lilly informs us, that one Evans having raifed a ppirit at the requeft of Lord Bothwell and Sir Kenelm Digby, and forgetting a fumigation, the fpirit, vexed at the difappointment, pulled him with. ont the circle, and carried him from his houfe in the Minories into a field near Batterfea Caufeway.

King James, in his Demonologia, has given a very full account of the art of forcery. "Two principal things (fays he) cannot well in that errand be wanted:

\section*{\(\mathrm{S} O \mathrm{R}\)}
holy water (whereby the devill mockes the papifts), and likew prefent of a living thing unto him. There are likewife certaine daies and houres that theyobferve in this purpole. Thefe things being all ready and prepared, circles are made, triangular, quadrangular, round, double, or fingle, according to the forme of the apparition they crave. When the conjured fpirit appeares, which will not be while after many circumftances, long prayers, and much muttering and inurmurings of the conjurors, like a papilt prieft difpatching a hunting maffe-how foone, I fay, he appeares, if they have miffed one jote of all their rites; or if any of their feete once flyd over the circle, through terror of his fearfull apparition, he paies himfelf at that time, in his owne hand, of that due debt which they ought him, and otherwife would have delaied longer to have paied him : I mean, he carries them with him, body and foule." How the conjurors made triangular or quadrangular circles, his majefty has not informed us, nor does he feem to imagine there was any difficulty in the matter. We are therefore led to fuppofe, that he learned his mathematics from the fame fyitem as Dr Sacheverell, who, in one of his \{peeches or fermons, made ufe of the following fimile: "They concur like parallel lines; meeting in one common centre."
Another mode of confulting fpirits was by the beryl, by means of a fpeculator or feer; who, to have a complete fight, ought to be a pure virgin, a youth who had not known woman, or at leaft a perfon of irreproachable life and purity of manners. The method of fuch confultation is this: The conjuror having repeated the neceffary charms and adjurations, with the litany or invocation peculiar to the fpirits or angels he wifhes to call (for every one has his particular form), the feer looks into a cryftal or beryl, wherein he will fee the anfwe; reprefented either by types or figures; and fometimes, though very rarely, will hear the angels or fpirits fpeak articulately. Their pronunciation is, as Lilly fays, like the Irif, much in the throat. Lilly defcribes one of thefe beryls or cryftals. It was, he fays, as large as an orange, fet in filver, with a crofs at the top, and round about engraved the uanes of the angels Raphael, Gabriel, and Uriel. A delineation of another is engraved in the frontifpiece to Aubery's Mifcellanies.

Thefe forcerers or magicians do not always employ their art to do mifchief; but, on the contrary, frequently exert it to cure difeafes inflicted by witches ; to dilcover thieves; recuver ftolen goods; to foretel future events, and the ftate of abfent friends. On this account they are frequently called white witches. See Magic, Witchcraft, \&c.

Our forefatlers were ftrong believers when they enacted, by ftatute 33 Fen. VIII. c. 8. all witcheraft and forcery to be felony without benefit of clergy; and again, by fatute I Jac. I. c. I2. that all perfons invoking any evil fpirit, or confulting, covenanting with, entertaining, employing, feeding, or rewarding andy evil fpirit; or taking up dead bodies from their graves to be ufed in any witcheraft, forcery, charm, or inchantment : or killing or otherwife hurting any perfon by fuch infernal arts; fhould be guilty of felony without benefit of clergy, and fuffer death. And if any perfon fhonld attempt by forcery to difeover hidden treafure,

Voz. XVII. Part II.
or to reftore itolen goods, or to provoke unlawful love, or to hurt any man or beaft, though the fame were not effected, he or fhe fhould fuffer imprifonment and pillory for the firft offence, and death for the fecond. Thefe acts continued in force till lately, to the terror of all ancient females in the kingdom; and many poor wretches were facrificed thereby to the prejudice of their neighbours and their own illufions, not a few having by fome means or other confeffed the fact at the.gallows. But all executions for this dubious crime are now at an end; our legiflature having at length followed the wife example of Louis XIV. in France, who thought proper by an edict to reftrain the tribunals of juftice from receiving informations of witheraft. And accordingly it is with us enacted, by ftatute 9 Geo. II. c. 5. that no profecution thall for the future be carried on againft any perfon for conjuration, witcheraft, forcery, or inchantment : But the mifdemeanor of perfons pretending to ufe witcheraft, tell fortanes, or difcaver ftolen goods, by fkill in the occult fciences, is ftill defervedly punifhed with a year's imprifonment, and ftanding four times in the pillory.

SOREX, the Shrew, in natural hiftory; a genus of animals belonging to the clafs of mammalia, and order of fera. It has two long fore-teeth in the upper jaw, which are divided into two points ; in the lower jaw are two or four fore-teeth, the two middle ones, in the latter cale, being fhorter than the others: On each fide in both jaws are two or more tufks: The grinders are knobbed. The animals of this genus have in general thick clumfy bodies, and five toes on cach of their feet ; the head refembles that of the mole, being thick at the fore-head, much elongated, and ending in a conical fnout, and having very fmall eyes; in other circumftances of general figure they refemble the murine tribe of quadrupeds. They burrow in the ground, fome fpecies living moftly about the fides of waters; and mof of them feeding on worms and infects. There are 16 fpecies ; of which the mof remarkable are,
1. The araneus, or field fhrew-moufe, with Short rounded ears; eyes fmall, and almoft hid in the fur; nofe long and flender, upper part the longeft; head and upper part of the body of a brownifh red; belly of a dirty white; length from nofe to tail, two inches and a half; tail one and a half. Inlabits Europe: lives in old walls and heaps of ftones, or holes in the earth ; is frequently near hay-ricks, dung-hills, and neceffary-houfes; lives on corn, infects, and any filth; is often obferved rooting in ordure like a hog; from its food, or the places it frequents, has a difagreeable fmell; cats will kill, but not eat it : it brings four or five young at a time. The ancients believed it was injurious to cattle; an error now detected. There feems to be an annual mortality of thefe animals in Auguft, numbers being then found dead in the paths.
2. The fodiens, or water-fhrew, has a long flender nofe; very minute ears; very fmall eyes, hid in the fur ; colour of the head and upper part of the body: black; throat, breaft and belly, of a light aflicolour; beneath the tail, a triangular dufky fpot; much larger than the laft; length, from nofe to tail, three inches three quarters; tail, two inches. Inhabits Europe: long fince known in England, but loft till May 1763; when it was difcovered in the fens near. Revelley Ab-

4 II
bey,

\section*{\(S O R\)}
bey; Lincolnhire ; burrows in the banks near the water ; is called by the fenmen the blind-moufe.
3. The minutus, or minute firew, has a head near as big as the body : very flender nofe; broad fhort naker ears; whifkers reaching to the eycs; eyes fmall, and capable of being drawn in; hair very fine and fhining; grey above, white beneath; no tail ; the leaft of quadrupeds, according to Linnæus. Inhabits Siberia; lives in a neft made of lichens, in fome moift place beneath the ronts of trees; feeds on feeds, digs, runs fiwiftly, and has the voice of a bat.
4. The tucan, or Mexican fhrew, has a fharp nofe; fmall round ears; without fight ; two long fore-teeth above and below; thick, fat, and flefhy body; fhort legs, fo that the belly almoft touches the ground; long crooked claws; tawny hair; fhort tail; length, from nofe to tail, nine inches. Inhabits Mexico ; burrows, and makes fuch a number of cavities. that travellers can fcarce tread with fafety; if it -gets out of its hole, coes not know how to return, but begins to dig another ; grows very fat, and is eatable ; feeds on roots, kidneybeans, and other feeds. M. de Buffon thinks it a mole; but it feems more properly to belong to the genus of forex.

SORITES, in logic, a fpecies of reafoning in which a great number of propofitions are fo linked together, that the predicate of the one becomes continually the fubject of the next following, till at laft a conclufion is formed by bringing together the fubject of the firt propofition and the predicate of the laft. Such was that merry argument of Themiftocles, to prove that his little fon under ten years old governed the whole world. Thus: My fon governs his mother; bis mother me; Ithe Athenians; the Atbenians the Greeks; Greece commands Europe; Europe the whole world: therefore my fon commands the whale world. See Lncic, \({ }^{9} 96,97\).

SORNING, in Scots law. See Law, No clexxvi. 30.

SORREL, in botany, a fpecies of the RUMEX, which grows in paftures and meadows, and is well known. The natives of Lapland boil large quantities of the leaves in water, and mix the juice when cold with the milk of their rein-deers which they efteem an agreeable and wholefome food. The Dutch are faid to cultivate this plant for its ufefulnefs in the dyeing of woollen cloths black ; and we know that by means of the common broad-leaved forrel an excellent black colour is, in many places of Scotland, given to woollen fuffs withont the aid of copperas. As this mode of dyeing does not in the fmalleft degree injure the texture of the cloth, which continues to the laft foft and filky, without that hardnefs to the touch which it acquires when dyed black by means of copperas, our readers will probably thank us for the following receipt, with which we have been favoured by a learned phyfician:
Let the ftuff to be dyed be well wafhed with foap and water, and afterwards completely dried. I'hen of the common broad-leaved forrel boil as much as fhall make an acid decoction of fufficient quantity to let the fuff to be dyed lie in it open and eafy to be ftirred. The greater quantity of forrel that is ufed, the better will the colour be; and therefore if the pot or cauldron will not hold enough at once, when part has been fufficient. ly boiled, it mutt be taken out and wrung, and a frehs
quantity be boiled in the fame juice or decoction. When the liquor is made fufficiently acid, frain it from the forrel through a fieve, put the cloth or yarn into it, and let it boil for two hours, ftirring. it frequently. If fock ings be among the ftuff to be dyed, it will be expedient, after they have been an hour in the boiling liquor, to turn them infide out, and at the end of the fecond hour let the whole be poured into a tub or any other veffel. The pot or cauldron mult then be wafted, and water put into it, withy half a pound of logwood chips for every pound of dry yaru or cloth. The logwood and water fhould boil flowly for four hours; and then the cloth or yarn being wring from the four liquor, and put into the logwood decoction, the whole mult be fuffered to boil flowly for four hours, ftuckings, if there be any, being turned infide out at the end of two hours. Of this lalt decoction there muit as of the former be enongh to let the cluth lie open and eafy to be firred while boiling. At the end of the four hours the cloth muft be taken out, and among the boiling liquor, firlt removed from the fire, mult be poured a Scotch pint or Englifh gallon of ftale urine for every pound of dry cloth or other ftuff to be dyed. When this compound liquor has been firred and become cold, the cloth mult be put into it and fuffered to remain well covered for 12 hours, and then dried in the fhade; after which, to diveft it of fmell or any other impurity, it may be wafhed in cold water, and dried for ufe.

Wood-Sorrel, in botany. See Oxalis.
Sorrel-Colour, in the manege, is a reddifh colour, generally thought to be a fign of a good horfe.

SORRENTO, a fea-port town of the kingdom of Naples, with an archbifhop's fee. It is feated in a peninfula, or the bay of Naples, at the foot of a mountain of the fane name, 17 miles fouth-eaft of Naples. It is the birth-place of Torquato Taffo. E. Long. 14. 24. N. Lat. 40.36.

SORTILEGE (Sortilegium), a fpecies of divination performed by means of fortes or lots.

The fortes Prenefinx, famous in antiquity, confifted in putting a number of letters, or even whole words, into an urn; and then, after flaking them-together, they were thrown on the ground; and whateger fentences could be made out from them, conftituted the anfwer of the oracle. To this method of divination fucceeded that which has been called the fortes Homerianze and fortes Virgiliane, a mode of inquiring into futurity, which undoubtedly took its rife from a general cuftom of the oracular priefts of delivering their anfwers. in verfe; it fubfifted a long time among the Greeks and: Romans; and being from them adopted by the Chriftians, it was not till after a long fucceffion of centuries. that it became exploded. Among the Romans it confifted in opening fome celebrated poet at random, and among the Chiritians the Scriptures, and drawing, from the firt paffage which prefented itfelf to the eye, a prognottic of what would befal one's felf or-others, or direction: for conduct when under any exigency. There is good evidence that this was none of the vulgar errors; the greatef perfons, philofophers of the beft repute, admitted this fuperfition. Socrates, when in prifon, hearing this line of Homer,

Within three days I Phthia's chore fhall fee,
immediately

\section*{Si O) I}
ilege. immediately faid, within three days I fhall be out of the world; gathering it from the double meaning of the word Phtbia, which in Greek is both the name of a country and fignifies corruption or death. This predietion, addreffed to Efchinus, was not eafily forgotten, as it was verified.

When this fuperfition paffed from Paganifm into Cluriftianity, the Chriftians had two methods of confulting the divine will from the Scriptures; the one, cafuilly, to open the divine writings, and take their direction, as above-mentioned; the other, to go to church with a purpofe of receiving, as a declaration of the will of heaven, the words of the Scripture, which were finging at the inftant of one's entrance.

This unwarrantable practice of inquiring into futurity prevailed very generally is England till the beginning of the prefent century; and fometimes the books of Scripture, and fometimes the poems of Virgil, were confulted for oracular refponfes. One remarkable inftance is that of King Charles I. who being at Oxford during the civil wars, went one day to fee the public library, where he was fhowed, among other books, a Virgil nobly printed and exquifitely bound. The lord Falkland, to divert the king, would have his majefty make a trial of his fortune by the Sortes Virgiliana. Whereupon the king opening the book, the period which happened to come up was this:

> At bello audacis populi vexatus, et armis, Finibus extorris, complexu avulfus Iuli, Auxilium imploret; videatque indigna fuorum
> Funera; nec, cum fe fub leges pacis iniqua Tradiderat, regno aut optata lice fruatur ; Sed codat ante diem, nediaque inbumatus arena.

Encid. lib. iv.
Yet let a race, untamed and haughty foes, His peaceful entrance with dire arms oppofe; Oppreffed with nurnbers in the unequal field, His men difcouraged, and himfelf expelled, Let men for fuccour fue from place to place, 'I'orn from his fubjects, and his fon's embrace: Firft let him fee his friends in battle flain, And their untimely fate lament in vain; And when at length the cruel war fhall ceafe, On hard conditions may he buy his peace. Nor let him then enjoy fupreme command, But fall untimely by fome hoftile hand, And lie unburied on the barren fand.

Lord Falkland obferving that the king was concerned at this accident, would likewife try his own fortune in the fame manner, hoping he might fall upon fome paffage that would have no relation to his cafe, and thereby divert the king's thoughts from any impreffion which the other might have upon him; but the place he Itumbled upon was as much fuited to his deftiny as the other had been to the king's; being the lamentation of Evander for the untimely death of his fon Pallas*: for this lord's eldeft fon, a young man of an amiable character, had been flain in the firt battle of Newbury.
We have ourfelves known feveral whofe elevotion has not always been regulated by judgment purfue this method of divination; and have generally obferved, that the conféquence has becin defpair or prefumption. To fuch we beg leave to recommend one paffage in Scrip-
ture which will never difappoint them: Thou finalt not tempt the Lord thy God.

SOTERIA, in antiquity, facrifices offered to the gods for delivering: a perfon from danger ; as alfo poetical pieces compofed for the faine purpofe.

SOUBISE, a town of France, in the department of Lower Charente, and late territory of Saintonge. It is feated on the river Charente, 22 miles fouth of Ro̊chelle, in W. Long. 1. 2. N. Lat. 45.57

SOUGH, among miners, denotes a paflage dug under ground, to convey off waters from mines. See Mine.
SOVEREIGN, in matters of government, is applieđ to the fupreme magiftrate or magifrates of an indeperdent government or fate; becaufe their authority is only bounded by the laws of God and the laws of the fate: fuch are kings, princes, \&c. See Prerogative, \&c.
